Comparative philology, though almost entirely a growth of the present century, took its origin long since. The missionaries of the Roman Catholic Church in America, especially in the Spanish regions, long ago collected great numbers of vocabularies, which are now prized not only as collections of words, but as affording illustrations of the relative fixity or mutability of barbaric languages—a point in regard to which the greatest diversities exist, some languages changing greatly, it would appear, in a single generation, while others preserve a large degree of sameness over great areas of space and through great epochs of time.

But the British occupation of India, and the consequent study of Sanscrit literature, gave to all branches of linguistic science a wonderful impulse; indeed, not till that time did studies of this class assume a truly scientific character. (See BÄCKER, "Grammaire Comparée des Langues de la France" (1860); BAISSAC, "De l'Origine des Dénominations Ethniques" (1867); BALBI, "Atlas Ethnographique" (1826); BASTIAN, "Sprachvergleichende Studien" (1870); BAUDRY, "Grammaire Comparée des Langues Classiques" (1868); BEAMES, "Comparative Grammar of Modern Aryan Languages in India;" KUHN and SCHLEICHER, "Beiträge zur Vergleichenden Sprachforschung," etc. (1856–69), *sqq.*; BENLOEW, "Aperçu Général de la Science Comparative des Langues" (1858); BLEEK, "Ueber den Ursprung der Sprache" (1868), and "Comparative Grammar of South African Languages" (1869); LOUIS LUCIEN BONAPARTE, "Specimen Lexici Comparativi" (1847); the writings of BOPP, especially his "Comparative Grammar" (1833; 3d ed. 1869, *sqq.*, translated by Eastwick; 3d ed. 1862); DIEFFENBACH, "Lexicon Comparativum" (1847–51); EICHOFF, "Grammaire Générale Indo-Européenne" (1867); FICK, "Vergleichendes Wörterbuch" (1870); J. GRIMM, "Deutsche Grammatik" (2d ed. 1869–72); KELLE, "Vergleichende Grammatik" (1863); LATHAM, "Comparative Philology" (1862), and his other writings on language; F. MAX MÜLLER, "Lectures on the Science of Language" (6th ed. 1871); A. F. POTT, "Etymologische Forschungen," etc. (1833–36; new ed. 1859–71), and his other works; RAPP, "Grundriss der Grammatik," etc. (1852–55); RENAN, "De l'Origine de Langage" (4th ed. 1864); "Histoire Générale et Système comparé des Langues Sémitiques" (4th ed. 1864); "Revue de Linguistique" (Paris, 1807, *sqq.*); DE SACY, "Principles of General Grammar" (translated by Fosdick, 1847); SCHELE DE VERE, "Outlines of Comparative Philology" (1853); SCHLEICHER, "Compendium der vergleichenden Grammatik" (3d ed. 1871); "Sprachvergleichende Untersuchungen" (1848–50); "Zur Morphologie der Sprache" (1859); STEINTHAL, "Charakteristik der hauptsächlichen Typen des Sprachbaues" (1860); WHITNEY, "Language and the Study of Language" (1867); "Zeitschrift für vergleichende Sprachforschung" (Berlin, 1851, *sqq.*); LAZARUS and STEINTHAL, "Zeitschrift für Völkerpsychologie und Sprachwissenschaft" (1859–69).

Com'pass [perhaps a corruption of the Lat. *circum*, "around," and *passus*, a "step," originally "that which goes round" or "embraces," because it embraces, so to speak, the entire horizon with its circle; Fr. *compas*, also *boussole*)], the name of an instrument used to show the magnetic meridian or the position of objects with reference to it. Among its various forms are the *mariner's* compass, the *azimuth* compass, and the *variation* compass. These several applications each demand a special construction, but the essential parts are invariably the same. These parts are the needle, which consists of a magnetized bar of steel, and, fitted to its centre, a cap, which is supported on a pivot upright and sharp at the point to lessen the friction, and on which the needle may move with the slightest attraction. A circular card is attached to the needle of the *mariner's* compass, which turns with it, and indicates the degrees, which with the thirty-two points, divided into half and quarter points, are all marked on its circumference. The pivot is fastened to the bottom of a circular box, which contains the needle and card, and has a glass cover to protect the needle from the air. This is called the compass-box, and is suspended in a larger box or binnacle by two concentric brass circles called gimbals; the outer one is attached by horizontal pivots to the inner circle and to the outer box, the two sets of axes being at right angles to each other. Thus, the inner circle, carrying the compass-box, needle and card, is sustained in a horizontal position, and is not subject to the rolling of the ship.

"Boxing the compass" is the enumeration, by name, of the thirty-two points which are marked upon the compass-card. These points are—north, north by east, north-north-east, north-east by north, north-east, north-east by east, east-north-east, east by north, east, etc. The point "east"

Mariner's Compass.

is frequently marked O on compasses. This is from the German *Ost*, "east." The steering of ships is much more difficult since the introduction of iron-plated ships. These vessels, being highly magnetic, produce much disturbance of the needle, and it requires all the skill of science to counteract it. It is found best to build the ship with her head south, but to change it to the north during the process of plating, as the magnetism acquired during building is modified by the hammering attendant on the plating. It is, however, found requisite to often change the first adjustments.

The *azimuth* compass has its circle divided only into degrees; it is used to show the bearing of objects with respect to the magnetic meridian, and is furnished with sights for the more accurate noting of the angles.

The *variation* compass shows such changes as occur daily in the deviation of the magnetic from the true meridian. The needle is much longer than in the mariner's compass, in order to make minute variations more apparent.

The origin of the compass is undoubtedly to be ascribed to the Chinese, who more than a thousand years B. C. made use of the loadstone to guide their cars or carriages without the aid of the sun or stars. It is certain that they employed the magnetic needle in the navigation of vessels soon after the Christian era, if not earlier. There is, indeed, every reason to believe that the mariner's compass was not an original European invention, but was introduced from China. None of the early European writers speak of it as invented in Europe; and it is certain that the compasses used by the Italians in the thirteenth century were constructed exactly like those made in China about the same period. The compass is mentioned by Guyot of Provence as early as 1190, and by Raymond Lully, 1286. (See EARTH, VII.)

Compass Plant, the *Silphium laciniatum*, a remarkable plant of the order Compositæ, sub-order Tubulifloræ, tribe Senecionidæ. It grows on the great prairies of the Mississippi Valley, and its radical leaves have, while growing, the property of pointing quite nearly to the north and south. In gardens it does not always show this property, but the testimony of numerous observers, scientific and otherwise, seems to establish the fact as above stated. In the poem of "Evangeline" Mr. Longfellow speaks of a "delicate flower" on the prairies whose leaves point northward, but the plant in question is very large and coarse. With its congeners it abounds in resin and has medicinal properties. It is often called "rosin-weed."

Compasses. See DIVIDERS.

Compensa'tion of Er'rors, the neutralizing in philosophical instruments for measurement (*e. g.* of time, pressure, temperature, distance, etc.) of errors caused by certain properties of the material agents used, by the introduction of other material agents which, acting alone, would produce errors of an opposite character. Thus, the expansion of the pendulum-rod by heat may be counteracted by making its weight of a much more expansive material, as lead or mercury, and connecting it with the rod by its lower end. (See PENDULUM, by F. A. P. BARNARD.)

Com'petine, a township and post-village of Wapello co., Ia. The village is 85 miles S. of Des Moines. Pop. of township, 1033.

Competi'tion [Lat. *competitio*, from *com* (for *con*), "together," and *peto, petitum*, to "seek"], the act of endeavoring to gain what another endeavors to gain at the same time; emulation; strife for superiority. The most important practical use of the term is in the political economy of commerce, where competition is a great motive-power of enterprise and production. Competition in trade and manufactures tends to reduce prices, as well as to improve the quality of goods. Most attempts to supersede competition by some other motive to exertion have been unsuccessful.

Compiègne, a town of France, department of Oise, on the Oise and on the railway from Paris to Saint-Quentin, 44 miles N. N. E. of Paris. It has a communal college and a public library of 28,000 volumes; also manufactures of muslin, hosiery, and cordage. Here is a palace built by Louis XV., a park, and a forest of 30,000 acres. P. 12,150.

Com'plement [Lat. *complementum*, from *com* (for *con*), intensive, and *pleo*, to "fill"], a full quantity or number; the number required or limited; that which completes or fills up. In mathematics, the complement of any magnitude is a second magnitude, which, added to the first, gives a sum equal to a constant third magnitude, which is purely arbitrary and conventional. Thus, the complement of an angle is its defect from a right angle. The arithmetical complement of a number is its defect from the next higher power of ten. Thus, the arithmetical complement of 64 is 36.

COMPLEMENT, in music, the quantity required to be added to any interval to complete the octave; for example, a fourth is the complement of a fifth.

Complemen'tary Col'ors. Each of the three primary colors is complementary to that secondary color which is produced by blending the other two; thus, red is the complementary color of green. Blue and orange are complementary colors, and each presents the most complete contrast to the other. The secondary colors have also each their complementary colors. Colors complementary to each other are always harmonious, and hence the subject is one of practical importance in personal and artistic decoration. The following is a table of some of the principal colors which are complementary to each other:

Red is complementary to Green.		
Blue	"	Orange.
Yellow	"	Purple.
Red-purple	"	Yellow-green.
Blue-purple	"	Yellow-orange.
Dark-purple	"	Citron-yellow.
Blue-green	"	Red-orange.
Olive	"	Dark-orange.
Russet	"	Dark-green.

Complexion. See SKIN.

Com'plin, or **Com'pline** [from the Lat. *compleo*, to "complete," because it finishes the day], the last of the canonical hours in the Greek and Roman Catholic churches, following vespers; also the prayer for that hour, anciently ordained to be said about nine o'clock in the evening.

Compluten'sian Bi'ble, a polyglot in six volumes, folio, so called from *Complutum*, the Latin name of Alcalá in Spain, where it was printed. It was projected by Cardinal Ximenes, who spent about $120,000 upon it. It was commenced in 1502, printed between 1514 and 1517, authorized by Pope Leo X. in 1520, but apparently not published before 1522.

Compo'nent [from the Lat. *com* (for *con*), "together," and *pono*, to "put;" literally, "composing" a part; hence, as a noun, "that which composes" a constituent part], something which unites with another to form a compound. In mathematics, any one of the factors of a composite number or of a literal product.

Compo'ser [for etymology, see preceding article]. This term is usually applied to a person who composes operas, oratorios, airs, or other pieces of music; one who invents new combinations of musical notes.

Compos'itæ [from the Lat. *com* (for *con*), "together," and *pono, positum*, to "put," referring to its compound flowers], the largest natural order of exogenous plants, distinguished by heads of flowers which are composed of florets crowded together upon a common receptacle, and surrounded by an involucre, so as to resemble single flowers. Another marked peculiarity is that the five (rarely four) anthers of each floret unite into a tube. The order contains both herbaceous plants and shrubs, those which are natives of temperate climates being generally herbaceous, those found in warm regions not unfrequently shrubby, and several, especially in St. Helena, are arborescent. They have alternate, opposite, or verticillate leaves, without stipules. The florets are bisexual, unisexual, or neutral, those of the circumference (or ray) often differing in this respect, as well as in form and color, from those of the centre (or disk) of the same head. Chaff-like bracts are often interspersed among the florets. The calyx is superior, adhering to the ovary, and afterwards to the fruit, its limb being either wanting or divided into a pappus of bristles, hairs, or feathers. The corolla is monopetalous, superior, strap-shaped, tubular, or more rarely labiate, different forms often appearing in ray and disk of the same head. It is rarely three or four-toothed, but often five-toothed. The ovary is one-celled, with a single ovule, the style simple, with a cleft apex; the fruit an achenium; the seed destitute of albumen. The order contains more than 1000 genera and about 10,000 known species. In the Linnæan system they form with a few others the class Syngenesia.

The order is divided into three sub-orders—the Tubulifloræ, the Labiatifloræ, and the Ligulifloræ. The artichoke, thistle, daisy, chamomile, sunflower, dandelion, chicory, and lettuce are well-known plants of this order.

From the seeds of some a fixed drying oil is expressed, the oil of the sun-flower, the *Madia*, and the *Guizotia* being among the most important. Many are valuable for their medicinal properties, as chamomile, arnica, wormwood, tussilago, etc. Not a few are characterized by bitterness and by stimulating properties; also anodyne, narcotic, diaphoretic, and diuretic properties. Some, as arnica, are poisonous. A large number are ornaments of our flower-gardens, especially in the latter part of summer and in autumn. Amongst these are the xeranthemum, dahlia, aster, and chrysanthemum. This order is called Asteraceæ by Lindley and others.

Compos'ite Or'der, in architecture, a style of building characterized by the employment of pillars designed to combine the lightness and grace of the Ionic order with the ornate finish of the Corinthian. In many cases the Ionic volute was blended with the Corinthian acanthus leaf, as in the example given. This union is regarded by most critics as an incongruous one, and the Composite style is considered effeminate. It was employed chiefly in the Roman empire in its period of decadence. The accompanying cut represents the Composite style as seen in the temple of Vesta at Tivoli. It is comparatively free from the characteristic faults of the order. Many writers consider the Composite order a mere variety of the Corinthian.

Composite Capital and Base.

REVISED BY C. COOK.

Composi''tion [Lat. *compositio*], in general, is the act of composing, or that which is composed; in literature, the act of inventing or combining ideas and expressing them in words; also a literary production, book, or essay. In music, it is the act or art of disposing and arranging musical sounds into airs, tunes, songs, etc. The term is also applied to an air or other piece of music. In printing, it is the setting of types, or putting them together to form words and sentences.

COMPOSITION, in the fine arts, is that combination of the several parts by which a subject is agreeably presented, each part being subordinate to the whole; such an arrangement of the objects represented that they shall all tend to illustrate the central thought or idea.

COMPOSITION, in bankruptcy, a percentage which creditors agree to receive from a bankrupt instead of full payment. (See INSOLVENCY, by PROF. T. W. DWIGHT, LL.D.)

Composition of Forces or **Motions,** in mechanics, signifies combining or uniting several forces or motions, and determining the result of the whole. If a body is impelled by two forces which act in the same direction, the *resulting* force, or *resultant*, is equal to the sum of both; that is to say, the effect produced is the same as would be produced by a single force acting in the same direction, and equal to their sum. If the two forces act in opposite directions, the resultant is equal to their difference, and the body will move in the direction of the greater. If the lines of direction of the two forces make an angle with each other, the resultant will be a mean force in an intermediate direction. Thus, if the two forces be represented in intensity and direction by the two sides of a parallelogram, then the resultant is represented in intensity and direction by the diagonal of the parallelogram which passes through the angle formed by those two sides. F. A. P. BARNARD.

Com'post [from the Lat. *com* (for *con*), "together," and *pono, positum*, to "place"], a mixture of substances adapted to the fertilization of the soil, which substances, being allowed to undergo chemical changes for a considerable time in heaps, become more valuable then they could have been if applied separately. Composts are made of farmyard manures and earth, road-scrapings, peat, leaves, and clearings of ditches. By allowing these to lie for six months in heaps of from three to four feet in depth, food is prepared for plants. The use of guano and other light manures will no doubt supersede in a great measure the necessity of this laborious process. The wonderful effects that have resulted from the application of nitrates, ammonia salts, and phosphoric acid should impress farmers with the truth that the valuable elements bear a small proportion in weight to the whole mass of farmyard dung or composts, and that the mixing of manures in heaps with earth often does not pay for the labor expended. Still, in some circumstances, the chemical or commercial fertilizers are best applied to the soil after composting them with earth or with coarse manures. The action of frost upon composts is highly beneficial, especially when peaty earth is used.

Compostella. See SANTIAGO DE COMPOSTELLA.

Com'pound [from the Lat. *com* (for *con*), "together," and *pono*, "to put"], a substance formed by the union of two or more substances joined by chemical affinity. The adjective "compound," which means composite or composed of several parts or elements, is applied in botany and other sciences to various objects which are not simple. A compound leaf is formed of several leaflets articulated to a common petiole, and is either pinnate or digitate. Compound motion is that which is effected by two or more conspiring forces or powers.

Com'pound An'imals are organisms of low grade, in which parts regarded by some theorists as individuals, and which are certainly distinct in many vital functions, are merged into one compound system. The living mass in all truly compound animals appears to originate from a single ovum, and the subsequent development of the individual parts by gemmation resembles in some respects the growth of vegetables. Examples of compound animal life are found in coral-polyps, cestoid worms, certain molluscoids,

etc. There is, however, much difference of opinion as to what constitutes animal individuality.

Compound Fracture, in surgery, is a fracture of any bone when the skin and tissues covering the bone are so lacerated that air may enter the fracture. The treatment of compound fracture requires the highest surgical skill. (See FRACTURE.)

Compound Interest. See INTEREST.

Compound'ing of Fel'ony, in England and the U. S., is the act of taking, or agreeing to take, a reward for forbearing to prosecute a felony, and is punishable with fine and imprisonment. A note or other promise taken on such a consideration is illegal in its inception, and cannot be enforced in a court of justice by the promisee. (See FELONY, by PROF. T. W. DWIGHT, LL.D.)

Compound Microscope. See MICROSCOPE, by PROF. J. W. S. ARNOLD, M. D.

Compressed Air, as a means of the transmission of motive-power, has been thoroughly tested in the railway tunnels of Mont Cenis and the Hoosac Mountain in Massachusetts. Compressed air, as an agent for transmitting power, is advantageously used only in those cases where belts or shafting could not be employed on account of the great distance between the motive-power and its point of application. At the Hoosac Tunnel the air was compressed partly by water-power (as at Mont Cenis), and partly by steam, which works by means of air-pumps. The compressed air is transmitted through tubes, and gives motion to drills by means of pistons working in cylinders somewhat as in steam-engines. The exhaust air from the engines aids in ventilation and in keeping down the temperature—important considerations in underground operations; and perfect ventilation may at any time be secured by turning on a blast directly from the reservoirs.

Compressed Air-Bath, an apparatus in which patients with pulmonary diseases are placed and submitted to increased atmospheric pressure. The great expectations formerly entertained from this treatment have not been realized, but it appears to be a useful adjunct, especially in bronchitis and asthma.

Compressibil'ity, the property of being compressible into smaller space; susceptibility of being reduced by pressure to smaller dimensions. All bodies, in consequence of their porosity, are compressible, though liquids resist compression with immense force. Water, if subjected to a pressure of 15,000 pounds on a square inch, loses one-twentieth of its volume. Solids are compressible in different degrees. Gases are more compressible than either liquids or solids. A number of cubic inches of air can be compressed into the space of one cubic inch. Carbonic acid and several other gases can be condensed by pressure into a liquid and even a solid state.

Com'promise [from the Lat. *com* (for *con*), "together," and *promitto, promissum*, to "promise"], something promised or agreed upon mutually; an amicable agreement between two parties or persons who have been involved in a controversy that they will settle the difference by mutual concessions, or, as used in the civil law, a mutual promise of such parties to refer their differences to the decision of arbitrators.

Compromise, a township of Champaign co., Ill. P. 707.

Comp'ton, a county in Canada, in the S. part of Quebec, borders on Maine, New Hampshire, and Vermont. The soil is fertile. It is drained by the Chaudière and St. Francis rivers. Capital, Cookshire. Pop. 13,665.

Compton (HENRY), an English prelate who had a large share in the revolution of 1688. He was born in 1632, held first a commission in the army, then entered the Church, became bishop of Oxford in 1674, was transferred to the see of London in 1675, was the instructor of the daughters of the duke of York (afterwards James II.), who became consequently attached to the Protestant faith. He incurred thereupon the bitter hostility of James, who, through the infamous Judge Jeffries, deposed him from his episcopal functions. This was one of the grievances done to the Protestant religion alleged by William in his proclamation on landing. James, in alarm, re-established Compton, who, however, openly joined himself to the party of the invader, and with his own hands crowned him king. Died July 7, 1713.

Compton Centre, a post-village of Compton county and township, Quebec (Canada), 1 mile from Compton Station on the Grand Trunk Railway, 182 miles from Portland, Me.

Comptrol'ler [for pronunciation and etymology see CONTROLLER], a name applied in the U. S. government to three highly important officers in the treasury department.

The FIRST COMPTROLLER countersigns warrants drawn by the secretary of the treasury upon the treasurer, examines the accounts of the first and fifth auditors, receives appeals from the sixth auditor, superintends unsettled accounts of the treasury, navy, war, and interior departments, prosecutes all debts and delinquencies in behalf of the U. S., etc.

The SECOND COMPTROLLER examines the accounts of the second, third, and fourth auditors, countersigns warrants for the pension and Indian bureaus, and performs duties in the navy and war departments analogous to those of the first comptroller in the treasury department.

When a claim has been granted by the proper comptroller there is no revision or appeal allowed. When a claim has been refused by the comptroller, appeal may be made to the court of claims. (See CLAIMS, COURT OF.)

The COMPTROLLER OF THE CURRENCY issues printed notes to the national banks, exchanges new currency for that which is worn out, superintends the national banks, reports their condition annually to Congress, and has numerous other important duties. He gives heavy bonds when entering upon his duties, and is allowed no share in the profits of any banking association.

Com'stock, a township and post-village of Kalamazoo co., Mich. The village is on the Michigan Central R. R., 4 miles E. of Kalamazoo. Pop. 2018.

Comstock (ANDREW), M. D., an elocutionist, born in New York in 1795, published a "System of Phonetics" and "Elocution" (16th ed. 1844), and other works.

Comstock (CYRUS B.), an American officer, born in 1831 in Massachusetts, graduated at West Point in 1855; major of engineers Dec. 28, 1865. He served in constructing fortifications 1855–59; as assistant professor at the Military Academy 1859–61; in the civil war in erecting defences of Washington 1861–62; in Virginia Peninsula 1862, engaged in various engineer operations; in Maryland campaign 1862, engaged at South Mountain and Antietam; as chief engineer Army of the Potomac 1862–63; in Rappahannock campaign 1862–63, engaged at Fredericksburg and Chancellorsville; in the department of the Tennessee 1863, engaged at Vicksburg (brevet major), and as chief engineer Army of the Tennessee; assistant inspector-general of the military division of the Mississippi 1863–64; as senior A. D. C. to Lieut.-Gen. Grant, rank of lieutenant-colonel, 1864–66; in Richmond campaign 1864–65, engaged at Wilderness (brevet lieutenant-colonel), Spottsylvania, Cold Harbor, assaults of Petersburg and mine, and Fort Harrison; as chief engineer of the expedition to Cape Fear River, N. C., 1865, engaged at Fort Fisher (brevet colonel U. S. A. and brevet colonel and brigadier-general U. S. V.); as senior engineer in Mobile campaign 1865, engaged at the siege of Spanish Fort, storming of Blakely, and capture of Mobile (brevet brigadier-general U. S. A. and brevet major-general U. S. V.); and A. D. C. to the general-in-chief, rank of colonel, 1866–70. Since 1870 he has been superintendent of the geodetic survey of the northern lakes.

GEORGE W. CULLUM, *U. S. Army.*

Comstock (GROVER S.), born at Ulysses, N. Y., Mar. 24, 1809, graduated at Hamilton College, Clinton, N. Y., in 1827, studied law, and was admitted to the bar in 1830. Powerfully moved by the preaching of Rev. C. G. Finney, he studied theology at the institution at Hamilton, N. Y., and became a Baptist minister. He sailed in 1834 as a missionary to British Burmah, and finally went to Aracan. In 1837 he founded a church at Kyouk Phyou. Here he remained, in spite of the deadly climate, which carried off his wife and children, until his death, which occurred April 25, 1844. He is especially honored by his denomination as one of its most laborious and devoted missionaries.

Comstock (JOHN LEE), an American author, born at East Lyme, Conn., in 1789, served as an army-surgeon in the war of 1812–15. His work on "Natural Philosophy" is said to have reached a sale of about 1,000,000 copies. Besides numerous works for schools on natural and physical science, he published a "History of the Greek Revolution" (1829), etc. Died at Hartford, Conn., Nov. 21, 1858.

Comte (ISIDORE AUGUSTE MARIE FRANÇOIS XAVIER), a French philosopher and mathematician, founder of the system of POSITIVISM (which see), was born Jan. 19, 1798, at Montpellier. He entered in 1814 the Polytechnic School in Paris. He became in 1820 a disciple of Saint-Simon, and contributed articles to his journal "L'Organisateur," in which the germ of his ideas already appeared. He was entrusted by his master with the preparation of a Saint-Simonian "Politique Positive," which proved unsatisfactory to the old philosopher. In 1832 he was appointed a tutor of mathematics and an examiner of candidates at the Polytechnic School; which posts he resigned in 1852. He lived obscurely, with straitened means, and died Sept. 5, 1857. His writings were "Cours de Philo-

sophie Positive" (6 vols., Paris, 1830–42), and "Système de Politique Positive, ou Trinité de Sociologie, Instituant la Religion de l'Humanité" (1851–54); besides "Calendrier Positiviste" (4th ed. 1852), and "Catechisme Positiviste" (1853). A clearer exposition of his doctrines is contained in Littré's "Comte et la Philosophie Positive" (1863). His "Cours," etc. was published in English in a condensed form by H. Martineau (2 vols., 1853). (See Robinet, "Notice sur l'œuvre et sur la vie de Comte," and Lewes, "Exposition of the Principles of the Positive Philosophy.")

Co'mus [Gr. Κῶμος] was originally the Greek name of those songs of carousal which young people would sing when passing the houses of their friends or lovers. Thence it became the name of the god of such revel; and Philostratus gives a description of a picture in which Comus was represented as a youth, drunken, sleeping, leaning forward on a down-turned torch. Milton makes him a foul sorcerer, the son of Bacchus and Circe.

Con, a Latin particle signifying "together," and sometimes "with." It is commonly changed to *col* before *l*, *com* before *b*, *m*, and *p*, *cor* before *r*, and to *co* before a vowel or *h*. Hence we have *collect*, *combine*, *compress*, and *correct*, instead of *conlect*, *conbine*, etc.; *coagulate* and *cohabit*, instead of *conagulate* and *conhabit*. Sometimes *con* is intensive, as *concutio*, *concussum*, to "shake violently."

Co'nant (Hannah O'Brien Chaplin), wife of T. J. Conant, was born in Danvers, Mass., in 1812. She was distinguished for her great attainments and fine literary taste. She was the author and translator of numerous works, among which is a "History of the English Bible" (1859). Died in Brooklyn, N. Y., Feb. 18, 1865.

Conant (Roger), a colonist, born in Devonshire, England, in 1593, settled in Plymouth Colony in 1623, founded Salem, Mass., in 1626, and became a justice of the "quarterly court." Died Nov. 19, 1679.

Conant (Thomas J.), D. D., born at Brandon, Vt., Dec. 13, 1802, graduated at Middlebury College in 1823, professor of languages in Waterville College (now Colby University) till 1833, and appointed in 1835 professor of biblical literature in the Theological Seminary at Hamilton, N. Y. From 1850 to 1859 he occupied a similar position in the Theological Seminary at Rochester, N. Y. In 1839 he published a translation of Gesenius's "Hebrew Grammar;" in 1857, a new version, with notes, of "the Book of Job"—a work which has attained a European reputation. He has since published similar versions of "Genesis" and the "Psalms" in the interest of the American Bible Union. By common consent he is one of the most accomplished Hebraists in America.

Con'cave [from the Lat. *con*, intensive, and *cavus*, "hollow"]. A curve is said to be *concave* at a given point when the lines joining the latter to adjacent points on the curve fall between the spectator and the curve, and *convex* when the curve is interposed between the spectator and the small chords in question. A surface is said to be concave or convex at any point when the plane sections through that point and the spectator's eye are all concave or convex; when some of these sections present their concavity and others their convexity to the spectator, the surface is sometimes said to be concavo-convex. This is the case with the hyperboloid of one sheet. When at a point on a curve the centre of curvature and the point of view fall on the same side of the tangent, we have concavity; when on opposite sides, convexity. (See Lens.)

Conceal'ment, in law, the suppression of the truth to the injury of another. A distinction is taken between such facts as are extrinsic to the contract, such as the existence of war or peace, and those which are intrinsic. Concealment of extrinsic facts is not, in general, fraudulent. (See Fraud, by Prof. T. W. Dwight, LL.D.)

Concepcion', a town of the Argentine Republic, capital of the province of Entre Rios, on the China, is the see of a Catholic bishop and a national college. Pop. 6050.

Concepcion, a province of Chili, between the ocean and the Argentine Republic, and the provinces of Maule on the N. and Aurico on the S. Area, 5453 square miles. It is traversed by the Biobio. The climate is mild and favorable for tillage and pasturage. The fruit of the *Araucaria imbricata* (*piñon*) is abundantly produced. Coal, wheat, and excellent wine abound. Pop. 148,340.

Concepcion, La, a seaport of Chili, capital of the above province, is situated on the river Biobio, 7 miles from its mouth: lat. 36° 49′ S., lon. 73° 5′ W. It has broad streets and many handsome houses. It is a bishop's seat. Its port, Talcahuano, is one of the best in Chili. It has an extensive foreign trade, and exports large quantities of hides and tallow. Concepcion was ruined by earthquakes in 1730, in 1752, and in 1825. Pop. 13,958.

Concept' [Lat. *conceptus*, from *concipio*, to "conceive;" Ger. *Begriff*], in metaphysics, a thing which may be conceived; a collection of attributes united by a sign, and representing an object of possible intuition. Kant and his followers use the word concept to indicate notions which are general without being absolute. They divide these into three different classes: "Pure concepts," which derive nothing from experience; "empirical concepts," wholly derived from experience; "mixed concepts," ascribable partly to experience and partly to the pure understanding. A concept is "clear" when its object can be distinguished from any other; "distinct," when its component parts can be defined.

Concep'tion [Lat. *conceptio*, from *concipio*, *conceptum*, to "conceive"] is a psychological term denoting the last, finishing process by which consciousness takes possession of an object. It is distinguishable from sensation as active from passive. As long as an object is allowed to impress the mind through the senses, immediately and directly, without any reaction or interference from the side of the mind, consciousness is in a merely passive state; and this passive state of consciousness is called sensation. In order to master an object, the mind cannot stop, however, at the mere sensation; it must make the sensation itself the subject of a scrutiny and discrimination; and this active part of the whole psychological process by which the mind takes possession of an object is called perception and conception; the former referring to the sensation as representing the details of the object, the latter as involving the whole of it. As we go over an object with the finger-tips to ascertain the exact position and relations of its outlines, thus perception runs over all the outlines given in the sensation, partly verifying their truth with respect to the object, partly lifting them into perfect clearness of consciousness. Conception does not begin its work until perception is through with its task. The mode and the meaning of an object as a whole is the task of conception, and thus the conception of an object corresponds very nearly to that which we generally call a view of the object; with this difference only, that a view always is understood to be more or less influenced by the individuality of the subject, while the conception always is supposed to be, strictly and scientifically, the subjective equivalent for the idea of the object. The difference between conception and imagination is, simply, that conception is a process and imagination a faculty; in the process of conceiving the faculty of imagination is very largely used.

Conception, in physiology. See Embryology, by Prof. J. C. Dalton, M. D.

Conception, Immaculate, Doctrine of the. See Immaculate Conception of the Blessed Virgin Mary, by Prof. R. D. Hitchcock, D. D., LL.D.

Conception, Orders of the Immaculate. Among the orders of the Roman Catholic Church there have been the following: (1) The Knights of the Immaculate Conception of the Blessed Virgin, an order founded in 1618, at Vienna, with the intention of bearing arms against heretics and infidels. The institution was confirmed by Pope Urban VIII. in 1623, but the brotherhood did not flourish, and soon was extinct. (2) The Nuns of the Immaculate Conception of Mary, founded at Toledo, in Spain, in 1484, by Beatrix de Sylva, and confirmed by Pope Innocent VIII. in 1489. They afterwards joined the Clarisses, and took their rule, which rule was changed by Pope Julius II. in 1511. They are often called Conceptionists. (3) The Congregation of the Immaculate Conception of the Blessed Virgin is the appellation of the lay sisters attached to the nuns of Notre Dame, who were established by the blessed Peter Fourier (1565–1640).

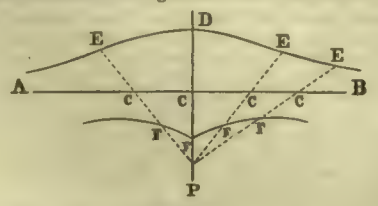
Concep'tualism, a doctrine of the Schoolmen intermediate between realism and nominalism. The Realist asserts that genera and species have an independent existence—that there exist certain "ideas," the pattern after which single objects are fashioned. The Nominalist asserts that nothing exists but things and names of things—that universals are mere names. The Conceptualists assign to universals an existence which may be called psychological—that is, independent of single objects, but dependent on the mind of the thinking subject in which they exist as conceptions. Abelard is considered the founder of this doctrine, which was held by Reid, and probably by Aristotle.

Concerti'na [from *concert*], a modern musical instrument invented by Prof. Wheatstone of London. Its sounds are produced by free vibrating metallic springs, as in the accordion. The scale of the concertina is very complete and extensive, beginning with the lowest note of the violin, G, and ascending chromatically for three and a half octaves

to C. Every sound in the scale is double, and can be produced either by opening or closing the bellows.

Concer'to, an Italian term applied to a piece of music composed for a particular instrument, as a piano or violin, which bears the chief part in it and is usually accompanied by the full band. It is a composition for a solo instrument with orchestral accompaniments, adapted to give the performer an opportunity to display the highest artistic skill as well as intellectual cultivation.

Concetti, kon-chet'tee [an Italian term, rendered by English writers on rhetoric "conceits"], ingenious thoughts or turns of expression, points, *jeux d'esprit*, etc. in serious composition. In the sixteenth century the taste for this species of brilliancy, often false and always dangerous, spread rapidly in the poetical composition of European nations, especially in Spain and Italy, where the name of concetti was applied rather in a good than a bad sense, the critical taste being much perverted. Tasso is not free from concetti. For a century after his time they became offensively prominent in Italian poetry. Marino and Filicaia are marked examples. In France concetti were equally prevalent in the seventeenth century, and were peculiarly in vogue with the fair critics of the Hôtel Rambouillet, so well ridiculed in Molière's "Précieuses Ridicules." Donne and Cowley are instances of a style full of concetti.



Con'cha, de la (Don José), Marquis de la Habaña, a Spanish general, born in Buenos Ayres in 1800. He was captain-general of Cuba from 1849 to 1852, and was again appointed to that office in 1854. In 1862 he was sent as minister to France. In 1863 he was Spanish war minister, and in 1864 was appointed president of the senate.

Concha, de la (Don Manuel Gutièrrez), Marquis del Duero, brother of the preceding, a Spanish general, born April 25, 1808, in Córdova del Tucuman, in the Argentine Republic. He distinguished himself in the war against the Carlists, was, 1839, appointed brigadier-general and, 1840, field-marshal, and overthrew in 1843 the regency of Espartero. After the outbreak of the revolution in Sept., 1868, he was appointed prime minister by Queen Isabella, but soon resigned when his advice was not followed. Killed at the battle of Muro, June 28, 1874.

Conchif'era [from the Lat. *concha*, a "shell," and *fero*, to "bear"], in Lamarck's arrangement of mollusks a class containing those which have bivalve shells. The term is now used to indicate the class usually called Acephala, but it does not include the Brachiopoda.

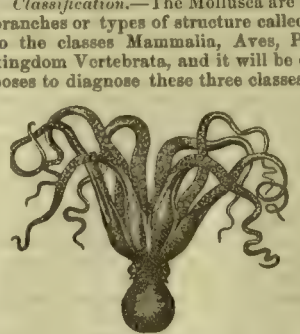
Con'cho, a county in W. Central Texas, is bounded on the N. E. by the Colorado River, and is drained by the river Concho. Area, 1025 square miles. Wood and water are scarce. The surface is generally rough and rocky, but affords good sheep-pasturage. According to the census of 1870, the pop. was 0.

Con'choid [from the Gr. κόγχη, a "shell," and εἶδος, "appearance"] **of Nicomedes,** a curve of the fourth degree, invented by Nicomedes as a means of trisecting an angle, of constructing two geometrical means between two given straight lines, and of finding a cube double a given cube. The curve may easily be described, and is occasionally used in architecture as a bounding line of the meridian section of columns. It is generated as follows: Let A B be

Conchoid.

a straight line, and P any point not upon it; then if lines P E, P E', etc. be drawn, cutting A B, which is called the directrix, in points C C', and let C E, C F be laid off from the points of intersection, each equal to a given line; the curves traced by the successive points E and F form the conchoid. That branch which is most remote from P (the "pole" of the conchoid) is called the first or superior conchoid, and the other branch, traced by points F F', is the second or inferior conchoid. Both branches may extend to infinity, and they have the line A B for a common asymptote. The constant distance C E of the points E and F from the points of intersection is called the modulus of the curve. If we take C in the line E P as origin, and the lines A B and E P, at right angles to one another, as co-ordinate axes, the equation to the conchoid is $x^2 = \frac{(b+y)^2(a^2-y^2)}{y^2}$, where a is the modulus of the curve, and b = the perpendicular distance of P from A B. If $a = b$, P becomes a cusp point of the first species.

Conchoi'dal, a term used in mineralogy to describe a variety of fracture. When the fractured surface of a mineral exhibits curved concavities similar to the valve of a bivalve mollusk, it is said to have a conchoidal fracture, as flint, anthracite coal, etc.



Conchology [from the Gr. κόγχη, a "shell," and λόγος, a "discourse," a "treatise"], a treatise on shells; also the science which treats of shells and their inhabitants. The soft parts of the Mollusca were almost unknown to the earlier naturalists, hence their external coverings or shells were separately classified, without reference to the contained animals. The more scientific modern method requires that the species shall be thoroughly investigated, as well as regards their soft as their hard parts. Malacology (from the Gr. μαλακός, "soft," and λόγος, a "discourse," a "treatise," *i. e.*, a "treatise on soft animals") is a more proper designation for this science, but the word Conchology has become so well known in this connection that it has been found difficult to supersede it. Thus, the latter name is still commonly used, but with the enlarged signification that it is the science or classification and description of molluscous animals, including their shells.

Mollusca (from the Lat. *mol'lis*, "soft") is the second of the five great divisions or structural types of the animal kingdom. An external shell, in nearly all cases, protects the animal, and may be regarded as an exo-skeleton, replacing the bones of the Vertebrata. Occasionally, as in the cephalopods or cuttle-fish, the shell is internal, and in some of the gasteropods it is rudimentary or entirely wanting; still, the absence of the internal skeleton, and consequently of the bony envelopes protecting the great nerve-chord, will, even in such cases, sufficiently distinguish the Mollusca from the Vertebrata. Shells are composed principally of carbonate of lime, with but little other mineral or animal material, and are therefore much harder than the bones of the vertebrates, which contain a large proportion of gelatin. The Mollusca also have colorless blood, while that of the vertebrates is red.*

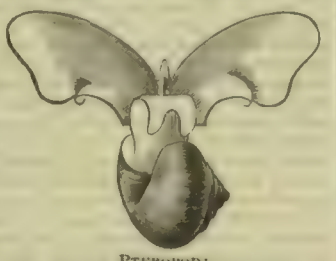
The Mollusca do not attain the size and strength or exhibit the complex structure of the vertebrates, but they cannot justly be said to be of inferior or lower type; their plan of conformation is more simple, but it is just as perfectly adapted to the purposes of their existence. The greater number of individuals of the more simple organisms seem to compensate, in the economy of nature, the superior individual force of the more complex ones.

Geology reveals to us that in the early ages of the world shells were among its first inhabitants, flourishing in its waters almost to the exclusion of other types of animal life, and leaving their imperishable coverings on the geological shores, to become in our day the great record of the succession of strata by the aid of which the geologist reads so unerringly the history of the past.

Classification.—The Mollusca are divided into three great branches or types of structure called *classes*, corresponding to the classes Mammalia, Aves, Pisces, etc., of the subkingdom Vertebrata, and it will be convenient for our purposes to diagnose these three classes somewhat hastily, before describing in detail their structural peculiarities and habits. The first two are *encephalous*—that is, the animal is furnished with a distinct head, and the shell, when developed (as it usually is), is univalve or in one piece. They are named

Cephalopod:
Octopus tuberculatus (about one-tenth its natural size).

Gasteropod:
Helix desertorum.



1. Cephalopoda [from the Gr. κεφαλή, the "head," and πούς, ποδός, a "foot"]. In this class the head is encircled by eight or more feet, or more properly arms, used in swimming and in seizing food.

2. Gasteropoda [from the Gr. γαστήρ, the "belly," and πούς, ποδός, a "foot"]. The

*A few molluscous animals possess red blood, but, viewed with a microscope, the entire fluid is found to be colored, whereas in vertebrate blood the color is due to red corpuscles floating in a colorless fluid.

animal is destitute of separate limbs, but glides, creeps, or swims by the muscular action of the under part of its body.

In an aberrant form of this class, formerly considered a distinct class, locomotion is effected solely by means of a pair of wing-like fins attached antero-dorsally, and used in swimming. These are the PTEROPODA (from the Gr. πτερόν, a "wing," and πους, ποδός, a "foot").

PTEROPOD:
Limacina antarctica (enlarged).

The third class is *acephalous*, or without a head, and the shell (which always envelops the animal) is *bivalve*, or composed of two distinct, generally similar, pieces, united at the back by a horny hinge called the *cartilage*. The distinctive nomenclature used for the encephalous classes is inapplicable here, because the foot is more or less specialized or entirely wanting in the various bivalve families—some of them being sedentary or attached, while others are locomotive. The best designation for the class is

3. ACEPHALA [from the Gr. α, privative, and κεφαλή, the "head"]. Most conchologists use the term *Conchif'era* (shell-bearers) for this class, but it is an objectionable word, inasmuch as it is equally applicable to the other two classes. Others call the bivalve mollusks *lamellibranchiates* (plate-gilled), describing their respiratory organs, but this term is also objectionable, because (as we shall show hereafter) the differences in the organs of respiration enable us to divide the gasteropods satisfactorily into *orders*, and a designation indicating inferior value in one class cannot properly be used to express a high value in another.

Arca granosa (acephalous shell).

Until quite recently systematists have included among the mollusks certain aberrant forms, such as the brachiopods or lamp-shells, the tunicates, and the bryozoans. Of these the first only possess a shell, but the external bivalve test differs in its relation to the contained animal from the acephalous mollusks in this respect, that its valves are applied dorsally and ventrally instead of bilaterally. Internally, we find in one valve a shelly process acting as a support to the animal, and (in this respect) simulating the vertebrate skeleton. The tunicates are shelless animals, enclosed in elastic gelatinous integuments, having two openings only—an orifice for the mouth, and one for the excretions. The organ of respiration is a ribbon-like band crossing the interior cavity. Finally, the Bryozoa, microscopic polypous animals, attach themselves in generally symmetrical patterns upon the surface of rocks or shells, the aggregation of their minute cells resembling corals. All these aberrant forms have been excluded from the true Mollusca by some of the best systematists of the age; but by way of compromise they are generally assigned a position immediately following them as a sub-branch, named MOLLUSCOIDEA (which see). The brachiopods are generally represented in conchological cabinets and described in conchological works. Scientific opinion as to their place is by no means uniform.

BRACHIOPOD:
Spirifera Walcotti (fossil).

While dealing with exclusions it may be well to mention the cirripeds or barnacles, and the echinoderms or sea-urchins. These were included in the Mollusca by Linnæus, whose "Systema Naturæ" divided all invertebrates into two classes—the VERMES (mollusks, etc.) and the INSECTA. Lamarck and Cuvier also included the barnacles in the Mollusca, and even so recently as 1855, Professor T. Rymer Jones so arranged them.*

ANATOMY AND PHYSIOLOGY OF THE MOLLUSCA. 1. REPRODUCTION.—The Cephalopoda and nearly all of the marine Gasteropoda are *dioecious*—that is, the sexes are distinct; but the pulmoniferous terrestrial and fluviatile snails, the Pteropoda, the Nudibranchiata or naked marine mollusks, and a few other marine genera, such as *Bulla* and its allies, are *monoecious*, or with sexes united in the same individual. The Acephala are partly dioecious and partly monoecious.

In the Cephalopoda or cuttle-fishes one of the arms of the male becomes a specialized reproductive organ, and in copulation becomes detached from its owner. It has been found *living* within the sac of the female. In consequence of this very curious method the male organ has been considered by some naturalists to be a parasitic worm, while others have supposed it to represent the normal form of the male animal.

The sexes in the cephalopods are distinguished by external differences of form, as well as by the *pen* or internal shell. The eggs in their passage from the ovary are invested with a gelatinous fluid which greatly enlarges after deposition. The egg-mass is always clustered; in the genus *Se'pia*, the typical cuttle-fish, it assumes the appearance of a bunch of black grapes; in *Oc'topus* it is irregular and attached to sea-weed; and in *Loli'go* it is pudding-shaped, the eggs united by a ligament to a common centre. The liquid of the eggs is at first colorless, but soon after impregnation a central speck appears in each, which grows so rapidly that before the yolk is consumed the embryo has attained a recognizable form; so that previous to hatching the fœtal cuttle-fish already presents all the organs necessary to its after existence. The most remarkable physiological feature of the embryo is the duct for the conveyance of the yolk which communicates with the œsophagus through the head, penetrating in the front of the mouth, instead of entering the walls of the abdomen, as in the vertebrates. Only one oviposit takes place yearly, but the number of eggs contained in the mass is considerable, reaching forty thousand in the *Loli'go vulga'ris*.

The shell of the *Argonaut*, the paper nautilus as it is called, is not a mere egg-case, being developed both by the male and female. It is therefore a true shell, although produced under abnormal conditions, being formed *after* the birth of the animal.

The powerful, complexly-organized gasteropods, including the predatory tribes respiring by the aid of branchiæ, are dicœcious, and of course sexual union is with them a necessity; but it is no less necessary with the monœcious helices or garden snails, in which the co-operation of two individuals is required for reciprocal impregnation. As a preliminary to actual connection the two snails become lively and crawl around one another, while from the generative orifice on the right side of the neck of either is protruded a sacculus containing a sharp-pointed spiculum or dart, with which they strike one another upon the skin; the dart-sack is then withdrawn, and another sack extruded containing both male and female organs. In the eggs of the Gasteropoda much diversity is exhibited, and three distinct types are recognizable, according with the habits and situation of the animals. Thus, the land snails deposit separate eggs covered by calcareous shells; the phytophagous fluviatile and marine species, animals inhabiting shore-lines and shallow waters, cover their eggs with a gelatinous substance, by means of which they are agglutinated into one mass; and finally, the zoophagous mollusks, inhabitants of deeper and rougher waters, where the spawn is more exposed to the depredations of other animals, protect them by horny pouch-shaped coverings variously aggregated: these masses, small and gelatinous when expelled from the female, rapidly enlarge and toughen until they frequently attain a bulk exceeding that of the parent, and the integument becomes as tough as parchment. Sometimes these egg-cases are separately extruded, and in such instances they are individually attached to a piece of timber, shell, or rock by the animal, but ordinarily the whole cluster is expelled together. The process of laying is thus described by Sir E. Home: "A friend of mine saw the female (*Turbinel'la py'rum*) shed her eggs: a mass, apparently of mucus, passed along the deep groove in the lip of the shell in the form of a rope, several inches in length, and sunk to the bottom; this rope of eggs, enclosed in mucus at the end last discharged, was of so adhesive a nature that it became attached to the rock or stone on which the animal deposited it. As soon as the mucus came in contact with the salt water, it coagulated into a firm membranous structure, . . . and this connected nidus, having one end fixed and the other loose, was moved by the waves, and the young in the

* "Animal Kingdom and Comparative Anatomy," 2d edit., p. 466, London, 1855.

eggs had their blood aërated through the membrane, and when hatched they remained defended from the violence of the sea till their shells had acquired strength."

The terrestrial mollusks lay few eggs, but the marine and fluviatile species are more fecund. The Helices deposit from twenty to fifty oval eggs, pure white in color, which they hide in the earth or under stones, or cover with leaves. They so rapidly increase in size and hardness that in a day or day and a half they aggregate a greater bulk than the parent, and the shells have become opaque and consistent. The arboreal helices and bulimi of the Philippine Islands generally deposit their eggs in clusters, within two leaves previously curled together by the animal for their protection; the *Buli'mus Mindorocn'sis* arranges its eggs in parallel rows agglutinated perpendicularly to the surface of a leaf. The eggs of the African Achatinæ differ from those of other land snails in the color being deep yellow instead of white. An *Achati'na Numid'ica* which I kept alive for two years deposited about seventy yellow eggs, which were loosely covered with earth; in a few days nearly every one of them had hatched, and shortly afterwards they entered the earth to pass the torpid season. Alas! the rigor of an American winter proved too much for their tender constitutions, although my vivarium was kept in a heated apartment, for in the ensuing spring fifty-one of them were no more. Those that survived had by that time attained a bulk three times exceeding that of the egg.

The large South American snails lay eggs as large as those of a pigeon, and they are eaten by the natives, but African snails of equal size deposit eggs not more than one-eighth of the above bulk.

The *Natica*, a predatory sea mollusk, constructs a nest of agglutinated sand, in form resembling an inverted bowl with convex sides, a small circular aperture at the top and attached by its broad base. The eggs, encased in the usual tough tissue, are suspended to the inner surface, so that the sea-water has access to them through the contracted aperture, while at the same time they are shielded from the attacks of enemies of their race.

The Acephala were, until a few years ago, supposed to be generally hermaphrodite, but the number of these is being constantly reduced by the discovery of the dicœcious character of various families. In the dicœcious bivalve Mollusca the spermatozoa are discharged into the water, whence they are inhaled with the respiratory currents by the opposite sex. In many cases the sex cannot be distinguished by the shell alone, but in others the posterior portion of the shell of the female is enlarged in order to cover and protect the charged ovary. So great is the sexual difference in the shells of some of the Unionidæ or fresh-water mussels of the United States, that they have been frequently mistaken for distinct species.

Reproduction commences in the Acephala long before full growth is attained. The *Cy'clas* or *Sphæ'rium* reproduces when so immature as to possess hardly any of the external characters of the species; and oysters, although they do not attain full growth under three or four years, spawn when four months old. So prolific are they that the ova of a single oyster have been estimated as high as ten million in number. Mr. Isaac Lea found the oviducts of the *Anodon'ta undula'ta* charged with about six hundred thousand individuals. This accurate observer has described and figured the embryonic forms of numerous species of American Unionidæ, which in all cases differ widely from the parent; the valves are granulose on their external surfaces, and frequently furnished with basal hooks, which, by interlocking, keep them together; in form these valves are rounded or oval, and they are attached to the animal by a single central muscle, instead of the two lateral muscles of the adult. As the ovary is included in the body of the animal, its enlargement when gravid would, in many cases, be so great as to preclude the closing of its valves, thus endangering its safety: in such cases the ova are expelled from the nidus while still immature, but allowed to complete their growth in the branchial fringes, where, spread over a much greater surface, they enjoy the advantage of respiration in the ciliary currents.

The Brachiopoda are believed to be all moncœcious.

Viviparous Reproduction.—This is not uncommon in the phytophagous gasteropods; indeed, different species of the same genus are dissimilar in reproduction; thus, one of the periwinkles (*Littori'na ru'dis*) is viviparous, while another (*Littori'na litto'rea*) is oviparous—that is, in the former the young are lodged and retained in the branchial cavity until fitted for a separate existence. The *Paludi'na* is another familiar example, exhibiting the same care for its young, which may be found within the parent shell perfectly formed and numbering from fifty to a hundred individuals. The *Cym'ba Neptu'ni*, a zoophagous gasteropod, is retained within the folds of the large foot of its parent until its shell has grown to the length of one and a half inches.

Maternal instinct is shown in the selection of favorable situations for oviposition, as in the Ampullariæ, which deposit their eggs in shallow water, where, anchored to a stick or stone, they are exposed to the sun's vivifying influence; the fresh-water snails, which attach the mass of gelatinously-enveloped ova to floating objects, in order to obtain for them the advantages of the solar heat and protect them from the dispersing action of the waves; the *Ianthina*, a mollusk inhabiting the mid-ocean, which constructs a float (attached to her own body), to the under surface of which the eggs are glued; while the *Argonaut* hatches them within the protection of her beautiful shell. But perhaps the most extraordinary instance of maternal care is that exhibited by one of the limpets (*Calyptræ'a Chinen'sis*), which actually sits upon her eggs, and continues thus to protect the young animals when hatched until they have acquired shells sufficiently strong to defy aggression.

The study of the larval metamorphoses of mollusks has recently received much attention, and many curious and important discoveries have been made in this connection. We have already noticed the larval condition of the Unionidæ, and like differences occur in many Acephala. The larvæ of the *attached* species are provided with a ciliated swimming-disk, and are extremely active; they are also provided with eyes, which are lost when the animal, becoming adult, attaches itself for life and has no further use for visual organs. Similar changes occur in the brachiopods; and the development of the nudibranchiate sea snails is thus described by Messrs. Alder and Hancock: "The spawn is deposited in the shape of a gelatinous band, always arranged in a more or less spiral form, and fastened to corallines and the under sides of stones by one of its edges. The ova are minute and very numerous, amounting in some species to several thousands. Before the period of exclusion the young may be seen revolving on their own axis by means of vibratile cilia, and on escaping from the egg they swim about freely in the water by the same means. The larva is extremely minute, and has more the appearance of a rotiferous animalcule than a mollusk. It is enclosed in a transparent, nautiloid, calcareous shell, with an operculum. Its structure is very simple, showing no signs of the external organs that distinguish the future adult. The principal portion visible outside the shell is composed of two flat disks or lobes, fringed with long cilia, by the motion of which it swims freely through the water. These are often withdrawn into the shell, and the operculum is closed upon them when the animal is at rest." In this stage of its existence the tentacles are not developed, but are replaced by two ear-like veils; afterwards the tentacles appear, the foot enlarges and projects beyond the operculum, and the mantle becomes detached, yet the shell remains; finally, the latter is displaced, and except in the retention of the frontal veils the appearance is that of the adult; soon the foot exercises its locomotive function, the gills are developed, the jaws and tongue appear, and finally the veils fall, and the animal has attained its full development.

Thus we find that the larval gasteropods are provided with an external shell even in those genera in which it is finally concealed in a fold of the mantle or entirely absent in the adult, and that they are temporarily furnished with a pair of ciliated fins by which they can swim about freely. In this manner nature has provided alike for the protection of the young animal and for the dispersion of the species.

2. *Nervous System.*—The principal nerve-centre is a ring of ganglia surrounding the throat in the cephalopods and gasteropods, and situated on the posterior adductor muscle in the Acephala. This ring is perhaps somewhat analogous to the vertebrate brain in its functions, and from enlargements of it are distributed the nerves to every portion of the body. From this typical plan of the molluscous nerve-system there are, in some cases, considerable variations. In the most complex organisms the concentration into an œsophagal ring is the most perfect, but in those animals which are more simply organized the centres are more or less dispersed; so that in the *So'len*, for instance, the cerebral and abdominal nerves have their origin at opposite extremities of the long body, but are connected by a long commissure.

The various senses are unequally developed in the different classes of the Mollusca. The animal, when protruded from its protecting shell, is of course measurably defenceless; hence the most delicate and the most important of the senses is that of

Touch.—This sense resides in every external portion of the animal, the moist, glutinous skin being particularly sensitive. So delicate, indeed, is it that the slightest impression alarms the mollusk and causes its immediate retreat. Specialized organs of touch exist in the *tentacula* of the encephalous species, organs arising from the top of the head or near the mouth, generally two (but sometimes four) in

number. They are very flexible, and generally retractile at the will of the animal. In the *Nautilus* about one hundred of these tentacles surround the mouth, but only four of these are organs of sensation. There are also, in many genera, tentacular filaments arising from the sides of the mantle or body, and not generally retractile. The *Haliotis* or ear-shell, *Cypræa* or cowry, *Turbo*, etc., are genera possessing these beautiful fringed appendages. In the bivalve species these filaments also exist; in those having the mantle open, like the oyster, they form the *beard* or fringe which lines its margin, while in those having a closed mantle they are attached to the circumference of the orifices. It is supposed that mollusks are not very sensible to pain, and their tenacity of life and power of reproducing lost or mutilated parts is wonderful; the latter extends to the growth of new tentacula, and even, in well-ascertained instances, of a new head!

Taste.—The possession of this sense is rather inferred from the habits of the animals, the selection of food, etc., than from any specialized organs discovered by naturalists—their use being in most cases conjectural only. We can readily suppose that the Acephala, which swallow everything small enough to enter the mouth, cannot have very delicate gustatory organs; indeed, the only selection made by them is in the reflex muscular action of the stomach, which enables them to eject through the mouth indigestible substances. The encephalous species, however, and particularly the carnivorous ones, are certainly endowed with the faculty of taste, as their food is carefully selected.

Smell.—There is no reason to suppose that this sense is possessed by the bivalves, but its existence in the univalves is very evident, as snails will approach food for which they have a preference, directed by the odor only, and cephalopods are known to avoid the vicinity of certain strong-smelling plants.

Sight.—The encephalous mollusks are provided with two eyes, placed on the sides or front of the head; they are either sessile or elevated on stalks or pedicels. Sometimes these stalked eyes are on short tubercles placed in the rear of the tentacles or branching from them, and sometimes they are situated at the extremity of the tentacles themselves. The eyes of cuttle-fish and of many carnivorous gasteropods are complex in organization, and endowed with visual powers equal to those of vertebrates, but the structure is much more simple in the plant-feeders, and is believed to possess only limited powers, having perhaps in most cases no faculty of distinguishing form or color, but merely a general susceptibility to light.

It can no longer be doubted that the black objects which occupy the summits of the tentacles in helices are eyes; it is said that the snail will avoid an object placed in its path before ascertaining its position by actual contact, and that it is capable of perceiving, and is attracted by, gay colors. Nature has provided for the safety of these tentacular eyes by giving the animal the power of withdrawing them rapidly *through* the tubes to their bases upon the approach of danger. This action is accomplished by the disappearance of the tentacle through its own cavity by a motion which may be likened to the inversion of the finger of a glove.

The bivalve Mollusca enjoy visual faculties proportioned to their locomotive powers; thus, those which, like the *Pecten*, are of active habit, have a number of eyes situated among the tentacular filaments on the margin of the mantle, but in the fixed genera the eyes are rudimentary or absent. The North American Unionidæ appear to be sensitive to light. In a communication addressed to the Academy of Natural Sciences of Philadelphia, 1857, Mr. Lea says: "I became satisfied that the closing of the siphonal tubes, on my approach to the specimens I had in my vivarium, was not altogether occasioned by the vibration caused by my approach, and I accordingly arranged numerous individuals of several species with a view carefully to observe them. In the course of these examinations, repeatedly made, I found several species of *Unio* quite sensitive to my passing my hand between them and the light, while others showed no signs of sensitiveness. Some individuals were more sensitive than others, and the females exhibited this power much more than the males, often withdrawing not only their siphons, but their mantle, within the valves. It is difficult to say with certainty how far their visual organs are developed. The fringes of the branchial and anal siphons are, in the Uniones, formed of small, subconical tentacula. With a good lens the terminal points of the tentacula may be observed to be rounded and furnished with at least the appearance of an eye; and that it will prove to be a true eye, however imperfect, there can be but little doubt."

Hearing.—Some of the cephalopods possess external ears, and auditory capsules, connected with auditory nerves, are found near the bases of the tentacles in gasteropods. The capsules contain one or more oval or rounded vibratory bodies termed *otolites*, and the occurrence of one of these vibrators in the vesicular cavity indicates the single auditory organ of the Acephala and Brachiopoda. Considering that such an exquisitely delicate sense of touch pervades the whole exposed surface of the mollusk, thus enabling it to perceive by vibration the approaching objects, it may be doubted if the auditory faculty be very highly developed.

Voice.—With but few exceptions, mollusks are dumb. The cephalopods squeak and groan when removed from the water, and some of the nudibranchiates, the *Eolis* and *Tritonia*, emit audible sounds.

3. *Muscular System.*—The prehensile arms of the cuttle-fishes, the foot of the gasteropods and of some bivalves, and the wings of pteropods, exhibit great muscular power. It is with its foot that the *Pholas* excavates the cave in solid rock or mud which becomes its lifelong dwelling, and with the same organ the razor-shell (*Solen*) buries itself with great rapidity beneath the wet sand of the sea-shore. In many of the gasteropods the foot is the swimming organ, as it is that of locomotion in all of them; but in bivalves another class of muscles become more important; they are those which, attaching the animal to the valves of its shell, enables it to open and to close them. These *adductor* muscles are sometimes two in number, as in the clam (*Venus*), and to this class the term *dimyaries* is applied, whilst others have but a single central muscle of attachment, like the oyster, and these are called *monomyarics*. We find also in the Acephala other muscles in the border of the mantle, controlling its movement. Their position is indicated upon the inner surface of the valves by an impression running parallel with the margin, and called the *pallial line*. When the animal possesses retractile siphons, the position of the siphonal muscle is shown in the shell by a *sinus* of the pallial line, which otherwise is said to be *entire*.

Gasteropods are attached to the axis of their shells by muscles passing into the foot and operculum, thus enabling them, when alarmed, to retire quickly and to close the door against the enemy. In non-spiral shells, like the limpet, this muscle is attached to the inner surface in a half circle, making a horseshoe impression within the shell.

The cephalopods only, have muscles attached to internal cartilages, representing the attachment to the bones in the vertebrates.

4. *Digestive System.*—The cephalopods are furnished with a pair of horny jaws (*maxillæ*), of which one is much superior to the other in size. They may be likened to the mandibles of the parrot, have cutting edges and sharp-pointed ends, which are useful in dividing their food. In the helices the mouth has an upper jaw only: it is frequently ridged across to assist the process of comminution, which is effected by its opposition to the siliciously armed tongue; in the fresh-water snail (*Limnea*) this superior jaw is assisted by two lateral accessory ones. None of the gasteropods are possessed, like the cuttle-fishes, of both superior and inferior maxillæ, and many of them are entirely destitute of these organs. Bivalves have a mouth supplied with a pair of soft membranous palpi.

Encephalous Mollusca are provided with a tongue or *lingual ribbon* studded with denticles, which usually are arranged in the form of a triple band. The central portion is the *rhachis*, and the similar lateral portions are called the *pleuræ*. The recurved silicious denticles are in numerous transverse series, those of the centre being differently shaped from the pleural ones. As they are worn away with use, a constant growth maintains their effectiveness, and they number in some cases as many as twenty-five thousand in a single individual. Following the threefold division of the tongue or lingual ribbon, the teeth of the central portion are called *rhachidian* or centrals, the others *uncinian* or laterals. The tongue is elliptical in the land snails, forked, fleshy, and placed at the end of the muscular proboscis of the carnivora; but in most of the phytophagous tribes it is very long—in the limpet, for example, when extended, it exceeds the length of the animal, and when retracted it lays reversed along the gullet and coiled spirally within the stomach. In the *Bulla* the rhachis is unarmed, and trituration is effected by the calcareous plates lining its muscular gizzard.

The bivalves have no tongue; the so-called *gastric dart*, a styliform cartilaginous body contained in the stomach of some species, is the representative of a gizzard rather than of a tongue.

Modern investigators have assiduously studied the lingual dentition of mollusks, and many hundreds of specific forms have been described and figured. Unfortunately for conchological science, many of these students, misled by the great significance of dentition characters in the classification of the Mammalia, have attempted classifications of mollusks based entirely on relationships of dentition, which, instead of according with other structural resemblances, destroy the natural groups and force into juxtaposition the

most heterogeneous forms. It might be supposed that the study of the dentition would at least indicate whether the animal be carnivorous or herbivorous, but even in this respect it fails, because its relationships have occasioned the separation of carnivorous mollusks from others to which they are closely allied, to place them among the herbivora, with which they have no other affinities.

In mollusks the liver is always of large size, and the existence of a renal organ has been demonstrated in nearly all the species observed. The intestine is sometimes straight, terminating posteriorly, as in the *Chiton*, but more generally it is convoluted, and is more so in the herbivorous than in the carnivorous species. In the Encephala it generally turns upon itself, the funnel opening on the under side of the neck in the cephalopods, and on the right side, behind the head, in the gasteropods. In bivalves the intestine is much convoluted, passes through the ventricle of the heart and terminates near the respiratory aperture, whence the excrements are washed away by the water from the gills.

5. *Circulation.*—The heart includes an auricle, occasionally double, which receives the blood from the gills, and a ventricle for its propulsion into the arteries; from the capillary extremities of these it is collected into the veins, again passes through the gills, and becomes arterial blood. It is colorless or pale gray. In the cephalopods there are two additional branchial hearts, and the œsophagus is more or less enveloped in a wide venous sinus. In the Acephala the visceral cavity forms part of the circulatory system. Mr. Alder has counted 120 pulsations per minute in the *Vitri'na*, and half as many per minute in some nudibranchs; but it may be fairly inferred that the difference is due partly to the condition of excitation of the animals under observation.

6. *Respiration.*—The cuttle-fishes, Acephala, and brachiopods are water-breathers—that is, they respire water containing air, absorbing the oxygen of the latter during the process. The gasteropods, however, are divided into water- and air-breathers, and the latter class, besides including all of the land snails, comprehends most of those inhabiting fresh water, as well as a few marine species.

In the pulmoniferous species the lung is formed by a fold of the mantle, forming a chamber having pulmonary vessels distributed over its walls. The cavity of the lung opens on the anterior portion of the right margin of the mantle, and its alternate expansion and contraction in breathing is quite visible to the eye unassisted by a lens. The same folded mantle forms the cavity for the gills of the aquatic species, except in the nudibranchiates; in these the branchiæ are arranged in a plumose festoon on the animal's back, and entirely exposed.

The bathymetrical distribution of marine mollusks is determined principally by the quantity of oxygen required by them for respiration, and a transition from sea to fresh water, or *vice versâ*, or even a great change of depth in the same element, is generally destructive to their existence. Some sea mollusks, although water-breathers, are littoral in station, the moist sea air and visits of the tides sufficing for their respiration; such animals will sometimes live for a lengthened period when removed from their native element. For example, a species of *Littori'na*, or periwinkle, of which several individuals were collected at San Domingo (1871), has now survived for nearly a year in various cabinets in Philadelphia.

The carnivorous gasteropods generally receive the water for respiration through a tube specialized from the mantle-margin, and called the *siphon;* while in the herbivora the mantle is simply somewhat prolonged and curled up. The bivalve Mollusca are in the same manner divided into those having specialized siphons, and those having merely a rudimentary fold of the mantle.

7. *Food.*—The bivalve species, generally sedentary or attached, and seldom active, obtain microscopic food from the currents of water directed into the mouth by the joint action of the lips and branchiæ, while the cephalopods, on the other hand, dart through the water with great rapidity after their prey, seize it with their long arms, and draw it to their powerful jaws. Once enclosed in the eight powerful arms, which are covered with formidable sucker-like disks, escape is impossible, and even large fishes and crustaceans become the victims of these voracious animals. Man has been attacked by them, and there are well-attested instances of narrow escapes from these monsters—some of the species attaining gigantic proportions, with bodies several feet long, and arms still longer, the whole weighing several hundred pounds.

The food of the zoophagous gasteropods includes fishes, crabs, zoophytes, and particularly bivalve Mollusca. With their spiny tongues they bore through the shells of the latter, which are incapable either of resistance or escape. Tender, succulent plants, algæ, etc. are eaten by the land and fresh-water species; the snails showing a preference for the tender shoots of cabbage, lettuce, etc. which is very annoying to gardeners. In Europe these animals multiply so fast and are so destructive to gardens that it is necessary to collect and destroy them. An American gentleman on his first visit to the Royal Botanical Gardens at Kew was surprised to see a bucketful of snails in the hand of a gardener, who informed him that it was part of his daily duty to collect and destroy that quantity, which he had done for years.

8. *Shell-Growth.*—The majority of the mollusks are covered with an external shell; the Acephala always are so covered, the shell being in two pieces, united at the back or commencement of growth by a ligament or hinge; these are called *bivalves*. The gasteropods are generally provided with a single or *univalve* shell, which is in form some modification of the spiral principle, varying from *fusiform*, in which the elongation of the axis gives it a conspicuous spindle shape, through countless intermediate forms to *planorboid*, in which the whorls revolve on the same plane with the initial one. A few gasteropods have no shell whatever, the nudibranchiates, for example; others have a more or less perfect internal one secreted beneath the mantle, as in the naked slugs or snails. In the genus *Chiton* it is composed of a number of transverse pieces called valves, united by a ligament, and allowing some freedom of motion, by which the convexity can be accommodated to the surfaces over which the animal passes or to which it attaches itself. In the *Patella* and the limpets generally the spiral nucleus is obscured or lost, so that the shell assumes a conical form, open at the base.

Only two living genera of cephalopods, the *Nautilus* and the *Argonaut*, have external spiral shells; all others are possessed either of an internal calcareous plate imbedded under the back, of porous texture, called cuttle-bone, or of a somewhat horny narrower plate called the *pen*.

The nucleus of the shell covers the young animal in the egg even before its internal organs assume definite form; it is generally of a transparent horn-color. After birth the enlargement of the shell is effected by additions to the lip or circumference of its aperture; these additions are effected by an exudation of carbonate of lime and animal matter from the *mantle* or contiguous part of the animal, which becomes calcified on exposure. Of course as the animal increases in bulk, so the circumference of this growth-margin enlarges, and the spiral shell "grows;" and the lines running parallel with the aperture which the outer surface exhibits are called "growth-lines," and indicate these successive additions. The *epidermis*, or horny external skin of animal matter which invests most shells, protecting them from the corroding action of the elements, is exuded from the neck or collar of the animal, and here also originates the cellular or main substance of the shell; but the interior lining of porcelanous or pearly matter comes from that portion of the animal containing the viscera. Of course in limestone regions land and aquatic mollusks flourish, and their shells are large and ponderous, while in places destitute of that material they are rare and small, and their shells fragile and of horny rather than calcareous material.

In case any portion of the shell occupied by the animal becomes fractured, a viscid exudation takes place from the exposed portion of the latter, which soon hardens, repairing the fracture; but if the break occur in one of the earlier whorls, which the growth of the animal has compelled it to vacate, there is no means of repairing the injury, which accordingly remains, but a partition is thrown across the whorl immediately in the rear of the animal for its protection. Such being the method of construction of the shell, it will be readily understood that spines, tubercles, ribs, etc. on the external surface are the consequence of inequalities of like character in the mantle of the animal, and that colors, whether in bands or spots, are exuded by pigment-cells similarly arranged upon its collar. The inner surface being secreted by the transparent visceral covering which is never exposed to the light, is of course white. Some shells, like the cowry, olive, bulla, etc., are entirely enveloped in the mantle, and the colors are thus derived from its entire surface. In consequence of this protection, the epidermis is not developed in such cases. Thickening and contraction of the lip of the shell indicate adult characters, and further growth generally leaves these thickened portions visible externally, forming *varices;* but the animal in many cases possesses the power of removing both these external varices, spines, etc., and all internal thickenings—even the partitions of the whorls and the very axis of the shell—when the room is needed for its growth or when they impede its movements. Analysis has revealed the existence of muriatic and sulphuric acids in the saliva of some species, and it is believed that these are the agencies employed in the removal of superfluous shell-material.

In nacreous shells the beautiful *mother-of-pearl* constituting the lining or inner surface is composed of alternate, minutely-undulated layers of thin membrane and carbonate of lime. Precious pearls are similarly composed, and are originated by the irritation of intruding extraneous substances, causing the animal to cover them by the deposition of successive layers of pearly material. Pearls are frequently found attached to the internal surface of many species of bivalve mollusks, both marine and fluviatile, but the most valuable ones are those which are completely detached and spherical, and are only found in the soft parts of the animal. The Chinese and others have made the manufacture of pearls a branch of human industry by the careful introduction of irritating substances within the shells.

The *operculum* is generally a horny lid (sometimes stiffened by an exterior calcareous layer, and occasionally it is entirely calcareous) which is developed in the embryo, and grows with the growth of the animal; its accretions are exuded from the latter, and applied to the circumference in the same manner as in shell-growth. Typically, the operculum is closely fitted to the aperture of the shell, so that when the animal is at rest it acts as a door, preventing the intrusion of marauding enemies. It is a means of defence, hence generally developed in the harmless herbivorous species. It is occasionally found in the carnivorous Mollusca, but then it is often so small in proportion to the size of the mouth of the shell as to be nearly useless for defensive purposes.

Ordinal Classification.—The following outline of the main features of the most approved classification will give an idea of the application of the foregoing structural details to the systematic arrangement of the Mollusca:

Class I., Cephalopoda (the cuttle-fish).

Order 1, *Dibranchiata*.—Animal swimming, naked (shell, when present, internal), mandibles horny; arms eight or ten, provided with suckers; branchiæ two.

Order 2, *Tetrabranchiata*.—Animal creeping, with an external shell (as the *Nautilus* and *Ammonite*); mandibles calcareous; arms very numerous; branchiæ four. Only a few living representatives of this order are known, but several hundred fossil species have been described.

Class II., Gasteropoda (univalve mollusca).

Order 1, *Prosobranchiata*.—Animal creeping or swimming, protected by a shell, usually large enough to cover it; branchiæ plume-like, situated before the heart; sexes distinct.

This large order, containing fifteen thousand species, is divided into two sections, as follows:

A, *Siphonostomata*.—Carnivorous; provided with a breathing-siphon. The shell is spiral, with imperforate axis, the aperture terminating in a prolongation or canal. Operculum lamellar, horny. In this section are included the strombs, murices, whelks, cones, volutes, and cowries, all well-known marine shells.

B, *Holostomata*.—Respiratory siphon wanting, or replaced by a lobe in the collar of the mantle; gills plume-like, placed obliquely across the back or attached to the right side of the neck. Shell spiral or limpet-shaped, generally somewhat globular, with the margin of the aperture mostly rounded and continuous. Inhabiting both sea and fresh water; a large portion of the former and all of the latter being phytophagous. The naticas, pyramidellas, cerites, turritellas, periwinkles, nerites, turbos, trochi, ear-shells, and limpets are the familiar marine representatives of this section; while the fresh-water genera include the melanians, paludinas, and ampullarias.

Order 2, *Pulmonifera*.—Plant-eating, air-breathing snails, inhabiting land or fresh water; some furnished with opercula; monœcious. Includes the garden snails, helices, cyclostomas, limnæans, etc., about seven thousand species. The terrestrial Mollusca are confined to this order; more than half of the fresh-water univalves also are lung-breathers.

Order 3, *Opisthobranchiata*.—Shell rudimentary or wanting; branchiæ arborescent, more or less completely exposed on the back or towards the sides of the body near its rear end. The sexes are united in each animal. These are marine snails, met with only on the high seas, swimming on the surface, which they render brilliant by their gaudy coloring. They can only be preserved in alcohol, which, unfortunately, destroys their brilliant tints. A few of them, the *Bulla* and its allies, secrete a shell within the folds of the mantle.

Order 4, *Pteropoda*.—Marine animals, swimming by the aid of a pair of wing-like fins proceeding from the sides of the neck. Shell glassy and translucent, sexes united. A small group of pelagic animals almost unknown to collectors.

Class III., Acephala (bivalves).

Marine or fresh-water mollusks protected by a bivalve shell. Two systems of classification have been proposed, neither of which is entirely satisfactory. The first divides them, in accordance with the number of adductor muscles, into *Monomyaria*, *Dimyaria*, etc., and the second is founded on the presence or absence of the siphon and the character of the pallial impression, thus:

1. *Without siphons. Pallial line simple.*
   (The oysters, arks, marine and fresh-water mussels.)
2. *With siphons.* (*a*) *Pallial line simple.*
   (Chamas, tridacnas, lucinas, cockles, cyclades, clams, etc.)
   (*b*) *Pallial line sinuated.*
   (Veneridæ, mactras, tellinas, razor-shells, gapers, pholades, or borers, etc.)

The above brief outline of classification is all that our space will allow us to present. Recent systematists admit no less than three hundred families of Mollusca, including several times that number of genera, and the species described amount to between twenty-five and thirty thousand living species, besides nearly an equal number of fossil forms. The latter characterize by peculiar genera and species every geological period. They have become the "testimony of the rocks" and "the medals of creation," for without them the geologist would, in many cases, be utterly at a loss to classify the earth's strata. The primary classes of the Mollusca are all represented from the earliest period containing their fossil remains, but some of the lower divisions have become extinct, while others have originated at various subsequent periods. The ammonites and the Brachiopoda are familiar shells, which at one time swarmed in the ancient seas; the former have become entirely extinct, while of the latter a few species still exist.

Economical Value of the Mollusca.—Small as most of these animals are, the immense number of individuals enables them to take an important position in the economy of nature; mountain-chains are formed of their disintegrated shells; ships and piers are destroyed by the insidious attack of the *Teredo* or ship-worm, and by the same little animal the accumulations of floating timber which would otherwise block up the mouths of bays and rivers, and the wrecks which would impede navigation, are removed.

As articles of food, mollusks are of important value to man and beast. Large numbers of fishes, birds, and mammals prey on them habitually, and of many species they form almost the entire sustenance. Man has, in all ages, consumed large quantities of shell-fish—even the pre-historic cave-men ate them, and at the present time the annual consumption of them is so enormous that it would be difficult to calculate the quantities and values. In the waters of the State of Maryland alone, according to official report, 563 vessels are licensed for the oyster-fishery, and bring to market upwards of ten million bushels annually. The oyster of the waters of the Middle and South Atlantic coast of the United States belongs to the species *Ostrea Virginia'na*, while that of the northern coast (*Ostrea borea'lis*) is smaller, more rounded, and rugose. To the latter the European species is nearly related. *Ostrea Virginiana* has been successfully transplanted to the waters of Europe and California, where it flourishes, and is regarded as superior in flavor to the "natives." Besides oysters, many other marine bivalves and univalves are brought to market. Among the terrestrial species the Roman snail is an esteemed delicacy in the Latin countries of Europe, and large numbers are bred for sale.

Shells are extensively used for manufacturing purposes—for the making of buttons and many other articles; for cameo-cutting, in which advantage is taken of differently colored layers to produce striking effects of figure and background. Precious pearls, as previously stated, are secreted in the soft parts of those genera of Mollusca which form nacreous shells. They have frequently been found in the fresh-water Unionidæ or mussels of both hemispheres, but the principal product is from the pearl-fisheries of the Indian Ocean, an industry employing over sixty thousand hardy divers. *Mother-of-pearl*, used in manufactures, is derived principally from the *Meleagri'na margaritif'era*, inhabiting the Gulf of California.

The byssus of the *Pinna* or fan-mussel is spun into articles of hosiery in Italy: it is a beautiful but expensive material, resembling the finest silk. (See Byssus.) From remote antiquity mollusks have furnished brilliant dyes, such as the far-famed Tyrian purple, discovered and first used by the Phœnicians—a color yielded by mollusks of the genera *Pur'pura*, *Mu'rex*, etc. Many of the natives of Africa and Asia use the shell of the money-cowry (*Cypræ'a mone'ta*) as money, and whole cargoes of this species are exported by civilized nations to be used in trading with the natives. The *wampum* of the North American Indians, consisting of strings of fragments of the shell of the clam (*Ve'nus mercena'ria*), was also used in lieu of coin.

The molluscous fauna of the United States is very rich

in species, including three hundred land shells, six hundred fluviatile gasteropods, seven hundred Unionidæ or fresh-water mussels, six hundred species of marine Mollusca of the Atlantic, and about the same number of the Pacific coast; in all, nearly three thousand species.

The study of conchology is one of the most fascinating subjects in the whole range of natural science, and has perhaps engaged the attention of more investigators than any other department of zoology. Collectors explore assiduously every portion of the earth's surface and its waters for specimens, and the habits of the mollusks, as well as their geographical and bathymetrical distribution, are thus becoming extensively known. Private collections and cabinets abound, and public museums containing large numbers of species are to be found in every large city. Perhaps the finest conchological collection in the world is that of the Academy of Natural Sciences of Philadelphia, which contains about twenty-one thousand species and numerous varieties, with extensive series illustrating geographical distribution; aggregating, probably, nearly two hundred and fifty thousand specimens. The library of this institution contains nearly a thousand published works relating to the science of conchology. GEORGE W. TRYON, JR.

Conch-shell, a popular name for the shells of certain carnivorous gasteropods of the genera *Triton, Strombus,* etc. They are found chiefly in tropical seas. Many tons of these shells are annually exported from the Bahamas to Europe, where the finest are used in cutting shell-cameos, and the rest are useful in the porcelain manufacture. Conch-shells were formerly much used in the U. S. as "dinner-horns" by farmers, but have been largely superseded by those made of tin.

Con'chos, a river of Mexico, an affluent of the Rio Grande, flows through the state of Chihuahua. Its general direction is N. N. E. Length, about 330 miles.

Con'clave [from the Lat. *con* (for *cum*), "with," and *clavis,* a "key," originally, a room that may be locked up]. This term is applied either to the apartment in which the cardinals of the Roman Catholic Church assemble to elect a new pope, or more frequently to the assembly itself. The usages of the Church require that the conclave must be held in a single apartment having only one door, which is locked after the entrance of the cardinals, in order that they may have no intercourse with the public while the election is going on. When a pope dies, nine days are allowed for the funeral solemnities. The cardinals assemble on the tenth day, and voting begins on the eleventh. From their separate cells, into which they are locked every night, the cardinals come together twice a day till some one of their own number is made pope by a majority of two-thirds of all the votes. Each cardinal is attended by two or three waiters, called *conclavists,* sworn to secresy like the cardinals. This method, in its main features, dates from 1274. Since Gregory XV. (1621–23), the choice has been either by scrutiny (ballot), by inspiration, or by compromise, usually the first. Since 1823 the place of meeting has been in a long wing of the Quirinal Palace in Rome; for nearly 400 years before that, in the Vatican. (See CARDINAL.)

Concom'itance, Sacramen'tal, the doctrine of the Roman Catholic Church, that the body and blood of Christ *sacramentally accompany* each other, so that *both* are *sacramentally* received under *either* species, whether of bread or wine; hence, that the communion in one kind imparts all that is received sacramentally in both kinds. Aquinas substituted this term for the older one, "Unio naturales." (See ASCHBACH, "Kirch. Lex." s. v., and TRANSUBSTANTIATION.) The Lutheran Church maintains that from a *natural* concomitance we cannot argue to a *sacramental* one, which is wholly supernatural and dependent on the will of Christ; that this doctrine implies that the officiating priest receives both body and blood twice; and that it holds equally good for *one kind* in the sacrifice of the mass. (See KRAUTH'S "Conservative Reformation," 620, 621.)

C. P. KRAUTH.

Concom'itant [from the Lat. *con,* "together," and *comitor,* to "attend as a companion"], a term of modern algebra, applied to a quantic which is related to a given system of quantics in the following manner: Let u, u_2, etc. be a given system of quantics, which by linear transformation of their variables become converted into u'_1, u'_2, u'_3, etc., and let u and u' be quantics respectively derived from these two systems according to the same definite rule; then if u is converted into $m\,u'$, where m denotes some power of the modulus of transformation, by the same or by reciprocal systems of linear transformations of its variables or facients, u is said to be a concomitant of the given system u_1, u_2, etc. If u should contain no variables, and be therefore identically equal to $m\,u'$, it is called an invariant of the given system of quantics; if, containing variables, it should be converted into $m\,u'$ by the same linear transformations, it is called a covariant; but if its conversion into $m\,u'$ should require linear transformations reciprocal to those first employed, it is called a contravariant. Lastly, if u should contain two sets of variables, and still become converted into $m\,u'$ by transforming one set by the original and the other by the reciprocal substitutions, it is called a mixed concomitant of the given system of quantics. Concomitants, therefore, embrace covariants and contravariants.

Con'cord [Lat. *concordia,* from *con,* "together," and *cor, cordis,* "heart"], literally, "agreement in heart or sentiment;" agreement between persons; unity of opinions or sentiments; peace and harmony. In music, a combination of two or more sounds, forming harmony agreeable to the ear; the relation, harmony or agreement between two or more consonant sounds, such as the union of the major or minor third with the perfect fifth and octave. (See CONSONANCE.)

Concord, a post-village, capital of Hancock co., Ia. Pop. of township, 149.

Concord, a township of Louisa co., Ia. Pop. 892.

Concord, a township of Ottawa co., Kan. Pop. 720.

Concord, a post-twp. of Somerset co., Me. Pop. 452.

Concord, one of the finest towns of Middlesex co., Mass., is on the Concord River and on the Fitchburg R. R., 20 miles N. W. of Boston. It has a national and a savings bank, a high-school, town-house, and a fine public library; also manufactures of cotton and of woollen flannels, and of carriages. The provincial Congress met here in 1774 and 1775. On the 19th of April, 1775, several men were killed here in a skirmish between the British troops and the citizens of Concord. It is noted as being the residence of Emerson, and as having been that of Hawthorne, Thoreau, and other literary celebrities. Pop. of Concord township, 2412.

Concord, a township and post-village of Jackson co., Mich. The village is on the Michigan Central R. R., 90 miles W. of Detroit. It has one weekly newspaper and one banking-house. Pop. of township, 1465.

H. A. WETMORE, PUB. "NEWS."

Concord, a post-township of Dodge co., Minn. P. 792.

Concord, a township of Clinton co., Mo. Pop. 2491.

Concord, a township of Washington co., Mo. Pop. 1343.

Concord, a city, capital of Merrimack co. and of the State of New Hampshire, is pleasantly situated on the

State Capitol, New Hampshire.

right bank of Merrimack River, 73 miles by rail N. N. W. from Boston, 474 N. N. E. from Washington, 130 S. from

Mount Washington, White Mountains, and 30 S. from Winnipiseogee Lake; lat. 43° 12′ 20″ N., lon. 71° 29′ W. It is **one of the largest railroad centres in New England.** At this station trains are made up for the Boston Concord and Montreal, the Northern, the Concord and Claremont, the Contoocook Valley, the Boston Nashua and Lowell, the Boston Lawrence and Concord, and the Portsmouth R. Rs. Trains also connect at Nashua for Worcester and New York *viâ* Worcester and Nashua R. R., for Wilton *viâ* Nashua and Wilton, for Acton, Providence, and New Bedford *viâ* Nashua and Acton, at Manchester for North Weare *viâ* Manchester and North Weare, and at Hooksett for Pittsfield *viâ* Suncook Valley R. R. **The streets are wide, have fine sidewalks,** and are beautifully shaded. The principal business is on Main street. Many of the business and public buildings are fine and expensive structures. The State-house is built of Concord granite at an expense of $250,000. In the council chamber are large oil portraits, set in gilt frames, of all the governors of the State from 1785 to 1873. The court-house and city hall cost $45,000. New Hampshire Historical Society library contains over 6000 volumes of valuable books and 3000 pamphlets. The city contains **the State asylum for the insane, with a fund of over** $221,000, number of patients, 272; orphans' home, St. Paul's School, 160 students (Episcopal), and a jail and State prison. There are 15 church edifices, 52 schools with 2600 scholars, 6 hotels, 200 stores and shops for trade of various kinds, 4 weekly and 2 daily newspapers, 2 national banks (capital of $350,000), 5 savings banks (deposits $3,380,000), 2800 dwelling-houses, and in 1870, 12,241 inhabitants. The manufactories are varied, the most important of which are granite quarried and dressed, annually valued at $750,000; carriages, $550,000; furniture, $429,000; belting and leather hose, $390,000; railroad repair-shops, $290,000; foundry and machine work, $260,000; harnesses, $250,000; woollen goods, $250,000; cotton goods, $235,000; leather tanned, $175,000; sale of boots and shoes, $150,000; organs and melodeons, $120,000; confectionery and bakers' bread, $100,000; printing, $110,000; and many smaller factories of $90,000 and less. Whole number of manufactories, 137; capital invested, $2,276,350; males employed, 2143, females, 364; annual pay-roll, $1,329,500; value of goods manufactured, $4,600,000. The water-power is valuable, but not much of it is improved. The city waterworks cost $300,000, and the sewerage $100,000. Valuation of the city, $12,000,000.

A. J. Fogg, Ed. of "New Hampshire Gazetteer."

Concord, a township of Erie co., N. Y., contains Springville and other villages. Pop. 3171.

Concord, a post-village, capital of Cabarrus co., N. C., on the North Carolina R. R., 20 miles N. E. of Charlotte. It has a cotton-factory and two public gins, iron manufactories, foundry, machine-shops, one boys' and two girls' academies, a national bank, and a weekly newspaper. There are large mines in the vicinity. Pop. 878; of township, 1259. Charles F. Harris, Ed. Concord "Sun."

Concord, a township of Iredell co., N. C. Pop. 869.

Concord, a township of Randolph co., N. C. P. 1028.

Concord, a township of Champaign co., O. Pop. 1035.

Concord, a township of Delaware co., O. Pop. 1092.

Concord, a township of Fayette co., O. Pop. 981.

Concord, a township of Highland co., O. Pop. 1262.

Concord, a post-township of Lake co., O. Pop. 797.

Concord, a township of Miami co., O. Pop. 4701.

Concord, a township of Ross co., O. Pop. 2772.

Concord, a township of Butler co., Pa. Pop. 926.

Concord, a township and village of Delaware co., Pa. The village is on the Philadelphia and Baltimore Central R. R., 25 miles S. W. of Philadelphia. Pop. of township, 1293.

Concord, a township and village of Erie co., Pa. The village is on the Atlantic and Great Western R. R., about 30 miles N. E. of Meadville. Pop. of township, 1436.

Concord, a township of Clarendon co., S. C. Pop. 800.

Concord, a township of Sumter co., S. C. Pop. 1519.

Concord, a township and post-village of Essex co., Vt., 37 miles E. N. E. of Montpelier. The township has five churches, and manufactures of lumber, furniture, starch, sash, blinds, cassimeres, and other commodities. Pop. of township, 1276.

Concord, a post-township of Jefferson co., Wis. Pop. 1627.

Concor'dance [Lat. *concordantiæ*, from *concordo*, to "agree"], an index or dictionary in which all the important words used (*verbal* concordance) or subjects treated of (*real* concordance) in any work are arranged alphabetically, and references made to the places where they occur. Of biblical concordances the number is very large. The earliest was to the Vulgate by Antony of Padua (born in 1195; died in 1231 A. D.). Next in order was the Hebrew concordance of Rabbi Isaac Nathan (finished in 1448, published in 1523). The first Greek concordance to the New Testament, by Xystus Betuleius (whose real name was Birck), appeared in 1546. Kircher's concordance to the Septuagint appeared in 1607. The best are: For the Hebrew, Fürst (1840); for the New Testament Greek, Bruder (1853); for the Septuagint, Trommius (1718); for the Vulgate, Dutripon (1838). The first English concordance was by John Marbeck (1550); the best by Alexander Cruden (1737). The Englishman's Greek concordance to the New Testament (1839) is very valuable. Among the chief concordances to the German Bible are those of Lankisch (1677), Schott (1827), and Hanff (1828–34). The first French concordance was by Mark Wilks (1840). There is a concordance to Shakspeare by Mrs. Mary Cowden Clarke (1845), and to Tennyson by Brightwell (1869). The special lexicons, as to Homer by Crusius, and to Plato by Ast, are essentially concordances.

Concor'dat [Lat. *concordata*, "things agreed upon," from *concordo*, "to agree;" Fr. *concordat;* It. *concordato*], a treaty in relation to the ecclesiastical affairs of a Roman Catholic state, between the pope, as head of the Roman Catholic Church, and the government of that state. The treaties between the pope and Protestant powers are usually called conventions. The name concordat was first given to the treaties made by Pope Martin V. with Germany, France, and England in 1418. These treaties are called in history the Concordats of Constance. The name, however, is often given to various ecclesiastical treaties of older date than the ones just mentioned.

The usual subjects of concordats have been the right claimed by the popes to fill vacant sees and benefices, and to appropriate the whole or a part of the revenues during the vacancy, as well as to confer on the clergy certain immunities from taxation and civil jurisdiction, and to offer an asylum to criminals. The "Calixtine Concordat," one of the most famous of the earlier treaties of the kind, was concluded in 1122 between Henry V. of Germany and Pope Calixtus II., and has since been regarded as a part of the fundamental law of the Roman Catholic Church of Germany. At Frankfort, in 1446, the electors of Germany made formal demands upon the pope for the redress of certain ecclesiastical grievances. These demands were granted by Pope Eugene IV. in 1447 in the "Concordat of the Princes," or "Frankfort Concordat." This, with the "Aschaffenburg Vienna Concordat," of 1448, which granted large powers to the pope, was long of great importance in the ecclesiastic law of Germany. Among the most celebrated concordats are that of 1516 between Leo X. and Francis I. of France, and that which Bonaparte as first consul forced upon Pius VII. (July, 1801), which was ratified in 1802, and has since, for the most part, regulated the relations of the Gallican Church to the Roman see. The clergy became subject to the civil power in all temporal matters; and though the pope in matters of discipline had very large powers, and was still to confer canonical institution, the appointment of all the bishoprics was retained by the government. By the concordat which was entered into between Rome and Austria at Vienna on the 18th of Aug., 1855, the emperor Francis Joseph I. promised that the pope should have direct communication, free from surveillance by the civil power, with the bishops, clergy, and people. Bishops were to have free communication with their clergy and their flocks, and to perform all functions which are prescribed by the canon law. The whole system of national education, even in private schools, was placed under the control of the Church. No one could teach theology without episcopal permission. The government bound itself to prevent the dissemination of books pointed out by the bishops as dangerous to religion. All questions of marriage, except in so far as they involved civil consequences, were reserved exclusively for the ecclesiastical courts. This concordat was abrogated without the consent of the pope in July, 1870. Important conventions were concluded in the nineteenth century with the Netherlands in 1827, with Russia in 1847, and with Wurtemberg in 1857. (A complete list of the important concordats is given by A. J. Schem in McClintock and Strong's "Cyclopædia.")

Con'cord, Book of (*Concordia, Concordien-Buch*), the collection of the Confessions which are received either by the entire Lutheran Church or by the larger part of it. It was published in 1580, and supplanted a great number of bulky Corpora Doctrinæ. It contains—1, the three General Creeds, the Apostles', Nicene, and Athanasian; 2, the Augsburg Confession; 3, the Apology of the Confession; 4, the Schmalcald Articles; 5, the Smaller and the Larger Catechism of Luther; and 6, the Formula of

Concord, to which the "Book of Concord" is related as the whole to a part, though the two are often confounded. (See KRAUTH'S "Conservative Reformation," art. vii.)

C. P. KRAUTH.

Con'cord, For'mula of (*Concordiæ Formula*), the last part of the "Book of Concord," in which it appeared, for the first time, in 1580. It consists of two parts, of which the first may be said to be the text, the second the commentary, and has an appendix of testimonies. It was occasioned by the vacillations of MELANCHTHON (which see), real and seeming, the Crypto-Calvinistic and other controversies, and the appearance of a number of Corpora Doctrinæ objectionable in various respects. Protracted and patient conferences and labors, in which the greatest divines of the Lutheran Church, especially Andreæ and Chemnitz, took part, preceded and accompanied the preparation of it. Eighty-six of the states of the empire united in it. Augustus of Saxony was among its most important promoters. Its topics are—the Rule of Faith and the Creed, Original Sin, Free-Will, Justification, Good Works, the Law and the Gospel, Third Use of the Law, the Lord's Supper, the Person of Christ, the Descent into Hell, Ceremonies, the Adiaphora, Predestination, various sects and heresies. "The war of the Formula was fought for great principles; it was bravely and uncompromisingly fought, but it was fought magnanimously under the old banner of the Cross. It was crowned with victory, and that victory brought peace." (See KRAUTH'S "Conservative Reformation, and its Theology," art. vii.)

C. P. KRAUTH.

Concor'dia, a goddess of the Roman mythology, may be considered a personification of domestic concord and of harmony between several classes of the body politic. Several temples were erected to her in ancient Rome. The sessions of the senate were sometimes held in the Temple of Concord (Ædes Concordiæ).

Concordia, a parish in the N. E. of Louisiana. Area, 790 square miles. It is bounded on the E. by the Mississippi River, on the W. by the Washita, and on the S. W. by the Red River. The surface is level, low, and subject to inundation; the soil is fertile. Cotton is the staple crop. Capital, Vidalia. Pop. 9977.

Concordia, a post-village, capital of Cloud co., Kan., on the Republican River, about 60 miles N. W. of Junction City. It has a normal school and one weekly newspaper.

Concord River, of Middlesex co., Mass., is formed by the junction of the Assabet and Sudbury Rivers, at the village of Concord. It flows northward, and enters the Merrimack near Lowell. The scenery of this river has been described by Thoreau in his work entitled "A Week on the Concord and Merrimack Rivers."

Con'cow, a township of Butte co., Cal. Pop. 490.

Con'crete [from the Lat. *concresco, concretum,* to "grow together"], in philosophy, is a term applied to any quality which is considered in connection with the object to which it belongs; a quality not concrete is abstract. Thus "wisdom" is an abstract quality; but when we speak of a "wise man," the quality becomes concrete.

Con'crete, a compound of hydraulic cement or of mortar with gravel, which hardens into a stone-like mass. It is sometimes moulded into blocks and used as an artificial building-stone, but more often it constitutes the foundation of buildings which would otherwise have to rest upon sand or insecure earth. It is also used as a flooring for cellars, and is said to effectually prevent the rising of miasmata and vapors from the earth. The name concrete is often applied to a mixture of coal-tar or asphaltum with gravel, much employed for walks or pavements, and also used as a roofing-material. (See CEMENT, by GEN. Q. A. GILLMORE, U. S. Army.)

Concre'tion [Lat. *concretio,* from *con,* "together," and *cresco, cretum,* to "grow"], in medicine, an extraneous solid which accumulates within the body. Concretions may be chemical precipitates from the secretions, and as such occur in the bladder, the gall-cyst, or salivary ducts. These are called calculi, and are sometimes of organic and sometimes of non-organic matter. Again, concretions may be of phosphate or carbonate of lime, occurring in tubercular or other degenerate masses; while in the joints they are sometimes of urate of soda, as in "gouty concretions." Within the alimentary canal they are often composed of hair which has been swallowed, or of cholesterin, and sometimes of magnesia salts.

Concu'binage [Lat. *concubinatus,* from *con,* "together," and *cubo,* to "lie"], a term used to denote the relation of a man and woman who habitually cohabit without lawful marriage; or, more frequently, a kind of inferior marriage, which does not give the woman the legal position of a wife. Concubinage was lawful among the ancient Hebrews, as the cases of Abraham, Jacob, and many other examples show. Concubinage in ancient Rome was often a union between persons who could not legally intermarry on account of difference in rank. It appears that in general the children of a concubine were illegitimate among the Romans, though many examples of their apparent legitimacy have been adduced. The Church of Rome never formally forbade concubinage until the Council of Trent. The Protestant churches have uniformly opposed it, as contrary to the spirit of Christianity. The only relic of legalized concubinage in enlightened countries is MORGANATIC MARRIAGE (which see).

Concur'rent, acting in conjunction; agreeing in the same act or opinion; contributing to the same event. Jurisdiction is said to be concurrent or cumulative when it may be exercised in the same cause by any one of two or more courts. To prevent the collision which might arise from each of the courts claiming to exercise the right, it has been established as a rule that the judge who first exercises jurisdiction in the cause acquires a right *jure prævenionis* to judge in it, exclusive of the others. This right of prevention appears to be peculiar to criminal jurisdiction.

Concus'sion [from the Lat. *concutio, concussum,* to "shake violently" (from *con,* intensive, and *quatio, quassum,* to "shake")], in surgery, the disturbance caused by a fall or blow. In all severe injuries a concussion or shock is caused to the nervous system, which may require the assiduous care of a physician. (See SHOCK.)

CONCUSSION OF THE BRAIN [Lat. *commotio cerebri*] sometimes causes alarming symptoms, even to suppression of the functions of the brain, yet without any apparent organic disease. Slight concussion of the brain (popularly called "stunning") causes vertigo, loss of memory, tinnitus aurium, and stupefaction; but these are temporary. When more severe, there is loss of sensation and volition, with vomiting, the patient being apparently in a sound sleep, but without stertorous breathing. The pulse is variable, being more rapid and feeble than in compression of the brain; the extremities are cold. Little can be done until reaction occurs, when the case can be treated according to general principles. In some cases of concussion it is necessary to use local or general stimulants, but usually moderate heat applied to the surface, abundant supplies of air, and proper adjustment of the injured parts are all that are required until consciousness is partly restored, when a small portion of wine or other stimulant may be useful. The effect of these should be carefully noted, and the patient should be placed in a comfortable position in bed during the process. In all cases absolute rest is essential. If the concussion has been severe, the patient is often not secure until a long time after, even though apparently well, for serious nervous lesions may be slowly developed.

REVISED BY WILLARD PARKER.

Concussion Fuse. See FUSE.

Condamine, La (CHARLES MARIE), a French savant, born Jan. 28, 1701, accompanied Bouguer to Peru, 1736, in order to determine the figure of the earth. He published an "Account of a Journey to South America" (1745) and "The Figure of the Earth Determined" (1749). Died Feb. 4, 1774.

Condé, a town of France, department of Nord, at the confluence of the Haine and Scheldt, 7 miles N. N. E. of Valenciennes. It is well built, and has strong fortifications constructed by Vauban. It has a town-hall, an arsenal, and a military hospital; also manufactures of chicory, starch, cordage, and leather. It has been several times besieged, and was taken by the Austrians in 1793. The princes of Condé derived their title from this town. Pop. in 1866, 4642.

Condé, de (HENRI I. DE BOURBON), PRINCE, born Dec. 9, 1552, was a son of Louis I. (see below). He was a cousin of Henry of Navarre, and joined the Protestant army about 1584. He died Mar. 5, 1588, and it is supposed he was poisoned by his servant. He left a son, Henry II., prince de Condé, who was educated a Catholic, and was the father of the great Condé. Died in 1646.

Condé, de (LOUIS HENRI JOSEPH), PRINCE, styled also DUKE OF BOURBON, the last of the line of Condé, was born in 1756. He was the father of the duc d'Enghien, who was murdered in 1804. Condé fought against the French Republic (1792–1800), and was found dead in 1830, having died by violence, and perhaps by his own hand.

Condé, de (LOUIS I. DE BOURBON), PRINCE, an eminent French general, born at Vendôme May 7, 1530, a son of Charles de Bourbon, duc de Vendôme, brother of Antony of Bourbon, and uncle of Henry IV. As an adversary of the family of Guise he took a prominent part in the conspiracy of Amboise in 1559. He was the general-in-chief of the Huguenots in the civil war which began in 1562. He was defeated and taken prisoner at Dreux in that year.

In 1567 he commanded at the battle of Saint-Dénis. Having been defeated and wounded at the battle of Jarnac, Mar. 15, 1569, he was killed after he had surrendered. (See DESORMEAUX, "Histoire de la Maison de Condé.")

Condé, de (LOUIS II. DE BOURBON), PRINCE, styled THE GREAT CONDÉ, a celebrated French general, born in Paris Sept. 8, 1621, was a son of Henri II., prince of Condé, and was the first prince of the blood. In his youth he was called the duc d'Enghien. He married, in 1641, Clarie Clémence de Maillé-Brézé, a niece of Cardinal Richelieu. In May, 1643, he gained a signal victory over the Spaniards at Rocroi. He defeated the Bavarian general Mercy at Nordlingen in 1645, and inherited his father's title in 1646. He gained a decisive victory over the Spaniards at Lens in 1648. In the civil war of the Fronde, which began in 1649, he at first supported Mazarin and the royalist party. Early in 1650 he was arrested by Mazarin, whom he offended by his haughty conduct. After he had been confined nearly a year he was released, and raised an army to fight against the court. He marched in 1652 against Paris, which was defended with success by Turenne. In 1653 he was condemned to death, and entered the service of the king of Spain, who gave him command of an army in Flanders. He was there opposed to Turenne, over whom he could not gain much advantage. The war was ended by a treaty between France and Spain in 1659. The prince of Condé was then pardoned, and returned to the service of the French king. Having obtained the command of an army in Flanders, he fought an indecisive battle at Seneffe against William, prince of Orange, in 1674. Died Dec. 11, 1686. "The art of war," says Voltaire, "seemed in him a natural instinct." Bossuet pronounced a funeral oration on him. (See DESORMEAUX, "Histoire de Louis, Prince de Condé," 4 vols., 1768; LORD MAHON, "Life of the Prince of Condé," 1840; VOLTAIRE, "Siècle de Louis XIV.")

Condé, de (LOUIS JOSEPH DE BOURBON), PRINCE, the only son of the duke of Bourbon, was born Aug. 9, 1736. He served with distinction in the Seven Years' war (1755–62), and emigrated as a royalist in 1789. He led the French emigrants who in 1792 fought against the republic in cooperation with the Austrian army. He disbanded his corps of emigrants, 1801, returned to France, 1814, and died May 13, 1818.

Condensa'tion [Lat. *condensatio*, from *con*, and *densus*, "dense, compact"], the act of rendering a body more dense and compact by bringing its particles into closer proximity and increasing its specific gravity. The term is often applied to the conversion of a vapor or gas into a liquid or solid either by pressure or by the agency of cold.

Condensed Milk. See MILK, by PROF. C. F. CHANDLER, PH. D., LL.D.

Condensing Steam-Engine. See STEAM-ENGINE, by PROF. W. P. TROWBRIDGE.

Condé-sur-Noireau, a town of France, department of Calvados, on the river Noireau, 23 miles S. S. W. of Caen. It has manufactures of muslin, linen, woollens, cutlery, and leather. Pop. 6643.

Con'dict (JOHN), a surgeon in the Revolutionary war, born in 1755, was a member of Congress from New Jersey (1799–1803 and 1819–20); and U. S. Senator (1803–17). Died at Orange, N. J., May 4, 1834.

Con'die (D. FRANCIS), M. D., an American physician and author, was born in Philadelphia May 12, 1796, and graduated as M. D. at the University of Pennsylvania in 1818. He has published, besides other works, "Diseases of Children" (4th ed., 1854), edited Churchill's "Diseases of Women," and contributed much to the periodical literature of his profession. Died Mar. 31, 1875.

Condillac, de (ÉTIENNE BONNOT), ABBÉ DE MUREAUX, an eminent French philosopher, born at Grenoble in 1715, was a brother of the abbé de Mably. He associated in his youth with J. J. Rousseau and Diderot. In 1746 he published an ingenious "Essay on the Origin of Human Knowledge" ("Essai sur l'origine des connaissances humaines," 2 vols.), and in 1749 a "Treatise on Systems" ("Traité des Systèmes," 2 vols.). His reputation was widely extended by his admirable "Treatise on Sensations" ("Traité des Sensations," 3 vols., 1754). He was chosen a member of the French Academy in 1768. He adopted the theory that our knowledge and ideas are derived from the operations of the senses. Died Aug. 3, 1780. Among his works is "The Art of Thinking," forming part of a series entitled "Cours d'Études." He argues that man owes the development of his faculties to the use of signs. His complete works appeared in 1798 (23 vols.; new ed. 1824, 16 vols.). (See ROBERT, "Les Théories logiques de Condillac," 1869.)

Con'dit, a township of Champaign co., Ill. Pop. 755.

Condi"tion [Lat. *conditio*, from *condo*, *conditum*, to "build" or "found"], in logic, denotes that which must precede the operation of a cause, that which must exist as the ground or necessary adjunct of something else. For instance, when an impression is made on wax by a seal, the seal is said to be the cause of the impression, and the softness of the wax is a condition.

CONDITION, in law, has several significations. 1. *In the Civil Law.*—The principal case here is a clause in a contract, whereby a party, anticipating that an event may produce some change which he is desirous to guard against, provides what shall be done in case the event happens. For example, if it is provided that if a house that is sold is found to be subject to a certain burden or servitude the sale shall be void, the provision is a condition. Conditions were classified in an artificial manner (for which see POTHIER on "Obligations," DOMAT, and other text-writers). 2. In common law, it means the *status* of a person in respect to his legal rights, capacities, and disabilities. (The subject will be more fully considered under the word STATUS.) 3. In common law it further means a qualification or restriction annexed to an estate arising either upon a conveyance or under a will, whereby the estate is created or enlarged or defeated, or a like clause affecting the existence of an instrument or the operation of a contract. The leading instance to be considered is a qualification annexed to an estate. It is important, at the outset, to distinguish between a *condition* and a *covenant*. A condition either enlarges or defeats an estate; a covenant is a mere engagement under seal to do an act. If a condition be broken, the estate either does not exist at all, or, if vested, the grantor may by appropriate means defeat it. In case a covenant is broken, the remedy is to sue for damages, or to compel the covenantor to perform it, or to prevent him by injunction from breaking it. The same act may by suitable words have imparted to it both the character of a condition and a covenant, when a grantor will have his choice of remedies. Conditions as to their form are either express or implied; as to their relation to the estate, they are either precedent or subsequent. A condition is said to be precedent when it precedes the vesting or enlarging of the estate; it is subsequent when, the estate having vested, its regular effect is to defeat it. The distinction does not depend upon any form of words, but upon the intent of the parties. It will be observed that the regular effect of a condition subsequent is to lead to a forfeiture. As the spirit of the law is opposed to forfeiture, it is governed by technical rules that would not be applied in case of a mere action upon a promise or covenant. Great care must be taken not to confound rules which appertain to the one subject with those which prevail in the other. It is an elementary rule that a condition subsequent does not affect the nature of the estate; it only qualifies it to this extent, that in the happening of the specified event it may be made to terminate before its natural expiration. Thus, an estate in fee or for life or for years remains a member of its class, though it may be defeated by the happening of the event which is called a condition. It should also be stated that the happening of the prescribed event does not *of itself* defeat the estate. There must be an affirmative act on the part of the grantor whereby he repossesses himself of his estate. This is technically called a "re-entry." In well-drawn instruments a power of re-entry is expressly reserved. This rule is so rigidly adhered to that if a lease should prescribe that an estate of a tenant should, on the happening of an event, be null and void, a re-entry would still be necessary. This rule leads to an important principle, that the right to take advantage of the forfeiture may be waived expressly or by implication, as where rent upon a lease is accepted with knowledge of the cause of forfeiture. The technical rules of the common law do not apply to testamentary provisions or legacies of personal property, as that branch of jurisprudence was developed by the ecclesiastical courts from the Roman law. Much caution is accordingly necessary in discriminating between devises of land and legacies of personal property, for, though in the same instrument, they will be governed by different rules. The rule that the grantor must re-enter is to be confined to a strict case of *condition*. It does not apply to a *conditional limitation*. The distinction between the two should be pointed out. In a condition the estate on the happening of the prescribed event is to return to the grantor; in a conditional limitation it is to pass over to a third person. An illustration will show the difference between them. Thus, if a testator should give his daughter an estate to be defeated in case she entered a convent, there would be a condition; but if he had added that in the event supposed it should go to his brother, it would be a conditional limitation. The main importance of the distinction is, that in case of the conditional limitation no re-entry is necessary, and the estate

on the happening of the event passes at once to the person designated. (The law of conditions will be found in the works on real property, such as WASHBURN, CRUISE, and HILLIARD, and to a certain extent in works on landlord and tenant, such as TAYLOR.) T. W. DWIGHT.

Conditioned, Philosophy of the, a name given to the system of Sir William Hamilton. It is a development and application of the general principle of the Antinomies of Kant. It regards the judgment of causality as derived from an impotence of the mind—the principle of the conditioned—the law that the conceivable has always two opposite extremes, and that the extremes are equally inconceivable. We conceive of existence as conditioned in time, and thus expressing at once and in relation the three categories of thought which afford us in combination the principle of causality, the law of which is that when an object is presented phenomenally as commencing, we cannot but suppose that the complement of existence which it now contains has previously been. (See HAMILTON'S "Metaphysics," lect. XXXVIII., XXXIX.)
C. P. KRAUTH.

Condom, a town of France, department of Gers, on the Bayse, here crossed by two bridges, 24 miles N. N. W. of Auch. It has a noble Gothic church, two hospitals, and manufactures of cotton and mixed fabrics. It was founded in 721 A. D. Pop. 8140.

Condona'tion [Lat. *condonatio*], in the law of divorce, means the conditional forgiveness of an offence for which, without such forgiveness, a divorce may be obtained. In form it may be either express or implied. It is sometimes difficult to decide whether the acts are of such a nature as to justify an implication of forgiveness. Cohabitation of the parties with knowledge that the offence has been committed, and with the means of establishing its commission in a court of justice, will lead to an implication of forgiveness. Condonation is conditional in this sense, that a repetition of the offence revives the original charge. According to some authorities, the original charge may be revived by the commission of an offence of an inferior grade. The forgiveness is said to imply that the innocent party shall in all respects be treated kindly. The point, however, is not fully settled. When an offence has been condoned and not repeated, it must be treated as though it had never existed. The original charge is blotted out conditionally. (The subject will be found fully treated in the treatises on divorce, such as BISHOP and POYNTER. The ecclesiastical reports in England and those of the court of divorce may be advantageously referred to.)

Con'dor [a Spanish word of Peruvian origin], the

Condor.

Vultur or *Sarcorhamphus gryphus*, or *Gryphus typus*, the great vulture of the Andes, the largest known bird of prey; it is four feet high. The average expanse of wing is not over nine feet. It is not much larger than the lämmergeyer, but it has a more gigantic appearance than that of any other bird except the ostrich.

The condor is known to soar to the height of nearly six miles, far above ordinary clouds, and thence to survey the vast expanse in search of prey. This rarefied space, incapable of long sustaining human life, is his native air, and he only descends to capture his prey. Condors rarely attack human beings, notwithstanding their gigantic size and strength. They pursue the deer, the llama, and young cattle, and devour them with great voracity. After these meals they are almost unable to fly, and are easily caught by the Indians. The eggs are white, and three or four inches long; they are deposited on the bare rocks, as the condor makes no nest. The female guards the young for a year; they are for several months covered with down or soft frizzled hair which causes them to appear almost as large as the adult. The condor is found in the Cordilleras of South and Central America and Mexico, and is said to inhabit the southern range of the Rocky Mountains, but it is found chiefly in the highest peaks of the Andes.

Condorçet, de (MARIE JEAN ANTOINE NICOLAS CARITAT), MARQUIS, an eminent French philosopher and mathematician, born at Ribemont, in Picardy, Sept. 17, 1743, of an ancient family of Dauphiné. He studied in the college of Navarre, and became in 1762 a resident of Paris. Having written an "Essay on the Integral Calculus," he was admitted into the Academy of Sciences in 1769. He was an intimate friend of D'Alembert. In 1777 he was chosen perpetual secretary of the Academy of Sciences, and in 1782 was admitted into the French Academy. He had a large share in the "Encyclopédie." He favored the popular cause in 1789, wrote several able political treatises, and published the influential "Feuille villageoise," and was elected to the National Convention in 1792. He was a moderate republican, and voted generally with the Girondists. He married in 1786 Sophie, sister of Gen. Grouchy, noted for her beauty (born in 1764, died in 1822). Having been proscribed by the Jacobins in May, 1793, he remained secreted in the house of a friend in Paris for eight months. During this period he wrote a "Historical Sketch of the Progress of the Human Mind" ("Esquisse d'un Tableau historique des Progrès de l'Esprit Humain," 1795). This is regarded as his greatest work. He believed in human perfectibility, and had noble ideas of human destiny. He quitted his place of refuge early in 1794 in order to enjoy a rural excursion, was arrested, and confined in prison at Bourg-la-Reine, where he took poison and died Mar. 28, 1794. "Thus died," says Lamartine, "this Seneca of the modern school. The day of recognition has not come for him, but it will come and will exculpate his memory from reproach." A collection of his numerous works was published by O'Connor and Arago (12 vols., 1847–49). (See D. F. ARAGO, "Biographie de Condorcet," 1849.)

Condottie'ri, an Italian word signifying "conductors," was applied to the mercenaries who during the Italian wars in the fourteenth and fifteenth centuries took service under any prince or government that chose to engage them. They consisted principally of heavy-armed cavalry, and for a long period the wars of Italy were left entirely to them. There came to be an understanding between them to spare their troops as much as possible, until at length battles were fought with little more hazard than would be incurred in a tourney. Among the most celebrated were Lodrisio, about 1339; Fra Moreale, 1350; Guarmeri, Lando, and Francisco di Carmagnola, about 1412; Francisco Sforza, about 1450; and the English Hawkwood.

Conduction. See HEAT, by PROF. W. P. TROWBRIDGE, and ELECTRICITY, by PRES. HENRY MORTON, PH. D.

Conduc'tor [from the Lat. *con*, intensive, and *duco*, *ductum*, to "lead"], a leader, a guide, a director, or commander. Conductor in music is the person placed at the head of a band of musicians to lead the performance and beat the time. The term is applied to a person who has charge of a train of railway cars and receives the fare. Also a metallic lightning-rod or other substance through which electricity will pass freely. (See ELECTRICITY.) The metals are the best conductors of electricity. Among the numerous non-conductors are glass, wax, silk, wool, resin, caoutchouc, amber, gems, sulphur, lime, and dry air.

Cone [Gr. κῶνος; Lat. *conus*], in mathematics, the name of a solid whose surface is generated by a straight line moved in such a manner as to pass through a fixed point and to touch continually a given curve or directrix. The fixed point is called the *vertex;* the part of the cone on which the directrix lies is the *lower nappe*, and the other part is the *upper nappe*. There are many varieties of the cone, but the term is usually applied to those having circular bases. The most common kind is the right cone, which may be conceived as being generated by the revolution of a right-angled triangle round one of its legs. The line from the apex of a cone to the centre of the base is called the axis, and in the right cone it is perpendicular to the base. In the oblique cone the axis is inclined to the plane of the base at an angle other than a right angle. A truncated cone is the lower part of a cone cut by a plane parallel to the base. Four curves, called the *conic sections*, may be formed by a plane cutting the right cone. If the cone be cut by a plane parallel to the base, the section is a circle; if the plane cut the cone across, making any angle

other than a right angle with its axis, the section is an ellipse. If the cutting plane be parallel to the side, the section will be a parabola. In every other case than those stated the section will be a hyperbola, unless section is made through the apex, when a point is produced. Hence the point is one of the conic sections. If two cones were set one above the other, point to point, the one being a continuation of the other through the apex, or, more strictly, if a cone be regarded as consisting of two nappes, as in the definition given, the plane producing the hyperbolic section would cut the second as well as the first, though none of the other planes would. There are thus two equal branches of the hyperbola belonging to the two nappes of a cone.

Cone [Lat. *strobilus*; Gr. κῶνος and στρόβιλος], in botany, is a term applied to a collective fruit and form of inflorescence sometimes called a **Strobile**, which is a spike furnished with scales, each of which has two naked seeds at its base. Such cones are characteristic of the trees of the natural order Coniferæ, and are so called because some of them are conical in form. The scales of true cones are closely compacted together, until they separate to permit the dispersion of the seeds. In some of the Coniferæ the fruit assumes a berry-like form. The Greeks called the cone στρόβιλος, from στρεφω, to "twist," alluding to the beautiful spiral arrangement of the scales.

Cone (Spencer Houghton), D. D., born in Princeton, N. J., April 30, 1785, pursued a partial course at the College of New Jersey, became an actor, and played with great success for seven years, principally in Philadelphia. From 1812 to 1815 he was an editor in Baltimore, and had command of a company of volunteers which were called into service during the war of 1812. He was ordained to the Baptist ministry in 1815, was pastor at Alexandria, Va. (1816–23), Oliver Street church, New York, 1823–41, First Baptist church, New York (1841–55), and was noted as a pulpit orator and presiding officer, and as an advocate of a new version of the Bible into English. Died in New York Aug. 23, 1855.

Cone'cuh, a county in the S. of Alabama. Area, 750 square miles. It is drained by the Sepulga River. The surface is uneven; the soil is sandy and mostly poor. Cotton and wool are produced. Pine lumber is procured in the forests. It is intersected by the Mobile and Montgomery R. R. Capital, Evergreen. Pop. 9574.

Conegliа'no, a town of Italy, in the province of Treviso, on a railway, 30 miles N. of Venice. It has a cathedral, and silk and woollen manufactures. Pop. 6834.

Cone'jos, a county of Colorado, bordering on New Mexico. It is bounded on the E. by the Rio Grande del Norte. It is generally well watered and timbered, and has much good grazing-land. The W. part is occupied by the Ute reservation. Cattle and wool are staple products. The surface is partly mountainous. Gold and silver are found abundantly. It comprises part of the beautiful and fertile San Luis Park. Capital, Conejos. Pop. 2504.

Conejos, a post-village, capital of Conejos co., Col., on one of the head-streams of the Rio Grande.

Con'emaugh', a post-borough of Cambria co., Pa., on the Conemaugh River and the Central R. R., 80 miles E. of Pittsburg and 2 miles E. of Johnstown. Pop. 2336.

Conemaugh, a township of Cambria co., Pa. P. 728.

Conemaugh, a township of Indiana co., Pa. P. 1493.

Conemaugh, a township of Somerset co., Pa. P. 1172.

Cone-Shells (*Conidæ*), a family of prosobranchiate gasteropodous mollusks, of the section Siphonostomata, having a shell of inversely conical form; the spire on the base of the cone (sometimes a sharp point, sometimes almost flat); the aperture long, narrow, and straight, extending from the base of the cone to its apex. The animal is carnivorous, and has a proboscis capable of much extension. The shell is covered with an epidermis. The mollusks of the genus *Conus* inhabit shores and banks of sandy mud, chiefly within the tropics, a few only occurring in the Mediterranean. More than 270 living species are known, besides many fossils. The genus *Pleurotoma* is of nearly world-wide distribution, and has about 450 living species, with 300 fossil ones. Most of the living species are marine. These two genera constitute the family, and are for convenience divided into many sub-genera. Many of these shells are very beautiful.

Conesto'ga, a post-township of Lancaster co., Pa., in the Conestoga Valley, which gives name to a once celebrated stock of large horses. Pop. 2079.

Cone'sus, a township and post-village of Livingston co., N. Y. The village is on a branch of the Erie R. R., 38 miles S. of Rochester. Pop. 1362.

Conesus Centre, a post-village of Conesus township, Livingston co., N. Y. Pop. 237.

Conesville, a post-township of Schoharie co., N. Y. Pop. 1314.

Cones, Volcanic. See Volcanoes, by Prof. Arnold Guyot, Ph. D., LL.D.

Conewa'go, a township of Adams co., Pa. Pop. 1029.

Conewago, a township and village of York co., Pa. The village is on the Northern Central R. R., 17 miles S. E. of Harrisburg. Pop. 1382.

Conewago, a township of Dauphin co., Pa. P. 831.

Conewan'go, a post-township of Cattaraugus co., N. Y. Pop. 1281.

Conewango, a township of Warren co., Pa. P. 1212.

Coney Island, a place of summer resort, is in the Atlantic, 11 miles S. of the city of New York, and is near the S. W. extremity of Long Island. It is 1½ miles long. Here are several hotels for the accommodation of visitors. It is the terminus of the Brooklyn Bath and Coney Island R. R.

Confarrea'tion [Lat. *farreum* or *confarreatio*, from *con*, "together," and *far*, "meal"], a mode of marriage among the ancient Romans practised by the patricians only. It consisted in the employment of certain words in the presence of ten witnesses, and in the performance of a religious ceremony in which *panis farreus*, a peculiar kind of bread, was eaten by bridegroom and bride. The offices of Flamen Dialis, Flamen Mercurialis, and Flamen Quirinalis were open only to those who were born of parents thus married. The custom probably did not come down to the time of Cæsar.

Confed'eracy [Lat. *confœderatio*, from *con*, "together," and *fœdus* (gen. *fœderis*), a "league"], a federal compact; an alliance or league of independent states; several states or nations united by a league; a coalition. In law, a combination of two or more persons to commit an unlawful act. The term confederacy has often been applied to the government of the U. S.

Confederate States, or Southern Confederacy. The earlier authentic assertions of a right (alleged therein to have been reserved by the States in ratifying the Federal Constitution) to resist the constituted authorities and subvert the laws of the Union when one or more of those States should adjudge any exercise of Federal authority unwarranted by the said Constitution, were made by the legislature of Kentucky in 1798, and by that of Virginia in 1799; the Kentucky resolves in which this doctrine was formulated having been prepared by Thomas Jefferson, as those of Virginia were by James Madison. In neither case did these resolves appear to contemplate disunion, but rather a *nullification* of the obnoxious Federal act by the sovereign power of a State. The first distinct avowal of disunion sentiment was made on the floor of the House of Representatives by Josiah Quincy (of Boston, Massachusetts), who, in opposing the purchase of Louisiana, asserted that this measure (which he agreed with its author, President Jefferson, in pronouncing unconstitutional) virtually dissolved the Union, so that the States were freed from its obligations and should prepare for peaceable or forcible separation. This avowal elicited little sympathy or approval. Again, during our last war with Great Britain (1814–15) some of the more ardent Federalists of New England, being intensely hostile to that war, openly advocated secession, and a convention held by them at Hartford, Connecticut, was popularly and not unreasonably regarded as impelled by a spirit inimical to the Union. Hence, the members of this convention were ever after under the ban of public opinion, and the Federal party never regained the public confidence. Again, when the North and South came into fierce collision respecting slavery on the question of admitting Missouri as a slave State, menaces of disunion if she were excluded were heard—this time from the South. When in 1828 Congress passed a stringently protective tariff, South Carolina, under the lead of John C. Calhoun, George McDuffie, and General James Hamilton, Jr., threatened to nullify the operation of that act within her own borders; and, though that tariff was modified in 1832, she adhered to her resolve and proceeded to call a convention whereby the existing tariff was pronounced null and void. General Jackson, then President, denied her right to do this with effect in a vigorous and masterly proclamation, whereof Edward Livingston, secretary of state, was understood to be the scribe, and, in some degree, the author. Congress proceeded to modify still further the tariff, and South Carolina thereupon waived the execution of her ordinance; so a collision was averted.

African slavery, which, though the slaves were few at the North, had been all but universal, became at length distinctively Southern, and was reprobated by an intelligent, conscientious, growing minority at the North. They agitated for the overthrow of human bondage, regardless of

the fact that the Federal Constitution conferred on Congress or the non-slaveholding States no power over the domestic institutions of the South. Prophecies and threats of disunion were now freely uttered in the slave States. The question of organizing new Territories from the public domain constantly inflamed this controversy; the South insisting that her people had a right to migrate to any Territory, and there hold their slaves as in their own States; the North denying this, and demanding the conservation of the national domain to free labor. Another compromise in 1850 essayed to end this dispute, but with poor success, the collisions between free and slave labor which followed the organization (in 1854) of Kansas as a Territory widening and deepening the agitation. An attempt to array the South under the banner of State Rights against the compromise of 1850 had broken down, even South Carolina refusing to sustain it; but when, in 1860, Abraham Lincoln had been chosen President, on a platform of resistance to slavery extension, by all the electoral votes of the free States except three of the seven cast from New Jersey, the long-meditated struggle for disunion was inaugurated by South Carolina, whose legislature was then holding a called session. A convention was summoned, which promptly met and by ordinance (December 20) declared the State no longer in the Union—Georgia, Alabama, Mississippi, Florida, Louisiana, and Texas following her example, making seven States in all which had declared themselves out of the Union before Mr. Lincoln was inaugurated (March 4, 1861). Some of these were barely carried for secession, and in none but South Carolina was the step taken with an approach to unanimity. The other eight slave States, though urged to unite in secession, refused to do so, mainly by overwhelming majorities. In pursuance of an invitation from South Carolina, the seceded States, forming an aggregate population of 2,656,948 free persons and 2,312,046 slaves, sent delegates to a convention which met at Montgomery, Alabama, February 4, 1861, and promptly formed a confederacy under a constitution modelled on that of the Union, except that it expressly asserted the right to take slaves into any State or Territory of said Confederacy, and there hold them as property. Of this Confederacy, Jefferson Davis of Mississippi was made President, and Alexander H. Stephens of Georgia Vice-President—at first *pro tem.*, but they were in due time chosen without opposition for a regular term of six years. Montgomery was continued as the capital of the Confederacy, and its first Congress there assembled.

Hostilities against the Union were inaugurated by Confederates while Mr. Buchanan (who offered no resistance) was still President. General David E. Twiggs had willingly surrendered (February 18) to them at Indianola, Texas, the largest Federal force anywhere embodied; the detachments guarding our Mexican and Indian frontiers werelikewisecaptured, and their arms and munitions treated as spoils of war; the Federal sub-treasury at New Orleans, containing $500,000, had been turned over to the new government, as had several national fortresses and vessels; so that when Mr. Lincoln assumed the duties of President the war had been fairly inaugurated on the side of the Confederacy, but not on that of the Union. Still, he forbore to initiate hostilities—unless the sending of food to the hungry garrisons of the Southern forts still held for the Union could be deemed such—until fire was opened (April 12), by express, repeated orders from the Confederate war department, upon Fort Sumter in Charleston harbor, South Carolina, on an islet which had been all but created by Federal effort and expenditure. Batteries had been erected without opposition so near it that this fort was reduced within thirty-six hours; its garrison of seventy men, under Major Robert Anderson, being allowed to march out, salute their flag, and be transported northward, not prisoners of war.

A tremendous excitement was produced throughout the country by tidings of this almost bloodless cannonade. At the South it was regarded as at once a general call to arms and an omen of easy, speedy triumph. At the North, where the hope of a peaceable solution had till this time been obstinately cherished, it was received with momentary amazement, followed by intense indignation. "It is an impeachment of our manhood—a challenge to fight!" was the general exclamation. Partisanship, hitherto rampant, of the South, as wronged and outraged by Northern abolitionism, was overawed and silenced; the national flag was everywhere displayed; President Lincoln called out for three months 75,000 militia to "repossess the forts, places, and property which had been seized from the Union." But part of the regiments called out were to be furnished by Virginia, North Carolina, Kentucky, Tennessee, Missouri, and Arkansas, whose Democratic governors spurned the call as a usurpation, and by Maryland and Delaware, whose authorities were little better inclined to the suppression of secession by force of arms. Virginia, whose convention, then in session, had previously refused by two to one to secede, now passed an ordinance of secession, and North Carolina soon followed the example, as Tennessee and Arkansas did somewhat later. Governor Claiborne F. Jackson tried to lead Missouri the same road, but the convention called at his beck utterly refused, so that he was obliged to raise Confederate troops and inaugurate civil war by virtue solely of his executive authority. He was speedily arrested by the prompt, decisive action of Captain Nathaniel Lyon and Francis P. Blair, Jr., who raised a force which captured his "Camp Jackson," near St. Louis, and most of the men he had assembled; and he was soon forced to flee the State, which, though its people were pretty evenly divided, adhered to the Union, as did Kentucky under kindred auspices. These two last were for years ostensibly represented in the Confederate Congress, but not by their own choice. When the Confederacy was full grown it embraced the States of Virginia, North Carolina, South Carolina, Georgia, Alabama, Mississippi, Florida, Tennessee, Arkansas, Louisiana, and Texas—eleven in all—covering nearly half of the inhabited area of the Union, with rather less than a third of its people. Considering, however, that Kentucky, Missouri, and Maryland contributed largely, persistently, to the Confederate armies, it is fair to estimate the practical Confederate strength at one-half that of the States which remained loyal to the Union.

The Confederate Congress, two days after Mr. Lincoln's inauguration, had authorized the raising of a military force of 100,000 men, to be under the chief command of President Davis. The States which had seized forts, arms, vessels, money, and other public property of the Union were requested to turn them over to the Confederacy, and generally did so. Commissioners were sent from Montgomery to Washington to negotiate for a peaceful adjustment of all questions arising between the Union and its new-born competitor. They were courteously received by Hon. William H. Seward, Mr. Lincoln's secretary of state, but no reconciliation of the antagonist pretensions was practicable, and they left, asserting that they had not been frankly, candidly met. The Confederacy had organized its revenue system, and commenced collecting duties on imports from the loyal States and elsewhere, before striking the blow at Sumter which was deemed necessary to draw Virginia and other hesitating States out of the Union. Two days after President Lincoln's call for militia, President Davis, by proclamation, accepted that as a declaration of war, and authorized (May 17) the issue of letters of marque and reprisal against the commerce of the United States. A loan of $5,000,000 was advertised at Montgomery, to which $8,000,000 were subscribed. Before the close of April the Confederacy had 35,000 men in arms, of whom 10,000 were being pushed rapidly northward, and the Confederate Congress, which organized at Montgomery on the 29th of April, adjourned on the 21st of May to meet at Richmond, Virginia (the newly-chosen capital), on the 20th of July. Treasury notes had already been authorized, and a heavy loan, based on a pledge of cotton by the planters to the Confederacy. All debts due from inhabitants of the Confederate to those of the loyal States were impounded, and directed to be paid into the Confederate treasury. This act was obeyed to the extent of not paying the loyal creditors, but the Confederate treasury was but slightly replenished from this source. At length, when war had begun in earnest, all male citizens of the United States over fourteen years old were required by law and proclamation (August 14) either to swear allegiance to the Confederacy or leave its borders within forty days. The Confederate marshals were directed to apprehend and imprison all who disobeyed this edict. A Confederate privateer having been captured and her crew imprisoned in New York as criminals, President Davis, by proclamation (July 6), declared that he would retaliate upon Union prisoners of war any infliction upon those Confederates, and proceeded to make good his word. President Lincoln recoiled before this menace, and thenceforth treated privateersmen as prisoners of war. Regular exchanges of prisoners between the belligerents were initiated in the winter of 1861–62, and thenceforth accorded without objection. The Confederate authorities, however, did not scruple to treat belligerent Unionists resident within their borders, especially those of East Tennessee, as traitors. Jefferson Davis as President, and Alexander H. Stephens as Vice-President, were unanimously elected (November 6) for a term of six years ensuing; their previous election having hitherto been provisional only.

The civil war, formally initiated by the bombardment and reduction of Fort Sumter, was prosecuted thenceforth during 1861 with varying fortunes, but with a preponderance of success for the Confederacy. Its first signal triumph was the easy capture (April 20) of the Norfolk navy-yard, with three or four national vessels, including the frigate Merri-

mack (which months afterwards, having been transformed into the rebel iron-clad Virginia, wrought fearful havoc among the national vessels in Hampton Roads), with nearly two thousand cannon, besides small arms, munitions, etc. of immense value—all abandoned without firing a shot by the naval officers who should have defended and saved them. The Sixth regiment of Massachusetts militia, hastening to the relief of menaced Washington City, had just before been assailed (April 19) in the streets of Baltimore by a mob, which showered hardware, paving-stones, and other missiles upon it from housetops as it peacefully traversed their city, killing three and wounding fifteen of the Massachusetts men, while eleven of the mob were killed and four severely wounded. The militia passed on, but Baltimore was held by the mob, and communication by telegraph or otherwise between the Federal capital and the North arrested until General B. F. Butler reoccupied it, unresisted, by an advance from Annapolis (May 5–13). That important city was henceforth firmly held for the Union. General Butler, being in command at Fortress Monroe, ordered an advance under Brigadier-General Pierce against a Confederate outpost at Big Bethel, Virginia, but the ill-directed attack was repulsed by General J. B. Magruder with considerable loss to the Unionists. That portion of Virginia westward of the Alleghany range having opposed secession and still adhering to the Union, a Confederate army was sent across the mountains to overbear this (alleged) disloyalty to the State, but was promptly met by a greater Union force under General George B. McClellan, and driven from Philippi (June 2), then beaten at Rich Mountain and also at Laurel Hill, and again at Carrick's Ford (July 12), and the remnant driven in disorderly flight over the dividing ridge. Hostilities were renewed on the Kanawha by the advance (Aug. 1) of a fresh Confederate force under General John B. Floyd, afterwards succeeded by General Robert E. Lee, but these were met and baffled by a stronger Union army under General Wm. S. Rosecrans, and indecisive actions ensued at Carnifex Ferry, on Cheat Mountain, and at Alleghany Summit, which left West Virginia almost wholly under the flag of the Union at the close of 1861. In Eastern (or old) Virginia hostile armies confronted each other near Harper's Ferry and Winchester under Generals Robert Patterson (Union) and Joseph E. Johnston (Confederate) for a month without fighting, until a stronger Union force under General Irwin McDowell was pushed forward by Scott from Washington and Alexandria to Centreville, menacing the Confederate force concentrated around Manassas Junction, and advancing (July 21) to attack its left near Sudley Church. The advance was gallantly made, and for a time promised success; but Johnston's army from Winchester arrived by rail at the critical moment, and was hurried forward to the support of the recoiling regiments, so that the fortunes of the day suddenly changed, and the Union troops, exhausted by twelve hours' marching and fighting under a July sun, had to give way before this unexpected effort, and retired in a disorder not uncommon on battle-fields, even among veteran troops. The Confederates, unaware of the completeness of their victory, did not pursue it, though their President Davis, had arrived on the field about the close of the battle. The Union loss in this affair was not less than 4000 men, mostly wounded and prisoners, with at least twenty cannon and large quantities of small arms; the Confederates lost about 2000, including two generals (Bee and Bartow) killed. The men who fought were not far from 25,000 on each side, but quite as many more Union soldiers listened to the sound of the guns at Centreville, Fairfax Court-house, in Washington, and on the Potomac, who should have been on the bloody field.

General McClellan was now called from West Virginia, and soon made commander-in-chief, vice General Scott retired; but there was no more serious fighting on this line till October 20, when a Union force of 1900, pushed across the Potomac opposite Harrison's Island, was attacked near Ball's Bluff by General Evans's brigade, mainly Mississippians, and nearly destroyed; its commander, General E. D. Baker of Oregon, being killed, with 300 of his men, and more than 500 taken prisoners. Two months after, General E. O. C. Ord, with the Third Pennsylvania brigade, having advanced, also on General McClellan's right, to Dranesville, was there attacked by a rebel brigade under General J. E. B. Stuart, who was quickly repulsed, with a loss of 230 men. This closed the campaign on the Potomac. Meantime, General Butler, sailing from Fortress Monroe (August 20), had captured Forts Hatteras and Clark at the entrance to Pamlico Sound, taking 700 prisoners under Commodore Bowen, 25 guns, 1000 muskets, and some stores. A more formidable expedition, 10,000 strong, under General T. W. Sherman and Commodore S. F. Dupont, left Hampton Roads October 29, and steered for Port Royal, South Carolina, where it bombarded and reduced the Confederate forts on Hilton Head and Phillips' Island, driving out their defenders and taking undisputed possession of the Sea Islands adjacent, which were thenceforth firmly held by a Union land and naval force which menaced both Charleston and Savannah, and repeatedly, though unsuccessfully, struck at the railroad connecting them.

In the West, Missouri was this year the arena of a violent though desultory conflict. Major-General John C. Fremont, who had been appointed to command here, was hastening westward to organize at St. Louis an army under the depressing influence of the Bull Run disaster in the East, when Governor C. F. Jackson returned from a two months' sojourn in the Confederacy and prepared to dispute possession of the State, though a convention of her people had declared (July 20) his office and those of his adherents vacated by treason, and all their disloyal acts null and void. He thereupon assumed to take Missouri out of the Union by proclamation (July 31), negotiated a close alliance with the Confederacy, and was raising a large army, in good part from Arkansas, when General Nathaniel Lyon, commanding 6000 Unionists at Springfield, took the field against Jackson's far more numerous but not so well-provided army, led by General Sterling Price, who suddenly resigned his command to General Ben McCulloch from Arkansas. Lyon, having advanced to Wilson's Creek, sent General Sigel with 1200 men to flank the enemy, whom he assailed in front, but his force was too small; Lyon fell mortally wounded, and the Union attacks in front and flank were repulsed; but the Unionists retired deliberately and unpursued to Springfield, insisting that they had fought quadruple their numbers and not been beaten. Major Sturgis, who succeeded General Lyon, soon afterward retreated to Rolla, abandoning all Southern Missouri to the Confederates. McCulloch returned to Arkansas, but Price advanced in large force to the Missouri River at Lexington, where he invested Colonel Mulligan and his Irish brigade, numbering 2780 men, and pressed them so vigorously that Mulligan was forced to surrender (September 20) before Fremont could relieve him. Fremont took the field directly afterwards, and pushed down to Springfield at the head of 30,000 men; but Price avoided him by retreating, and there was no fight, except that Colonel Zagonyi, with 300 Union cavalry, routed a far larger force which held Springfield, capturing that city. Fremont was still looking for Price when he was relieved (November 2), and ordered to turn over his command to General David Hunter, who, in pursuance of his orders, retreated to Rolla, again abandoning all Southern Missouri to the enemy. Brigadier-General U. S. Grant was at this time in command of the important post of Cairo at the junction of the Ohio with the Mississippi, watched by a Confederate force at Columbus, Kentucky. Grant, with 2850 men on four steamboats, dropped down the river to Columbus, landing at Belmont in Missouri, and attacked the Confederate camp on that side. The attack was spirited, and at first successful; but Major-General (Bishop) Polk, commanding at Columbus, crossed with five regiments, increasing the Confederate force to 5000, by which Grant was beaten off and driven to his boats with a loss of 500 men. The Confederate loss was rather more. One month later, Colonel Jefferson C. Davis, acting under General John Pope, commanding in Central Missouri, surprised a Confederate camp at Milford, and captured 1000 prisoners (including three colonels) and as many horses and muskets. General Pope reported 2500 prisoners taken this month, with a loss on his part of barely 100. So closed the campaign of 1861.

The battles of the bloody year 1862 were initiated at Mill Spring, near the Cumberland River, in Southern Kentucky, where General George B. Crittenden, having just supplanted General F. K. Zollicoffer in chief command of the Confederate force in that quarter, ordered an attack on the Unionists in their front, who, being in superior numbers and led by General George H. Thomas, repulsed them (January 19) after a hot struggle of two hours, and, following them to their camp, found it deserted—Crittenden having fled across the Cumberland, leaving ten guns, 1500 horses, etc. General Zollicoffer was killed while leading the attack. This blow was soon followed by one more serious, directed from St. Louis by General Halleck, who sent from Cairo Brigadier-General U. S. Grant with 15,000 men, and Commodore A. H. Foote with seven gunboats, to open a way into Tennessee. Fort Henry, 80 miles up the Tennessee River, was quickly reduced (February 6) by the gunboats, the garrison mainly escaping to Fort Donelson, 12 miles eastward, commanding the navigation of the Cumberland, leaving their chief, General Lloyd Tilghman, a prisoner. General Grant followed the fleeing Confederates, and nearly invested, with his force considerably increased, their stronghold, two miles below Dover, held by 15,000 men under the Virginian general John B. Floyd (late United States secretary of war). Commodore Foote, ascending the Cumberland, first attacked (February 14) the river-batteries, but

was repulsed with considerable loss. Floyd, seeing Grant proceeding leisurely to cut off his retreat, anticipated that result by an advance under General Simon B. Buckner on Grant's right towards Dover, commanded by General John A. McClernand of Illinois, who was overpowered and driven back after a protracted deadly struggle, losing a six-gun battery. The Union centre, under General Lew Wallace, sent two brigades to McClernand's support, by which the Confederate advance was arrested, and General Grant, arriving on the field at 3 P. M. from a conference with Commodore Foote, ordered a general attack, which was crowned with success. Wallace recovered by it the ground previously lost by McClernand, while General C. F. Smith led the Union left clear over the breastworks in their front, and the day closed with a decided Union victory. A cold night of suffering followed, during which General Floyd, despairing of cutting his way out, surrendered his command to General Gideon J. Pillow, who passed it to General Buckner, who, after some parley, surrendered next morning (February 16) not less than 6000 men, besides 2000 sick and wounded. General N. B. Forrest, with 800 cavalry, escaped up the bank of the swollen river, while Floyd, Buckner, and a remnant got across by boat before daylight and fled. One result of this success was the immediate evacuation of the Confederate camp at Bowling Green, Kentucky, as also of Nashville and all Northern Tennessee; Governor Isham G. Harris and his legislature being among the fugitives. Nashville was promptly occupied by the Unionists, while the main army of Tennessee, under General A. Sidney Johnston, retreated unmolested to Corinth, Mississippi, leisurely followed by General Don Carlos Buell, who had commanded the Union forces in Kentucky. General Grant's army, now confided to General C. F. Smith, was embarked and moved up the Tennessee to Savannah and Pittsburg Landing, nearly opposite Corinth. These Union successes compelled the evacuation of Paducah and Columbus, while General Pope, with 40,000 Unionists, marching down through Eastern Missouri, drove Major-General McCown, with 9000 Confederates, from New Madrid, taking thirty-three cannon and many thousand muskets, also tents, wagons, etc., without a serious contest. Brigadier-General Makall, with 6700 men, 123 cannon, and 7000 small arms, was now caught between Pope's army and Foote's fleet on Island No. 10 in the Mississippi, and compelled to surrender. Commodore Foote, dropping down the river, routed the Confederate flotilla in a brief engagement before Memphis, which thereupon surrendered without a blow. By July 1st the Mississippi River saw none but the Union flag floating above Vicksburg, which successfully resisted successive attempts at its reduction by Commodore Foote from above and Commodore Farragut from below.

General C. F. Smith was soon disabled by sickness and died, and the command of his army again devolved upon General Grant, who, while awaiting the arrival of General Buell from the North, was attacked at Pittsburg Landing by an advance in force of the Confederates from Corinth, 50,000 strong, under General A. S. Johnston, while General Grant was still at Savannah, eight miles below. The Unionists, about 40,000 strong, were completely surprised without intrenchments or even abatis, and were driven with heavy loss from Shiloh Church, three miles inland, to the brink of the river, having lost heavily in guns, killed, wounded, and prisoners. Meantime, General A. S. Johnston had been shot dead, the Union gunboats on the Tennessee had come into play, General Grant had joined his shattered army, while the advance of General Buell's force was beginning to come to its relief. Night brought a cessation of hostilities, and General Beauregard had succeeded to the chief command of the Confederates. On the Union side, General W. H. L. Wallace had been killed at the head of his division. General Nelson's division of Buell's army had crossed the Tennessee in boats at 5 to 6 P. M., and taken position on the field by 7. Two more divisions were on hand by sunrise next morning, when the battle was reopened by an advance of the Union forces, of whom 25,000 (including General Lew Wallace's division of General Grant's army) were fresh, while only 3000 of the Confederates had not yet been engaged. The fighting throughout the forenoon was spirited, but the forces were unequal, and the Confederates had lost by 4 P. M. all the ground they had gained the day before, and were soon afterwards in full retreat. There was but a faint show of pursuit. The reported Union loss in the two days' fighting was 1735 killed, 7882 wounded, 3956 missing; total, 13,573. Beauregard reported the Confederate loss at 1728 killed, 8012 wounded, 957 missing; total, 10,699.

General Grant was soon superseded by General Halleck, who, taking command of the combined army, advanced by approaches to Corinth, which was evacuated by General Beauregard, who retreated with little loss into the heart of Mississippi. Meantime, General O. M. Mitchell, with part of Buell's army, had advanced eastward up the Tennessee, taking Huntsville and other towns on the river, but failing to carry Chattanooga. Mitchell was now transferred to the command on the coast of South Carolina, where he sickened and died.

The war in the Territories was early initiated by an effort of Colonels Loring and G. B. Crittenden to carry over the 1200 regulars stationed in New Mexico to the Confederacy; but their intrigues were repulsed on every hand, and they were constrained to flee to El Paso, where Major Lynde, who had 700 men, made a pretence of resistance, advancing twenty miles to meet a much smaller Texan force, then retreating, and surrendering his entire command, which was paroled and marched northward for exchange, suffering terribly from heat and thirst. General H. F. Sibley, commanding a Confederate force of 2300 Texan volunteers, undertook the conquest of New Mexico in the fall of 1861; but his advance was retarded by lack of supplies till the opening of 1862, when he met Colonel E. R. S. Canby, commanding a much larger Union force, at Fort Craig. The Unionists were first drawn out of their stronghold, and then defeated by a brilliant charge on McRae's battery, which was taken. Canby's men fled precipitately to the fort, which Sibley could not reduce; so he turned it and pushed on to Apache Pass, where his farther advance was opposed by 1300 men, mainly Colorado volunteers, under Colonel John P. Slough, whom he defeated by another Texas charge, which routed Slough's motley crowd and cleared the road to Santa Fé, which Sibley soon entered in triumph. But his brilliant victories proved barren; he could not feed and clothe his little army from all the resources of New Mexico, while Canby was in the way of his receiving supplies from Texas, had any been sent. Forced to evacuate the capital of New Mexico for Albuquerque, whence (April 12, 1863) he moved down the Rio Grande, he encountered Canby at Peralta, but escaped him, after some fruitless long-range fighting, by destroying his train and dragging his guns over a desolate, waterless, mountainous region east of the river, and thus made his way down to Fort Bliss, Texas, having left half his force dead or prisoners, though never defeated; and returned to report his sage conclusion that New Mexico was not worth a quarter of the cost of taking and holding it.

Some of the largest of the semi-civilized tribes settled in the Indian Territory were incited by their old Democratic agents and other influential whites to link their fortunes with the Confederacy soon after the Union defeats at Bull Run and Wilson's Creek. Their aid proved, however, of little worth, and they were glad to return to the protection and alliance of the Union so soon as the progress of events had made it probable that this was the stronger side.

General Sterling Price, after Pope's successes in Missouri near the close of the campaign of 1861, unable to fight a pitched battle, retreated rapidly through Springfield and Cassville, closely pursued, and fighting when he must, till he had reached Arkansas and formed a junction near Boston Mountain with General Ben McCulloch, commanding a division of Texas and Arkansas volunteers, which raised his force to an equality with that of his pursuers. General Albert Pike now added to the ration-consuming power of the Confederates a brigade of Indians, swelling their total to nearly 20,000 men. Earl van Dorn, late a captain of Union regulars, now a Confederate major-general, assumed chief command, and resolved to fight the Unionists (now led by General Samuel R. Curtis of Iowa) before they could be concentrated. Advancing rapidly from his camp at Cross-Timber Hollows, Van Dorn fell upon General Franz Sigel, holding the extreme Union advance at Bentonville. Sigel retreated (March 3, 1862) fighting, and falling back coolly, until reinforced at 4 P. M., when he encamped at Leetown on Curtis's right. Curtis held a good position on Sugar Creek, which Van Dorn avoided by moving far to the left and attacking in overwhelming force the extreme Union right under Colonel Carr, holding a swell of ground known as Pea Ridge. Carr, fearfully overmatched, resisted stubbornly for seven hours, during which he was repeatedly wounded, lost a fourth of his men, and was driven back half a mile. Curtis, who had but scantily reinforced him up to 2 P. M., now ordered Generals Asboth and Sigel to the support of Carr, himself accompanying Asboth, whose batteries were soon engaged with the enemy's, and he severely wounded. Night closed the combat as Sigel was coming into position on Asboth's left. Next morning, General Curtis, having completed his dispositions, ordered his centre to advance, and the cannonade was reopened on both sides, but the Confederates soon desisted and disappeared, fleeing through Cross-Timber Hollows in their rear so rapidly as to defy pursuit. The Union loss in this battle was 1351 out of 10,500 men. Van Dorn's force was at least 16,000, including 5000 Indians. Among his killed were Generals Ben McCulloch and McIntosh; among his wounded, Generals Price and Slack. Lack of ammunition was the reason alleged for his hasty retreat.

General Curtis then advanced without resistance to Batesville, Arkansas, and thence marched to Helena on the Mississippi, but once resisted by 1500 cavalry under General Albert Rust, who were easily routed with a loss of 100 to 8 Unionists.

Curtis's movement south-eastward opened Missouri once more to Confederate incursions. Tidings of Union reverses in Virginia filled the invading ranks with volunteers from all quarters. Colonel Porter, commanding some 2000 of these raw levies, was attacked near Kirksville by Colonel John McNeil with 1000 cavalry and a battery, and after a desperate fight was defeated and his force virtually destroyed. Colonel Poindexter, with 1200 Confederates, was attacked by Colonel Odin Guitar while crossing the Chariton River, and his command likewise captured or destroyed. After several more petty conflicts the Confederates were again chased out of Missouri and compelled to take refuge in Arkansas, where General T. C. Hindman was now in chief command. General Blunt commanded the Unionists, who had again entered that State some 5000 strong; General F. J. Herron, encamped at Wilson's Creek with 7000 men, hastened to his aid when apprised of his danger, reaching Fayetteville, Arkansas, December 7. Hindman, deceiving Blunt by a threat of fighting, turned his left, and with 10,000 men fell upon Herron's 4000 infantry and artillery at Prairie Grove, his cavalry having been pushed forward to help Blunt. A spirited fight ensued, Herron, desperately charged, bravely holding his ground until 2 P. M., when the welcome sound of Blunt's batteries was heard opening on his left. The forces engaged were now nearly equal, and the battle raged till after dark, little ground being gained on either side. Next morning the Confederates had left the field. Hindman's loss was 1317, including General Stein, killed. The Union loss was 1148, of whom 953 were from Herron's 4000.

An expedition consisting of thirty-one steamboats and 11,500 men, led by General A. E. Burnside and Commodore L. M. Goldsborough, sailed from Fortress Monroe January 11, 1862, for Roanoke and Albemarle Sounds, North Carolina, landing (February 5) on Roanoke Island a force by which Fort Bartow, its main defence, was speedily taken by assault, with a Union loss of 300, while about 2500 Confederates were captured. The next point of attack was Newbern, which was likewise carried by assault (March 14). Among the captures were two steamboats, sixty-nine cannon, and 500 prisoners. The Union loss in the assault was 600. Fort Macon, on the coast, was next invested and taken, with its garrison of 500 men. This was the first of the regular Union fortresses retaken from the enemy. Washington, Plymouth, and other North Carolina ports fell without resistance, but General Reno was repulsed in a fight at South Mills, and General Foster in an attempt on the important railroad junction at Goldsboro'.

General Benjamin F. Butler, having raised in New England six regiments of 1000 men each for the purpose, and being aided by a fleet under Captain David G. Farragut, left Fortress Monroe (February 25, 1862) for his rendezvous on Ship Island, Mississippi, whither one of his brigades under General J. W. Phelps had preceded him, and where his troops were soon augmented to 15,000. His objective point was New Orleans, a city of 170,000 inhabitants, defended by 3000 men under General Mansfield Lovell, but the strong forts St. Philip and Jackson, half way between the city and the mouths of the Mississippi, were Lovell's main reliance. Earnest efforts to strengthen them by a raft or boom across the river were all but thwarted by the high stage of the heavily-swelling current. Captain Farragut, with his fleet of forty-seven armed vessels and 310 guns, appeared before the forts April 17, opened fire next morning, and destroyed or evaded three fire-rafts sent down to annoy him. After three days' ineffective bombardment, the Itasca, Captain Caldwell, steamed up to the great boom or chain, and cut it with sledge and chisel, when another fire-raft was sent down to no purpose, and two more days were wasted in fruitless cannonading; then Farragut, with his fleet in three divisions, resolved to fight his way by the forts against the sweeping current; which he successfully did, fighting and capturing or scattering the Confederate gunboats above, with a net loss of the Varuna steamship sunk and some 200 men. The forts, thus rendered useless, were soon surrendered. Captain Farragut, with nine of his vessels, steamed directly up to the city, whence a thick black smoke apprised him that the Confederates were burning ships, steamboats, etc. laden with cotton, sugar, flour, etc. Lovell drew off his men, and the city ungraciously signified that she could make no resistance. Passing up to Carrollton, eight miles above, Farragut found its works abandoned and in flames. General Butler, having reduced the forts, soon came up and took possession, which was not thenceforth disputed.

All the towns on the Mississippi below Vicksburg were easily captured by Farragut, and an attempt to retake Baton Rouge (August 5), by a force of 2500 Confederates under Major-General John C. Breckenridge, was repulsed by an equal Union force under General Thomas Williams, who was killed. The Confederates lost 300 men, including General Clarke and six colonels. The Union loss was 250. The lower parishes of Louisiana hereupon fell to the Unionists without serious resistance. Butler was relieved by General N. P. Banks December 16, having just before been outlawed as a felon by Jefferson Davis.

General George B. McClellan had been called from West Virginia to the command of the Army of the Potomac soon after the Union disaster at Bull Run, and on the retirement of General Scott made commander-in-chief of the Union armies. A very large force, fully 200,000 strong, was rapidly gathered around him and drilled into the coherence of a regular army. The far weaker Confederate force confronting him gradually recoiled to Centreville and Manassas Junction, where they spent the winter of 1861–62. General McClellan remained quiet till expressly ordered (February 22) by President Lincoln to advance, when he moved out to Manassas Junction, to find it evacuated by the Confederates, who, under General Joseph E. Johnston, had quietly retired behind the Rapidan. General McClellan now transferred the bulk of his army by water to Fortress Monroe, preparatory to an advance on Richmond up the peninsula between the James and York Rivers. Meantime, General Banks was left in command in the Valley of Virginia, and had just left for Washington, when his 7000 men, now under General James Shields, well posted near Kernstown, were attacked by Stonewall Jackson with but 4000 men, who were defeated with a loss of at least 1000. General Shields's loss was about 600.

Just before McClellan reached the James, the Confederate iron-clad Virginia (late the United States steam-frigate Merrimack) had sallied out of Norfolk (March 8), and, attended by two gunboats, made directly for the Union frigates Congress and Cumberland, lying near Newport News, and disdaining to reply to their rapid cannonade, of which the balls rebounded from her sloping roof of iron as though they were peas, struck the Cumberland with her iron beak, smashing in the frigate's bow, so that she filled and sank in half an hour, carrying down a part of her crew. The Congress, seeing the fate of her consort, set sail and ran aground under the batteries of Newport News, where she was raked by the ram until her commander, Lieutenant Joseph B. Smith, and most of her officers and men, were either killed or wounded, when her flag was hauled down; but her captors were prevented from burning her by a fire from the Union batteries on shore. The Merrimack afterwards returned and bombarded her until she was set on fire and blown up; half her crew of 434 men having fallen. The steam-frigate Minnesota and frigate Lawrence, hurrying to the aid of the Cumberland and Congress, had severally grounded in the harbor. The Lawrence soon got off and returned to port, but the Minnesota, still aground, was cannonaded for hours by the entire Confederate flotilla, the Merrimack being unable to approach nearer than a mile, owing to the shallowness of the water. At 7 P. M. all three desisted and steamed towards Norfolk. At 10 the new Union iron-clad Monitor, Lieutenant John L. Worden, steamed into the roadstead on her trial-trip from New York. At 6 A. M. the hostile fleet reappeared and made for the Minnesota, but the little Monitor interposed, and the strange combat was renewed and continued with varying fortunes until the Confederate fleet sheered off and stood for Norfolk. The Merrimack was badly crippled, her commander, Buchanan, having been wounded in the fight with the wooden ships. She never fought again, and was blown up when Norfolk was evacuated by the Confederates not long afterwards. The little Monitor (styled a "cheese-box on a raft") remained master of the situation, but was lost, months afterwards, in passing Cape Hatteras.

General McClellan reached Fortress Monroe April 2d. Of his army, 58,000 had preceded him, and as many more soon followed. Advancing up the peninsula, he was soon arrested by Confederate batteries on Warwick Creek (which nearly crosses the peninsula abreast of Yorktown), manned by General J. B. Magruder, who had some 11,000 men in all wherewith to hold a line thirteen miles long. Thirty days were spent here; when McClellan had planted his breaching-batteries, and was nearly ready to open fire, it was found that Magruder had retreated. On reaching Williamsburg, McClellan's advance was stopped by works known as Fort Magruder, where Hooker's division fought nine hours and lost heavily. At length the Confederate position was flanked by General Hancock of Sumner's division, and Magruder retreated during the night, leaving 700 of his severely wounded. The total Union loss was 2228, that of the Confederates probably less. West Point, at the head of York River, was occupied May 6, with a

Union loss of 200. This movement up the peninsula, coupled with Burnside's successes in North Carolina, compelled the Confederates to evacuate Norfolk, with its navy-yard, about 200 guns, and some worthless vessels. That city they never recovered. General McClellan, no longer resisted, advanced to the Chickahominy on the 20th.

Here he halted and fortified with over 100,000 effective men, believing the Confederate army in his front nearly if not quite equal in numbers to his own. Meantime, General Fremont, to whom Western Virginia had been assigned as a department, advanced into the Alleghanies and threatened Staunton from the direction of Monterey. Jackson sent General Edward Johnson to oppose Fremont's advance under Milroy, who retreated and was joined by General Robert C. Schenck near McDowell, where a battle was fought, with a Union loss of 461, the Unionists retreating after nightfall. Jackson recrossed Shenandoah Mountain, and marched rapidly down the Valley to Front Royal, where he surprised and routed Colonel John R. Kenly, taking 700 prisoners. Pushing on to Strasburg, Jackson compelled Banks to retreat rapidly to Winchester, where he fought five hours, and then, being greatly outnumbered, retreated hurriedly to Martinsburg and Williamsport, where he crossed the Potomac, having lost about 1000 men, besides the sick and wounded in his hospitals. Jackson's cavalry pursued to Martinsburg, but most of his infantry were halted not far beyond Winchester, and soon retreated rapidly to confront Fremont and McDowell, who were hastening to bar his way. Fremont, crossing the Alleghanies by a rugged route, reached Strasburg June 1, a few hours after Jackson had passed that point. Jackson, still retreating, destroyed the numerous bridges behind him, and turned to fight (June 7) at Cross Keys, where he checked Fremont; then, again retreating, he crossed the South Fork at Port Republic, falling with a superior force upon General Tyler, who, with a part of Shields's division of McDowell's army, was forced back with loss. Jackson thus balked all his foes, having lost but 1167 men since he left Winchester. His baffled pursuers were now recalled, and he, triumphant, was soon ordered to join General Robert E. Lee, now in chief command at Richmond. The rebel general Heth had attacked Colonel Crook at Lewisburg, West Virginia, and been routed on the same day with Jackson's demolition of Kenly.

An unsuccessful attack (May 15) on Drewry's Bluff, eight miles below Richmond, by a Union fleet under Commander John Rodgers, was followed, May 27, by a fight near Hanover Court-house between the Union Fifth corps, General Fitz-John Porter, and General L. O'Brien Branch's North Carolina division, which was driven off with a loss of 700, to 400 on the Union side.

Keyes's Fourth corps having been thrown forward across the Chickahominy to Seven Pines on its right and Fair Oaks on its left, was attacked (May 28) by the Confederates under General Jos. Johnston, who judged that Keyes might be overwhelmed before he could be sufficiently supported. Four divisions, under Longstreet, D. H. Hill, Huger, and G. W. Smith, were designated to make the attack, supported by all the rest of the Confederate army. Hill, at 1 P. M., first attacked Casey's division at Fair Oaks, surprising it while its defences were still uncompleted, and pushing it back on Couch's division near Fair Oaks, with a loss of six guns, two of its colonels killed, and many men. Keyes barely held his ground at Fair Oaks till Sumner's corps, rapidly thrown across the Chickahominy, came to its aid. Heintzelman's corps, though nearer, came into the fight later, and our right was now attacked by Smith's corps, directed by Jos. Johnston as commander-in-chief, till he was struck by a shell, and so badly wounded that he was disabled for months. Lee succeeded him. McClellan was at New Bridge, several miles up the Chickahominy, with the corps of Fitz-John Porter and Franklin, which were not brought into action. The battle raged without much advantage to either side till dark, when the Confederates drew off. They made a pretence of attacking next morning, to cover their removal of arms and stores from the camp of Keyes's corps, but the fighting amounted to little. Hooker, by Heintzelman's order, made a reconnoissance in force to within four miles of Richmond, meeting no resistance, but was recalled to Fair Oaks by McClellan. The Union loss in this affair was 5739, including five colonels killed and seven generals wounded. Of Keyes's 12,000 men, 4000 fell or were captured. General McCall's divison of McDowell's corps now joined McClellan, raising his total to 156,828, and his effective force to 115,102.

No further offensive movement was made by him until Jackson, whose movements had been studiously concealed, came in on Lee's left, and was pushed forward to assail and turn McClellan's extreme right at Mechanicsville, being supported by Branch, D. H. Hill, Longstreet, and A. P. Hill, with the bulk of the Confederate army.

A. P. Hill, on Jackson's arrival, crossed the Chickahominy and attacked Fitz-John Porter's corps of 27,000 strong, which, recoiling from Mechanicsville, took up a strong position behind it across Beaver Dam Creek, but was repulsed (June 26), Jackson having not yet got into position. Porter now retreated by order to Gaines's Mill, where he was at once reinforced by Slocum's division of Sumner's corps, raising his force to 35,000 men. But opposed to them were 50,000 veterans, led by their ablest commanders, including Longstreet and Jackson. After fighting gallantly for several hours, he telegraphed for aid to McClellan, who sent two brigades of Sumner's corps to his assistance, but the field was lost before their arrival. Porter lost nineteen guns, but halted just off the field, and was not pursued. The Union loss that day was 8000, that of the Confederates about 5000. But McClellan's base of supplies, West Point, had been captured by Stuart's cavalry, and he decided to retreat by his left flank through White-Oak Swamp to the James. This movement puzzled Lee, who did not pursue with vigor, and the first attacks upon the Union rear were easily repulsed. Finally, McCall's division, serving as rear-guard, was assailed (June 30) in great force at Glendale, and after hard fighting defeated and driven; McCall himself being captured, with most of his guns. The struggle ended at 9 P. M., Hooker's and two brigades of Slocum's division having arrived too late to win the battle, but in time to check pursuit. The loss of men in this action was about 3000 on either side.

The Union forces were now concentrated at Malvern Hill on James River, where they were attacked by the entire Confederate army, which was signally defeated in one of the most desperate actions of the war. The first attack was made at 3 P. M.; the most desperate charge was made at 6, and repulsed with great slaughter. The Confederate loss in this struggle must have been nearly or quite 10,000, that of the Unionists perhaps half as many. McClellan during the evening moved down the James to Harrison's Landing, where Lee did not choose to assail him. He claimed 10,000 prisoners, 52 guns, and 35,000 small arms as captured during the seven days' fighting, from Mechanicsville to Malvern inclusive. The Union loss during those days is reported by McClellan at 1582 killed, 7709 wounded, and 5958 missing; total, 15,249. Jackson's and A. P. Hill's losses during those days were reported by them as 1585 killed, 7688 wounded; total, 9336. This is probably about half the total Confederate loss, which included General Griffith and three colonels, killed. General Hooker soon afterwards reoccupied Malvern Hill without resistance, taking 100 prisoners, but the Union army was soon withdrawn by the President's order to the Potomac. Its retreat and embarkation were unmolested. General McClellan and his staff reached Aquia Creek August 23.

Major-General John Pope had been called from the West to Washington, and given the chief command of Fremont's, Banks's, and McDowell's forces, aggregating 50,000 men. Major-General Halleck was also called from the West to Washington, and made general-in-chief. Pope concentrated his forces near Culpeper Court-house, and sent Banks forward with 8000 men to Cedar Mountain, where he was confronted by Stonewall Jackson, from Richmond, with 25,000 men. Banks attacked (August 9) under every disadvantage of position, and was steadily repulsed, losing 2000 men; Jackson's loss was 1314. Pope arrived at nightfall with Ricketts' division and part of Sigel's (late Fremont's) corps, but Jackson, seeing that Pope was about to move against him in superior force, soon retreated across the Rapidan.

Pope, continuing to act on the offensive, soon found the whole army of Virginia concentrating upon him, and retreated across the Rappahannock. Lee did not choose to force a passage on his front, and sent Jackson around by a long flank march up that river. Encamping at Salem, and emerging through Thoroughfare Gap, he struck the Alexandria Railroad at Bristow Station, in Pope's rear, and captured two trains of cars running westward from Warrenton. He now sent Stuart with two regiments to Manassas Junction, seven miles farther north, which he surprised, taking eight guns, 300 prisoners, and seven trains laden with provisions, etc. Colonel Scammon, with two Ohio regiments, now crossed Bull Run and assailed Jackson, but was easily beaten off, and General F. G. W. Taylor, with four New Jersey regiments, renewed the experiment with like result; all of Jackson's and A. P. Hill's divisions being by this time at the Junction.

Pope, by this time aware that something was wrong in his rear, began to fall back on Bristow Station, where Hooker drove Ewell, capturing part of his train. Ewell fell back on Manassas, which Pope's gathering force compelled Jackson to abandon, moving westward, leaving the captured provisions, which he could not remove. Moving towards Thoroughfare Gap, he encountered Rufus King's

division of McDowell's corps, which fought him stoutly, but did not bar his way. The loss on either side was heavy, Major-General Ewell being among the Confederate wounded.

Pope, now at Centreville, still hoped to envelop and crush Jackson, but was baffled by the non-arrival of Fitz-John Porter at Manassas Junction, and by the emerging of Longstreet's corps through Thoroughfare Gap, driving off Ricketts' division, which attempted to push it back. Before noon (August 29) Longstreet had come in near Gainesville, on the right of Jackson's hotly-engaged corps at Groveton, and the battle raged furiously till night, when Pope claimed advantage, and expected to crush the enemy next day. But the reinforcements he reasonably expected from McClellan's army did not come up; and Pope, unsupported, was beaten and retreated on Centreville, near which Franklin's corps, 8000 strong, had stood idle all that day (August 30). Here Pope was reinforced by Sumner, as well as by Franklin; and Lee, now in command, did not choose to attack him in front, but sent Jackson to gain his rear again by a flank march to the northward. Gaining Pope's rear, Jackson attacked his flank near Chantilly, where Reno's two divisions and Phil Kearney's confronted him. General Kearney was killed, as was General Isaac I. Stevens, commanding one of Reno's divisions; but Jackson gained no victory. Pope quietly retreated to the Potomac unassailed, and resigned his command, which was given to General McClellan. The Union loss in this brief and bloody campaign was hardly less than 25,000, including 9000 prisoners; the Confederate loss was hardly less than 15,000. Colonels Fletcher Webster (son of Daniel) of Massachusetts, Roberts of Michigan, O'Conner of Wisconsin, Koltes of Pennsylvania, Cantwell of Ohio, and Brown of Indiana, were among the Union killed. Major-General R. C. Schenck was wounded.

General Lee, reinforced from Richmond by D. H. Hill's fresh division, crossed the Potomac, unopposed, opposite Leesburg, and advanced to Frederick, whence he issued (September 8) an address to the people of Maryland, implying that he came as a liberator, but obtained few recruits. Intent on capturing a Union force of 12,000 men holding Harper's Ferry, he divided his army. McClellan followed Lee's right wing, moving west towards Hagerstown, overtaking it at Turner's Gap of South Mountain, and driving it westward, after a fight (September 14) in which he lost 1568 men and took 1500 prisoners. Franklin simultaneously cleared Crampton's Gap on the left. Harper's Ferry was surrounded by the Confederates in great force under Stonewall Jackson, and after a brief cannonade was surrendered (September 15) by General D. S. Miles, who was killed by a ball just as he had raised the white flag. Colonel Davis had escaped with 2000 cavalry during the night, but 11,583 men and seventy-three guns were the trophies of this triumph.

Lee rapidly concentrated his army around Sharpsburg, along a ridge facing Antietam Creek. McClellan soon confronted and attacked him (September 17), and a bloody, determined battle was fought there between 87,000 Unionists and 70,000 Confederates, of whom but 40,000 were in position at the outset. McClellan's loss was 2010 killed, 9416 wounded, and 1043 missing; total, 12,469; Lee's, 1842 killed (including Generals Branch of North Carolina, Starke of Mississippi, and G. B. Anderson of Georgia), 9399 wounded, and 2292 missing; total, 13,533. That was the bloodiest day America has known. Many regiments lost more than half their men. It was in one sense a drawn battle, yet when McClellan, after a day's rest, advanced to renew it, he found that Lee had recrossed the Potomac into Virginia. An irresolute attempt by General Porter to follow was repulsed by Lee's artillery, with a Union loss of 200 prisoners. Lee retreated at leisure by Bunker Hill and Winchester, while Stuart, with 1500 cavalry, made a raid to Chambersburg, Pennsylvania, where he paroled 275 sick and wounded Unionists and destroyed valuable stores, passing around McClellan's army and recrossing the Potomac below Harper's Ferry. McClellan, facing Lee, had moved down to Warrenton, Virginia, where he was relieved of his command (November 7). General Burnside succeeded him, and, still moving to the left as Lee faced him, at length threw a bridge across the Rappahannock at Fredericksburg, and assailed (December 13) Lee's army, holding the heights south of that river, attempting also to flank his right; but the attack in front, 60,000 strong, led by Hooker and Sumner, was repulsed with great slaughter, while that by 40,000 men under Franklin, in flank, was unsuccessful. The Union loss in this disastrous affair was 1152 (including Major-General G. D. Bayard) killed, 9101 wounded, and 3234 missing; total, 13,771. The Confederate loss was about 5000, including General Maxcy Gregg (just chosen governor of South Carolina) and General T. R. R. Cobb of Georgia. Burnside purposed to renew the attack next day, but was dissuaded, and recrossed the Rappahannock unassailed during the night of the 15th–16th. Burnside attempted (January 20, 1863) to cross the Rappahannock by fords above Fredericksburg, but was baffled by a terrible storm, and desisted. Eight days later he was relieved from the command.

General Halleck had taken command of Grant's and Buell's combined forces, now swelled to 100,000 men, directly after the battle of Pittsburg Landing, and by slow and regular approaches had forced Beauregard to retreat with little loss from his fortified position at Corinth. Beauregard was pursued by Pope as far as Baldwin and Guntown, Mississippi, but to little purpose. Meantime, General O. M. Mitchell, with a division of Buell's army, had struck eastward up the Tennessee, occupying Huntsville, Bridgeport, Tuscumbia, etc., and making considerable captures of munitions, railroad cars, etc., with little loss. An attempt on Chattanooga under General Negley was repulsed by Kirby Smith. Subsequent to this the war in that quarter languished under Buell's command, while daring raids were made in all directions by Confederate guerillas and cavalry under Generals N. B. Forrest and John Morgan. Clarksville (Tennessee), Henderson, and Cynthiana (Kentucky) were among the towns thus pounced upon, while at Murfreesboro', Tennessee, Forrest captured some 1500 Union troops. The general result of these partisan conflicts was adverse to the Union cause.

General Bragg, having succeeded Beauregard in chief command in this quarter, advanced in June with 45,000 men from the heart of Mississippi into Tennessee, crossing the Tennessee just below Chattanooga, and striking boldly northward through a rugged, mountainous, thinly-peopled region. At Richmond, Kentucky, his advance, under Kirby Smith, fought (August 29) and routed in detail a Union division under General M. D. Manson of Indiana, who was taken prisoner with nearly 5000 of his men. Smith boasted that his prisoners equaled in number his entire force. Smith entered Lexington in triumph. Munfordsville, Kentucky, was captured (September 16) by Bragg, who claimed 4000 prisoners. Thence Bragg advanced unopposed through Bardstown to Frankfort, where he inaugurated (October 1) Richard Haines as Confederate governor of Kentucky. Cincinnati, in great alarm, fortified the Kentucky approaches to the Ohio, and Louisville seemed in imminent peril.

General Buell, leaving Nashville strongly garrisoned, had of late been marching northward on Bragg's left with an army finally swelled by raw levies to 100,000, or at least twice the number of Bragg's much better disciplined force. Still, Buell hesitated to attack, distrusting the effectiveness of his men, but at length moved (October 1) from Louisville to Bardstown and Springfield; Bragg retiring and concentrating before him. Moving thence on Harrodsburg, his left was struck (October 9) near Perryville by five divisions of Bragg's army under General L. Polk, which outnumbered and drove the inferior force directly opposed to it, killing Major-General James S. Jackson, a Kentucky member of Congress. The fight was maintained from 2 P. M. till dark, with advantage at last on the Union side, but Buell's total loss this day was 4348, and Bragg's but 2500. Buell had 58,000 men under his command, but not half of them were engaged, as he did not know his left wing was in action until 4 P. M. Advancing at sunrise next morning to renew the battle, he learned that Bragg had decamped, and he did not stop till he was behind the Cumberland Mountains in East Tennessee.

General Grant, left in command of West Tennessee, with Rosecrans in Northern Mississippi, the two attempted a combined movement on General Stirling Price at Iuka, Mississippi. Rosecrans alone attacked (September 19), but Price held his ground firmly, abandoning it during the ensuing night. His loss was at least 1000; Rosecrans' was 782. Price retreated to Ripley, Mississippi, where he was succeeded by Van Dorn, who now, with at least 30,000 men, undertook to drive or capture Rosecrans and his 20,000, holding the former Confederate fortifications at Corinth. One of the great charges of the war was made by Price, but failed, because Van Dorn was seven minutes too late on his side. The rebel loss in this repulse was at least 5000, including 1423 killed and 2248 prisoners. On the Union side 315 were killed, including General P. A. Hackleman of Indiana, 1812 wounded, and 232 missing; total, 2359. Van Dorn and Price retreated precipitately.

General Rosecrans was hereupon given command of the Army of the Ohio (renamed the Army of the Cumberland), in place of General Buell. He had 65,000 effective men, mainly clustered around Bowling Green, Kentucky, whence he soon transferred his head-quarters to Nashville, and prepared to advance. Meantime, the brigade of Colonel A. B. Moore of Illinois, at Hartsville, nearly 2000 strong, was surprised and captured by John Morgan with 1500 cavalry.

Rosecrans, with 46,910 men in three divisions, led by Generals Thomas, McCook, and Crittenden, left Nashville December 26, advancing slowly, with some desultory fighting, to Stone River, opposite Murfreesboro', where his right under McCook was surprised and crushed by Hardee at 7 A. M., December 31st; McCook losing twenty-eight guns and nearly half his men. But when Rosecrans' centre was assailed in turn by the triumphant Confederates, his firmness and soldiership, with those of General Thomas, saved the day. Heavy fighting continued throughout the day, with little to boast of on either side since McCook's disaster. But the Confederates had assailed him at all points without success, losing heavily, having been so roughly handled that they did not care to try again. Next day (January 1, 1863) there was a little desultory fighting, mainly at long range. On the day following (January 2) a heavy cannonade was begun by the Confederates, and replied to with spirit; and at 3 P. M. a great charge was made on the Union left by Breckenridge's corps, aided by a heavy enfilading fire from Polk's artillery, but was repulsed after a bloody struggle by the divisions of Negley and Jefferson C. Davis, supporting the fire of Crittenden's batteries, and charging in turn. The Confederates lost four guns and some prisoners, and were pursued across Stone River, where the victors intrenched and rested for the night. The next day passed with little fighting. Bragg at 11 P. M. began to evacuate Murfreesboro', where Rosecrans, on advancing next morning, found only the desperately wounded. Rosecrans reported his losses in this protracted struggle at 1533 killed, 7245 wounded, and 2800 prisoners; total, 11,578 out of 43,400. Bragg reported his loss at over 10,000, including 9000 killed and wounded, out of 35,000. Cavalry raids by Forrest in West Tennessee, John Morgan in the heart of Kentucky, and Wheeler on the Cumberland, were made this winter to little purpose. Colonel A. D. Streight of Indiana was sent by Rosecrans (April 10) with 1800 cavalry to operate on Bragg's rear, but was surrounded near Rome, Georgia, by Forrest and Reddy, and compelled to surrender. Sundry minor conflicts in this quarter inflicted in the aggregate about equal losses on either belligerent.

Commodore Foote had triumphantly swept down the Mississippi from Cairo to Vicksburg, co-operating with General Pope on the Missouri and General W. T. Sherman on the Kentucky side. Columbus, Kentucky, was abandoned on his approach; New Madrid, Missouri, and Island No. 10 in the Mississippi, were successively taken by Pope, compelling General Makall to surrender 123 guns and 6700 men; then Forts Pillow and Randolph, which opened the river to Memphis, where a Confederate fleet of steamboats undertook to bar the way, but was soon demolished (June 4), when Memphis was quietly surrendered. An expedition thence up White River, to open communications with General Curtis, did not find him, but lost the steamboat Mound City, with 150 men, by a ball through her boiler in an attack on St. Charles, which was taken. Commodore Davis steamed down to Vicksburg, and communicated with Farragut below it from New Orleans; but a combined naval attack (July 1) on that stronghold was repulsed, and the siege raised July 24.

General Grant, now at Jackson, Tennessee, after the battles at Iuka and Corinth had his department enlarged so as to include Mississippi, while 11,500 men were sent him under McPherson. He had advanced as far as Oxford, Mississippi, on the way to Vicksburg, when Van Dorn struck (December 20) with cavalry at Holly Springs in his rear, where Grant's stores were awaiting a further reopening of the railroad. The place was occupied by Colonel R. C. Murphy of Wisconsin, who surrendered nearly 2000 men, nearly half of them in hospital. Grant at once cashiered Murphy in a stinging order, but meantime his stores, worth $4,000,000, had been destroyed or carried off, and he was compelled to turn back into Tennessee.

General W. T. Sherman, with 30,000 men, left Memphis on steamboats December 21, and fell down the Mississippi to co-operate in the reduction of Vicksburg. Ascending the Yazoo, he made (December 22) a resolute attack on the rebel batteries commanding Chickasaw Bayou, but the ground was difficult, the banks strong and well manned, and he was repulsed with a loss of 2000, while General Pemberton reports the Confederate loss at 267.

General John A. McClernand now superseded General Sherman, and at once resolved on the reduction of Fort Hindman (known as Arkansas Post), 50 miles up the Arkansas River. His force was so large, and his dispositions so well made, that his first assault compelled its surrender, with 5000 prisoners and seventeen guns. The Union loss in the assault was 977. General Grant arrived from Memphis and assumed chief command February 2, 1863.

Attempts to cut a channel across the narrow isthmus opposite Vicksburg on which the Union army was encamped proved failures, and a boat-expedition under General L. F. Ross from the Mississippi, through Yazoo Pass, into the Coldwater and Tallahatchie Rivers, was stopped and turned back by Confederate works at the head of the Yazoo, returning to the Mississippi unmolested; and one or more kindred attempts to circumvent the defences of Vicksburg were likewise baffled. At length General Grant decided to gain their rear by the south rather than the north, and, defying high water and other impediments, marched his army 70 miles to Hard Times, nearly opposite Grand Gulf. Commodore Porter, commanding the Union fleet above Vicksburg, ran the batteries of that city with eight gunboats and eight barges, whereof but two were destroyed by their fire, the rest appearing before Grand Gulf in season to bombard its defences, but to no purpose. Grant thereupon crossed (April 30) at Bruinsburg, some miles below, and, taking them in reverse, easily took possession of Port Gibson and Grand Gulf, defeating General Bowen, who had been sent from Vicksburg to resist him, with a loss of nearly 1000 on each side. Moving up the Big Black, General Grant's advance easily crushed at Raymond two rebel brigades under Gregg; Union loss, 443; Confederate, 723. Advancing to Jackson, the capital of the State, McPherson was there resisted by General W. H. T. Walker, who was promptly defeated, with a Confederate loss of 845 to 265 Union. Here seventeen guns were taken and much material destroyed.

By this time General Jos. Johnston had arrived with reinforcements, and assumed chief command of the Confederates, directing Pemberton to join him with the defenders of Vicksburg. Grant of course moved rapidly westward to bar such junction, and at Champion Hills encountered (May 16) Pemberton, who attempted too late to move northward and join Johnston, but was compelled to fight thrice his force, and was beaten with a loss of General Tilghman among the killed, 2000 prisoners, and fifteen guns. General Loring's division was cut off from Pemberton's, and escaped southward to Jackson. At the crossing of the Big Black, Pemberton fought again, but was soon put to flight, with a loss of eighteen guns and 1500 prisoners. Pemberton, with whatever he still had left, fled into Vicksburg, necessarily abandoning his strong defences on the Yazoo, with a number of heavy guns. The Confederate navy-yard and hospital at Yazoo City, with 1500 sick and wounded, were among the fruits of these successes. Grant followed Pemberton closely, and tried to carry his stronghold by assault, but was repulsed with heavy loss. He then sat down to patient sapping and mining, fortifying his rear against Johnston, who was threatening him from Clinton and Jackson, and worked away until Pemberton was starved into a surrender (July 3), having still 1500 men fit for duty, besides 10,000 in hospitals. Grant reports his total loss from his landing at Bruinsburg to his triumphant entry (July 4) into Vicksburg at 943 killed, 7095 wounded, and 537 missing; total, 8515, of whom 4236 fell before Vicksburg; and claims 37,000 prisoners, of whom a large part were sick or wounded, with arms and munitions for 60,000 men. Among the Confederates killed were Generals Tracy, Tilghman, and Green. Grant now turned, with a force raised to 50,000, upon Johnston, who had but 24,000, pushed him back to Jackson, and there besieged him, with a loss of 600 on either side, until he decided to decamp, retreating by Brandon to Morton.

During these momentous operations Colonel B. H. Grierson, with 1700 cavalry, raided northward from Lagrange, Tennessee, through Pontotoc, by Jackson and Natchez, to the Mississippi at Baton Rouge, taking 500 prisoners and 3000 small arms, having traversed 600 miles of mainly horrible roads in sixteen days, losing but twenty-seven men. Milliken's Bend, on the Mississippi, held by General E. A. Dennis with 1400 men, was attacked by the Confederate general Henry McCulloch with a superior force, which was repelled with a loss of some 500 to either side. Helena, Arkansas, held by General B. M. Prentiss with 4000 men, was likewise attacked (June 30) by the Confederate general Holmes with 7646, losing 1636, whereof 1000 were captured. Helena was thereafter let alone.

General Banks, commanding at New Orleans, found Galveston already surrendered (October 8, 1862), without resistance, to a Union fleet of four gunboats, and thence quietly held till he sent down a regiment, of which part was debarked (December 28), when General Magruder, just appointed to command in Texas, organized a fleet of mercantile steamers, shielded by cotton-bales and manned in good part by volunteers, with which he came down the bayou in the night (December 31) and boldly attacked the Union fleet in the harbor, captured the Harriet Lane, sunk the Westfield, and compelled the troops ashore to surrender. And the Confederate corsair Alabama, arriving off the bar soon after, silenced and took the Union gunboat Hatteras, Captain Blake, which sunk six minutes afterwards. Major

O. M. Watkins, blockading the mouth of the Sabine with two gunboats, was attacked by two Confederate gunboats from up-river, and easily captured.

General Banks had 30,000 men, which sickness, desertion, and detachments soon reduced to 14,000. Having pushed these westward, so as to clear the country of all enemies to the Atchafalaya by an easy fight at Carney's Bridge, he at once returned and laid siege to Port Hudson on the Mississippi, where the Confederates had established batteries to dispute the passage of the river. Commodore Farragut, with four frigates and five gunboats, passed the batteries, losing one of his best vessels in so doing. Banks, deeming the garrison too strong to be successfully assaulted by his force, again moved westward to Alexandria, driving General R. Taylor and taking 2000 prisoners, several steamboats, and twenty two guns. Again Banks returned to the Mississippi at Port Hudson, which he invested and soon tried to carry by assault, but was beaten off with a loss of 2000 against 300. He now besieged in due form, and at length made (June 14) a second assault, which likewise failed. But no relieving army appeared, supplies were very short, and the garrison were on short allowance, with little to eat left, when a tremendous salute from the investing Union batteries and gunboats gave notice (July 6) that Vicksburg had fallen. Upon being convinced of this fact, General Gardener surrendered the fort with its garrison of 6408 men, of whom many were sick or wounded. Banks's effective force was that day about 10,000; his total captures during the campaign, 10,584 men, seventy-three guns, and 6000 small arms.

Brashear City, on the Atchafalaya, was surprised and captured by the Confederate general R. Taylor (June 22), with a Union loss of 1000 men and ten guns. The Union camp of General Dudley near Donaldsonville was in like manner surprised (July 12) by 1200 Texans, and 300 prisoners taken. Banks returned to New Orleans, and sent General Franklin with a fleet and 4000 men to take the fort at Sabine Pass; but the naval attack was repulsed with a loss of two gunboats, fifteen guns, and 250 men, which exceeded the whole number opposed to them.

General Banks pushed out a part of his command, under General C. C. Washburne, to Opelousas, to make his own movement on Texas. On his retreat to the Teche, General Washburne's right was attacked (November 1) by General R. Taylor, and roughly handled, the Sixty-seventh Indiana being captured entire. Reinforcements being brought up, Taylor drew off, having inflicted a loss of 716, and suffered but 125.

General Banks, with 6000 men, steamed from New Orleans to the Rio Grande, thence capturing Brazos Santiago, Brownsville, Aransas Pass, Fort Esperanza (commanding Matagorda Bay) with little opposition and hardly any loss, there being no considerable force to oppose him. He then returned to New Orleans, leaving General N. J. T. Dana in command, but the latter found no hostile force in that part of Texas, and accomplished very little.

When the spring of 1864 had fairly opened, General A. J. Smith's corps from Sherman's army, supported by Commodore Porter with a powerful steam-fleet, advanced up Red River, menacing Shreveport, while General Steele was to co-operate by a movement from Little Rock, which had been taken by an advance with 12,000 men from Helena six months before. General Price, who was in command there, was far outnumbered and easily routed. He burned six steamboats and some stores, falling back to the vicinity of Red River. Steele lost but 100 killed and wounded in this advance, and took 1000 prisoners.

Banks's advance, which should have passed Alexandria before March 1st, only reached that point on the 16th, and he was not ready to advance farther till about April 1st, at which time the river was rapidly falling, and barely navigable for gunboats. By this time his 40,000 men had been reduced by details and sickness to 20,000, whereof the van had reached Sabine Cross-roads, near Mansfield, when, as it moved carelessly through a pine-woods region, it was attacked in great force, outflanked and routed, and an attempt to re-form was baffled by the presence of a supply-train which should have been elsewhere. Retreating, or rather fleeing, three miles to Pleasant Grove, the routed van re-formed upon General Emory's division, and was again charged heedlong by the flushed Confederates, and brisk fighting ensued, in which the Confederate general Mouton was killed. Every attack was repulsed, and darkness closed the combat. General Banks retreated during the night fifteen miles to Pleasant Hill, where General Smith's corps was awaiting him, raising his entire force to 15,000. At 11 A. M. the Confederates appeared, and skirmished continuously till 4 P. M., when they made a grand attack, and were again beaten off, losing 400 prisoners. General M. Parsons (Confederate) and Colonel Lewis Benedict (Union) were among the killed. Banks's loss in these fights was 3969, mainly taken prisoners at the first collision. Though successful in the last struggle, he did not again advance, but marched to the Red River at Grand Grove, thence convoying the fleet, which was often hard aground, back to Alexandria. His rear and his vessels were repeatedly and sharply assailed; in one attack, General Thomas Green of Texas was killed. The Eastport, one of the gunboats, being hard aground, was blown up. The rest of the fleet was saved, and taken down to the Mississippi, passing Alexandria with great difficulty by the help of dams. Having now to spare A. J. Smith's corps, Banks continued his retreat, forced to fight and push aside General Bee with 8000 men, with a loss of 250 on either side. One steamboat was burned and three captured by Confederates near Dunn's Bayou, 30 miles below Alexandria, some 500 Unionists being made prisoners. Part of them were retaken in repulsing (May 6) a Confederate attack on Banks's advance near Mansura, and an attack on his rear (May 19) at Yellow Bayou on the Atchafalaya.

General Steele's advance from Little Rock to co-operate with Banks was, by the retreat of the latter, exposed to great peril. The Confederates under General Fagan turned upon him in great force, drove in or captured his foraging parties, and at length struck his advance a heavy blow (April 25) at Marks's Mill, taking some 1500 prisoners. Steele thereupon retreated, and was attacked (April 30) by Kirby Smith at Jenkins's Ferry on the Sabine; but the Unionists, though inferior in numbers, had the advantage in position, and repulsed their assailants after a sharp contest, in which the Union loss was 700; the Confederate, 2300, including three generals. Steele's retreat to Little Rock was thenceforth unmolested. Several spirited contests were afterwards had in different parts of Arkansas with varying results, but the north-eastern half of its area was generally held by the Unionists, the other half by the Confederates nearly to the last.

In 1864, General Rosecrans being now in command in Missouri, General Price entered it from Batesville, Arkansas, first resisted at Pilot Knob by General Hugh S. Ewing, who held his post throughout a day's fighting, and then retreated. Price advanced to Jefferson City, but, finding it too strong to attack, pushed westward to Lexington, and thence to the Little Blue, sharply followed by General Pleasanton with a superior force, and overtaken at the Big Blue, where he made a stand, but was soon driven westward. Sharply pursued, Price was again overtaken at the Little Osage, where he was again routed with the loss of eight guns and 1000 prisoners, including Major-General Marmaduke, a brigadier, and five colonels. The residue were chased to Fayetteville, Arkansas, but without much fighting.

General Hooker, on succeeding to the command of the Army of the Potomac, had found it exceedingly demoralized by its disaster at Fredericksburg, the desertions averaging 200 per day. After devoting two months to reorganising and reinspiring it, during which its force had been gradually raised to 100,000 infantry, 13,000 cavalry, and 10,000 artillery, he judged himself ready to assume the offensive. Despatching most of his cavalry under Stoneman to destroy railroads, dépôts, etc. in Lee's rear, his van forded the Rappahannock at Kelly's Ford, above Fredericksburg, advancing rapidly to Chancellorsville, where he established his head-quarters and paused. General Anderson, who had been watching the fords, being too weak to resist, fell back quietly before him to within five miles of Fredericksburg, where Lee met him with two divisions. Meanwhile, Stonewall Jackson with two more moved rapidly from Lee's right below Fredericksburg, and passed silently around Hooker's right, several miles west of Chancellorsville. Suddenly, just before sunset (May 2), Howard's corps, holding the Union right, was struck in flank and rear while ignorant of danger, and in part at supper with arms stacked, by Stonewall Jackson's corps, 25,000 strong, which burst from the thick woods of that region and literally demolished it. Ten minutes after the first shot its men were rushing in wild consternation towards Chancellorsville and the river beyond; thousands of them were unarmed, while very many of them were made prisoners. Two or three regiments were sacrificed in unsuccessful attempts to stay Jackson's impetuous rush. Finally, General Pleasanton got his battery of horse artillery into position, and arrested the advance by murderous discharges of grape at short range. Here fell Stonewall Jackson, mortally wounded: it was said by a volley from some of his own men. It was dark, and they were in the woods; all that is certain is that he died of his wounds eight days afterwards. The flight was here stopped, and some of the lost ground regained, but the Eleventh corps was temporarily extinct; so Hooker drew back his right towards Chancellorsville.

The Confederates next morning followed up their decided success by charge after charge in great force on General Sickles's corps, now holding the Union right, and caused it

to give some ground during the day. The carnage of that day was frightful, Sickles having 4000 out of 18,000 killed or wounded. Hooker had been stunned by a cannon-ball striking a pillar of the Chancellorsville House against which he leaned, and hence failed to support Sickles when support was needed.

Sedgwick, with 22,000 men, had been left in front of Fredericksburg. He crossed the river early this morning, just below that city, and was reinforced by Gibbon, who crossed on a pontoon bridge, raising his troops to 30,000. By noon he had stormed and carried Maryo's Heights, taking some guns and prisoners, thence pushing out four miles to Salem Church. But this brought him full upon Lee's army, which, having crossed to assail Hooker, now turned upon him, fighting him till darkness interposed. Next morning (May 4) Hooker remained passive, and Sedgwick, finding himself overpowered, retreated across Banks's Ford, having lost nearly 5000 men. Lee might now have turned in full force upon Hooker, but his men had been overworked, and he hesitated. Hooker recrossed the Rappahannock unassailed during the ensuing night, claiming that he brought back one more gun than he took over, and that he had inflicted greater loss than he suffered, though his own (including Sedgwick's) was no less than 17,197 men. Lee's loss must have been heavy, but was not made public. Stoneman's cavalry returned May 8, having inflicted little loss and suffered little.

Lee soon after recalled Longstreet from a fruitless demonstration against Suffolk, Virginia, and while Hooker was planning to flank him by crossing the Rappahannock below Fredericksburg, was himself executing a more extensive and daring flank movement by Culpeper Court-house and Sperryville into the Shenandoah Valley, and down that across the Potomac. This movement was first fully developed to Hooker by an advance in great force under General Early on Winchester, held by General Milroy of Indiana, who evacuated it when too late, and lost twenty-nine guns and 4000 men in his hurried flight across the Potomac. Ewell pursued unresisted to Chambersburg, Pennsylvania, which Jenkins, with his cavalry, had reached some days before (June 17). Early's division of Ewell's corps moved forward to York, Pennsylvania, while Johnson's division pressed northward to Carlisle, and Imboden's brigade swept the valley of the Potomac westward to Cumberland, Maryland. By June 25th all of Lee's army had forded the Potomac, and was advancing into Pennsylvania. Ewell's van reached Kingston, but 13 miles from Harrisburg. As counted by two Unionists as it passed through Hagerstown, Lee had 91,000 infantry, 280 guns and 6000 cavalry, while 5000 cavalry under Stuart entered Pennsylvania without traversing Hagerstown.

General Hooker had waited long below and around Washington, incredulous that Lee would invade the free States. At length he too crossed the Potomac with 100,000 men, of whom 15,000 were spared him from the defences of Washington. He wished to draw 10,000 more from Maryland Heights, opposite Harper's Ferry, but was forbidden to do so by General Halleck. Hooker thereupon asked (by telegraph) to be relieved from the command, and was promptly directed by Halleck to turn it over to General Meade, which he did, and was no more seen in the Army of the Potomac.

A cavalry fight (June 28), inaugurated by Stuart and repelled by Kilpatrick, was the first notice that the two great armies were nearing each other. They casually encountered near Gettysburg, Pennsylvania, where General Buford's division of Unionists met the Confederate van under Heth, and drove it back upon its corps (Hill's), by which they were driven in turn. The sound of guns brought up General Wadsworth's division of Reynolds' (First) corps, Reynolds himself going forward to reconnoitre, and being shot dead as he did so. General Doubleday assumed command, but his force, being too weak, was driven back, capturing 800 prisoners as they retreated. Doubleday halted on Seminary Ridge, just west of the village, where the residue of Reynolds' and all the Eleventh corps soon came up, Howard assuming command. Ewell's (Confederate) corps next came up from York, and again gave the ascendency to their side, driving the Unionists through Gettysburg, with the loss of their wounded in hospital and several guns. Howard took position on Cemetery Hill, just south of the village, and despatched couriers to Meade and Sickles for aid. Sickles was at Emmittsburg, ten miles away, but hastened to the scene of conflict; Meade, who was at Taneytown, expecting and preparing to fight on Pike Creek, sent Hancock at once to take command at Gettysburg, directing his corps under Gibbon to follow. Slocum arrived at 7 P. M., and took command, Hancock returning to report to Meade. Before morning (July 2) each army had been concentrated around Gettysburg, save that Sedgwick's (Sixth) corps, which was 30 miles distant at 7 P. M., did not arrive until 2 P. M. of that eventful day. One hour later, Sickles, who held an advanced position on the Union left, was attacked in overwhelming force by Longstreet just as he was about to recede, and was crushed back with heavy loss, losing a leg by a cannon-shot. Meantime, Sykes's (Fifth) corps had seized Round Top, the highest point on that wing, and firmly held it. Hancock rushed to Sickles's relief, and Longstreet's advance was arrested, but he held the ground from which Sickles had been driven. Ewell also had assailed and driven the weakened Union right, and the second day's fighting closed with the advantage still on the side of the Confederates.

The third day (July 3) opened with an advance of the Union right under Slocum, who had now been rejoined by a division sent over the day before to support the imperilled left. Slocum retook the ground he had lost, and rested upon it. Then there was a lull of an hour or more.

At 1 P. M. the roar of 115 heavy guns from Hill's and Longstreet's front, crossing their fire over the Union centre at Cemetery Hill, announced the crisis of the struggle. For two hours they ploughed the Union lines, being less effectively replied to by the less numerous Union artillery. At length the Union guns stopped firing in order to cool their pieces, and now the grand Confederate column of assault emerged from behind their suddenly silent batteries and pressed swiftly towards the Union lines. Pickett's and Heth's (now Pettigrew's) divisions led, charging up to the mouths of the Union guns, but were repulsed with terrible carnage. Pettigrew's brigade, having lost 2000 out of 2800 men, retreated under the command of a major. When the remnant regained their own lines the battle of Gettysburg had been lost and won, though a charge was afterwards made by Crawford's division of Sykes's corps on the Union left, capturing a battery with 260 men, and retaking 7000 small arms, with Sickles's wounded, who had lain for twenty-four summer hours unguarded within the Confederate lines.

General Meade reports his total loss in these three bloody days at 2834 killed, 13,709 wounded, and 6643 missing (mainly taken prisoners on the 1st). He claims as trophies three guns, 24,978 small arms, and 13,621 prisoners, including wounded. He estimates the Confederate loss as much greater, which is probable, as about 7000 of them were buried at Gettysburg, with 4000 Unionists. Among the Confederate killed or mortally wounded were Generals Pender, Barksdale, Garnett, Armistead, and Semmes. Had Meade known how badly the Confederates were beaten, he might probably have crushed them; but he doubted and hesitated while Lee retreated to the Potomac, sorely annoyed by the way. Lee says his rear remained near Gettysburg till after daylight of the 5th. He might have been assailed at the Potomac, as his bridge had been burned by General French in his absence, and the river was swollen by heavy rains; yet he rebuilt his bridge, and crossed (July 12–13) his infantry and guns without loss; but a cavalry charge by General Kilpatrick on his rear-guard drove it across with a loss of 125 killed (including General Pettigrew) and 1500 prisoners. Lee retreated the length of the Shenandoah, and resumed his position behind the Rappahannock, General Meade following and facing him on the north bank.

General Keyes, with 3000 men, was ordered from Fortress Monroe to capture Richmond during Lee's absence in the North, but though few troops had been left to defend it, he desisted without a serious effort.

A series of partisan affairs ensued on either bank of the Rappahannock, the most important of which was the capture by storm of Rappahannock Station with 1000 men by the Union brigades under General David A. Russell. The Confederate rifle-pits at Kelly's Ford were in like manner taken, with 400 prisoners.

Meade, aware that Longstreet had been detached for service in Georgia and Tennessee, now advanced to attack Lee's depleted army at Mine Run, but finally concluding that its position was too strong, desisted and retreated across the Rapidan, and thus closed the campaign of the Army of the Potomac in 1863.

General Morgan made a fresh raid clear through Kentucky, striking and crossing the Ohio (July 7) at Brandenburg, 40 miles below Louisville, with a mounted force said to number 4000. He then made his way through Indiana and Southern Ohio to Buffing Island, not far below Parkersburg, but found the river patrolled by armed steamboats, while a considerable land force was pressing in his rear. Ultimately, less than 400 of his men escaped; all the rest were made prisoners with little fighting. Morgan himself was taken prisoner and confined in the State prison at Columbus, Ohio, whence he escaped and regained the Confederate lines, but was surprised and shot in East Tennessee not long afterwards.

General Burnside had been sent from the East to the Ohio, taking his (Ninth) corps with him. Having despatched a

cavalry force under Colonel H. S. Saunders across the Cumberland Mountains to burn railroad bridges and destroy stores, in which it was quite successful with little loss. he crossed those mountains with 20,000 men, and suddenly appeared (September 3) at Knoxville, where he was hailed by the long-suffering Unionists as a deliverer. He next moved on Cumberland Gap, where he captured General Frazier with fourteen guns and 2000 men. But his activity was here arrested by the reverse encountered by Rosecrans at Chickamauga.

Rosecrans had stood idle at Murfreesboro' since January 1, 1863, awaiting reinforcements and supplies, till June 24, when he advanced, taking three guns and 500 prisoners at Shelbyville, and soon cleared all Middle Tennessee of armed Confederates: Bragg retreated before him with little loss. Crossing the Tennessee at several points, Rosecrans compelled him to evacuate Chattanooga without fighting, retreating down the railroad that led into Georgia. Rosecrans, misled by his easy success, was pursuing in hot haste, when Bragg, having been reinforced by Longstreet's corps from Virginia, turned suddenly on his widely-scattered divisions, compelling him to concentrate hastily behind the Chickamauga Creek. He had 55,000 men: Bragg had scarcely more, and the first day's fighting (September 19) was indecisive. Next morning, Rosecrans' right, while attempting to close down on his centre, was struck heavily by Longstreet and torn to fragments, the *débris* flying in impotent dismay to Chattanooga, and sweeping Rosecrans along with it. But General Thomas, farther to the left, stood firm, gaining ground somewhat, but maintaining a bold front, and, resting on a wooded ridge, repulsed all attacks until night closed the bloody encounter, when the Confederates drew off, and Thomas stood still through the following day (September 21). At night, still unassailed, he retired to the position assigned him by Rosecrans in front of Chattanooga.

The Union loss in this bloody, protracted struggle was 1644 killed (including General W. H. Lytle of Ohio), 9262 wounded, 4945 missing; total, 15,581. Bragg's admitted loss was 18,000, but he claims to have taken 8000 prisoners (including wounded) and fifty-one guns. But he failed to take Chattanooga, which Rosecrans firmly held, though suffering badly for forage, owing to the barring in of the Tennessee River below him and the raids of Wheeler's Confederate cavalry on the trains coming to supply his rear, until he was directed to turn over his command to General Thomas.

General Longstreet, with his corps, was now detached from Bragg's army, and sent to drive Burnside out of East Tennessee. Longstreet drove the Union forces west of Knoxville, but here Burnside was found too strong, and an assault made (November 28) on an outpost known as Fort Sanders was repulsed with a loss of 800 Confederates, including two colonels killed. The Union loss was but 100. Longstreet thereupon raised the siege, and returned to the army of Virginia.

General Grant succeeded to the command of Rosecrans' army, while Sherman was ordered from Vicksburg still further to reinforce it, General Hooker having already been sent in haste with the Eleventh and Twelfth corps from the Army of the Potomac. Meantime, Wheeler had burned a supply-train of 1000 wagons in the Sequatchie Valley, and another at McMinnville, fighting several cavalry commands sent against him, burning many railroad bridges, and escaping into Alabama with but little loss.

Grant found Hooker at Bridgeport, below Chattanooga, and directed him to clear the river, so that supplies could reach the hungry army around Chattanooga. Hooker crossed the Tennessee unmolested, and advanced to Wauhatchie, overlooked by Law's division from Lookout Mountain. At 1 A. M., October 29, Geary, in Hooker's front, was attacked with great impetuosity, but easily beat off his assailants, with a loss of about 400 on each side.

Sherman arrived November 15, soon followed by his army, which was diverted to Grant's left, up the Tennessee. All being at length ready, Grant advanced against Bragg, who was still looking down into Chattanooga from the west of Lookout Mountain. General Grant's Fourth corps first moved out (November 22), directly in front of Chattanooga, seizing the Confederate outposts before they could be supported, and taking 200 prisoners: then Hooker's command, during a heavy mist, mounted (November 24) the south and west sides of Lookout Mountain, climbing, fighting, and at length entrenching themselves on the ground they had won. Meantime, Sherman crossed the Tennessee in his front, and having firmly intrenched himself, assaulted the north end of Mission Ridge, Thomas's cavalry raiding and burning stores in Bragg's rear, while his infantry felt their way up the river till they clasped hands with Sherman's left; and now Hooker crossed the Chattanooga Valley from Lookout Mountain to Mission Ridge, pushing the enemy before him and taking 2000 prisoners. Meanwhile, Sherman, stubbornly opposed, was making little progress on the left, until Grant at 2 P. M. gave Hooker orders to advance in the centre. His men obeyed with alacrity, charging right up the long, steep ascent, and reaching the west on six points at once, when the Confederates were seized with panic and fled, abandoning forty guns and losing many prisoners. Darkness alone prevented the destruction of the beaten army, which retreated rapidly to Dalton, Georgia, Cleburne in their rear repulsing with ease an attempt to drive his men through a narrow gap in White Oak Ridge, inflicting a loss of 439 to 130. Pursuit was maintained to Ringgold, Georgia.

General Grant states his losses in the above battles at 757 killed, 4529 wounded, and 330 missing; total, 5616; and claims 6142 prisoners. The Confederate loss in killed and wounded was undoubtedly the smaller.

Charleston, South Carolina, and the railroad connecting it with Savannah, Georgia, were often menaced, and sometimes struck at, by the Union forces at Port Royal and the adjacent Sea Islands, but nothing decisive was effected, save the reduction (April 11, 1862), by General Q. A. Gillmore, of Fort Pulaski, commanding the main entrance to Savannah, until Commodore Dupont, having easily taken possession of the islands and most of the coast-towns of Georgia, steamed down to Jacksonville, which, with Pensacola and other Florida ports, were conceded to him without a struggle. Attempting upon his return to Port Royal to advance upon Charleston off Stono Inlet and river, he was stopped by batteries, and an attack (June 16) by General H. G. Wright with 6000 Unionists on Secessionville was repulsed with a loss of 574 men. Several kindred but feebler attempts to reach Charleston were baffled, as was one by Commodore Dupont to reduce Fort McAllister on the Ogeechee. The Confederates made a sally in the dark of rams and gunboats (January 31, 1863) out of Charleston, disabling two of the blockading gunboats and alarming the residue, but taking refuge behind Fort Sumter when daylight appeared. The blockade was not interrupted.

Dupont, with nine iron-clads, next (April 6) bombarded that port at close quarters, but found his way to Charleston impeded by all manner of piles, chains, etc., and was compelled to retire with little loss on either side. The Atlanta, a Confederate gunboat, steaming down from Savannah, was met by the Weehawken, Captain John Rodgers, as she emerged from Wilmington River, and torn to pieces in fifteen minutes. She surrendered four large guns and 165 men.

General Quincy A. Gillmore having succeeded General Hunter in command, and being considerably reinforced, commenced operations by seizing the north end of Morris Island, south of Charleston, and thence besieging Fort Wagner, near its north end, which was regularly assaulted after bombardment July 18, but the storming-party was quickly repulsed with a loss of 1500, including General Strong and Colonels Shaw and Chatfield, killed. The Confederate loss was but 100.

Gillmore, undismayed, next established a battery of great guns on a platform in a marsh west of Morris Island, whence he could shell Charleston, five miles distant. Eleven batteries rained shot and shell on Forts Wagner and Sumter and the batteries on Cummings' Point. Pushing steadily his approaches to Wagner, he had ordered General Terry to assault (September 7), when he found that the Confederates had evacuated both fort and island, leaving eighteen guns in Wagner and seven in Battery Gregg. Next night, Rear-Admiral Dahlgren, now commanding the besieging fleet, sent a large force in row-boats to scale the walls of Fort Sumter, but it was repulsed with a loss of three boats and 200 men.

General Gillmore early in 1864 despatched General Truman Seymour with a fleet and 6000 troops to Florida, where he easily took possession of Jacksonville and Baldwin, capturing valuable stores, but advancing rashly westward to Olustee, he was there suddenly attacked by General Finnegan, and beaten with a loss of 2000 to 730 Confederates. Seymour retreated to Jacksonville, burning $1,000,000 worth of stores.

In North Carolina the Confederate general M. Hoke besieged and captured (April 20, 1865) Plymouth, held by General Wessels with 2000 men. Among the spoils were twenty-five guns, 7000 small arms, and 1600 effective men. Hoke's loss was but 300.

General Grant, having been made (March 1, 1864) lieutenant-general of the Union armies, repaired to Washington and assumed the more immediate direction of the Army of the Potomac, which had been largely reinforced. General Kilpatrick had just led his cavalry on a raid to within six miles of Richmond, whence, after some indecisive fighting, he made his way unharmed to Fortress Monroe. But Colonel Ulric Dahlgren, with 400 of his men, having ad-

vanced by a separate route on Kilpatrick's right, reached Richmond a day later, and striking thence by a more northerly route, was stopped and killed by a regiment of militia at Dabney's Ferry on the Mattapony, his men dispersed, and most of them captured.

General Grant, with Meade's army, crossed the Rapidan unresisted (May 4–5) at Germania and Ely's Fords, striking due south into the Wilderness. Lee, though looking for him at a higher crossing, at once turned to the right, and attacked in full force. The ground, thickly covered for the most part with small trees, and thoroughly familiar to the Confederates, while strange to the Unionists, was especially favorable to the army which must match its superior knowledge and determination against superior numbers. Two days of desperate fighting, with great slaughter and little advantage to either side, were closed at dark on the 6th with a dashing attack on the Union right by General Gordon, who took 4000 prisoners, including General Truman Seymour.

Next morning, General Lee awaiting an attack behind his intrenchments, General Grant put his army in motion southward, and was unmolested save by Stuart's cavalry during his march to Spottsylvania Court-house. He had lost in the Wilderness no less than 20,000 men, including General James S. Wadsworth of New York, killed, and seven generals wounded. General Sedgwick of Connecticut was killed two days afterwards. The Confederate loss was 8000, including Generals Samuel Jones, wounded, Stafford, killed, and A. G. Jenkins, wounded, and Longstreet was disabled for months.

There was heavy fighting around Spottsylvania Court-house for two or three days. On the 11th, at daybreak, Hancock's corps carried by assault a part of the Confederate works, capturing Generals Edward Johnson and George H. Stewart, with 3000 men. General Lee narrowly escaped. Hancock captured thirty guns, but after holding them for hours only brought off twenty of them. But he was unable to advance, and days of desperate fighting, which cost the Unionists at least 20,000 men at this point, proved Lee's position impregnable. Acting on the defensive and behind strong works, his loss was much less than Grant's, but it included Generals Daniels, Perrin, and J. M. Jones, killed.

Grant again moved southward, transferring his right to his left, while his cavalry under Sheridan made a fresh raid towards Richmond, fighting (May 11) and killing General J. E. B. Stuart a few miles north of that city. Crossing the Chickahominy at Meadow Bridge, Sheridan returned with little loss to Grant's army.

General Butler, with 30,000 men, embarking all but his cavalry, moved up the James and occupied City Point, below Richmond. He was to have seized Petersburg, but missed it, General Beauregard being hastily summoned from Charleston to aid D. H. Hill in defending it. Butler even failed to cut the railroad between that city and Richmond, and was rather worsted by Beauregard in a fight near Procter's Creek, which cost the Unionists 4000 and the Confederates 3000 men. Butler was further assailed on several succeeding days, but held his ground with little loss.

General Grant, moving by poorer and more circuitous roads than the direct one held by Lee, on approaching the North Anna (May 17) found his enemy strongly posted, well intrenched, and ready to receive him. There was more fighting here, generally with results favoring the Unionists, but Lee's position could only be stormed at an immense cost of life, and Grant, again moving by his flank, pressed on to Cold Harbor, where he ordered a general assault on the Confederate lines, here, as before, confronting him. Those lines were defended by deep and strong *abatis* of slashed timber, the limbs so intertwisted with each other as to defy speedy untying. The assault was deployed at sunrise (June 3), and in a few minutes was repulsed with great slaughter. The Union loss was 1705 killed, 9072 wounded, and 2406 missing. Generals P. A. Porter, L. O. Morris, and F. F. Wood (all of New York) were among the killed, with six colonels.

General Grant, unable to interpose between Lee's army and Richmond, now decided to pass the James below that city, while Sheridan was sent on a fresh raid around Lee's left, to tear up railroads and burn stores in his rear. Disappointed in his expectation of finding Hunter in possession of Gordonsville, he was soon surrounded by enemies, with whom he fought an indecisive battle at Trevilian's, returning to Grant with 370 prisoners, having lost in all 735 men.

Grant appeared south of Richmond in time to have seized Petersburg, but the precious moment was squandered by uninformed or timid subordinates until Lee's army was in good part behind its defences. Assault after assault was now made (June 16–18) on those defences with heavy loss, and no result but the knowledge that they could not be thus carried. Then abortive attempts were made (June 21–24) to turn them by the south, which A. P. Hill resisted and baffled, taking in all at least 5000 prisoners. Then Wilson, with 8000 cavalry, raided down the Weldon and Danville Railroad, but was fought and beaten at Stony Creek and Reams's Station, losing thirteen guns and 1000 prisoners.

Grant now moved the Second corps from his extreme left to his extreme right, and threw it across the James, as if about to attack Richmond from the east. And now (July 30) a mine which had been skilfully run from the centre of the Union lines under one of the forts or bastions of Petersburg, was exploded, blowing 300 Confederates into the air and opening a gap in their lines. Hereupon the cannon thundered all along the Union front; but the column of assault, which should have rushed forward on the instant, did not move for several minutes, and then advanced bravely into the chasm made by the explosion, and there halted. The Confederates of course rallied from every side, and poured volley after volley upon the helpless crowd huddled together in the "crater," inflicting on the Unionists a loss of 4400 men, mostly prisoners, while the entire Confederate loss was but 1000.

Again (August 12) Hancock assailed Lee's extreme left below Richmond, but with little advantage, the Union loss in operating on this flank aggregating 5000, while the Confederate was much less, but included Generals Chambliss and Gherardie, killed.

Lee having necessarily sent several divisions from his right to his left, Grant ordered General Warren southward to seize and hold the Weldon Railroad; but Warren's divisions were struck in flank by A. P. Hill at the critical moment, and twice rolled up on themselves, with an aggregate loss of 4455 men, mainly prisoners. The Confederates had lost but 1200, but Warren had seized the Weldon Railroad, and he thenceforth held it.

Hancock was sent to seize this road also at Reams's Station, farther down, which he did, but was in turn attacked and driven off by Hill, with a loss of five guns and 2400 men. Hill lost but half so many.

Again, after a pause, Warren advanced (October 1) by order, with four divisions, to the Squirrel Level road in his front, fighting for two days and losing 2500 men, but holding his ground, and intrenching it so firmly that it could not be taken from him. To cover this advance, General Butler on the Union side had assaulted Fort Harrison with the Tenth and Eighteenth corps, taking the fort with fifteen guns. He next attempted Fort Gilmer, but was repulsed with a loss of 300, including General Dunnovan, killed. General Field attempted next morning to retake Fort Harrison, but was beaten off with heavy loss. A few days later General Kautz, whose Union cavalry had been pushed up the Charles City road to within five miles of Richmond, was there surprised and driven, with a loss of nine guns and 500 men. The Confederate general Gregg of Texas was killed in the ensuing fight, which had no result.

Hancock was next ordered farther to the Union left to find and turn the Confederate flank, and in a fight with Hill's corps, which attempted to interpose between his divisions, took 1000 prisoners. Darkness arrested the fighting, but Hancock drew off in the night, having lost 1500 men and inflicted equal loss upon the enemy. Thus closed on this point the campaign of 1864, with Warren holding the Weldon Railroad, and Butler threatening Richmond; the losses of the Army of the Potomac during the year having aggregated 88,387 men.

When Virginia separated from the Union her western counties, including most of those lying beyond the Alleghanies, strongly protested against the ordinance, voted "No," when it was submitted to the ordeal of popular suffrage, and refused to be bound by it. Calling a convention at Wheeling, they decreed a separation from the old State and the formation of a new one, first named Kanawha, but since known as West Virginia. They had previously organized a loyal State government for Old Virginia, which (hardly an eastern county being represented in it) readily agreed to the organization of the new State. Meantime, the Confederates had seized Harper's Ferry and destroyed the Baltimore and Ohio Railroad for some distance west of it, and they soon sent a force over the Alleghanies to secure obedience to the Confederate authorities at Richmond. It was promptly confronted by General McClellan with a far larger army, organized in Ohio, but largely composed of West Virginians. A part of it routed (June 3, 1861) the enemy at Philippi, another detachment at Rich Mountain (July 12), and the main body under General Garnett, who, in full retreat, was overtaken and routed at Carrick's Ford on the Cheat River, where Garnett was killed and some prisoners were taken. The residue escaped over the Alleghanies.

General J. D. Cox, advancing up the Kanawha, drove the Confederates under General Wise before him: Wise burning (July 28) Gauley Bridge to arrest the pursuit.

General John B. Floyd now assumed command of the Confederates, inspirited by their triumph at Bull Run, and had an indecisive conflict (August 10) with General Rosecrans at Carnifex Ferry. Floyd held his ground, but retreated during the ensuing night.

General R. E. Lee now assumed command in this quarter, and there was much marching with little serious fighting till winter closed the campaign, and little of consequence occurred here the next year, when General J. C. Fremont succeeded to the command of the Union forces, but was hurried over the mountains to resist Stonewall Jackson's raid down the Valley. Thereupon the Confederate general Heth raided across the mountains and attacked (May 23, 1862) Colonel George Crook at Lewisburg, but was beaten off with loss. Thenceforward the operations on either side in this quarter were limited to inconsiderable raids and surprises.

General Franz Sigel was assigned chief command (Union) in the Valley in the spring of 1864, when, with 10,000 men, he advanced to New Market, where he was met by General John C. Breckenridge with an equal force, and routed with a loss of six guns and 700 men.

Breckenridge was unable to follow up his victory, being obliged to send much of his force over the mountains to oppose Crook, who, with 6000 men, had beaten McCausland's far inferior but well-posted force near Dublin Station, and had broken the Virginia and Tennessee Railroad at that point. General Averell, with 2000 cavalry, raiding farther west, had tried to destroy the Confederate salt-works near Wytheville, but had been beaten off by John Morgan. Both Crook and Averell thereupon retreated.

General David Hunter was now assigned to the command of Sigel's beaten army, which was strengthened, while Breckenridge had been called off to reinforce Lee at Richmond. Hunter advanced to Piedmont, near Staunton, where he was confronted by General W. E. Jones with a hastily-collected army, which was beaten (June 8) in a spirited action, wherein Jones was killed and 1500 of his men captured.

Hunter thereupon occupied Staunton, where he was joined by Crook and Averell, and then, with 20,000 men, pressed on to Lynchburg and fiercely assailed it, but was met and beaten off by a superior Confederate force under Early, hastily despatched by rail from Lee's army. Outnumbered and short of ammunition, he retreated over the Alleghanies into West Virginia, whence he regained the Potomac by a long and toilsome circuit. Meanwhile, the Valley was left without any considerable Union force, and Early hurried down it with 20,000 triumphant veterans, Sigel retreating and burning stores till he had crossed the Potomac and took post on Maryland Heights, where Early did not choose to assail him, but crossed into Maryland, scouring the country for cattle, horses, and provisions of all kinds, threatened Pennsylvania, and then turned upon Baltimore. General Lew Wallace could hardly muster 5000 men to oppose him, but fought him (July 9) at the passage of the Monocacy, near Frederick, and was of course defeated, losing 2000 men (mainly prisoners), while the victors lost but 600. Early now turned upon Baltimore, and menaced Washington, skirmishing (July 12) with its outpost defences, but made off rapidly into Virginia with 2500 captured horses and 5000 cattle.

General Wright's Sixth corps had just been sent from Grant's army to the relief of Washington, as had Emory's Nineteenth corps, just arrived by sea from New Orleans. Wright followed Early to the Shenandoah, where his rear was sharply turned upon and repulsed (July 19), with a loss of 500. Wright recoiled to Leesburg, and turned over his command to Crook, while Averell had (July 20) a cavalry fight near Winchester, and took four guns and 200 prisoners.

Wright's and Emory's corps being now recalled to the James, Crook, supposing Early gone likewise, advanced to Winchester, and was there beaten (July 24), and driven to Martinsburg and across the Potomac, with a loss of 1200, including General Mulligan, killed.

Early now sent B. T. Johnson with 3000 cavalry on a raid into Pennsylvania, where they burned without resistance Chambersburg and the barracks at Carlisle. Averell, with an equal cavalry force, soon encountered the raiders, but they escaped with little loss into Virginia. Pursuing to Moorefield, Averell at last struck the raiders (August 4) and worsted them, with a loss of their guns, wagons, and 500 prisoners.

General Grant now sent Sheridan to command in this department, where Hunter's army, just arriving from the West, the Sixth and Nineteenth corps (whose recall to the James had been countermanded), and Torbert's and Wilson's divisions of cavalry from Grant's, had raised his effective force to 30,000 men.

Sheridan, after taking time to reorganize his army, advanced to Winchester, and found Early strongly posted and fortified on Opequan Creek, whence he dislodged him (September 19) after an obstinate fight, in which his loss was fully 3000 prisoners, including wounded, while among his killed were Generals Rhodes and Godwin.

Early rallied his beaten army at Fisher's Hill, a very strong position south of Winchester, where his flanks were guarded by two mountains. Here Sheridan again attacked and routed him (September 25), taking sixteen guns and 1100 prisoners. Pursuing the remnant to Port Republic, he sent his cavalry to Staunton and to Waynesboro', destroying provisions and munitions, then retired down the Valley to Winchester, burning all the grain and forage as he passed, so that the enemy should find no subsistence there. This devastation was made an excuse for the attempts to burn New York and other cities by incendiaries soon afterwards.

Sheridan had encamped on Cedar Creek, and apprehending no danger had gone on a visit to Washington, when Early, reinforced, having stealthily followed down the Valley, determined to surprise the unsuspecting army before him. In this he succeeded perfectly, flanking Crook's force on both sides in the dense darkness, and rushing into the camps with a fearful yell just before daylight, and in fifteen minutes Crook's army was a fleeing, panic-stricken mob, having lost twenty-four guns and 1200 prisoners. Sheridan was at Winchester on his return when the disastrous tidings met him, and, riding at full speed, reached his beaten army at 10 A. M. He spent two hours in reviving the spirits of his men, and after repulsing one fresh attack on his left, ordered at 3 P. M. a general advance, which was successfully made, followed by a second charge, which was still more successful—though the Confederates opposed to them nearly all the cannon of both armies—facing the foe to the rear, and driving them through Staunton, recovering the twenty-four guns lost in the morning, and taking twenty-three others, with 1500 prisoners. The total loss of men this day was about 3000 to each side, including the Confederate general Ramseur and the Union general Bidwell of New York, killed. This closed the campaign in that quarter.

There were various partisan conflicts in Alabama, Mississippi, and West Tennessee during 1864, but none of consequence, save at Fort Pillow, Tennessee, which was assailed and taken (April 13) by the Confederate general Forrest, killing Major L. F. Booth, who commanded, with most of his garrison of 557 men, of whom 262 were blacks, many of them after resistance had ceased. This was in accordance with the threats previously made by Confederate officers, that colored troops should in no case receive quarter.

General S. D. Sturgis with 12,000 men was sent from Memphis in quest of Forrest, whom he found at Guntown, Mississippi, where Sturgis was speedily routed and driven back to Memphis, with a loss of at least 4000, mainly prisoners. Forrest's entire force was not much greater than this. General A. J. Smith now assumed command, and pressed Forrest back to Tupelo, Mississippi, where the Confederates thrice assaulted his lines, and were repulsed with loss, but with no decisive result. Smith retreated, and again advanced to Holly Springs, not seriously opposed, while Forrest raided into Memphis with 3000 cavalry, and took a few prisoners, but failed to capture the Union generals of whom he was in quest, or to liberate the captured Confederates.

East Tennessee was this year the scene of several partisan conflicts to little purpose; and John Morgan raided through Pound Gap into Eastern Kentucky, capturing and paroling General Hobson with 1600 Unionists in a field at Licking River. General Burbridge struck the raider at Mount Sterling, and again near Cynthiana, capturing or dispersing at least half his force, and chasing the rest into South-western Virginia. Attempting here to destroy the salt-works near Abingdon, Burbridge was beaten off (October 3), with loss, by General Breckenridge.

General Sherman, on Grant's transfer to the East, was left in chief command at the West. Advancing with 100,000 men from Chattanooga early in May, 1864, he was confronted by Joseph E. Johnston, who, having but 54,000, declined a pitched battle, but availed himself of the broken country and fortified positions on the rugged road to Atlanta. He was stubbornly resisted (May 10) at Resaca, where the railroad crosses the Oostenaula River, and was at first repulsed with loss, but soon flanked the position and compelled its abandonment. Checking Sherman's advance at Adairsville and Cassville, Johnston made his next determined stand at the Allatoona Pass, and days were expended in fighting and flanking before he could again be driven. He next made a stand at Kenesaw Mountain,

flanked by Pine and Lost Mountains, connected by strong field-works, where he for several days resisted every effort to move him. In one assault (June 27) Sherman lost 3000 men, including Generals Harker and Dan McCook, killed; Confederate loss, 442. And now, by again advancing his right, Sherman forced Johnston out of his impregnable position, compelling him again to retreat, which brought him to Atlanta. Here he was relieved by General Hood, who condemned his cautious policy, which had only depleted his army by 14,700 men in two months' constant fighting. Reinforcements had nearly kept its ranks full, its present strength being 51,000. Sherman advancing his left under McPherson to break Hood's railroad connection with the East, Hood struck heavily (July 20) at his right under Thomas, but was repulsed after a bloody struggle, which cost the Confederates at least 4000 men, including Generals W. S. Featherston of Mississippi, Armistead of Georgia, and George M. Stevens of Maryland, killed. The Union loss was but 1500. Supposing that Atlanta had been silently evacuated, the Unionists thereupon rushed up to within two miles of the city, but found here strong works well manned, and were repelled with loss. Major-General McPherson of Ohio was killed, as was General Greathouse of Illinois, and another bloody struggle resulted, with advantage to the Unionists, though it cost them over 4000 men. The Confederate loss was nearly double, including General W. H. T. Walker of Georgia, killed.

A pause in the fighting now ensued, and General Stoneman with 5000 Union cavalry raided upon the railroads and stores in Hood's rear, but, scattering or dividing his forces too much, he was surrounded and captured with 1000 men, as Colonel Harrison, with 500 more, had just been.

Sherman now moved the Army of the Tennessee, led by Hooker, from his extreme left to his extreme right, initiating a new flanking movement, when Hood assailed Logan's (Fifteenth) corps on the new Union right, but was repulsed with heavy loss. Hood now sent Wheeler's cavalry to raid on the Union rear, while Kilpatrick's Union cavalry pressed to the Confederate rear, breaking both the railroads leading southwardly from Atlanta, and returning to camp August 22. Sherman again threw forward his right till most of his army was behind Atlanta, holding firmly the railroad to Macon. Hood had already sent off part of his army to Jonesboro', whence Hardee with two corps attacked (August 31) Howard fiercely, but was beaten off with a loss of 2000 to Howard's 500. And now Jonesboro' was assailed in its turn by Jefferson C. Davis's corps, and carried, eight guns, General Govan, and many men being captured. Hood hereupon exploded his munitions and burned his stores in Atlanta, and escaped eastward. Slocum took quiet possession of what was left September 1. Sherman returned to the city, and gave his men a well-earned rest.

Wheeler's raid was prosecuted throughout Northern Georgia and East Tennessee, returning through the Sequatchie Valley, and being chased across the Tennessee near Florence. He destroyed much property, but with little influence on the fortunes of the war.

Hood, rejoined by Hardee, now passed Sherman's right, and sent French's division to capture the Union post at Allatoona, which General J. M. Corse held with 1944 men, but so gallantly that assault after assault by quadruple numbers was repulsed with fearful slaughter. General Cox at length relieved Corse, who was wounded, as were most of the higher officers. He had lost in all 707 men, while French left 231 dead, 411 prisoners, and 800 muskets. Hood, still marching northward, surrounded Resaca, but did not assault it, Sherman being too near. Sherman, at length learning that Hood had advanced into Middle Tennessee, gave up the pursuit, sending the Fourth and Twenty-third corps to Chattanooga, with orders to report to Thomas at Nashville, while he, facing about, returned to Atlanta, and reorganized and equipped his remaining forces for his march to the sea.

Hood, with 35,000 infantry and artillery, struck boldly for Nashville, preceded by Forrest with 10,000 cavalry. Of course there was immense destruction of stores, bridges, and dépôts—$1,500,000 worth of boots and provisions having been burned at Johnsonville, Tennessee, to save them from capture.

Thomas concentrated 30,000 men at Pulaski, but was unable to copé with Hood's army, now swelled to 55,000 in all, which still clung to the Tennessee River till assured that Sherman had cut loose from Atlanta, marching southward, when he set his columns in motion northward. General Schofield, on his part, retreated from Pulaski to Columbia, and thence to Franklin, in a bend of the Harpeth, where he, with less than 20,000 men, but a good position, was assailed (November 30) with desperate resolve. The Confederates were repulsed with a loss of at least 4500, including Generals Cleburne, Gist, Adams, Trahl, and Granbury. The Union loss was 2320, but no guns. Schofield continued his retreat that night. Hood followed, and soon sat down before Nashville.

The movement was audacious, as Thomas was at least his equal as a commander, and could soon concentrate a larger force than that which attempted to besiege him. But Thomas would not strike till he was ready, while severely cold weather impeded operations. At length Thomas struck out (December 15), and, after two days' skilful fighting, drove his besiegers at all points, heading them toward Alabama, and taking fifty-three guns and 4462 prisoners, including a major-general. Hood got across the Tennessee at Bainbridge with a few guns and barely the *débris* of an army. Thomas had taken in this brief campaign seventy-two guns and 11,857 prisoners, besides administering the amnesty oath to 2207 deserters from the Confederate service. The aggregate Union loss in this campaign was 10,000. And General Stoneman, moving eastward from Knoxville, had cleared East Tennessee of armed Confederates, captured Wytheville and the lead-mines and salt-works, driving Breckenridge's depleted force over the mountains into North Carolina.

General Sherman, after despatching Thomas with two corps to the defence of Tennessee, had still with him four corps, numbering in all 65,500 men. Concentrating these around Rome and Kingston, Georgia, he destroyed the railroads about him, cut the telegraph which still connected him with the North, and stood clear of all communications as he commenced his famous march to the sea. There being no considerable army in his front, he advanced rapidly through Atlanta, Macon, Milledgeville, and Millen to Savannah, slightly opposed at several river-crossings, while Kilpatrick with his cavalry covered his flanks and screened his movements, so that Augusta seemed to be his objective point. Fort McAllister on the Ogeechee was assaulted (December 13) by Hazen's division, and communication at once opened with Dahlgren's fleet, when Savannah was evacuated (December 20) by Hardee, after destroying his vessels and stores. Thus far, Sherman had on this march lost but 567 men, and had taken 167 guns with 1328 prisoners. He remained a month in Savannah, while Generals Dana, Davidson, and Grierson, who had been sent out from Vicksburg and Memphis to distract attention from his march, swept over large portions of Mississippi and Alabama, breaking up railroads, destroying stores, and taking prisoners. These raids were uniformly successful, but General Foster, who had ascended Broad River from the Sea Islands to break the railroad connection between Charleston and Savannah near Gordonsville, was beaten off, losing 746 men.

Sherman, leaving Savannah well garrisoned, set his column again in motion (February 1, 1864), traversing the heart of South Carolina with little resistance, except from its flooded swamps, and compelling Hardee to evacuate Charleston and its harbor-defences, retreating northward with 12,000 men. Columbia, the State capital, though undefended, was undesignedly burned. Kilpatrick, who, with 5000 cavalry, still covered the advance on the left, was surprised and routed by Wade Hampton near the north line of the State, but soon rallied his men and beat off his assailants. Reaching Fayetteville, North Carolina, March 11, Sherman found himself confronted by Joe Johnston with 40,000 men, collected by Hardee, Beauregard, Cheatham, and Bragg, and including Wheeler's and Hampton's cavalry. After halting three days, Sherman once more advanced, when his left wing was attacked (March 15) in a narrow pass by Hardee, who was soon driven; but Slocum on the right was next assailed (March 18), when approaching Bentonville, by Johnston with his main body. The Confederates withdrew after a sharp action, in which Sherman lost 1643 men and took 1625 prisoners, including wounded, burying 267 Confederate dead. Next day, Sherman advanced to Goldsboro', and halted his troops while he made a hasty visit to General Grant at City Point.

Wilmington, North Carolina, had long been the principal port through which blockade-runners found access to the Confederacy. General Butler, with Commodore Porter, led an army and fleet to reduce it (November 16, 1864), but returned to Fortress Monroe unsuccessful. General A. H. Terry was next despatched with a stronger force, which, after a heavy bombardment by Porter's fleet, carried Fort Fisher by assault (January 16, 1865), killing Major-General Whiting, its commander, and taking 169 guns and 2083 prisoners, with a Union loss of 110 killed and 536 wounded; but 300 more were lost by the explosion next day of the fort's chief magazine.

General Schofield was now sent to Terry's aid, ranking him, and raising his force to 20,000, with which Schofield entered Wilmington, February 22; Hoke retreating after a sharp fight, burning two privateers and other vessels, with heavy stores, but leaving sixty-five guns. Schofield now advanced inland, losing 700 men by a surprise, but beating

off (March 10) an attack on his left by Hoke, who here lost heavily and retreated, enabling Schofield to communicate and co-operate with Sherman on his arrival at Goldsboro'.

General Canby, commanding at New Orleans, moved eastward in the spring to menace Mobile, while General James H. Wilson, with Grant's and Thomas's cavalry, 15,000 strong, pushed southward from Eastport, Mississippi, the head of steamboat navigation on the Tennessee, confronted only by Forrest with but 5000, whom Wilson easily defeated near Maplesville and routed (April 2) at Selma, Alabama, which he took, with thirty-two guns and 2700 prisoners. Crossing the Alabama, Wilson entered Montgomery, which Adams had just left, burning 125,000 bales of Confederate cotton. Turning eastward, Wilson soon appeared at Columbus, Georgia, where he took fifty-two guns and 1200 prisoners, burning a gunboat, 250 cars, and 115,000 bales of cotton. Taking by assault Fort Tyler on the Chattahoochee, Wilson pushed on to Macon, Georgia, where he learned that the war was virtually at an end.

General Canby, with nearly 30,000 men, aided by Porter's powerful fleet, invested Mobile, which was held by Dick Taylor with some 15,000. Investing Spanish Fort, he reduced it by bombardment, taking 652 prisoners, and then assaulted Blakely, which was carried by assault, with a Union loss of 1000 to 500 Confederate killed and wounded, with 3000 prisoners. Mobile was then evacuated by General Maury, who, with 9000 men, escaped up the river, abandoning 150 guns.

General Grant, still before Petersburg, had bloodlessly (December 7, 1864) extended his left twenty miles down the Weldon Railroad to Hicksford, which he fortified and held. He next essayed to advance his left to Dabney's Mill, but was resisted and driven back to Hatcher's Run, where the Confederates were in turn repulsed (February 6, 1865), and the ground up to this point held and fortified. The Union loss in this operation was 2000; the Confederate, 1000, including General Pegram, killed.

General Sheridan moved up the Valley from Winchester with 10,000 mounted men, drove Early (March 2, 1865) from his intrenched camp at Waynesboro', taking eleven guns and 1600 prisoners, thence rode into Charlottesville, where he destroyed immense stores and miles of the Richmond and Lynchburg Railroad, and, passing behind Lee's army, reported to Grant at Petersburg March 27.

Lee, assuming the offensive, sent Gordon with two divisions against the centre of the Union line before Petersburg. Charging at daybreak (March 25), Gordon surprised and took Fort Stedman in his front, capturing three batteries and some prisoners, but not being properly supported, he was attacked and routed in turn by the Ninth corps, losing 2000 prisoners; besides which the loss to either side was about 2500. Grant interpreted this rash assault as premonitory to a Confederate evacuation of Richmond and Petersburg, which he resolved to harass if not intercept. Again throwing forward his left (March 29) to seize the Boydton plank-road, while Sheridan's cavalry on its flank advanced to Dinwiddie Court-house, he was opposed by Lee with most of his army, who suddenly struck Warren's corps in flank and rear, with intent to repeat the lesson of Chancellorsville. Two divisions were then broken, but Griffin's, behind them, stood firm while the fugitives were rallied, and Warren was thus enabled to repel his assailants with heavy loss; but an attempt to carry their works was defeated in turn. Meantime, Sheridan had gained Dinwiddie Court-house, but, attempting to advance thence to the Boydton plank-road, was foiled, but advanced again next morning (April 1) to Five Forks, where he connected with Warren, advancing on his right, and ordered a general charge on the Confederate works in their front, held by two divisions, who were fearfully overpowered and routed, with a loss of 5000, mainly prisoners. The Union loss was but 1000, including General Frederick Winthrop, killed. And now, sending two divisions eastward to Gravelly Church, Sheridan again connected with the Union lines before Petersburg, whence a general cannonade preluded the assault, which was delivered at daylight next morning (April 2). Wright's Sixth corps gaining the rear of these works by the south, and taking many prisoners, while Ord's corps carried Forts Gregg and Alexander by storm, losing 500 men. A. P. Hill, in attempting to retake some of the captured works, was shot dead, and his corps utterly defeated.

Lee now, at 10½ A. M., telegraphed to Davis that Richmond must be evacuated at once, and it was evacuated between that time and next morning, while its immense warehouses, filled with provisions, munitions, and stores of all kinds, were fired by the departing Confederates, burning out the heart of the city. Flames and explosions notified the Unionists in front that the Confederate capital was abandoned, and General Weitzel at 4 A. M. (April 3) was assured by a negro from the city that Davis and all his official or military adherents had departed. Picking his way through the abatis, earthworks, rifle-pits, torpedoes, etc. which encircled the burning city, Weitzel at 6 A. M. led his men into the city, soon followed by President Lincoln, who was at City Point. Petersburg was simultaneously abandoned. Lee retreating up the railroad towards Danville, while ringing of bells and immense gatherings all over the North and West hailed the relinquishment of Richmond as the downfall of the Confederacy.

Davis escaped by train to Danville, while Lee halted two days at Amelia Court-house, vainly seeking provisions for his hopeless army, now reduced, mainly by prisoners, to 35,000 men. Grant was soon on his trail. The fleeing host was first seen from Deatonsville, and was struck near Sailor's Creek by Custer's horse, supported by Crook's and Davis's divisions. Here sixteen guns, 400 wagons, and some prisoners were taken, while Ewell's thinned corps was cut off from Lee's rear, and so enveloped that it was obliged to surrender. Ewell himself was among this day's 6000 prisoners.

Lee crossed the Appomattox at Farmville, repelling General Theodore Read, who tried to stop his way with two regiments. But Humphrey's Second corps was again so close on his rear that he was obliged to turn and fight a few miles beyond Farmville, repulsing his assailants with a loss of 600. But this lost a day, which was wasted by attempts to bar the Danville road, while Lee was really making for Lynchburg. Undeceived on this point, pursuit was resumed on the morning of the 8th, Grant having meantime sent Lee a courteous note inviting a surrender. Sheridan pushed his troops twenty-eight miles on the 28th, reaching Appomattox Court-house, heading Lee's army, intercepting its sorely-needed supplies from Lynchburg, and planting himself across the road whereon it must move on the morrow, and sending word to Grant, who ordered a forced march of Griffin's and Ord's corps to Appomattox Station during the night. Lee had meantime sent a note to Grant inviting a meeting, with a view to peace, at 10 A. M. In the morning (April 9) Grant replied, saying he had no authority to make peace, but urging a surrender. Lee's weary, famished army set forth as usual this morning, and, seeing cavalry in their front, advanced to push it aside, when it was withdrawn to the flanks, disclosing solid regiments of infantry behind it. Lee, seeing that further fighting would be a useless slaughter of his men, at once called a parley, which resulted in a surrender, "each officer and man to be allowed to return to his home, not to be disturbed by United States authority so long as they observe their paroles and the laws in force where they may reside." The number thus paroled at this point was 27,000. Johnston's army in North Carolina surrendered on the same terms to Sherman at Raleigh, April 26, and Dick Taylor's to Canby at Citronelle, Alabama, May 4. E. Kirby Smith, commanding the Confederates west of the Mississippi, attempted to make a stand after the surrender of Lee, but his men all deserted him, and, taking whatever Confederate property they could lay hands on, dispersed to their several homes.

Jefferson Davis halted at Danville, anxiously awaiting advices from Lee, until astounded (April 10) by tidings of his surrender. He then fled southward to Greensboro', North Carolina, and again halted till it was evident that Johnston would soon capitulate, when he flitted again to Washington, Georgia, with a cavalry scout, which at first numbered 2000, but rapidly wasted. Here he abjured the state of a ruler, and was making his way to the coast with his family and a few faithful followers when he was surprised and captured (May 10) while encamped near Irwinsville by two detachments of cavalry sent out from Macon by General Wilson to look for him. His family was liberated at Savannah, but he was held a close prisoner in Fortress Monroe for two years, then released on bail and never brought to trial. So ended the Southern Confederacy.

HORACE GREELEY.

Confedera'tion [for etymology see CONFEDERACY], a league, a federal compact, an alliance of princes, states, or nations. It is nearly synonymous with confederacy. The republic of Mexico is called the *Mexican Confederation*. The numerous states of Germany were united in 1815 by the congress of Vienna, and formed the Germanic confederation (*der Deutsche Bund* in German). Before the adoption of the Federal Constitution of the United States in 1788, the government of this country was a weak confederation of thirteen independent States, which recognised no superior or central authority.

Confederation, Articles of, a document drawn up by the Congress of the United States, November 15, 1777, and adopted finally July 9, 1778, by which the several States united in a league of perpetual friendship "for the common defence, the security of their liberties, and their mutual and general welfare." These articles, thirteen in number, were soon ratified by all the States, but the con-

federation proved almost an utter failure, from the fact that Congress had very limited powers. There was indeed no executive authority of any kind. For these reasons a convention called by Congress met at Philadelphia May 14, 1787, with Washington as its president, and on September 14 of that year the convention closed its labors and reported the CONSTITUTION OF THE UNITED STATES (which see).

Confedera'tion of the Rhine [Ger. *Rheinbund*], the name of a league formed in July, 1806, by sixteen German states under the protection of Napoleon. The princes of these states signed an act of confederation, dissolving their connection with the Germanic empire and forming an alliance with the French emperor. They were the kings of Bavaria and Würtemberg, the arch-chancellor, the elector of Baden, Murat, duke of Berg, the landgrave of Hesse-Darmstadt, the princes of Nassau-Usingen, Nassau-Weilburg, Hohenzollern-Hechingen, Hohenzollern-Sigmaringen, Salm-Salm, Salm-Kyrburg, the duke of Aremberg, the count of Leyen, and the princes of Isenburg-Birstein and Liechtenstein. In September, 1806, the confederation was joined by the elector of Wurzburg; in December, 1806, by the elector (subsequently king) of Saxony, and the Saxon dukes of Weimar, Gotha, Coburg, Meiningen, and Hildburghausen; in 1807, by three dukes of Anhalt, two princes of Lippe, three princes of Reuss, the prince of Waldeck, and the new kingdom of Westphalia; in 1808, by the dukes of Mecklenburg-Strelitz, Mecklenburg-Schwerin, and Oldenburg. The confederation had an area of 126,075 square miles, and a pop. of 14,608,877. In 1810 a part of the confederation was incorporated with France, and its territory reduced to 114,467 square miles, with 13,475,000 inhabitants. In consequence of the downfall of Napoleon the confederation was dissolved in 1813, and its members united with the other German states to form the Germanic Confederation.

Con'ference [from the Lat. *con'fero*, to "confer" (from *con*, "together," and *fe'ro*, to "bring"), alluding to the different parties bringing together or comparing their thoughts], the act of conversing on a serious subject; an oral discussion; a formal discourse; a meeting for consultation or instruction; a meeting of two branches of a legislature by their committee when they disagree respecting the passage of a bill. In such cases each house appoints a committee of conference, in order to settle the difference by a compromise. In English law, conference signifies also the interview of an attorney or solicitor with a counsel when consulting him.

In a political sense, conference denotes the meeting of plenipotentiary ministers of several states for the peaceable settlement of international complications. Of special importance in modern history are the conferences of Vienna, held in 1820 and 1834, the Paris conference of 1856, and the London conferences of 1864, 1867, and 1871. "International conferences" have also of late been held on many non-political questions. Among the most important of these are the conferences of Geneva, August, 1864, for the organization of the sanitary commission, and of Paris, June and July, 1867, for the examination of the monetary question.

CONFERENCE is also an ecclesiastical term used in various senses. In the Roman Catholic Church the term was formerly applied to certain assemblies of priests or canons presided over by an arch-priest or dean. They originated in the eleventh century, but are now seldom convened.

PASTORAL CONFERENCES are meetings held annually, quarterly, or monthly by pastors of various Protestant churches for the discussion of pastoral duties and for other similar purposes. They are held in the French Protestant churches, also among English dissenters, and in many churches of the United States, etc.

The Wesleyan Church in England has an annual meeting of its preachers called the "Conference," which has administrative and other powers, defined by Wesley's "Deed of Declaration" (1784). A similar conference is held in Ireland. (See STEVENS, "History of Methodism.") In the Methodist Episcopal Church and the Methodist Episcopal Church South, a "General Conference" meets every four years. It has full power to make "rules and regulations," subject to certain restrictions found in the "Discipline," part II., chapter 1. It is presided over by the bishops. In the same churches the territory where preachers are stationed is divided into "conferences," which are again divided into "districts." The preachers and certain lay delegates of each conference meet in an "annual conference," where preachers receive their appointment for the year from the presiding bishop. There are "quarterly conferences" held in each circuit or station.

"General" (triennial) and "annual" conferences are also held by the Free-will Baptists, and "yearly conferences" by the Six-Principle Baptists, the minor Methodist bodies, and others.

The "Conference of Hampton Court," in 1604, was a meeting of King James I., nine bishops, and nine other divines of the Anglican Church, and four Puritan theologians, held with reference to the differences between the Anglicans and the Puritans. This meeting led to some slight changes in the Anglican Liturgy.

The "Savoy Conference" at the palace of the bishop of London in the Savoy, in 1661, consisted of thirteen Anglican bishops and eleven non-conformist divines, with a number of other theologians on each side as counsellors. Instead of healing the breach, the SAVOY CONFERENCE (which see) increased the differences between the two parties.

The "Evangelical Church Conference" ("Evangelische Kirchenconferenz") is the name given to the regular (annual or biennial) meetings of delegates of the governments of the German states and Austria for the discussion of important church questions.

Confer'va, a genus of plants of the division Algæ, order Confervaceæ. The plants consist of simple or branching jointed filaments, which are filled with green, purple, or red endochrome, and are found, some in fresh, some in salt water, and some on moist earth. The name Conferva is not strictly limited to the genus or the order, but is often extended to its near allies. Among the Confervaceæ are included many plants which have flat fronds. Many also consist of cells immersed in a slimy matter. Reproduction takes place by *spores* formed in the interior of the cells, and which at last are discharged through the walls of the mother-cell. Confervaceæ are found plentifully in many mineral waters. Their abundance often gives a color to the water of tanks, marshes, etc. The etymology of this word is doubtful, and the limits of the genus and order are unsettled. Most British and American Confervæ are now referred to *Cladophora* and other genera. (See HARVEY'S "Nereis Boreali-Americana," part iii. (1858), in vol. x. of the "Smithsonian Contributions;" also S. O. GRAY'S "British Sea-weeds," 1867; WOOD, "The Fresh-water Algæ of the U. S.," 1872.)

Confes'sion [Lat. *confessio*, from *confiteor*, *confessus*, to "confess;" Ger. *Beicht*], one of the seven sacraments of the Roman Catholic Church; a disburdening of the conscience in the hearing of an authorized priest with a view of obtaining absolution. Most Protestants assert that such confession is not enjoined in the New Testament, and that auricular confession was established as an essential part of church discipline at the fourth Lateran Council (1215 A. D.), though the practice may have been older. By a canon of the above council, confession must be made orally at least once a year, but frequent confession is recommended by the Church, and generally practised. The custom of making a money-offering with confession is optional, though formerly regarded as obligatory. The Greek Catholic Church, as well as the Catholic Maronites and the Armenians, holds that special confession is wholesome in cases of mortal sin, but does not consider it binding. The Greek Church regards this discipline as necessary for the reception of the Eucharist. The Lutheran Church professes that private confession may be retained in the Church, but that particular statement of sins is not necessary. The Church of England employs a general form of confession in its services, but retains private confession in the rubric for visitation of the sick. The Scottish and most of the other Protestant churches do not recognize it at all.

The SIGILLUM CONFESSIONIS ("seal of confession") both in the Roman Catholic and the German Protestant churches means the obligation of a confessor or priest not to divulge the secrets of the confessional. This custom of secresy was made binding by the fourth Lateran Council, and its violation by a priest makes him subject to the severest ecclesiastical penalties.

Confession, in criminal law, an admission by a person that he has committed or participated in a crime. It is either judicial or extra-judicial. It is said to be judicial when made in the course of legal proceedings. An instance is the plea of guilty. An extra-judicial confession does not have the same weight as one that is judicial, and is insufficient for conviction unless corroborated by proof of the actual commission of the offence (*corpus delicti*). A confession must be voluntary—that is, not the result of hopes or fears held out or caused to the prisoner by one having authority, such as a public official or the party against whom the act was committed (prosecutor). It is not necessary that it should be spontaneous. The question of the admissibility of a confession in evidence is decided by the judge; its effect after its admission is determined by the jury. Questions concerning the admissibility of confessions frequently arise when taken by magistrates making an examination of a prisoner charged with crime.

Confes'sional [Ger. *Beichtstuhl*], the seat in which the priest sits to hear confession in a Roman Catholic

church. Confessionals are closed cells, having a door in front for the priest to enter by, and an opening on one or both sides, like a small window, for the penitents to speak through. By the ancient canons confessionals were required to be so built that priest and penitent could both be seen by all present.

Confession of Faith. See CREED.

Confirma'tion [Lat. *confirmatio*, from *con*, intensive, and *firmo*, *firmatum*, to "make firm" or "strong"], literally, corroboration or strengthening; a ceremony of the Christian Church which is not practised by most denominations of Protestants, though retained by the Anglican and Lutheran churches. In the ancient Church the rite was administered immediately after baptism, if the bishop happened to be present at the solemnity, which is still the custom in the Greek and African churches. In the Roman Catholic Church there is interposed a delay of not less than seven years after infant baptism; in the Lutheran Church the rite is usually delayed for from thirteen to sixteen years, and in the Anglican Church, from fourteen to eighteen years. There is, however, no established limit to the period. The ceremony consists in the imposition of hands by the bishop, accompanied by an invocation of the Holy Ghost as the Comforter and Strengthener. But both in the Lutheran and Anglican churches the ceremony is made the occasion of requiring from those who have been baptized in infancy a renewal of the baptismal vow made for them by their godfathers and godmothers, who are thereby released from responsibility. In the Roman Catholic Church confirmation is held to be one of the seven sacraments. It can be received only once, as it is counted among the three sacraments which impress upon the soul an ineffaceable character.

Confisca'tion [Lat. *confiscatio*, from *fiscus*, a "treasury"], the forfeiture of land or other property to the public treasury as a part of the punishment of certain crimes. During the French Revolution a large quantity of land owned by the Church was confiscated—*i. e.* was taken from the Church in order to convert it into a source of national revenue.

Conflict of Laws. See INTERNATIONAL LAW, PRIVATE, by PRES. T. D. WOOLSEY, S. T. D., LL.D.

Conform'able, a geological term applied to strata which lie parallel to each other. In some cases a bed is disturbed from its original position before another bed is deposited on it. If the new bed or stratum is not parallel to the former, it is said to be *unconformable*. Conformable in general signifies agreeable, suitable, consistent, compliant.

Confu'cianism, the state religion of China; a religious, or rather philosophical, system, which has greatly modified the destinies of China. It is professed at present chiefly by the learned classes, though it has much influence upon the Booddhism of the common people. (See CONFUCIUS.)

Confu'cius, the Latinized form of **Kong-Foo-Tse,** or **Khoong-Foo-Tse,** the greatest of Chinese philosophers, was born, according to the best authorities, in 551 B. C., in Loo, a kingdom or state which now forms part of the modern province of Shang-Toong. He was of illustrious descent, and his father, Shuh-Liang-Heih, was a soldier remarkable for strength and courage. After the death of his first wife, Shuh-Liang-Heih, then in advanced age, married a young lady of remarkable virtues, who became the mother of an only son, the subject of this notice. Confucius was often called Kew or K'ew, because his mother went to a certain hill called Ne-Kew (*i. e.* "hill Ne") and offered her prayers that Heaven might bless her with children. From this circumstance he was also called Ne, and after his death "The venerable Ne."

In childhood, Confucius was, we are told, remarkable for his exemplary obedience to his mother, for his respectful treatment of those older than himself, and for his observance of all the ceremonies with which the Chinese honor the dead and living. To go through the different forms of politeness usual among persons of great culture formed his favorite pastime. He was at school singularly obedient, gentle, and modest, and possessed, it is said, wonderful intellectual quickness. He married when at the age of nineteen, and was made a mandarin of an inferior grade at about the same period. In discharging the duties of his office he showed great intelligence and faithfulness. He took care that nothing should be sold in the markets that could endanger the health of the people, and that unreasonable prices should not be charged for the necessaries of life. The charge of the public lands and of the sheep and cattle was afterwards given to him, and through his industry and sagacity the greatest improvements were introduced into agriculture, and abundance and affluence were made to replace dearth and poverty among the tillers of the earth.

At the age of about twenty-two Confucius first appeared as a public teacher, giving his instructions, however small the fee offered him, to all who had the ability and a true desire to learn. Having once shown them how to acquire wisdom, he expected his pupils to be able to pursue their studies alone and without further assistance from him. He said, "When I have presented one corner of a subject to any one, and he cannot from it learn the other three, I do not repeat my lesson." His mother died when he was twenty-four, and, following the custom of his country, he mourned for her three years, filling no public office during that time. He is said to have studied music when twelve years old, and to have acquired wonderful skill in that art.

In 499 B. C. we find Confucius one of the ministers of the king of Loo. A dispute having occurred between this prince and the neighboring king of Tsi (or Ts'e), it had been arranged that the two rulers should meet on the common frontier and settle their differences in a friendly interview. It was the design of the king of Tsi to seize the person of the king of Loo during this interview, but Confucius (who is said to have possessed in a wonderful degree the gift of reading human character) suspected his treacherous scheme, and by his foresight and resolute courage baffled all his plans, and obtained for his sovereign the secure enjoyment of his rightful possessions. Confucius filled for a while the position of minister of crime. At length, the king of Loo having found the precepts of his minister too high and difficult to be conveniently practised, Confucius perceived that his services were no longer desired, and retired from public life. From this date he appears to have passed most of his time in travelling from place to place, spreading his doctrines as he went, and always accompanied by his disciples. He spent the last five years of his life in his native state of Loo, teaching and completing the work which he had before begun.

Several of the disciples of Confucius gave promise of attaining eminence in philosophy, but the sage himself seems to have centred all his most earnest hopes and warmest affections on his favorite and most gifted pupil Yen-Hoei (or -Hwuy). To him he looked as his successor in those labors for the promotion of wisdom and virtue in which his own life had been passed. But he was destined to disappointment, for the early death of the beloved pupil crushed all these brilliant hopes and plunged Confucius into the deepest sorrow. Confucius, though very observant of the outward forms of propriety and politeness, was not wanting in spontaneous and heartfelt affection. He appears to have looked upon the observance of those forms as directly advantageous to society, besides exerting an indirectly useful influence through their effect upon the minds of those who followed them. He died 478 B. C.

Confucius had one son, Pé-Yu (or Pih-Yu), who died before his father, leaving a son named K'ung Keih, also called Tse-Sse (or Tsze-Sze), who was distinguished as a philosopher, and who wrote a famous work called "Chung-Yung."

Confucius has enjoyed a renown more extended than that of any other of the human race. Through all the changes of the Chinese dynasties, by whatever causes brought about, his descendants have received peculiar honors. At this day they number more than eleven thousand males, and are said to constitute the only hereditary nobility in China. From his own time to the present his writings have been the principal objects of study in all the schools of that vast empire. It has, however, been justly observed that the aim and scope of the Confucian philosophy were limited to this present life, and none of his sayings indicate that he had any definite belief in a continued existence after death. His life and teachings tended to the promotion of the useful and practical only. "There is a total difference in kind between the philosophy of Confucius and the philosophies of Plato, Aristotle, Bacon, and Locke. The Chinese sage did not aim to investigate the mysteries of the universe, or even the hidden laws of nature or of the human mind. His great object was to lay down such rules as would best promote the happiness and virtue of the community at large. And it must be acknowledged that in the practical wisdom of his precepts, both to rulers and subjects, he has never been surpassed by any philosopher of any age or nation. That wise and beautiful thought which is the basis of Chinese government—that the ruler or officer should be as a father, and the people as children—dates, there is reason to believe, from a very remote antiquity. Confucius did not originate this idea, but he did everything in his power to give it practical efficacy."

In the "Analects" (in Chinese *Lun-Yu*, *i. e.* "Digested Conversations") of Confucius are to be found the best and most trustworthy indications of his genius and character. They are well worthy to be read by whoever would rightly understand his philosophy. It is doubtful whether among any of the pagan writers of the West anything surpassing these sayings in practical sagacity and lofty morality can be found. Indeed, they seem amply to justify the enco-

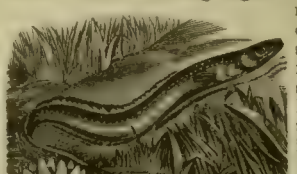
miums they have called forth upon the wisdom of the Chinese sage.

The following will serve as illustrations of the character of his sayings: "Learning without thought is labor lost; thought without learning (or knowledge) is perilous." "When we see men of worth, we should think of equalling them; when we see men of a contrary character, we should turn inward and examine ourselves." "He who exercises government by means of his virtue may be compared to the north polar star, which keeps its place, and all the [other] stars turn towards it." "Good government obtains when those who are near are made happy, and those who are far off are attracted." When asked what were the necessary conditions of a government, he answered, "Sufficiency of food, military equipment, and confidence of the people in their ruler." Being asked which could be most easily dispensed with, he replied, "The military equipment." And when pressed to say which of those yet remaining might be most easily dispensed with, he said, "Part with the food; from of old death has been the lot of all men, but if the people have no faith in their rulers, there is no standing for the state." In one place he gives us the negative form of the golden rule: "What you do not like," he says, "when done to yourself, do not do to others." Again he says, "I am not concerned that I have no place (or office); I am concerned how I may fit myself for one. I am not concerned that I am not known; I seek to be worthy to be known." "The superior man is affable, but not adulatory; the mean man is adulatory, but not affable."

One of his disciples said of Confucius, "There were four things from which the master was entirely free: he had no foregone conclusions, no arbitrary predeterminations, no obstinacy, and no egotism." (See LEGGE'S "Life and Teachings of Confucius;" PAUTHIER'S "Chine;" PLATH'S "Confucius und seiner Schüler Leben und Lehre," 1867; and the "Edinburgh Review" for April, 1869.)

J. THOMAS.

Con'garee', a river of South Carolina, is formed by the Broad and Saluda rivers, which unite at Columbia. It flows south-eastward, and joins the Wateree to form the Santee River. Steamboats ascend this river to Columbia.



Congaree, a township of Lexington co., S. C. Pop. 1095.

Congé d'Élire, kôn'zhà' dà'leer, a French phrase signifying "permission to choose," is the name given in England to the king's warrant or license to the dean and chapter in the older dioceses to elect a bishop for a vacant see. The bishop is, however, nominated by the sovereign (or premier), so that the dean and chapter have no real power or liberty to choose.

Congen'ital Diseases. These must be distinguished from hereditary diseases, which may show themselves either soon after birth or at some later period, and from malformations of the infant, resulting from either an arrest of development or a disease of the fœtus contracted during its intra-uterine life. Both of these classes will be discussed in future. Congenital diseases proper are—1st, transmitted from the diseased mother either before or during birth; 2d, acquired during birth, without a direct maternal influence; 3d, acquired shortly before birth. To the first class belong puerperal fever and primary syphilitic and gonorrhœal infection; to the second, asphyxia, atelectasis (unexpanded condition) of the lungs, and cephalhæmatoma (sanguineous tumor upon the head); to the third, acute fatty degeneration of the fœtus and newly born. *Puerperal fever* is transmitted from the mother; the blood of the babe is infected. The principal symptoms are high fever, abscesses in the subcutaneous tissue, particularly around the joints, erysipelas, and a severe form of jaundice. It terminates fatally within a limited number of days, rarely weeks. When the vagina of the mother is infected with syphilitic ulceration, the child is subject to be attacked with a *primary ulceration*. When it is the seat of gonorrhœal discharge, it gives rise to the most dangerous forms of *purulent inflammation of the eyelids*, which, unless treated at once, is apt to result in blindness. The treatment consists in absolute cleanliness; the eyes must be opened frequently and washed out with water. Ice is applied constantly to the outside, and a solution of nitrate of silver to the inside of the eyelids. *Asphyxia* is mostly seen after protracted labor or abnormal presentation of the child, the breech or the feet being born before the head. In such cases the umbilical cord is apt to be compressed, circulation thereby permanently or temporarily stopped, and premature respiratory movements brought on. The child is born almost or apparently lifeless, blue or pale, with no respiration and no pulsation of the heart. Artificial respiration is brought on by Marshall Hall's, Sylvester's, or Howard's method, by slapping the buttock of the babe, by alternately placing it in warm and cold water, by slapping its breast with a wet cloth, by swinging it forcibly in the air, by the application of an electro-magnetic current to its chest. When the surface is very blue a few drachms of blood may be allowed to flow from the untied umbilical cord. *Atelectasis* depends on an absence of the normal expansion of the lungs which follows the entrance of the air. The muscles of the chest may not be sufficiently developed, or their innervation may not be satisfactory from some disease of the brain, or the lungs may be inflamed or filled with mucus or some foreign substance introduced into them during birth (blood, mucus, amniotic liquor, etc.). Emetics will empty the lungs (tickling of the fauces is sometimes sufficient), mustard plasters and the electrical current excite the nerves, and the above-mentioned methods of inducing respiration will restore the normal action. *Cephalhæmatoma* results from two causes: the external layer of the cranial bones of the new-born is but little developed; thus the blood-vessels located in it are but little protected. Now but little violence, sometimes none at all, is required to burst them. A hæmorrhage takes place between the bone (usually one of the parietal) and its enveloping membrane (periosteum), which from a small size may increase to that of a walnut or small apple in the course of four or six days. It is not dangerous, will always get well in from four to ten weeks when left alone, but is apt to undergo suppuration or putrefaction when interfered with; for instance, by lancing. *Acute fatty degeneration* of more or less of the organs is not frequent. The covering epithelium of the lungs and bronchial tubes, of the uriniferous tubes of the kidneys, of the intestines, also the cells of the liver and blood-vessels, sometimes even the whole body, are affected. Thus, the physical functions are not rightly performed. One of the most fearful symptoms is uncontrollable hæmorrhage from the stomach, the bowels, and particularly from the umbilical cord. It is almost always fatal.

ABRAHAM JACOBI.

Con'ger Eel (or **Con'ger**), a genus of marine fishes of the eel family, having the tail longer and more pointed than the fresh-water eels, the dorsal fin commencing nearer the head, and the teeth of the upper jaw placed together, so as to form a cutting edge. The species are not at all numerous. The American conger (*Conger Americanus*) is from three to five feet long, and is occasionally seen in fish-markets. It has a very disagreeable taste. The *Conger vulgaris* is a native of British seas. In form the conger much resembles the fresh-water eel; its color is brown above, shading into dull white beneath; the fins whitish edged with black, and the lateral line almost white. The English conger attains a large size, often five to ten feet long and eighteen inches in circumference, weighing more than 100 pounds. It is very strong, and is a formidable antagonist when hauled into a boat by the fisherman's line. Great numbers are consumed as food by the poorer classes. The principal conger-fishery of Great Britain is on the Cornish coast.

European Conger Eel.

Conges'tion [Lat. *congestio*, from *con*, "together," *gero*, *gestum*, to "carry" or "heap"], in pathology, a term indicating fulness of blood, or hyperæmia, a condition to which much importance has been attached by medical writers. Congestions are either active or passive. Active congestions are always essential parts of a further morbid process, such as inflammation. Passive congestions are often determined by some mechanical cause of obstructed or retarded circulation. Active congestions of the brain or lungs are in themselves very alarming symptoms of disease; while the passive congestions, resulting from cirrhosis of the liver or from organic disease of the heart, are fruitful causes of local or general dropsies.

REVISED BY WILLARD PARKER.

Con'gleton, a market-town of England, in Cheshire, is in a deep valley on the river Dane, 22 miles S. of Manchester. It has manufactures of silk ribbons and other silk fabrics. Pop. in 1871, 11,344.

Congleton (HENRY BROOKE PARNELL), LORD, a British statesman, born July 3, 1776, was for many years a Liberal member of Parliament. He became secretary at war in 1830, and paymaster of the forces in 1835. He was well versed in financial affairs, and wrote several works, one of which was "On Financial Reform" (1830). Committed suicide June 8, 1842.

Conglom'erate [Lat. *conglomeratus*, from *con*, "to-

gether," *glomero, glomeratum*, to "wind," as on a ball, to "gather"], or **Pudding-Stone,** the name of a rock consisting of rounded, water-worn pebbles cemented and compacted together. These pebbles are fragments of quartz and other hard rocks, the rubbing and polishing of which must have required a long period of time. They are united by a silicious, calcareous, or ferruginous cement, sometimes so loosely that they are easily separated by a blow with a hammer. In other cases they are very firmly united, so that the rock breaks as if it were a homogeneous mass. Conglomerates occur in various formations and several geological ages.

Con'go, or **Zaire,** a large river in the S. W. part of Africa, forms the boundary between Loango and the kingdom of Congo. It flows nearly westward, and enters the Atlantic in lat. 6° S., and near lon. 13° E. Its source has not been explored by Europeans, and its length is not known. According to Behm, whose opinion is fully endorsed by Sir Henry Rawlinson, the Lualaba discovered by Dr. Livingstone is the upper course of the Congo, and not of the Nile. The mouth is 10 miles wide. About 140 to 180 miles from the sea this river is confined by high rocks in a channel from 300 to 500 yards wide, and here occur several great cataracts. The Congo is said to be three or four miles wide above these cataracts. According to Petermann, its annual discharge of water is much greater than that of the Mississippi.

Congo, a large country of Western Africa, in Lower Guinea, is bounded on the N. by Loango, on the S. by Angola, and on the W. by the Atlantic Ocean. The coast-region is level, and has a very hot climate. In the central portion are fertile uplands, which produce the palm tree, sugar-cane, the yam, the orange, etc. The soil yields maize, manioc, pulse, plaintains, oranges, pineapples, tamarinds, etc. The oil-palm yields palm wine. Among the animals found here are lions, leopards, elephants, buffaloes, hogs, and monkeys. The capital is Banza, which the Portuguese call São Salvador. The inhabitants are divided into innumerable petty tribes, each with a chief, and all subject to the Lindy N'Congo, who resides at Banza Congo. It was discovered by the Portuguese in 1486.

Congoon', a maritime town of Persia, province of Fars, on the Persian Gulf, 130 miles S. W. of Shiraz. It has a good roadstead. Pop. about 6000.

Congrega'tionalism is a system of administering church affairs which secures to each congregation the right of regulating, without external interference, the details of its worship and discipline according to its own understanding of the principles of the New Testament, while it inculcates the duty of maintaining the fraternal communion of believers, especially of such as profess the same faith and accept the same order.

According to the fundamental principle of congregationalism, any association of believers, united by formal covenant for mutual watchfulness and help, the maintenance of divine worship, the observance of Christian rites, and combined efforts to promote the kingdom of God, is a church of Christ; and as such is competent to elect and ordain its own officers, admit or reject applicants for membership, exclude unworthy members, control its own property, and transact its own business. The orderly prosecution of church-work calls for the appointment of various officers, on whom is laid the special responsibility of oversight and direction; and long usage, based upon the instructions of the New Testament, recognizes the office of pastor and that of deacon as needing to be perpetuated in the Church. The pastor holds the office of a bishop or elder. By virtue of his ordination he becomes a minister, whose function is not only to preach, but to officiate in the administration of sacraments, as well as at the marriage service and the burial of the dead; and this rank as a minister he retains, even though his position as a pastor of a particular church may have been resigned. Ordinarily, each church has but one pastor, and for his support provision is made in the form of a stipulated salary, voluntarily contributed by the congregation. Among ministers, whether installed as pastors or not, there is no disparity of rank. The deacons are not salaried officers, nor technically ministers, but they are helpers of the pastor, and have special charge of receiving the charities of the church and making distribution for the relief of the poor.

The congregational system holds to the Holy Scriptures as the sufficient and exclusive rule of ecclesiastical polity, recognizes no organized and visible Church apart from local and particular assemblies of believers, and repudiates all claims of superior bodies to exercise legislative or judicial authority over the brotherhood.

Nevertheless, the relation of neighboring churches is most intimate and friendly, and is manifested in various ways; especially by mutual consultations and co-operation, the occasional transfer of members, and formal or informal associations for common work. Thus congregationalism differs from independency in maintaining the fellowship of distinct churches, and from presbyterianism in denying the right of a presbytery or synod to exercise authority over the churches.

In its principles this system is remarkably unsectarian and liberal, and its development during the last two hundred and fifty years has been closely identified with increased liberty of religious thought, and with the practical union of men holding different tenets in common works of philanthropy and beneficence.

As a system of church order, congregationalism is not necessarily connected with any school of theology or any class of doctrine. Its methods of administering church-affairs may be adopted alike by Calvinists, Arminians, Socinians, and Arians. The church government of the different denominations of Baptists is, for the most part, simply congregational. Some Methodists have followed the same order. The churches in this country known as Unitarian are built upon the same platform. This is true also of Christians and Universalists. All these denominations are to be grouped together as occupying common ground in opposition to the idea of a Church comprising many congregations, and of a government administered by a priesthood.

At the same time, the churches which are generally known as Congregational hold firmly to positive and evangelical views of truth, being Calvinistic rather than Arminian, Trinitarian rather than Socinian or Arian, accepting the doctrine of a future state of endless retribution, recognizing the families of believers as fit subjects of baptism, and regarding the mode of administering baptism as of comparatively small importance. Each church has its own articles of belief, which with greater or less fulness indicate the system of doctrine taught from the pulpit and accepted by the members. Some churches have taken as their standards the Confession and Catechisms of the divines who met at Westminster, London, in 1648; but the creeds in common use are much briefer, and being intended for use as formulas for the reception of members, are for the most part so framed as to be acceptable to Christians generally.

The Congregationalists, when assembled in a national council at Boston in 1865, declared in general terms their "adherence to the faith and order of the apostolic and primitive churches held by their fathers," but "extended to all believers the hand of Christian fellowship upon the basis of those great fundamental truths in which all Christians should agree." So also at Oberlin in 1871 the elders and messengers of the Congregational churches of the U. S., in forming a permanent national organization, thought it sufficient to define their doctrinal position by these words: "They agree in the belief that the Holy Scriptures are the sufficient and only infallible rule of religious faith and practice; their interpretation thereof being in substantial accordance with the great doctrines of the Christian faith commonly called evangelical, held in our churches from early times, and sufficiently set forth by former general councils."

The early home of congregationalism was New England, to which it was brought at the earliest settlement of the colonies; but as the population has moved westward, this form of church order has spread extensively through the West and North-west, till more than half of the 3200 churches designated as Congregational are W. of the Hudson River, while in the South and South-west this denomination is but little known. Recognizing the importance of culture and an educated ministry, the Congregationalists have been distinguished as the founders and liberal supporters of schools, colleges, and theological seminaries. Their theological schools are at Bangor, Andover, Hartford, New Haven, Oberlin, Chicago, and Oakland (California). The Congregationalists have earnestly co-operated with other denominations in missionary and benevolent organizations which, like the American Bible Society, have invited to united effort. Among the societies which are now chiefly under their direction are the American Board of Commissioners for Foreign Missions, the American Home Missionary Society, the American Congregational Union, the Education Society, the American Missionary Association, the Congregational Publication Society, the Congregational Library Association, and the Western College Society. These, however, are not strictly ecclesiastical organizations, but associations of individuals over which the churches, as such, have no control. Indeed, the congregational theory of administration hardly permits such wide-spread and far-reaching activities to be included within the province of a particular Church.

The theory and practice of congregationalism have been much discussed in the present generation. (A valuable re-

pository of essays may be found in the "Congregational Quarterly," established in Boston in 1859, of which fourteen volumes have been published. Other authorities are "Debates and Proceedings of the National Council of Congregational Churches" at Boston, 1865; DEXTER'S "Congregationalism;" POND'S "Manual;" BACON'S "Congregational Order;" UPHAM'S "Ratio Disciplinæ;" PUNCHARD on "Congregationalism;" CUMMINGS'S "Dictionary of Congregational Usages and Principles;" BUCK'S "Massachusetts Ecclesiastical Law;" "Contributions to the Ecclesiastical History of Connecticut," and numerous local histories and church manuals.)

Statistical summaries of the Congregational churches may be found each year in the January number of the "Congregational Quarterly," representing the numerical strength of the denomination and its changes during the preceding statistical year.

The returns thus published in 1872 for the U. S. showed 3202 churches, 3124 ministers, 312,054 church members, and 368,937 in Sabbath schools; 13,271 members had been received during the year on profession of faith, and 10,969 by letter from other churches; 4701 had died, and 9799 had taken letters of dismission. The increase in one year had been 81 churches, 26 ministers, 5536 church members, and 7472 in Sabbath schools. In 1862, ten years before, the aggregate returns showed 2555 churches, 2678 ministers, 255,034 members, and 246,178 in Sabbath schools. (For Congregationalism in England, see INDEPENDENTS.)

E. W. GILMAN.

Congress, a township of Morrow co., O. Pop. 1347.

Congress, a township and post-village of Wayne co., O. The village is about 45 miles S. S. W. of Cleveland. Pop. of village, 309; total pop. 2581.

Con'gress [Lat. *congressus*, from *congredior, congressus*, to "go together," to "meet;" Fr. *congrès*], in politics, a meeting of the sovereigns of states or their representatives for the purpose of arranging international matters. The first general European congress was after the conclusion of the Thirty Years' war in Germany, at Münster and Osnabrück, 1648. Remarkable general congresses have been—of the Pyrenees (1659); at Aix-la-Chapelle (1668); at Nimeguen (1676); at Ryswick (1697); at Utrecht (1713); at Aix-la-Chapelle (1748); at Teschen (1779); at Paris (1782); at Versailles (1785); at the Hague (1790); at Rastadt (1797); at Erfurt (1808); at Vienna (1814, concluded at Paris 1815); at Aix-la-Chapelle (1818); at Troppau (1820); at Laybach (1821); at Verona (1822). More recently the word CONFERENCE (which see) is commonly applied to international meetings of statesmen for the settlement of international complications. (See PHILLIMORE, "On International Law," ii., 45.)

CONGRESS also comes into use as a name for international meetings of scholars of a particular science, as statistical congress, archæological congress, etc.

CONGRESS, the title of the national legislature of the U. S. of America. It consists of a House of Representatives and of a Senate. The former is composed of members chosen every second year. The qualification of electors is the same as that required in their respective States for electors to the lower house in the State legislature. The number of representatives is apportioned according to the population of each State, and a new apportionment is made every ten years after the census is taken by authority. The Senate is composed of two members from each State; the Senators are chosen for six years by the legislature of the State. The House of Representatives chooses its own Speaker; the Vice-President of the U. S. is *ex-officio* president of the Senate. Bills for revenue purposes must originate in the House of Representatives, but are subject to the proposal of amendments by the Senate. The Senate has the sole power of trying impeachments, but it can only convict by a majority of two-thirds of the members present, and its sentence extends only to removal from office and disqualification to hold any office of honor or profit under the U. S. The regular meeting of Congress is on the first Monday in December, annually. Every bill which passes the two houses is sent to the President for approval or disapproval; in the latter case he returns it, with his reasons, to the house in which it originated; if on reconsideration it is passed again by a majority of two-thirds in each house, it becomes law. The powers of Congress are limited, and separated from those of the State legislatures by the Constitution. Members of Congress cannot legally have any interest in any contract with or claim against the government; they are forbidden to prosecute cases before the court of claims, or to present claims to any of the departments. The Senate consists (in 1873) of 74 members, and the other house of 292 members. No person is eligible to the Senate under the age of thirty years, nor to the House of Representatives under the age of twenty-five. (For a full statement of the origin, character, and powers of Congress, see CONSTITUTION OF THE UNITED STATES.)

Congress Spring, at Saratoga, N. Y., a saline mineral spring whose waters are highly charged with carbonic acid gas. When fresh, Congress water contains more than its own bulk of this gas, 100 cubic inches of water holding in solution 116 inches of the acid. Its saline ingredients are the carbonates, chlorides, iodides, bromides, etc. of potassium, sodium, lime, iron, magnesia, strontia, and other bases. These solid matters are found in the proportion of nearly 33 grains to a pound of the water, which possesses valuable tonic and deobstruent qualities.

Congress, Statistical. See STATISTICAL CONGRESS.

Con'greve (WILLIAM), a witty English dramatic poet, born of an old Staffordshire family near Leeds Feb., 1670. He was educated at the University of Dublin, and entered the Middle Temple as a student of law, but he never devoted much time to the study or practice of that profession. His first drama, "The Old Bachelor," was performed with great success at Drury Lane when Congreve was not yet nineteen years of age. The "Double Dealer," in the following year, did not succeed. He produced in 1695 a comedy called "Love for Love," which added much to his fame and fortune, and in 1697 "The Mourning Bride," a tragedy, which was greatly admired. He obtained several lucrative civil offices. His comedy called "The Way of the World" (1700) failed so completely that he renounced the drama in disgust. He affected to depreciate his dramatic triumphs, and was more ambitious to pass for a man of fashion than a poetical genius. Died Jan. 19, 1729. (CHARLES WILSON, "Memoirs of the Life of W. Congreve," 1730.)

Congreve (Sir WILLIAM), BART., F. R. S., an English officer and engineer, born in Middlesex May 20, 1772. He invented several improvements in canal-locks, and in 1804 the Congreve rocket. (See ROCKET.) He published several professional works. Died May 14, 1828.

Co'ni, or **Cu'neo,** a town of Italy, in Piedmont, capital of the province of Cuneo, is on the river Stura, 54 miles by railway S. by W. from Turin. It has a cathedral, a fine town-hall, a royal college, a theatre, several convents and palaces. It was a strong fortress before 1800, and was dismantled by the French after the battle of Marengo in that year. Here are manufactures of linen and hemp. Coni has an extensive trade. Pop. in 1871, 22,882.

Con'ic Sec'tions, in mathematics, the sections of a right cone by a plane. If the cutting plane is perpendicular to the axis, the section is a *circle;* if it is parallel to one side of the cone, the section is a *parabola;* if it makes a greater angle with the base than is made by the side of the cone, the section is a *hyperbola;* if it is oblique to the axis, and only cuts the conical surface, it is an *ellipse*. The circle, the line, and the point may each be regarded as particular cases of the ellipse; the line as a particular case of the parabola; the triangle as a particular case of the hyperbola. The study of conic sections is specially interesting and important on account of its connection with the laws of moving bodies. The orbits of planets, the paths of projectiles, the undulations of light and sound, are all either circular, elliptic, parabolic, or hyperbolic.

Conif'eræ [from the Lat. *conus*, a "cone," and *fero*, to "bear"], an important natural order of exogenous plants, comprising the pines, firs, etc. They agree with the other exogens in the structure of the stem and in the mode of vegetation, but differ remarkably from most of them in fructification. Their ovules are not enclosed in an ovary, but are fertilized by the direct application of the pollen to the *foramen*, with no style or stigma; and for this reason they, with the Cycadaceæ, are called gymnosperms. The flowers are unisexual, the male and female being sometimes on the same, sometimes on different plants. The male flowers have either one stamen or one bundle of stamens, the anthers often crested. The female flowers are in cones or solitary. The place of ovaries is supplied by the flat scales of the cones. The ovules are usually in pairs. The fruit is either a cone, a berry-like fruit, or a solitary naked seed. The seed has a hard, crustaceous integument. The embryo is surrounded by fleshy, oily albumen. The cotyledons are either two or numerous and whorled. The Coniferæ are trees or shrubs, mostly with resinous juice, and awl-shaped or needle-shaped leaves. Some of the Coniferæ attain a height almost unrivalled among other forest trees. The *Sequoia* of California affords the most striking example. The woody fibre is marked with circular disks, which, when highly magnified, exhibit a small internal circle surrounded by a larger one. This peculiarity of the wood of the Coniferæ is important, as enabling us to refer many fossils, particularly of the coal formation, to this order. Most of the Coniferæ have very narrow,

veinless, evergreen leaves, but some few are deciduous, and others have flat and wide leaves. By far the larger number of them belong to the northern hemisphere. They are very long-lived: some of them are supposed to be capable of enduring to the age of 2000 or 3000 years. Besides the valuable timber obtained from many of the Coniferæ, they are remarkably productive of turpentines and resins. Astringent substances are also found in their bark, and fixed oil in their seeds. The seeds of some species are used as food. By some botanists this order is divided into two, three, or more orders.

Co'niine, also called **Conine, Conicine,** and **Cicutine,** a volatile alkaloid constituting the poisonous principle of the *Conium maculatum,* or poison hemlock. It was discovered in 1827 by Giesacke, but first prepared in a pure state by Geiger in 1831. Formula, $C_8H_{15}N$. It exists in all parts of the plant, but in greatest quantities in the seeds just before maturity. Coniine is stated by Walz to exist in the ripe seeds of the *Æthusa Cynapium,* or fool's parsley, and Wagner claims to have found it in the root of the *Imperatoria.* Coniine is obtained by mixing the bruised seeds of the plant with a strong base, as lime, and distilling the base over with water. It is an oily liquid of specific gravity 0.89, boiling at about 170° C. (338° F.), with a penetrating repulsive and suffocating odor and a sharp taste. It has a strong alkaline reaction in the presence of water, but the blue color produced by it on reddened litmus paper is not permanent. At a low temperature it takes up considerable amounts of water, but if the solution is warmed it becomes turbid. It is but slightly soluble in water, but very soluble in alcohol and ether. It is very inflammable, burning with a bright smoky flame. When exposed to the air it slowly decomposes, ammonia being evolved and a resinous substance being left. With acids it forms crystallizable salts which are soluble in water and alcohol, are odorless when dry, and are decomposed by heat. According to Geiger, the salts are less poisonous than the base itself. Other authorities assert that the reverse is the case. In any case, the action is that of an acrid narcotic poison. One of the tests in the laboratory for the presence of this alkaloid is the peculiar odor developed by setting it free from its combinations by means of caustic potash.

In 1872, Schiff obtained synthetically a substance identical in composition with coniine, and resembling it in odor, appearance, and general reactions. This product has, however, optically no rotatory power, and differs from the natural coniine in a few other details. The name *paraconiine* has therefore been proposed for the artificial product.

The alkaloid, as well as the leaves and seeds of the *Conium maculatum,* is used in pharmacy as a narcotic.

C. F. Chandler.

Con'ington (John), a distinguished classical scholar and literary writer, was born Aug. 10, 1825, in Boston, England, and educated first at Rugby under Dr. Arnold, and then at Oxford, where he became a fellow of University College in 1848. While still a B. A. he published an edition of the "Agamemnon" of Æschylus, with a poetical version, in which he inaugurated the double career, which he successfully followed up, of critical editor and translator. In 1852 he had begun, in conjunction with Mr. Goldwin Smith, an edition of the works of Virgil, the first volume of which was published in 1858. In 1854 he was appointed to the chair of Latin in the university, and from this time to his early death in 1869 his pen was constantly busy. His Æschylean studies were continued in the edition of the "Choëphoræ" in 1857, but after this he felt drawn more particularly to the studies connected with his chair. In 1863 appeared a version of the Odes of Horace, and the second volume of his Virgil. In 1866 he published a spirited translation of the "Æneid" in the ballad measure of Scott, which he followed up the next year by completing the version of the "Iliad" begun by his friend Mr. Worsley. He completed his translation of Horace, and prepared an edition of the "Satires" of Persius, with a translation, just before his death in 1869. The last volume of his edition of Virgil appeared after his death, under the supervision of his friend and fellow-worker, Mr. Nettleship, in 1871. Two volumes of miscellaneous writings, with a memoir prefixed, were issued in 1872, the second volume containing a prose translation of the "Eclogues," "Georgics," and "Æneid" of Virgil. Henry Drisler.

Coniros'tres [from the Lat. *conus,* a "cone," and *rostrum,* a "bill"], a tribe of birds of the order Insessores (perchers), characterized by a strong conical bill without notches. It comprises numerous species, among which are crows, finches, larks, buntings, sparrows, starlings, and birds of paradise. Many recent systematists reject the term altogether, and group these birds in the section Oscines (singers), of the order Passeres and sub-class Insessores.

Coni'um [Gr. κώνειον], the leaves of the poisonous hemlock, *Conium maculatum,* an Old World umbelliferous plant naturalized in the U. S. It is in medicine a useful sedative, hypnotic, and anodyne. In over-doses it produces a dangerous paralysis. With this drug Socrates and Phocion were poisoned. Stimulants and emetics are the best antidotes.

Conjeveram, or **Cauchipoo'ra** ("golden city"), a town of Hindostan, on the railway, 62 miles S. W. of Madras, in the presidency of Madras. It consists mostly of mud cabins, extends over considerable ground, and contains large gardens and cocoa groves. It is noted for two interesting pagodas with remarkably fine sculptures. Pop. 20,000.

Conju'gate [Lat. *conjugatus,* part. of *conjugo,* to "yoke together"], an adjective frequently used in pure and applied mathematics with reference to two quantities, points, lines, axes, curves, etc., which present themselves simultaneously and have reciprocal properties.

Conjuga'tion [Lat. *conjugatio,* from *con,* "together," and *jugo, jugatum,* to "yoke"], in grammar, a regular distribution of the several inflections of verbs into their different voices, moods, tenses, numbers, and persons; a synopsis or statement of the changes of form or inflections to which a verb is subject. In Latin grammar there are four different forms of regular verbs, which are called the first, second, third, and fourth conjugations, and in some languages the number is even greater. (See Grammar.)

Conjugation is also a process occurring among the lower forms of organic life, in which the substance of two distinct organisms, coming into contact, is passed into a single mass. In plants it is always attended with reproduction, sometimes also in animals. It has been observed in numerous algæ and in some fungi.

Conjunc'tion [Lat. *conjunctio,* from *con,* "together," and *jungo, junctum,* to "join"], one of the aspects of the planets. Two or more heavenly bodies are in conjunction when they have the same longitude. The sun and moon are in conjunction at the time of new moon. In general, a heavenly body is in conjunction with the sun when it is on the same side of the earth and is in a line with him. When Mercury and Venus are in a line between the earth and the sun they are said to be in inferior conjunction. When the sun is between the earth and one of the planets the latter is in superior conjunction.

Conjunction, in grammar, a part of speech used to connect words or sentences; that part of speech which expresses the relation of propositions to each other. Conjunctions are co-ordinate when they unite expressions of equal grammatical importance; subordinate when they unite a dependent clause to a principal one.

Conk'lin, a township and village of Broome co., N. Y. The village is about 20 miles E. of Owego. Pop. 1440.

Conk'ling (Alfred), the father of Roscoe C., born at East Hampton, N. Y., Oct. 12, 1789, graduated at Union College in 1810, became a lawyer, was member of Congress (1821–23), afterwards U. S. district judge for Northern New York, and was minister to Mexico in 1852. He published several legal works. Died Feb. 5, 1874.

Conkling (Roscoe), an American statesman, born at Albany, N. Y., Oct. 30, 1829, studied and practised law. In 1846 he removed to Utica, of which place he was elected mayor in 1858, and was elected to represent his district in the U. S. Congress four times, and in 1867 and 1873 to the U. S. Senate.

Conk'lingville, a post-village of Hadley township, Saratoga co., N. Y. Has a large tannery and a manufactory of veneers.

Conlie, a French village, in the department of Tarthe, is situated 14 miles W. of Le Mans. Near it the French government established in Oct., 1870, a large fortified camp which could receive about 50,000 troops. After the battle of Le Mans the camp was, on Jan. 14, 1871, occupied by the Germans. Pop. of the village in 1866, 1720.

Connara'ceæ [from *Connarus,* one of the genera], a natural order of exogenous plants (trees or shrubs), natives of tropical countries, and nearly allied to the Leguminosæ. They have compound leaves destitute of stipules. They differ from the Leguminosæ by having the radicle remote from the hilum. Among the products of this order is the beautiful zebra-wood (the wood of *Omphalobium Lamberti*), a native of Guiana.

Con'naught, the most western province of Ireland, is bounded on the N. and W. by the Atlantic Ocean, on the E. by Ulster and Leinster, and on the S. by Munster. Area, 6863 square miles. It is divided into the counties of Galway, Leitrim, Mayo, Roscommon, and Sligo. The surface in the western part is mountainous. The coast is deeply indented, and affords good harbors. The river Shannon

forms the eastern boundary of the province. Connaught was formerly a kingdom of the Irish pentarchy. Pop. in 1871, 845,993.

Con'neaut', a post-borough of Ashtabula co., O., on Conneaut Creek and on the Lake Shore R. R., 68 miles E. N. E. of Cleveland and 2 miles from Lake Erie. It is a shipping-point for produce. Here the first settlers of Northern Ohio landed in 1796. The mouth of the creek makes a good harbor. Conneaut has a lighthouse, a good trade, and one weekly newspaper. Pop. 1163; of Conneaut township, 3010.

Conneaut, a township of Crawford co., Pa. P. 1729.

Conneaut, a township of Erie co., Pa. Pop. 1538.

Conneaut'ville, a post-village of Crawford co., Pa., on the Erie and Pittsburg R. R., 35 miles S. S. W. of Erie. It has one national bank and one weekly newspaper. P. 1000.

Connecticut, kon-net'e-kŭt, a river of the U. S., rises in the extreme northern part of New Hampshire, near the frontier of Canada. Its W. bank forms the entire boundary between New Hampshire and Vermont. (See New Hampshire.) It flows in a general S. S. W. direction until it enters Franklin co., Mass. It afterwards intersects Massachusetts and Connecticut, flowing nearly southward to Middletown (Connecticut), below which its course is S. E., and enters Long Island Sound at Saybrook. Length, about 450 miles. The valley of the Connecticut is celebrated for the beauty of its scenery, the fertility of its soil, and the luxuriant growth of the tobacco-plant known as the "Connecticut seed-leaf," which is used principally as "wrappers" in making cigars. It is not an uncommon thing for the crop to exceed 2000 pounds to the acre. Vessels drawing eight feet can ascend to Hartford, which is about 50 miles from its mouth. Its principal affluents are the Deerfield, Farmington, and Chicopee rivers.

Connecticut, one of the six New England, and one of the thirteen original, States of the American Union, lying

Connecticut Seal.

in the eastern division of the U. S., and bounded as follows: N. by Massachusetts, E. by Rhode Island, S. by Long Island Sound, and W. by New York. No one of its boundaries is a continuous straight line, that on the N. having a notch where the town of Southwick, Mass., interrupts the boundary; the eastern following at its lower portion the sinuosities of Pawcatuck River; the southern being the line of the sound shore; and the western boundary, after following a course S., slightly bearing W. till within about 15 miles of the sound, suddenly turns S. E. for about 8 miles, then S. W. for about 13, then S. E. for 6 or 7. The northern line is about 88 miles long; the eastern, 45 miles; the western, by the indirect line we have described, 72 miles. The sea or sound coast, from Pawcatuck River on the E. to Byram River on the S. W., is about 100 miles. The average length of the State from E. to W. is 86 miles, and its average breadth from N. to S., 55 miles. It lies between N. lat. 41° and 42° 3′, and W. lon. 71° 55′ and 73° 50′. Its area is 4674 square miles.

Face of the Country, Rivers, Mountains, Valleys, etc.—The State is mainly drained by its three principal rivers and their tributaries, the Housatonic, the Connecticut, and the Thames, though these are supplemented by numerous small streams from 10 to 15 miles in length, and one about 35 miles in length, the Quinnipiack, which, like the larger rivers, all discharge their waters into the sound. The Housatonic River rises in the N. W. part of Berkshire co., Mass., pursues a generally southern course till it reaches about the middle of the State of Connecticut, when it turns S. E., and discharges its waters into the Sound at Stratford. The Connecticut (see Connecticut River), rising near the Canada line, separates New Hampshire and Vermont, and passes through Massachusetts and Connecticut to the sound, deflected at Middletown to the S. E., like the Housatonic and Thames, and on about the same parallel. The Thames, a broad and noble river, is only known by that name from Norwich to New London Harbor. The Yantic and Quinnebaug unite to form the Thames at Norwich, and the Quinnebaug itself takes the Shetucket as its principal tributary—a tributary formed by the union of the Willimantic and Hop rivers. These streams drain most of Windham and a part of New London counties. The principal tributary of the Connecticut in the State is the Tunxis or Farmington River, which drains a part of Litchfield and Hartford counties. The chief affluent of the Housatonic is the Naugatuck River, which receives the waters of several towns of Litchfield and New Haven counties. The State has no prairies and but little absolutely level land. Its central valley begins at the sound, and, embracing a tract of the average breadth of about 20 miles, including the towns of East Haven, New Haven, and West Haven, passes N. E., its eastern border crossing the Connecticut River below Middletown, while its western border continues on the W. side of the river through Hamden, Cheshire, Southington, Farmington, Avon, Simsbury, and Granby into Massachusetts; the eastern border passing at the same time through Portland, Glastonbury, Manchester, East Windsor, and Somers to the Massachusetts line. The lower part of this valley is sandy and alluvial, but barren except when it is highly manured. In many places it forms extensive plains of drifting sand, and these sometimes invade the portions which have, under the stimulus of strong manures, grown a moderate crop. But at the point where it approaches the Connecticut River the character of the soil changes; the underlying rock, for the remainder of the course of the valley through the State, is the new red sandstone, and above it a rich, deep clayey loam, with sand enough to make it permanently arable; and there is hardly any section of the U. S. which yields, year after year, such ample crops as this portion of the Connecticut River valley. There are in the lower and western portions of this valley some ranges and several isolated buttes or elevated bluffs of trap-rock, which in some volcanic convulsion or earthquake was interjected through rifts in the overlying rocks. On the W. side these bluffs and ranges have a precipitous and sometimes an almost perpendicular descent, while on the E. side they descend to the level of the valley by a gentle declivity. There are also two or three cross ranges, of no great height, of trap-rock connecting with mountains on the eastern or western border of the valley. These trap ranges are broken by several gaps, cutting them completely through; one of these affords a passage for the Farmington River; another opens a way for the railroad from Hartford to Waterbury. The eastern part of the State, which is drained by the Thames and its affluents, has no broad valley, but numerous narrow ones, and the underlying rocks being granitic and metamorphic, the hills which bound these valleys are gently rounded slopes, cultivable even to their summits. This portion of the State is excellent grazing-land, and much of it is celebrated for its dairy products; while the numerous waterfalls and the uniformity of the streams make it a favorable region for manufactures, which are largely conducted in this section. The western part of the State, drained by the Housatonic and its tributaries and by the Tunxis, is of broken surface, with sharp cliffs and large boulders, while the surface is much of it covered with rocks. Less than a moiety of the land is susceptible of successful tillage, and the passage from one valley to another over the rough and precipitous hills is very difficult. Many of the valleys, though narrow, afford good and succulent pasture, and the butter, cheese, and condensed milk of Litchfield county have a reputation far beyond the limits of the State. S. of the point (Brookfield) where the Housatonic turns south-eastward the western part of the State is sandy and gravelly, though portions of it yield fine crops by the application of highly stimulating manures. The proximity of this portion of the State to New York has led to extensive culture of the small fruits and vegetables, which find a ready market in the metropolis. The shore line for a distance of from 5 to 15 miles back from Long Island Sound is alluvial and diluvial, and excessively sandy, but, by the application of large quantities of menhaden and the fish and other guanos, yields good crops of potatoes, rye, oats, and Indian corn. There are no elevations deserving the name of mountains in the State, the highest elevation being considerably below 1000 feet.

There is a large amount of mineral wealth in the State.

Neither gold nor silver has been found in any considerable quantities, though both the copper and lead ores are argentiferous. Copper is found in various parts of the trap-rock range; the Simsbury copper-mines were worked many years before the Revolutionary war, and subsequent to that event were made the State prison and worked by convict labor. The copper-mines in Bristol have yielded large amounts of copper, but owing to the comparatively small percentage of pure metal in the ore, and the heavy expense of raising it, the mines in both places have proved unprofitable in face of the abundant yield and purer ores of the Lake Superior region. Argentiferous galena, yielding a large percentage of silver, has been worked at various times in Middletown, but the net result has not been profitable. The iron ores of the State have been worked with advantage for about 125 years. Bog-iron ore is found in various parts of the State, but the extensive beds of hematite ore in Salisbury and Kent, as well as less extensive ones in Sharon, Cornwall, and Canaan, have yielded the best quality of charcoal iron in the country. These mines were opened about 1750, and the greater part of the iron required for cannon, for the chains across the Hudson, and for other purposes during the Revolutionary war, came from the Salisbury furnaces. The valley of the Housatonic above New Milford, and the narrow valleys which branch out from it, abound in limestone of the best quality, both for burning and building or ornamental purposes; and the Canaan lime, as it was called, held for many years the first rank in the market. The New Preston marble-quarries in the town of Washington, Litchfield co., furnish an admirable quality of dense white marble of pure color and fine grain, for which there is a constant demand. But the finest building-stone in the State, and that most in demand all over the U. S., is the red sandstone (better known as brownstone or freestone) from the quarries on both sides of the Connecticut River at Portland and Cromwell. The Portland quarries are the oldest, but both towns yield a stone identical in quality and color—an excellent building-stone, and which is in great demand for covering or veneering the fronts of brick buildings from its excellent properties of durability, resistance to climatic action, and quiet but effective color. Quarries at Bolton and at Haddam yield excellent qualities of flagging stone, which splits smoothly and wears well. There are also at the latter place extensive quarries of granite and gneiss. Sulphate of barytes (heavy spar) is found in large veins in the E. part of Cheshire and Southington, and is quarried and sent to New York, Boston, and Philadelphia to be used with white lead for paints. Hydraulic lime in immense quantities is found on the borders of Southington and Berlin, and large quantities of hydraulic cement are manufactured from it. There are quarries of a good tiling slate. In Milford and North Milford there is a quarry of a beautiful green marble of a quality nearly or quite equal to *verd antique*, but the expense of working it has proved very heavy. Fire-clay, porcelain-clay of excellent quality, and potter's clay are found in various parts of the State, and firebricks and firebrick furnaces and crucibles are made at New Milford, and the felspar quarried for porcelain at Middletown. There are mineral springs in various parts of the State, but those most celebrated are the slightly sulphurous chalybeate springs at Stafford. Salt is made by evaporation from sea-water at Stonington and other points on the shore of Long Island Sound.

Vegetation, Zoology, and Climate.—The forest trees of Connecticut, now much less numerous than formerly, since large tracts have been felled for ship-timber, for furnace and brick-kiln use, and for the production of charcoal, are those which are most serviceable in manufactures. Neither the pine nor the hemlock is abundant, but the white oak (an excellent ship-timber), the yellow and red oak, the hickory or walnut, the chestnut, butternut, tulip tree or white wood, beech, birch, ironwood or hop-hornbeam, sugar, rock, silver, and red maple, ash, elm, sassafras, wild cherry, red cedar, juniper, and among the shrubs or small trees the alder, box-elder, shad-bush, spice-bush, etc., are the principal trees of the forests which yet remain. Among the wild fruits are wild grapes, beach and sloe plums, crab-apples, whortleberries, blackberries, dewberries, raspberries of several varieties, barberries, cranberries, gooseberries, strawberries, partridge and wintergreen berries.

The State has been so long settled, and is so densely populated, that there are very few wild animals left in it. Foxes are occasionally, though rarely, found in the western counties, and the gray rabbit, gray, red, striped, and flying squirrels are found, though not in large numbers, in most parts of the State. Occasionally the wild-cat is seen in the larger forests, while the skunk, the muskrat, the woodchuck, and the smaller burrowing animals, moles, field-mice, and those pests, the Norway and water rat, appear in considerable numbers. Among birds, the birds of prey are represented by the eagle (two or three species), several species of hawk, some of them large, four or five species of gulls, as many of owls, the crow, raven, etc., while the robin, oriole, redbird, crow blackbird, blackbird, jay, blue-bird, hanging-bird, woodpecker, thrush, brown thresher, several of the finches, the wren, swallow, whippoorwill, humming-bird, etc., represent the class of song-birds; the grouse family and its congeners, and the pigeon, quail, partridge, pinnated grouse or heath-hen are found, snipe and woodcock are plenty in swamps and woods along the sea-shore, and several species of duck, wild geese, etc. are found along the rivers and bays. Fish, especially of the edible kinds, abound in the waters of the State. The shad, tautaug or blackfish, bluefish, porgy, black, rock, and striped bass, flounder, sturgeon, pickerel, perch, roach, sheepshead, weakfish, catfish, menhaden, etc. abound; the salmon, formerly so abundant in the Connecticut River, has recently been restored to it, and in the sound are found the shark (several species), the stingray, the skate, and occasionally the porpoise and the blackfish, a small species of whale. The shores of the sound abound in the best qualities of shellfish, the oysters, long or soft-shelled clams of several species, quahogs or round clams, scallops, and mussels being of excellent flavor. Lobsters, crabs, king-crabs, sea-urchins, sea-spiders, etc. are also very plentiful. Reptiles are less abundant than in most States. The only venomous snakes are the rattlesnake and two or three species of adder, and these are not abundant. The other snakes, of which there is a very considerable variety, though no great number of individuals, are all harmless, except the racer or blacksnake, our North American representative of the boa constrictor tribe, which crushes its prey in its folds. These are now found but rarely. Two or three species of frogs, as many of toads, and four or five of the lizard tribe, are the only other reptiles worthy of note. The *climate* of the State does not vary materially from that of the other States of the same latitude on the Atlantic slope. The spring opens usually from the 10th to the 20th of April, and except occasionally a single slight frost in September there is no more cold weather until November. The winters are, away from the sea-board, usually severe, and considerable snow lies on the ground sometimes for months. The temperature in summer is often high, and averages about 70° F. during the summer months, permitting most varieties of the grape and Indian corn to come to perfection. In the Connecticut Valley heavy fogs prevail during a part of the summer and autumn months. There seems to be little or no marsh miasm in the State, and intermittent and remittent fevers do not originate there. In diseases of the lungs, though more favorable than most of the other New England States, it is less so than the Southern or South-western States.

Agricultural and Manufacturing Products, Fisheries, etc.—Connecticut is not largely an agricultural State, much of her wealth being invested in manufacturing, commercial, and banking enterprises; but her fertile lands are under a high state of cultivation, while the comparatively barren ones are, under skilful husbandry, made to produce fair crops. The State Agricultural Society is an efficient body, and has done much to promote good farming. The statistics of the leading crops for the year 1872 were—Indian corn, 1,705,000 bushels, raised on 54,647 acres, and estimated as worth $1,568,600; wheat, 37,100 bushels, raised on 2182 acres, and worth $61,215; rye, 311,000 bushels, raised on 19,683 acres, and worth $342,100; oats, 1,063,000 bushels, raised on 29,692 acres, and worth $648,430; barley, 23,000 bushels, raised on 995 acres, and worth $20,700; buckwheat, 94,900 bushels, on 4942 acres, and worth $91,104; potatoes, 1,819,000, on 18,190 acres, and worth $1,491,580; tobacco, 8,336,000 pounds, on 5052 acres, and worth $2,500,800; hay, 534,000 tons, raised on 472,566 acres, and worth $13,910,700. The live-stock in the State in Jan., 1873, was as follows: 50,300 horses, valued at $4,974,167; 106,800 milch cows, worth $4,218,600; 111,200 oxen and other cattle, worth $4,521,392; 83,200 sheep, worth $410,176; 63,700 hogs, worth $836,381. According to the census of 1870, Connecticut had 1,646,752 acres of improved land in farms, and 717,664 acres unimproved, of which 577,333 acres were woodland. The cash value of its farms was $124,241,382, and of farming implements, $3,246,599. The total amount of wages paid for farm-labor was $4,405,064, and the estimated value of all farm products for the year 1869–70 was $26,482,150. The following additional statistics of the agriculture of the State are only collected at each decennial period, and refer to the census year 1869–70: The value of animals slaughtered or sold for slaughter was $4,881,858; the value of home manufactures, $53,297; of forest products, $1,224,107; of market-garden products, $599,718; of orchard products, $335,594; of wool, 254,129* pounds; of hops, 1004 pounds; of maple-

* There is reason to believe this an under-estimate.

sugar, 14,266 pounds; of sorghum molasses, 6832 gallons, and of maple molasses, 168 gallons; of sweet potatoes, 867 bushels; of peas and beans, 13,038 bushels; of beeswax, 1326 pounds; of honey, 32,158 pounds; of domestic wine, 27,414 gallons; of clover seed, 1725 bushels; of grass seed, 4471 bushels; of butter, 6,716,007 pounds; of cheese, 2,031,194 pounds; of milk sold, 6,253,259 gallons.

Connecticut is eminently a *manufacturing* State, ranking in the capital employed, notwithstanding the smallness of her territory, fifth, and in the value of her manufactured products eighth, in the list of States. It is to be regretted that the statistics of her manufactures in the census report are confessedly so inaccurate. The superintendent of the census estimates that the reported capital invested in manufactures is not more than one-fourth of that actually employed, and that in the other particulars there are necessarily great errors, mostly, it is supposed, in the way of under-estimate. The census of 1870 reports that in the year 1869–70 there were in Connecticut 5128 manufacturing establishments, operated by 711 steam-engines of 25,979 horse-power and 1988 water-wheels of 54,395 horse-power; these establishments employed 89,523 persons, of whom 61,684 were adult males, 20,810 adult females, and 7029 children. The capital invested is stated at $95,281,278, the amount of annual wages paid at $38,987,187, the value of materials at $86,419,579, and the annual product at $161,065,474. Among the largest of these industries were manufactures of cotton goods, of which there were 111 establishments, employing 12,086 hands, having a reported capital of $12,710,700, paying $3,246,783 in annual wages, using raw material of the value of $8,818,651, and producing goods valued at $14,026,334; woollen goods, of which there were 103 factories, employing 7285 hands, having a reported capital of $12,490,400, paying for annual wages $2,860,120, using raw material costing $11,016,925, and producing annually goods valued at $17,365,148; various manufactures of iron, of which there were in all 120 establishments, employing 3866 persons, having a reported capital invested of $5,202,650, paying as annual wages $977,897, using raw material of the value of $3,632,317, and producing iron and iron goods of the annual value of $7,018,711; hardware and saddlery hardware, 155 establishments, employing 7721 persons, reporting a capital invested of $7,138,645, paying wages to the annual amount of $3,748,822, using raw material valued at $5,344,811, and producing goods to the annual value of $12,672,034; India-rubber and elastic goods, 13 establishments, employing 1946 persons, a capital estimated at $2,345,000, paying as wages annually $761,434, using raw material estimated at $2,355,488, and producing annually goods to the amount of $4,239,329; firearms and small-arms, 8 establishments, employing 1607 hands, reporting $1,793,770 of capital invested, $1,100,668 wages paid annually, $315,247 worth of raw material used, and $2,222,873 of goods annually produced.* In the manufacture of clothing there are 244 establishments, employing 3414 hands and a capital reported at $1,250,220, expending $2,666,068 for raw material, and producing goods to the value of $4,481,259; of hat and cap manufactories there were 33, employing 2464 hands, a reported capital of $1,153,300, and producing from $1,894,647 worth of raw material, goods to the value of $3,740,871; there were 205 carriage and wagon factories, employing 2341 hands, and producing from $1,798,299 worth of raw material goods to the value of $4,164,480; there were 42 establishments for the manufacture of plated ware, employing 2107 hands, a capital reported at $2,337,500, and producing from $2,005,090 worth of raw material, goods to the value of $4,066,806; in the manufacture of machinery of all kinds there were 108 machine-shops, employing 2770 hands, reporting a capital of $4,342,641, and producing from $1,617,444 worth of raw material, machinery to the value of $5,010,379; there were 9 factories for sewing-machines and sewing-machine fixtures, employing 2525 hands, capital reported at $2,492,000, and producing from $1,356,015 worth of raw material, machines and fixtures to the value of $4,507,850; there were 23 silk-factories, employing 1703 hands, reporting a capital of $1,414,130, and producing from $2,049,834 worth of raw material, silk goods to the value of $3,314,845; the manufacture of paper is conducted in 66 paper-mills, employing 1397 hands, reporting a capital of $2,988,046, and producing from $3,327,266 worth of raw material, paper to the value of $4,874,241. The other branches of manufacturing industry which produced goods to the reported value of over $1,000,000 were—agricultural implements, 38 establishments, producing goods to the value of $1,183,947; bleaching and dyeing, 18 establishments, producing goods worth $2,849,743; boots and shoes, 38 establishments, producing $1,939,652 worth of goods; brass-founding and brass-wares, 47 establishments, producing goods to the amount of $2,404,990; carpets, 21 factories, with $1,530,000 capital, producing $2,027,136 worth of carpets; clocks and clock-cases and materials, 28 factories, employing 1471 hands, and making from $941,572 worth of raw material $2,747,153 worth of clocks and cases; cutlery, including edge-tools and axes, 125 establishments, employing 2378 hands, and producing goods to the value of $3,059,806; drugs and chemicals, 6 manufactories, employing 261 hands, and producing goods to the value of $1,289,845; flouring-mill products, 150 establishments, producing flour, etc. to the value of $2,946,010; furniture, 56 shops, producing $1,103,690 worth of furniture; hosiery, 14 factories, making $1,251,742 worth of goods; leather, tanned and curried, by tanneries, producing $1,024,316 worth of leather; lumber, sawed and planed, 145 mills, producing $1,774,014 worth of lumber; printing and publishing, 42 offices, producing papers, periodicals, books, etc. to the value of $1,094,440;† saddlery and harness, 106 shops, producing $1,055,350 worth of goods; straw goods, 3 factories, employing 1010 hands, and producing goods to the value of $1,026,000; tin, copper, and sheet-iron ware, 129 shops, employing 968 hands, and producing wares valued at $1,625,774; tobacco and cigars, 100 shops, producing goods to the amount of $1,133,665. There are 20 quarries and mines (mostly quarries), having a reported capital of $1,496,100, and producing annually to the amount of $1,227,400. There are also 171 fishing establishments, exclusive of the whale fisheries, having $421,775 capital, and yielding an annual product of $769,799.

Railroads.—There are 22 railroads wholly or in part in the State, having an aggregate length of 886 miles, aside from sidings, etc., which, added, made about 978 miles of completed railroad-tracks in April, 1873. The total number of miles of road in operation by all these railroads, including the portion in other States, is 1163 miles, exclusive of sidings, etc. The total capital of these roads was $41,542,100. Their cost and equipment have been not far from $50,000,000. The gross receipts for the year ending April, 1873, were $11,368,425.26, and the net income was $3,169,902.41. Only one of these roads can really be considered a trunk-line—viz. the New York, New Haven and Hartford, extending from New York to Springfield, Mass., and connecting there with the Boston and Albany R. R. of Massachusetts, with which it forms part of the trunk-line to Boston, Portland, and Halifax. The capital of this road is $15,500,000. The Hartford Providence and Fishkill forms a part of the New York and New England, which is intended to extend from Boston to Fishkill, and, crossing the Hudson by a lofty bridge, connect with the Erie Railway. The Norwich and Worcester, in connection with the Shore line and a line of steamers, forms another route from New York to Boston. The Shore line skirts the sound from New Haven to Stonington, and forms, with the New York and New Haven and the Stonington and Providence, a very direct route from New York to Providence, R. I. The New Haven Middletown and Willimantic R. R., not yet completed between Middletown and Willimantic, is intended to form a very direct route between New York and Boston, known as the Air-Line route. The Connecticut Western has a general N. W. course from Hartford through Litchfield co., connecting with the Naugatuck, Housatonic, and Harlem R. Rs. The remaining railroads, except some short branches, traverse the valleys from S. to N., and the State is very thoroughly gridironed with railways. Telegraphic wires run along all the railroad routes, and in some instances connect with towns on other highways.

Finances.—The valuation (called in this State the "grand list") for purposes of taxation amounted for the year Oct., 1872–73, to $348,855,457. The true valuation of the State, according to the census of 1870, was $774,631,524. The taxation of the State for the year ending Mar. 30, 1874, was estimated at $2,072,510, of which the State tax proper (on real and personal estate) was $697,710, the remainder being made up from the dues from savings banks, railroads, insurance and express companies, interest, commutation tax, etc. The State debt outstanding April, 1873, was $5,095,900, and there were funds on hand to retire $500,000 of the State bonds. The amount of interest paid on State bonds was $333,402. The amount of revenue received from all sources during the year ending April 1, 1873, was $2,054,465.24, and there was a balance in the treasury from the previous year of $716,345.40. The expenditures for all purposes, including the purchase and destruction of $673,400 of the State bonds, was $2,201,073.50. Besides the State debt, which will probably be extinguished within ten years, there were in 1870 town, city, and borough

* These returns are certainly an under-estimate, as in favorable years a single establishment produces goods to a larger amount than that attributed to the whole eight, and another nearly reaches that amount.

† Under-estimated.

debts, for which bonds had been issued, to the amount of $6,837,417, and debts not bonded of $2,969,486, as well as $6103 of county indebtedness; making the entire debts of the smaller incorporated communities $9,816,006. The State has little or no direct foreign commerce: there are indeed a few vessels which run to the West Indies, in connection with a coasting-trade, and some whale-ships (though the number is decreasing every year) from the ports of New London, Mystic, and Stonington. The cod and mackerel fisheries, on the coast of the British provinces, are also conducted in part from the sound ports. The internal trade and commerce of the State is very large. Being readily accessible, and with but a few hours' travel to New York and its suburban cities, as well as to Boston and its suburbs, the agricultural, horticultural, manufacturing, fishery, and quarried products of the State find a good and quick market. Its numerous banks, savings banks, life, fire, and accident insurance companies also promote its internal commerce, and have conspired to render it, in proportion to its population and territory, one of the richest of the States, if not the richest State in the Union.

Banks.—In proportion to its extent and population Connecticut has been more largely engaged in banking than perhaps any other State in the Union. For many years she supplied the West very largely with currency for moving its crops to market. The changes resulting from the establishment of the national banking system, and the organization of national banks in most of the Western cities and towns, have led to the abandonment of much of this business, but the principal banks of the State, as well as the private bankers, still do a large foreign business. There were on the 1st of April, 1873, 80 national banks in the State, having an aggregate capital of $27,000,000; 4 State banks of discount, with a capital of $1,450,000; 11 trust companies with power of discounting, having an aggregate capital of $2,263,890, and deposits to the amount of $2,869,106.19. There were also 78 savings banks, with assets amounting to $71,271,394.10, and 17 private banking houses, some of them with large capital. Thus, the capital on hand for banking purposes, aside from the deposits in the national and State banks, and the capital and deposits of the private bankers, was over $100,000,000.

Insurance.—Both life and fire insurance, and of late years accident insurance also, have formed an important portion of the business of the State. There were in July, 1873, 29 fire insurance companies incorporated by the State, and agencies of 63 companies incorporated by other States, and of 8 foreign companies. Of the 29 Connecticut fire and marine insurance companies, 13 were joint-stock companies, including one steam-boiler inspection and insurance company, having a paid-up capital of $5,812,000, subsequently increased to $7,062,000. The gross assets were $12,650,000, and the liabilities, not including capital, were $6,761,013.57. The gross amount of risks in force in these companies was $702,014,478, and of premiums received thereon, $8,459,184.53. To these sums respectively must be added $1,464,333 of risks on marine and inland business, and $46,133.83 of premiums thereon. The mutual fire insurance companies, 16 in number, had cash assets to the amount of $620,694.39, and had about $63,000,000 of risks in force at the beginning of 1873. There were in the State July 1, 1873, 8 life and 2 accident insurance companies, having a paid-up capital of $2,069,864, and assets amounting to $80,090,576. The net amount of outstanding insurance on Jan. 1, 1873, was $161,019,045, of which $73,836,241 was insured in 1872. One of these companies (the Connecticut Mutual) is, with one exception, the largest life insurance company in the U. S. 23 life insurance companies from other States also did business in the State.

Population.—The growth of the State in population has not been as rapid as that of some of the Western and Southern States, owing to the limited extent of its territory and the constant emigration of its citizens to other regions. According to the census of 1870, there were living, in that year, 137,000 citizens of other States who were born in Connecticut, and the entire number who in the past eighty years had migrated to other States exceeds the present population of the State. In 1790 Connecticut had a population of 237,946; in 1800, 251,002; in 1810, 261,942; in 1820, 275,148; in 1830, 297,635; in 1840, 309,978; in 1850, 370,792; in 1860, 460,147; in 1870, 537,454. The density of the population to the square mile is 113.1. Of the entire population in 1870, 265,270 were males, 272,184 females. The whole number born in the State or in the U. S. was 423,815 (of whom 350,498 were born in the State); of these, 207,014 were males and 216,801 females; 113,639 were of foreign birth, of whom 58,256 were males and 55,383 were females. Of the foreign-born population, 87,157 were from Great Britain and Ireland, 12,443 from Germany, 10,861 from British America (mostly Canadian French), 821 from France, 492 from Switzerland, 511 from Sweden, Norway, and Denmark, 117 from Italy, 191 from the West Indies, 154 from Austria, 99 from Holland, 95 from Bohemia, 83 from Poland.

Education.—The State has a high reputation for the excellence of its facilities for education. It has for its public schools a school fund having a capital of $2,043,375.62, and yielding an annual income of $132,943; a town deposit fund of $763,661.83, yielding an income of $45,712.80; and an annual income from local funds of $11,348.05. The State treasury pays the annual sum of fifty cents per head for the children of school age towards the support of public schools, amounting in 1873 to $66,472; the towns raised by school-tax in 1873, $642,194.11, and the districts, $485,525.56, while from voluntary contributions and other sources $60,268.49 more were added, making $1,442,669.01 received for the public schools during the year, while $1,528,440.07 was expended, of which $384,230.11 was for new school-houses and repairs, and $888,871.89 for teachers' wages. The number of children between four and sixteen years of age in the State in Jan., 1873, was 132,943, and the total cost of education annually per head $10.95. The number of different scholars registered during the year was 114,805; the number of children in other than public schools was 9029. The average attendance in the public schools in winter was 67,559; in summer, 58,113. The average wages per month of male teachers was $67.01; of female teachers, $34.09. The number of school districts in the State in 1873 was 1521; of public schools, 1638; of departments in public schools, 2348, of school-houses, 1647; of graded schools, 232. The average duration of the schools in months and days was eight months and three days. There is a State normal school at New Britain, which has 7 instructors, 185 students, and graduated 37 teachers in the year 1872–73. Its annual expenditure is about $12,000. Seven teachers' institutes were held in the State in 1872–73, with an average attendance at each of 113 teachers; usually, nine are held; the expense is about $3000 per annum. There are in the State, according to the census of 1870, 265 private schools and schools of secondary instruction, including under this head boarding-schools, female seminaries, institutes, collegiate and rectory schools, etc. In these there are 430 teachers and instructors, 140 males and 290 females; 7292 pupils, 3755 males and 3537 females; and endowments and tuition sufficient to give them an annual income of $164,220. There are also 6 parochial schools, with 5 male and 28 female teachers, with 1539 pupils (793 males and 746 females), the income of which is not reported. There are three colleges in the State: 1, Yale College at New Haven, founded in 1701, which is really a university in the German sense, having, in addition to its classical course, faculties and schools of theology, law, and medicine, an admirable scientific school with a large corps of professors, a school of art, and a school of agriculture. It had in the classical course, in 1873–74, 512 students; in the theological seminary, 101; in the law school, 46; in the medical school, 32; in the Sheffield Scientific School, 242; and in the art school and as resident graduates, 70; making a total of 955 students and 82 professors and other instructors. 2, Trinity (formerly Washington) College at Hartford, founded in 1823, and now entering, in its fiftieth year, upon a career of great activity and usefulness from its new site, its ample endowments, and facilities. In 1873 it had 89 students and about 20 professors and instructors. 3, Wesleyan University at Middletown, founded in 1831, and now also liberally endowed. In 1872–73 it had 189 students and 15 or 16 professors and instructors. These three colleges are respectively under the care of the Congregationalists, the Episcopalians, and the Methodists. There are in connection with the Wesleyan University and Trinity College the nuclei for post-graduate courses which will probably develop into scientific schools. There is at Hartford a theological seminary, also belonging to the Congregationalists, called the Theological Institute of Connecticut, which has 5 professors and 29 students; and at Middletown the Berkeley Divinity School, under the control of the Episcopal Church, having 4 professors and 31 students. The Baptists have a large and flourishing collegiate institute at Suffield, with a full corps of teachers and pupils of both sexes. Of schools of special instruction there are 3 in the State. The American Asylum for the Deaf and Dumb at Hartford is the oldest institution of its class in this country, and the mother of all the others. It was founded in 1817 by Rev. Thomas H. Gallaudet, and has 25 instructors and other officers, and an average annual attendance of about 230 pupils, and a total attendance during the year of 280. Of these, 60 were from Connecticut, the remainder from other States. The course of instruction includes a high class, with a course nearly analogous to that of the first two years in our colleges, though with a smaller measure of classical instruction. The whole term

of instruction, including this class, is seven years. There is also a home school for deaf-mutes at Ledyard, in charge of Mr. Z. C. Whipple, where these children are taught articulation by a process invented by Mr. Whipple; this school is yet small in numbers. The blind persons of school age in the State are provided for at the Perkins Institution and Massachusetts Asylum for the Blind in Boston. The annual appropriation is $6000, but it is not all called for. The usual number of pupils is about 25. There is a school for imbeciles and idiots at Lakeville, Salisbury, Litchfield co., which is aided by the State. It had 61 pupils in 1872–73, and has been very successful in developing the dormant intellects of these unfortunate children. There are also two reformatory schools, established by the State. The State Reform School at Meriden has been in existence for many years, and is in a prosperous condition. It had in Mar., 1873, 301 boys under instruction and training, 160 having been discharged and 147 received during the year. The Connecticut Industrial School for Girls at Middletown was opened in 1870. It had on April 1, 1873, 75 girls remaining in the institution; 34 had been dismissed during the year, and the same number received. There are in the State two hospitals for the insane: the General Hospital for the Insane at Middletown, which had in the year ending Mar. 31, 1873, 336 patients, an average residence of 265, and at the close of the year 271; and the Insane Retreat at Hartford, an incorporated institution, but largely aided by the State, which had nearly as many patients.

Libraries.—The public libraries of the State are some of them very large and of great value. In the ninth census no report was made of private libraries in the State, though some of them are known to be of great extent and value. Of the 63 public libraries reported by the census marshals, and containing in the aggregate 285,937 volumes, are the State Library with 12,000 volumes; the library (or rather libraries) of Yale College, containing 101,000 volumes, and forming the most valuable collection in the State; the library of Wesleyan University, containing nearly 30,000 volumes; that of Trinity College, about 15,000 volumes; the Watkinson Library of Reference and the Connecticut Historical Society's library, containing together about 37,000 volumes; the Silas Bronson Library at Waterbury, with 15,000 volumes; Otis Library at Norwich, with 7500 volumes; the library of the Theological Institute at Hartford, about 8000 volumes; the Young Men's Institute Library at Hartford, with 23,000 volumes; the New Haven Young Men's Institute Library, with 11,000 volumes; the New Britain Institute, with 5000 volumes, etc. Of the private libraries, the most remarkable are—the very large library of Mr. George Brinley of Hartford, devoted exclusively to American local and general history, and more complete on this subject probably than any other in the U. S.; the library of Hon. Henry Barnard, also of Hartford, mostly devoted to educational topics, and more complete on that subject than any other, public or private; the library of Hon. J. Hammond Trumbull, also of Hartford, on Indian languages and literature; those of President Porter, of Ex-President Woolsey, and of Prof. E. E. Salisbury, all of New Haven, the last being very full on all Oriental languages and science, etc.

Newspapers.—In 1870 Connecticut had 71 newspapers of all classes, having an aggregate circulation of 203,725 copies, and issuing annually 17,454,740 copies. Of these, 16 were daily, having a circulation of 35,730; one was semi-weekly, with a circulation of 800; 43 were weekly, with a circulation of 107,395; 2 were semi-monthly, with 900 circulation; 7 were monthly, with 56,400 circulation; 1 bi-monthly, with 1150 circulation; 1 quarterly, with 1350. The daily papers are, we believe, without exception, political; of the weeklies, 5 are religious, 10 or 12 literary, and the remainder political or miscellaneous; the monthlies are religious, scientific, and literary; the bi-monthly is theological and literary; the quarterly scientific.

Churches.—The census of 1870 reports 826 church organizations of all denominations, 902 church edifices, with 338,735 sittings, and $13,428,100 of church property. Of the Baptists, the census reports 116 churches, 120 edifices, 45,150 sittings, and $1,378,400 worth of church property. The Baptist "Year-Book" for 1873 gives 118 churches, 123 ordained ministers, 19,590 members, 108 Sunday schools, with 1613 teachers, 13,835 scholars, and 16,555 volumes in libraries. The contributions to benevolent objects, exclusive of the support of the churches, pastors, and Sunday schools, were $158,585.80; inclusive of these, about $290,000. Of the Christians in 1870, there were 4 churches, 4 church edifices, 750 sittings, and $6500 church property. Of the Congregationalists, the census reported 290 organizations, 360 church edifices, 133,175 sittings, $4,728,700 worth of church property. The "Congregational Quarterly" in Jan., 1873, reported 294 churches, 355 ministers, of whom 241 are engaged in pastoral work, 49,524 members, 49,052 scholars in Sabbath schools; benevolent contributions, $300,622.05, besides $183,093.69 of charitable legacies. Add expenses of home support, and the total would be about $833,000. The Episcopal Church, according to the census, had 139 parishes, 147 church edifices, 50,962 sittings, and $3,275,534 of church property. The "Connecticut Register" and the "Episcopal Almanac" for 1873 give 144 parishes, 174 clergymen, 11,046 families adherent, 15,969 communicants, 1595 Sunday-school teachers, 11,236 Sunday-school scholars, $326,513.84 of benevolent contributions, with home expenses about $475,000. The Friends have 2 organizations and 3 meeting-houses, with 350 sittings and $1500 of church property. The Lutherans in 1870 had 4 churches, 3 church edifices, 1240 sittings, and $23,500 of church property. The Methodist Episcopal Church in 1870 had 184 churches, 188 church edifices, 63,975 sittings, and $1,834,025 of church property. According to the "Conference Minutes" for 1873, there were 204 churches, 185 travelling and 135 local preachers, 21,308 members in full connection, 2193 probationers, $1,893,050 of church property, $22,097 of benevolent contributions, outside of church, ministerial, and Sunday-school support, or with these about $230,000; there were 170 Sunday schools, with 2837 teachers and 17,584 scholars. There are also 2 Protestant Methodist and 7 African Methodist churches in the State. The Presbyterian Church in 1870 had 7 churches, 10 church edifices, 3875 sittings, and church property valued at $195,300. In 1873 there were 16 churches and 27 ministers of that denomination, of whom 16 were pastors. In 1870 there were 1 Reformed (Dutch) and 1 Reformed (German) church in the State. In 1870 the census reported the Roman Catholics as having 44 parishes, 34 church edifices, 26,418 sittings, and property valued at $1,429,500. In 1873 Sadlier's "Catholic Directory" reports 76 churches, besides 9 more building, 60 chapels and outstations. The diocese of Hartford comprises the whole State, and is governed by a bishop, assisted by a vicar-general. A cathedral is building at Hartford, and there are convents and monasteries. There are also 77 priests, 1 male and 9 female academies, 18 male and 19 female free parochial schools, with 8000 pupils, 3 orphan asylums, with 150 orphans, and an adherent population (somewhat exaggerated) of 140,000 persons. In 1870 there were 7 Second Advent churches and the same number of church edifices, with 1380 sittings, and church property valued at $8700. There is 1 Unitarian congregation, with a church edifice having 225 sittings, and church property worth $6000. The Universalists have 18 congregations, 15 church edifices, 17 ministers; the church edifices have 6850 sittings, and the church property is valued at $309,100. The Jews have 4 synagogues and 5 rabbis; the number of sittings must exceed 2000, and the value of the property is hardly less than $120,000.

Constitution.—The present constitution of the State was adopted in 1818, the State having previously been under the charter granted by Charles II. in 1662. Repeated efforts have been made to call a constitutional convention for the revision of the constitution or the formation of a new one, but these efforts have not as yet proved successful. The constitution provides for perfect freedom of religious worship; for the promotion of education and the various interests of the State; for a legislature in two branches, each town to be represented by one or two representatives in the house of representatives, such representatives to be chosen annually; the senate to be composed of not less than 18 nor more than 24 members, to be chosen annually, one from each senatorial district (the number of districts is now 21); the election for both senators and representatives, as well as for the governor, lieutenant-governor, secretary of state, treasurer, and comptroller (all of whom are chosen annually), is held on the first Monday in April, and they assume office on the first Wednesday in May. The house of representatives has nearly 250 members. The commissioner of the school fund, the State librarian, and the board of education are appointed by the legislature, the last in classes, having four years to serve. The secretary of the board of education is chosen by that board. Every male citizen of the U. S. who shall have attained the age of twenty-one years, who shall have resided in the State for one year and in the town where he offers to vote six months, and who is able to read any article of the constitution, is entitled to the privileges of an elector upon taking the oath prescribed by law. Convicts, idiots, and imbeciles are excluded from these privileges. The judiciary of the State consists of the supreme court of errors, consisting of one chief-justice and three or four associate judges, who shall also be judges of the superior court; of a superior court, over which the chief-justice and his associate judges preside, together with six other superior court judges, who are eligible for promotion to be judges of the supreme court. These are all chosen for a term of eight years, and

are eligible for re-election, but by the constitution they are disqualified from further service when they reach the age of seventy years. There are now also in the counties of Hartford, New Haven, New London, and Fairfield courts of common pleas, each presided over by a single judge. The supreme court is the court of final appeal, and has jurisdiction over all matters brought to it from the lower courts on writs of error. The superior court has cognizance of all causes, civil and criminal, which are brought before it by suit, appeal, writ of error, *scire facias*, complaint, petition, or otherwise, according to law, and may try the same by jury or otherwise, as the law may require, and proceed therein to judgment and execution; but in all criminal trials punishable by death the court must consist of at least two judges, one of whom must be a judge of the supreme court. The courts of common pleas have concurrent jurisdiction with the superior court in regard to smaller offences and civil actions up to a certain limit, being created to relieve the superior court from too great a pressure of small causes. Connected with this subject of the judiciary are the criminal statistics of the State. The State prison at Wethersfield has an average of 180 prisoners. The buildings are old and somewhat incommodious, but the general management of the prison is good, though stern. The prison is somewhat more than self-supporting, so far as ordinary expenses go, the excess of earnings over ordinary expenses being $3430 in 1872–73. There are ten jails in the State, two each in the counties of New London and Fairfield, and one in each of the other counties. To these jails there were committed in the year ending Mar. 31, 1873, 2954 persons—viz. 2358 white males, 425 white females, 140 colored males and 31 colored females. Of these, 424 males and 63 females were minors; 759 were natives of this State, 584 natives of other States, and 1611 of foreign birth; 239 were strictly temperate, 1598 were reported as moderate drinkers, and 1120 as habitually intemperate. Of the whole number, 455 were committed for offences against the person, 565 for offences against property, and 1934 for offences against society.

Representation in Congress.—The State has four representatives in Congress, each congressional district consisting of two counties—viz. first district, Hartford and Tolland counties; second, New Haven and Middlesex; third, New London and Windham; fourth, Fairfield and Litchfield.

Counties.—There are eight counties in the State. Their names and population in 1860 and 1870 were as follows:

Counties.	Pop. in 1860.	Pop. in 1870.
Hartford	80,962	109,159
New Haven	97,345	121,292
New London	61,731	66,688
Fairfield	77,476	95,370
Litchfield	47,318	48,732
Windham	34,747	38,535
Middlesex	30,859	36,117
Tolland	21,709	22,015

Principal Towns and Cities.—There are nine cities in the State. Of these, seven have a population of more than 10,000 inhabitants—viz. New Haven, 50,886; Hartford, 37,825; Bridgeport, 19,876; Norwich, 16,653; Waterbury, 13,148; Middletown, 11,143; Meriden, 10,521; while New London has 9580 and New Britain, 9480. The town of Norwalk has 12,122 inhabitants. The following towns have a population above 5000: Stamford, 9138; Danbury, 8754; Derby, 8027; Greenwich, 7672; Enfield, 6322; Stonington, 6320; Killingly, 5712; Fairfield, 5642; Vernon, 5447; Windham, 5413; Groton, 5119.

History.—The territory now embraced in the State of Connecticut, as well as the eastern part of Long Island, was first explored by the Dutch from the neighboring colony of New Netherlands, who laid claim to it, before 1620, but made no settlement within its limits till 1633. The first English patent to the New England proprietors was granted Nov. 3, 1620, by James I., and included all the territory between 40° and 48° N. lat., and extended from the Atlantic Ocean to the Great South Sea. The patent of Connecticut, granted in Mar., 1631, by the council of Plymouth, embraced "all that part of New England in America extending in breadth 120 miles, as the coast lieth, from the Narragansett River towards Virginia, and in longitude from the Western Ocean to the South Sea." This grant did not define the northern boundary of the prospective colony, but that defect was remedied by the patent of Massachusetts, which made their S. boundary a due W. line three miles S. from every part of the Charles River. The same year (1631) an Indian chief who was sachem of the region along the Connecticut River sent messengers to Gov. Winthrop of the Massachusetts Colony, and to Gov. Winslow of the Plymouth Colony, inviting them to come and settle or send emigrants to the Connecticut Valley. The invitation was not immediately accepted, but the following year an exploring-party from Plymouth ascended the Connecticut River as far as the mouth of the Tunxis River at Windsor, and there fixed upon a site for a settlement. The first trading-house and fort in the State was erected by the Dutch, at what is now known as Dutch Point in Hartford, June 8, 1633. Jacob van Curler, the agent of Wouter van Twiller, the Dutch governor of the New Netherlands, having purchased the land of Sassacus, sachem of the Pequots, and landed on that day at the point with a small company of Dutch soldiers. The trading-house and fort which he erected was called the House of Hope, and was held by the Dutch for several years, but was finally sold to the English colonists. The same year (1633), somewhat later in the season, a party from Plymouth, under command of Capt. William Holmes, sailed up the Connecticut River with a load of timber to build their trading-house at the mouth of the Tunxis, the site selected by them the previous year. The Dutch opposed their passage, and threatened to fire upon them; but after a short parley they sailed on past the House of Hope to their destination. Neither of these establishments, however, merits the name of colony, though the trading-house at the mouth of the Tunxis was the nucleus around which the Windsor colony subsequently gathered. The first permanent settlement of colonists was made at Wethersfield in the autumn of 1634, by a party of emigrants from Watertown, Mass. These emigrants suffered terrible hardships, and nearly perished in the cold and severe winter of 1634–35. Some additions were made to their number in 1635, and in 1636 colonies migrated from Watertown, Dorchester, and Newtown (afterwards Cambridge), Mass., and established themselves at Wethersfield, Windsor, and Hartford. At the close of that year there were about 750 inhabitants in the three towns. In 1635 a landing was made by a party under John Winthrop, Jr., at Saybrook, and the next year a good fort erected and a garrison stationed there. There was no permanent settlement, however, until 1639. The three towns, Wethersfield, Hartford, and Windsor, were for one year under the government of Massachusetts, but in 1637 organized an independent government, and immediately declared war against the Pequot tribe of Indians, who had murdered without provocation about thirty of the settlers. They were promised assistance from Massachusetts, but could not wait for it, and a force of ninety men, under command of Capt. John Mason, sailed from Hartford for Narragansett Bay on the 20th of May, 1637, and with the doubtful aid of some Indian allies, who were in great terror of the invincible Sassacus, attacked and destroyed the Pequot fort, and, killing 400 or more of the Indian warriors, completely broke up the tribe. In 1638 the first settlement was made at Quinnipiack (now New Haven) by a company of wealthy English people, under the leadership of Rev. John Davenport and Theophilus Eaton, afterwards governor of the colony. This settlement, with the adjacent towns, Milford, Guilford, etc., remained a separate colony until 1665, when it was united with Connecticut under the charter of 1662. The Saybrook colony was united with Connecticut in 1644, and before 1653 there were flourishing settlements at Farmington, New London, Middletown, Norwalk, Branford, and one or two other points, as well as two considerable towns, East Hampton and South Hampton, on Long Island, which belonged to their jurisdiction. For nearly thirty years they lived under a constitution of their own framing, a perfectly independent people. After the restoration of Charles II. to the throne of Great Britain there came a necessity for a royal charter, and John Winthrop, Jr., very adroitly succeeded in persuading the monarch in one of his most amiable moods to put his hand to the charter of 1662, which embodied most of the privileges of their previous constitution. The charter included the New Haven colony, to which they objected, and they were not formally united with the Connecticut colony until 1665, when the fear of invasion by the Dutch led them to consent to a union. In 1685–87 a strenuous effort was made by James II. to abrogate all the New England charters, and place all the colonies under one government, with a royal governor appointed by the Crown. The demand was made for the charter of the Connecticut colony by Sir Edmund Andros, the royal governor, in person, in Oct., 1687; but after some debate in the general court or colonial legislature at the evening session, the lights were suddenly extinguished, and the charter conveyed away secretly, and hidden in the hollow of an ancient oak on the Wyllys estate, subsequently known as "the Charter Oak." Sir Edmund Andros took possession of the government, and ruled very oppressively for a year and a half; but on his deposition after the fall of James II. the old charter was again recognized as the supreme law of the colony, and continued in force for 129 years thereafter. The general court or colonial legislature, which had judicial as well as

legislative and executive functions, held two annual sessions—one in May, the other in October. From 1665 to 1701 both sessions were held in Hartford, but in the latter year it was ordered that the May session should be held in Hartford and the October session in New Haven. When, by the adoption of the constitution in 1818, it was ordered that there should be but one session of the legislature annually, it was agreed that it should meet the even years at New Haven and the odd years at Hartford; and this arrangement is still continued, though by vote of the State in 1873, Hartford is to be the sole capital after 1874.

During the first and second French wars the colony of Connecticut was very prompt to send her full quota of soldiers to the British and colonial armies, and in the Revolutionary war, she furnished more men in proportion to her population, and more aid in proportion to her wealth, than any other colony. Twenty days before the Declaration of Independence the general assembly of Connecticut instructed their delegates in the Continental Congress to propose to that body "to declare the united American colonies free and independent States, absolved from all allegiance to the king of Great Britain." Governor Jonathan Trumbull ("Brother Jonathan") was perhaps the most wise and efficient of Washington's counsellors during the war. The State was the fifth of the States of the Union to adopt and ratify the Constitution of the U. S., performing that act Jan. 9, 1788. The events which preceded the war of 1812 were very destructive to the commercial interests of the State, which was at the time very largely engaged in the West India and the coasting trade, as well as in the fisheries, and many of her wealthiest citizens were ruined by the embargo and other acts and the Berlin and Milan Decrees of Napoleon. The State, however, furnished its full quota of men and means for the war, and did its whole duty. In Dec., 1814, a convention of delegates from the several New England States—all of which had suffered very heavily from the war in their commerce—met at Hartford to take into consideration the condition of public affairs and prepare a statement of their grievances. The convention was composed of the ablest and best citizens of those States, and entertained no disloyal purpose, but the speedy conclusion of the war made any subsequent action on their part unnecessary. In 1818 the State adopted its present constitution, by which all relics of slavery and of a State Church were abolished. This constitution was at the time of its passage one of remarkable liberality and wisdom. It now needs modification in regard to the basis of representation, and perhaps some other minor matters. The State, as we have seen, by its charter could claim a strip of land nearly sixty miles in breadth to the Pacific Ocean, but as this claim interfered with that of other States, an amicable settlement was made, the State only retaining a tract of land in Central and Western New York, and one in Northeastern Ohio. The avails of these lands, which were sold on the most liberal terms, were by the State consecrated to the support of public schools, and form the basis of her present school fund. Since 1818 the State has been generally prosperous and peaceful. She took an active part in the war of 1861–65, and sent her full quota of men into the field, as thoroughly equipped and supplied with all that was needful to their efficiency as those of any State in the Union. Her soldiers were distinguished on all the battle-fields of the war, and her war-governor, Buckingham, was one of the President's most trusted counsellors. Politically, the State is very equally balanced between the Democratic and Republican parties, and her legislation is in consequence more cautious and honest than it would be if either party were largely in the ascendency.

The arms of the State are three vines in fruit, two and one, all proper. The motto is *Qui transtulit sustinet*—"He who transplanted sustains."

Governors of the State.

Samuel Huntington	1785–96	Isaac Toucey	1846–47
Oliver Wolcott	1796–98	Clark Bissell	1847–49
Jonathan Trumbull	1798–1809	Joseph Trumbull	1849–50
John Treadwell	1809–11	Thomas H. Seymour	1850–53
Roger Griswold	1811–13	C. H. Pond (acting)	1853–54
John Cotton Smith	1813–18	Henry Dutton	1854–55
Oliver Wolcott	1818–27	William T. Minor	1855–57
Gideon Tomlinson	1827–31	Alexander H. Holley	1857–58
John S. Peters	1831–33	Wm. A. Buckingham	1858–66
Henry W. Edwards	1833–34	Joseph R. Hawley	1866–67
Samuel A. Foote	1834–35	James E. English	1867–69
Henry W. Edwards	1835–38	Marshall Jewell	1869–70
William W. Ellsworth	1838–42	James E. English	1870–71
Chauncey F. Cleveland	1842–44	Marshall Jewell	1871–73
Roger S. Baldwin	1844–46	Charles R. Ingersoll	1873–

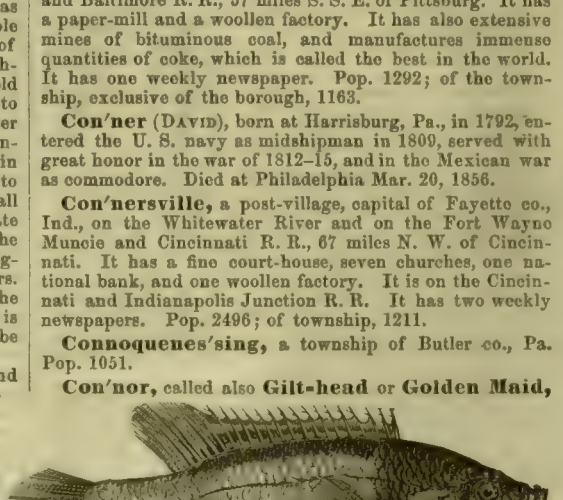
The following tables show the electoral votes for President and Vice-President at each presidential election from 1788 to 1872, and the popular vote for President at each election from 1824 to 1872. The record of the popular vote previous to 1824 is not exact:

Election Year.	Candidates for President and Vice-President.	Electoral Votes
1788	Washington and Adams	7 and 5
"	Samuel Huntington of Conn. for V. P.	2
1792	Washington and Adams	9
1796	Adams and T. Pinckney of South Carolina	9 and 4
"	John Jay of New York for V. P.	5
1800	Adams and C. C. Pinckney of South Carolina	9
1804	C. C. Pinkney and R. King of New York	9
1808	C. C. Pinckney and R. King	9
1812	D. W. Clinton and J. Ingersoll of Pa.	9
1816	Rufus King and J. Ross of Pa.	9 and 5
"	John Marshall of Virginia for V. P.	4
1820	James Monroe and D. D. Tompkins	9
1824	J. Q. Adams and Andrew Jackson	8
1828	J. Q. Adams and Richard Rush of Pa.	8
1832	Henry Clay and John Sergeant of Pa.	8
1836	M. Van Buren and R. M. Johnson	8
1840	W. H. Harrison and John Tyler of Virginia	8
1844	Henry Clay and Theodore Frelinghuysen	6
1848	Zachary Taylor and Millard Fillmore	8
1852	Franklin Pierce and William R. King	6
1856	J. C. Fremont and W. L. Dayton	6
1860	Abraham Lincoln and Hannibal Hamlin	6
1864	A. Lincoln and A. Johnson	6
1868	U. S. Grant and S. Colfax	6
1872	U. S. Grant and H. Wilson	6

Popular vote for President from 1824 *to* 1872.

Election Year.	Candidates.	Majority Vote.	Minority.
1824	Adams and Crawford	7,587	1,978
1828	Adams and Jackson	13,829	4,448
1832	Clay and Jackson	17,755	11,269
1836	Van Buren, Harrison, etc	19,234	18,466
1840	Harrison and Van Buren	31,601	25,296
	Birney		174
1844	Clay and Polk and Birney	32,832	31,784
1848	Taylor and Cass	30,314	27,046
	Van Buren		5,005
1852	Pierce and Scott	33,249	30,357
	Hale		3,160
1856	Fremont and Buchanan	42,715	34,995
	Fillmore		2,615
1860	Lincoln and Douglas	43,692	15,522
	Breckinridge and Bell	14,641	3,291
1864	Lincoln and McClellan	44,691	42,285
1868	Grant and Seymour	50,995	47,952
1872	Grant and Greeley	50,638	45,880

L. P. Brockett.



Con'nellsville, a post-borough of Fayette co., Pa., on the Youghiogheny River and on the Pittsburg Washington and Baltimore R. R., 57 miles S. S. E. of Pittsburg. It has a paper-mill and a woollen factory. It has also extensive mines of bituminous coal, and manufactures immense quantities of coke, which is called the best in the world. It has one weekly newspaper. Pop. 1292; of the township, exclusive of the borough, 1163.

Con'ner (David), born at Harrisburg, Pa., in 1792, entered the U. S. navy as midshipman in 1809, served with great honor in the war of 1812–15, and in the Mexican war as commodore. Died at Philadelphia Mar. 20, 1856.

Con'nersville, a post-village, capital of Fayette co., Ind., on the Whitewater River and on the Fort Wayne Muncie and Cincinnati R. R., 67 miles N. W. of Cincinnati. It has a fine court-house, seven churches, one national bank, and one woollen factory. It is on the Cincinnati and Indianapolis Junction R. R. It has two weekly newspapers. Pop. 2496; of township, 1211.

Connoquenes'sing, a township of Butler co., Pa. Pop. 1051.

Con'nor, called also **Gilt-head** or **Golden Maid,**

Connor, or Gilt-head.

a small European marine fish, the *Crenilabrus tinca.* A somewhat similar fish is the conner, blue perch, chogset, or bergall of the Atlantic waters of the U. S. (*Ctenolabrus cæruleus*). It is a tolerable fish for the table, for which it is extensively caught.

Co'no, a township of Buchanan co., Ia. Pop. 579.

Conococheague, a post-township of Washington co., Md. Pop. 1402.

Co'no-cu'neus [a compound of the Lat. *conus*, a "cone," and *cuneus*, a "wedge"], a skew surface of the fourth order, generated by a line moving on two directors, one of which is rectilinear and perpendicular to all generators, and the other is a circle usually perpendicular to the plane which contains its centre and the other director. The rectilinear director, and the line at infinity perpendicular to the latter, are double lines on the surface. Its equation is $c^2y^2 = y^2(a^2 - z^2)$, where a is the radius of the circular director, and c the distance of its centre on the axis of y from the rectilinear director or axis of x. This surface was discovered by Wallis.

Co'noid [Gr. *κωνοειδής*, "cone-like," from *κῶνος*, a "cone," and *εἶδος*, "form"], a skew surface, generated by the motion of a line which remains parallel to a plane, and has a rectilinear director. When the directing plane and line are perpendicular to each other, the latter is a line of striction on the surface. This line being taken as axis of z, the equation of the surface may be reduced to the form $z = f\left(\frac{y}{x}\right)$, whatever the nature of its second director. Should the latter be also a right line, not in the same plane with the first director, the conoid will be an equilateral paraboloid. The cono-cuneus of Wallis, already described, is also a conoid; and another example is the skew helicoid, the curvilinear director of which is a helix, having the rectilinear director for its axis. The under surface of a spiral staircase presents a familiar illustration of this conoid. A conoid may be regarded as having three directors—one curvilinear and two rectilinear; one of the latter being at infinity. If the first of these directors be a curve of the mth order, then the order of the conoidal surface will be $2m$, and each rectilinear director will be a multiple curve on the conoid of the mth order of multiplicity. The directing plane being horizontal, the lines of level on the surface will be the generators; the lines of greatest slope, since they cut the former lines perpendicularly, will be projected into circles on the directing plane. Formerly it was a custom to give the name *conoid* to any solid generated by the rotation of a conic section around one of its axes. In this acceptation the term is obsolete, and has been replaced by that of a *quadric of revolution*.

Co'non, or **Ko'non** [Κόνων], an Athenian general of high reputation, entered public life about 413 B. C. He was one of the ten generals chosen in 407, and was defeated by Lysander at Ægospotami in 405. He commanded the combined fleets of Persia and Athens which defeated the Spartans at Cnidos in 394 B. C. He afterwards rebuilt the long walls of Athens. His son Timotheus was an eminent commander.

Co'non of Samos, a Greek geometer and astronomer, was a friend of Archimedes, who expressed in one of his works a high estimation of his sagacity. He lived at Alexandria about 250 B. C. Conon invented the curve called the spiral of Archimedes. His works are all lost.

Conoy, a township of Lancaster co., Pa. Pop. 1984.

Con'quest, a township and post-village of Cayuga co., N. Y. The village is 12 miles N. of Auburn. Pop. 1821.

Conquest. See INTERNATIONAL LAW, by PRES. T. D. WOOLSEY, S. T. D., LL.D.

Con'rad I., of Germany, was elected emperor in 911 A. D. He was previously duke of Franconia. He waged war against Henry the Fowler and Arnulf, duke of Bavaria. His dominions were invaded by the Magyars. Died in 918.

Conrad II., called THE SALIC, was a son of Henry, duke of Franconia. He was elected king of Germany in 1024, and was crowned as emperor by the pope in 1027. He is said to have been a wise ruler and the author of the written feudal law of Germany. He died in 1039, and was succeeded by his son Henry III.

Conrad III., of Germany, born in 1093, was the first of the Hohenstaufens and a grandson of Henry IV. He was elected emperor in 1138, and waged war against Henry the Proud, duke of Saxony. The party names of Guelph and Ghibelline originated in this war. In 1147 he led a crusade. He besieged Damascus without success, and returned in 1149. He died in 1152, and was succeeded by Frederick Barbarossa. (See GUNDLING, "Geschichte und Thaten Kayser Conrads III.," 1720.)

Conrad IV., son of Frederick II., emperor of Germany, was born in Apulia in 1228. He was crowned king of the Romans in 1237, and on the death of his father in 1250 assumed the title of emperor. He was supported by the Ghibellines, but the pope and the Guelphs recognized his competitor, William of Holland. Conrad marched into Italy in 1251, and took Naples. He died in 1254.

Conrad V., or **Con'radin,** the son and heir of Conrad IV., was born in 1252. The kingdom of Naples was usurped by his uncle Manfred. Instigated by the pope, Charles of Anjou waged war against Manfred and conquered Naples. Conrad was defeated and captured at Tagliacozzo in 1268 by Charles, by whose order he was beheaded.

Conrad (CHARLES M.), a native of Winchester, Va., was taken in childhood to Mississippi, and thence to Louisiana. In 1828 he was admitted to the bar, was U. S. Senator from Louisiana 1842–43, member of Congress 1849–50, and secretary of war 1850–53. He was a Confederate brigadier-general and member of the Congress of the Confederacy during the civil war.

Conrad (ROBERT T.), an American dramatist and orator, born in Philadelphia June 10, 1810. He studied law, and became a judge of the court of general sessions in 1838. Among his works are a tragedy entitled "Aylmere," which was very successful, and a volume of poems (1852). He was elected mayor of Philadelphia by the American party in 1854, and judge of quarter sessions in 1856. Died June 27, 1858.

Conrad (TIMOTHY ABBOTT), an American conchologist and palæontologist, born in New Jersey in 1803. He published, besides other works, "Fossil Shells of the Tertiary Formation of North America" (1832), and wrote "Palæontology of the State of New York," which was published at the expense of that State (1838–40). He was one of the naturalists employed in the geological survey of New York.

Conrad Hill, a township of Davidson co., N. C. Pop. 1115.

Con'ring (HERMANN), a learned jurist, born at Norden, in East Friesland, in 1606. Among his works, which are in Latin, is a "Commentary on the Origin of the German Law" (1643). Died in 1681.

Con'salvi (ERCOLE), CARDINAL, an Italian statesman and reformer, born at Rome June 8, 1757. He became in 1800 chief minister of Pope Pius VII., and negotiated the concordat with Bonaparte in 1801. He promoted art and learning, and was an able diplomatist. Died Jan. 24, 1824. (See CRÉTINEAU-JOLY, "Mémoires du Cardinal Consalvi.")

Consanguin'ity [from the Lat. *con*, "with," and *sanguis, sanguinis*, "blood"], in law, is relationship by blood, or that subsisting between persons descending from a common ancestor, or where one descends from the other. It is either lineal or collateral. It is said to be lineal when one of the persons whose relationship is to be traced is descended from the other. It is said to be collateral when they are descended from a common ancestor, and one is not descended from the other. There are two principal modes of reckoning collateral consanguinity. One method is to count the degrees intervening between the one farthest removed from the common ancestor and such ancestor. Thus, the son of the nephew of A on that system of computation is related to A in the third degree, as being three removes from the common ancestor, the father of A. This is the method of the canon and common law. The civil law reckons the degrees from the one relative to the other, ascending, on the one hand, from one of the parties to the common ancestor, and then counting downward to the other. On that theory A would be related to the son of his nephew in the fourth degree. The civil law method is generally employed in this country. In reckoning lineal consanguinity the two systems do not differ. Thus, the father and son are related in the first degree, the grandfather and grandson in the second. It frequently becomes necessary to resort to these rules not only in considering the transmission of estates, but in ascertaining persons who are disqualified to act as judges or jurymen by reason of relationship.

Con'science [Lat. *conscientia*, from *con*, intensive, and *scio*, to "know;" Ger. *Gewissen*], a word originally meaning CONSCIOUSNESS (which see), but now applied to the moral sense, the power or feeling we have which enables us to know whether an act or desire is right or wrong. (See MORAL PHILOSOPHY, by PRES. NOAH PORTER, D. D., LL.D.)

Conscience, Cases of. See CASUISTRY.

Conscience, Courts of, in England, called also **Courts of Requests,** were constituted for the recovery of small debts by special local acts of Parliament, in London, Westminster, and other trading districts. They were abolished with few exceptions when the county courts were established.

Conscience (HENRI), a Flemish novelist, born at Antwerp Dec. 3, 1812. He passed six years as a common soldier, and several more in poverty and in unsuccessful efforts to obtain employment. His first work was "The Year of Miracles, 1566" (1837), which was well received. In 1838 he produced "The Lion of Flanders," "Jakob van Arte-

velde" (1849), "The Poor Gentleman" (1851), and "Valentyn" (1866).

Con'sciousness [Lat. *conscientia;* Fr. *conscience;* Ger. *Selbstbewusstseyn*] is the state in which we are when all or any of our mental faculties are in exercise. It is a condition or accompaniment of every mental operation. In metaphysical terminology it signifies the knowledge which the mind has of its own operations. "We not only feel," says Cousin, "but we know that we feel; we not only act, but we know that we act; we not only think, but we know that we think; to think without knowing that we think is as if we should not think; and the peculiar quality, the fundamental attribute of thought, is to have a consciousness of itself. Consciousness is this interior light, which illuminates everything that takes place in the soul; consciousness is the accompaniment of all our faculties, and is, so to speak, their echo." That consciousness is not a particular faculty of the mind, but the universal condition of intelligence, the fundamental form of all the modes of our thinking activity, and not a special mode of that activity, is strenuously maintained by Amédée Jacques, and also by Mr. Francis Bowen and Mr. Tappan. This view is in accordance with the opinion of Aristotle and that of certain Schoolmen. "No man," says Dr. Reid, "can perceive an object without being conscious that he perceives it. No man can think without being conscious that he thinks." And as on the one hand we cannot think or feel without being conscious, so on the other hand we cannot be conscious without thinking or feeling. "Annihilate the object of any mental operation, and you annihilate the operation." This view of consciousness, as the common condition under which all our faculties are brought into operation, or of considering these faculties and their operations as so many modifications of consciousness, has of late been generally adopted; so much so that psychology, or the science of mind, has been denominated an inquiry into the facts of consciousness. This view, however, has many strenuous opponents, especially among recent writers of the materialistic school.

Con'script Fa'thers [Lat. *Patres Conscripti,* from *con,* "together," and *scribo, scriptum,* to "write"], an appellation given to the senators of ancient Rome, because after the expulsion of Tarquin, when Brutus added another hundred to the number of senators, the names of the new members were "written together" with those of the old, and the whole body received the appellation of Conscript Fathers.

Conscrip'tion [Lat. *conscriptio,* a "written list"], a compulsory enrolment of men for military service. This is the system by which the armies of France and some other countries are recruited. The soldiers who are thus compelled to enter the army are called conscripts. The conscription was established in France during the Revolution of 1789. The number required for the service is drawn by lot from the number of young, able-bodied men who are not exempt.

Consecon, a post-village of Prince Edward co., Ontario (Canada), on Weller's Bay, Lake Ontario, at the mouth of Consecon Creek, has valuable water-power and extensive fisheries. Pop. about 500.

Consecra'tion [Lat. *consecratio,* from *con,* intensive, and *sacro,* to "make sacred"] is the act or ceremony of giving a person or thing to the service of God. It was a widely-spread religious ceremony of the ancient world. In the Old Testament we read of the consecration to the Lord of the first-born of man and beast, and the dedication of the Levites, etc. The custom, as regards places and things, was not transmitted immediately from Judaism to Christianity. As soon as the persecution of the Christians ceased, according to Eusebius, "the sight was afforded us so eagerly desired by all—of the festivals of dedications and consecrations of the newly-erected houses of prayer throughout the cities." The practice of consecrating religious edifices is continued to the present time. The forms were at first simple, consisting of prayer, the celebration of the Eucharist, thanksgiving, and benediction; but they subsequently became more imposing, and the bishops, etc. assumed the exclusive power of consecrating. The service which sets apart bishops for their official work is especially designated as consecration.

Conservation of Force. See CORRELATION OF FORCES, by PROF. J. H. SEELYE, S. T. D.

Conser'vative [from the Lat. *con,* intensive, and *servo, servatum,* to "keep," to "preserve"]. In politics, this term is applied to persons who oppose reform, progress, or radical changes in institutions or laws. In England the party formerly called Tory is now termed Conservative.

Conserva'tor, an officer who is charged to preserve the public peace or prevent and punish a breach of the peace. In England the sovereign is the principal conservator of the peace. The lord chancellor, the justices of the queen's bench, and the master of the rolls are conservators of the peace throughout all parts of the kingdom, and can commit breakers of the peace anywhere. Other judges possess the power only within the limits of their own jurisdiction.

Conser'vatory [from the Lat. *conservo, conservatum,* to "preserve"], in horticulture, a glazed structure in which exotic plants are cultivated. It is distinguished from an orangery by its having a glazed roof, whilst that of the latter is opaque, and from a green-house by the plants being in the free soil, thus growing from the floor, while in the green-house the plants are grown in pots placed on shelves. Conservatories are used for plants in a growing state during the winter, and are therefore warmed according to the temperature which such plants require. One of the largest conservatories in the world is that erected at Chatsworth in Derbyshire, England, for palms and other tropical plants; it covers more than an acre of ground, and is above sixty feet high.

Conser'vatory [Fr. *conservatoire;* It. *conservatorio;* Ger. *Conservatorium*], a school for the study of vocal and instrumental music. These schools were first so called because they were designed to conserve the science and art of music. They are of ancient origin, and were probably founded by ecclesiastics for the purpose of improving the character of church music. They were originally charity schools, recruited from foundlings and orphans of both sexes. The first conservatory was the famous one of Santa Maria di Loreto in Naples, founded by Giovanni di Tappia in 1537. Among the most famous conservatories of the present day may be mentioned the Conservatoire de Musique of Paris (founded in 1784), those of Vienna (1816), Brussels (1833), and Leipsic (1842). There are several successful schools of music in the U. S. called conservatories.

Conshohock'en, a post-borough of Montgomery co., Pa., on the Schuylkill River and on the Philadelphia and Reading R. R., 13 miles N. W. of Philadelphia. It has several blast-furnaces, machine-shops, and rolling-mills; also one national bank and one weekly newspaper. Gas-pipes and water-pipes are made here. Pop. 3071.

Considérant (VICTOR), a French socialist, born at Salins Oct. 12, 1808, was the chief disciple of Fourier. He became the editor of the "Démocratie Pacifique" in 1845, and a member of the National Assembly in 1848. He wrote "Destinée Sociale" (3 vols., 1834–44). He afterwards founded a colony called Reunion, near San Antonio, Tex., but returned to France in 1869.

Considera'tion [Lat. *consideratio;* etymology doubtful], mature thought, serious deliberation, meditation; also motive of action, reason. In law, it is the material cause of a contract, the reason which induces a contracting party to make a contract. The leading distinction respecting considerations is, that they are either *good* or *valuable*. A *good* consideration is based upon relationship or natural love, and is of avail only in an executed contract—*e. g.* a deed of land. A *valuable* consideration either confers some benefit on the promisor or causes some inconvenience or harm to be sustained by the promisee. Under these rules marriage is a valuable consideration. (See CONTRACT, by PROF. T. W. DWIGHT, LL.D.)

Consignee. See BILL OF LADING and SHIPPING.

Consign'ment, in mercantile law, is the term applied to goods which are consigned or transferred by the owner into the possession of another, either as his own or as an agent or factor for sale or for some other specified purpose. The word is sometimes used to denote the act of consigning.

Consis'tory [Lat. *consistorium,* from *con,* "together," and *sisto,* to "stand"], the place of meeting of the cabinet of the Roman emperors; the name is also applied to the council of cardinals, sometimes assisted by other prelates, who attend in person or by proxy, which meets in the Vatican to advise the pope in ecclesiastical and temporal affairs. A court under this title for the regulation of discipline and worship, composed of civil and ecclesiastical jurists, was established by the Lutheran princes of Germany at the time of the Reformation. The earliest was that of Wittenberg, founded in 1537. The lower church courts of the Reformed ("Dutch" and "German") churches in the U. S. are also called consistories.

Con'sole [etymology doubtful], in architecture, a projection like a bracket, used to support cornices or such movable objects as busts and vases. It frequently has the form of a letter S.

Con'sols, a contraction of "consolidated annuities," is the common name given to the annuities of three per cent. which the British government pays as interest on the national debt. This debt was contracted by loans negoti-

ated at different times and at various rates of interest. To obviate the confusion which arose from the variety of stocks thus created, they were consolidated into one fund, kept in one account at the Bank of England. The Consolidated Annuities act was passed in 1757.

Con'sonance [Lat. *consonantia*, from *con*, "together," and *sono*, to "sound"], a term in music applied to a harmonious blending of sounds which so satisfy the ear that no other sound is expected to follow. The effect of consonance depends on the greater or less simplicity of the interval formed by the combined sounds. Intervals whose relative vibrations can be expressed by numbers from one to six are considered consonant. Consonant intervals are therefore the third, fourth, fifth, sixth, and octave; from which it follows that there is only one consonant fundamental chord in music—*i. e.* the common chord, being a bass note with its third, fifth, and octave. The system of harmony of the ancient Greeks was different from ours, as they treated the third and sixth as dissonances. Their name for consonance was our word "symphony," and for dissonance, "diaphony." As early as the fourteenth century we find the important rule that two perfect consonances following in similar progression are not allowable. In the sixteenth century, Zerlino ascertained the true mathematical proportions of the major and minor thirds. The exact limit between consonance and dissonance is not definitely fixed.

Con'sonant, a letter which can be freely sounded only when joined with another letter called a vowel. Consonants are divided into *mutes* and *liquids* (or semi-vowels). Mutes are those letters which may be said wholly to interrupt or stop the voice when they occur at the end of a syllable—in other words, when they are not immediately followed by a vowel—as *p, k, t, b, g, d*. The liquids or semi-vowels do not wholly stop the voice; they are *l, m, n*, and *r*. The aspirates *f, s*, and *th* are sometimes classed with the mutes, though they admit of the voice passing beyond them, so to speak, when they terminate a syllable, as in *if*, etc. The sibilant *s* is also an aspirate.

Con'sort [Lat. *consors*, "allotted together," from *con*, "together," and *sors* (gen. *sortis*), a "lot"], in Great Britain, a term applied to the husband or wife of the reigning sovereign viewed in a public capacity, as participating to a limited extent in the sovereignty. Before the year 1857 the husband of Queen Victoria possessed no English title, and no place in court ceremonials except such as was conceded to him by courtesy. The title of prince consort was conferred upon him in that year.

Conspir'acy [Lat. *conspiratio* (from *con*, "together," and *spiro*, to "breathe," to "whisper")], an agreement between several persons to commit some crime, as to kill a ruler or deprive him of power. In law, it is an agreement of two or more persons to carry into effect some unlawful purpose, or to accomplish some lawful purpose by unlawful means. It is a crime of which the true basis is the unlawful combination, and may be prosecuted, though no overt act has been performed. Statute law in some instances makes a conspiracy a grave offence, as, *e. g.*, to destroy a ship with intent to injure insurers.

Con'stable [Late Lat. *comes stabuli*, "count of the stable," or *constabulus;* Fr. *connétable*], the former title of a military officer of the highest rank in France. The constable rose gradually in importance until he became *ex-officio* commander-in-chief of the army, the supreme military judge, and chief arbitrator in questions of chivalry. Mathieu de Montmorenci, who became constable in 1218, was the first who had the supreme command. The office was abolished in 1627. Napoleon I. appointed his brother Louis constable of the empire, and Berthier vice-constable. Under the Restoration the dignity was again abolished. In England the lord high constable was a personage of high rank and authority until the office was abolished by Henry VIII. A lord high constable is now appointed only on the occasion of great state ceremonies, such as a coronation. In England and the U. S. constables are inferior civil officers appointed to preserve the peace, to arrest felons, execute civil and criminal processes, etc. Some of the U. S. have an officer called "constable of the commonwealth," who is over a part of the constabulary forces, the members of which are his deputies.

Constable, a township and village of Franklin co., N. Y. The village is about 60 miles E. of Ogdensburg. Total pop. 1546.

Constable (John), an English landscape-painter, born in Suffolk in 1776, became a student in the Royal Academy in 1799. He was elected a Royal Academician in 1829. Among his works are the "Corn-Field" (1826) and the "Valley Farm" (1835). Died Mar. 30, 1837. His works are commended by Ruskin as "original, honest, free from affectation, and manly in manner." (See C. R. Leslie, "Life of John Constable," 1843.)

Con'stableville, a post-village of West Turin township, Lewis co., N. Y., on Sugar River, has four churches, a good trade, and several manufacturing establishments. Pop. 712.

Con'stance, a fortified city of Baden, is on the Rhine and the S. W. shore of the Lake of Constance, 35 miles N. E. of Zurich. It is one of the oldest towns in Germany, and was formerly a free imperial city. It has a magnificent cathedral, founded in the eleventh century; also manufactures of silk and cotton goods and watches. Here was held in 1414–18 an important council of the Church. Pop. in 1871, 10,052.

Constance, Council of [Lat. *Concilium Constantiense*], the seventeenth of the so-called œcumenical councils of the Roman Catholic Church, was convened by writ of the German emperor Sigismund, and opened on All Saints' Day, 1414, by John XXIII., one of the three claimants of the papacy. There were present during parts of the session, besides the emperor, seven patriarchs, twenty-one cardinals, one hundred and fourteen bishops and archbishops, besides many princes, nobles, and ambassadors from most of the Catholic powers and from the emperor Michael Palæologus. Representatives were also present from the principal universities of Europe. One of the objects of this council was the ending of the schism caused by the rival popes (John XXIII., Gregory XII., and Benedict XIII.). This object was accomplished by deposing all three (1415), and choosing Martin V. in their stead. The council also condemned the opinions of Wickliffe and Huss, and cited the latter to appear before it (1414). In the following year Huss was perfidiously burned at the stake for heresy, at Constance, notwithstanding the imperial safeguard which he possessed. In 1416 his friend, Jerome of Prague, met the same fate. The question of the relative authority of the pope and of the Church assembled in general council was warmly and persistently discussed by the Council of Constance, without decisive results. The reform of certain acknowledged abuses was also attempted, with no great success. The forty-fifth and last session was held April 22, 1418.

Constance, Lake of [anc. *Brigantinus Lacus;* Ger. *Boden See*], a lake of Central Europe, borders on Baden, Bavaria, Switzerland, the Tyrol, and Würtemberg, 1290 feet above the ocean-level. Area, 184 square miles. It is about 40 miles long, and 9 miles wide at the broadest part. The greatest depth is 912 feet. The Rhine enters this lake near the south-eastern end, and issues from the north-western extremity. In 1770 the water rose in one hour twenty feet above the ordinary level. This lake is said to contain twenty-five species of fish, including salmon. Several steamboats ply on it.

Con'stans (Flavius Julius) **I.,** born about 320 A. D., was the third son of the emperor Constantine I. On the death of his father, in 337, he became the sovereign of Italy, Africa, etc. His brother Constantine invaded Italy, and was killed in battle in 340, after which Constans was master of all the Western empire. He was defeated and killed by Magnentius in 350 A. D.

Constant de Rebecque (Benjamin), an eminent French political writer, born at Lausanne Oct. 25, 1767. He studied at Edinburgh, where he was a fellow-student of Erskine and Mackintosh, and afterwards in Germany. In 1799 he became a member of the French tribunate, but, having opposed the ambitious designs of Bonaparte, he was banished from France with Madame de Staël in 1801. He wrote in 1813 an able pamphlet "On the Spirit of Conquest and Usurpation." He returned to Paris in 1814, and was a member of Napoleon's council of state during the Hundred Days. In 1819 he was elected to the Chamber of Deputies, in which he was a very popular leader of the liberal party, and gained distinction as an able and witty debater. Among his works are "Cours de Politique Constitutionelle" (4 vols., 1817–20), a treatise "On Religion, considered in its Source, its Forms, and its Developments" (5 vols., 1823–31), and another in 2 vols. on the "Religion of Rome, considered in its Relations to Greek Philosophy and Christianity." Died Dec. 10, 1830. The style of his writings is much admired, and he has been called a second Voltaire. (See L. de Loménie, "B. Constant," 1841.)

Constan'tia, a superior wine from the Cape Colony, South Africa, produced upon the three Constantia estates, 12 miles S. of Cape Town. It is free from the earthy taste which characterizes ordinary Cape wines. It owes its excellence to the highly alkaline soil, the choice variety of grape employed in making it, the genial exposure of the estates, and perhaps more than all to care and skill in its preparation. There are white and red Constantia wines.

Constantia, a post-village and township of Oswego co., N. Y., on Oneida Lake and on the New York and Oswego Midland R. R., 34 miles S. E. of Oswego. Iron ore is found in the township, which contains also Cleveland and other villages. Pop. of Constantia village, 587; of township, 3437.

Constanti'na, a fortified city of Algeria, capital of a province of its own name, and seat of a Catholic bishop, is on a high hill surrounded on three sides by ravines; lat. 36° 24′ N., lon. 6° 8′ E. It is over 2000 feet above the level of the sea. It is surrounded by walls built by the Arabs, and has a citadel, and a fine old Roman bridge across one of the ravines. Here are manufactures of woollen cloth and saddlery. Remains of the ancient Roman *Cirta*, which was a great city of Numidia, are visible here. This place was besieged by the French in 1836; Oct., 1837, it was taken by assault. Pop. in 1866, 35,417.

Con'stantine, a post-village of St. Joseph co., Mich., on the St. Joseph River and on a branch of the Michigan Southern R. R., 94 miles by railroad S. W. of Lansing. It has a national bank and a weekly newspaper. Pop. 1290; of Constantine township, 2406.

Constantine (Flavius Valerius Aurelius), surnamed the Great, the first Christian emperor of Rome, was born in 272 (some say 274) A. D. He was a son of Constantius Chlorus and his wife Helena, and was originally a pagan. In the reign of Diocletian he gained distinction by his military talents, and became a favorite of the army. He was at York when his father died in July, 306, and was then proclaimed emperor by the army under his command. Galerius, who regarded him with jealous enmity, granted to him the title of cæsar, and conferred the higher rank of augustus on his own son, Severus. Maximian and his son Maxentius assumed imperial power at Rome, so that in 307 A. D. six men became competitors for the empire. Constantine married Fausta, a daughter of Maximian. After the death of Galerius (311), Licinius and Maximian were masters of the eastern provinces of the empire, and Constantine reigned in Gaul. In 312, Maxentius was defeated and killed by the army of Constantine, who then entered the city of Rome and became master of all the western part of the empire, including Italy and Africa. On the eve of this decisive battle he is said to have seen a sign of the cross in the sky, bearing the inscription: Ἐν τούτῳ νίκα ("By this conquer"). He afterwards treated the Christians with increasing favor, and adopted wise measures for the promotion of public prosperity and order.

In 314 he waged a short war against Licinius, who was the sole emperor of the eastern provinces. This war was followed by a peace of nine years, during which Constantine devoted himself to political reforms, organized a better form of government, and adopted a more humane code of laws, which recognized Christianity as the religion of the state. He renewed in 323 the war against Licinius, whom he defeated near Adrianople. After another decisive victory he reigned over the Roman empire with undivided power. He assembled at Nicæa, in 325 A. D., the first general council of the Church, and moderately favored the orthodox in the controversy against the Arians. He had a son, Crispus, who was accomplished and popular. Having been falsely accused of a crime by Fausta, his step-mother, Crispus was put to death. Constantine selected Byzantium as his capital, and enlarged or rebuilt that city, to which he gave the name of New Rome or Constantinople—"city of Constantine." This was founded by imposing ceremonies in May, 330 A. D. In the latter part of his life he showed favor to the Arians, and was baptized by an Arian bishop only a week before his death. The question is still warmly debated whether the man, or only the emperor, was converted. He died at Nicomedia May 22, 337 A. D., having divided the empire between his three sons, Constantine, Constantius, and Constans. He has a high reputation as a statesman and emperor. (See Eusebius, "Vita Constantini;" Gibbon, "Decline and Fall of the Roman Empire;" Joseph Fletcher, "Life of Constantine the Great," 1852.)

Constantine (or **Constantinus**) **VII.,** emperor of the East, surnamed Porphyrogenitus [Gr. Πορφυρογέννητος, *i. e.* "born to the purple" or "born in purple"], was born in 905 A. D. He was a son of the emperor Leo VI., who died in 911. Romanus Lecapenus usurped the imperial power in 919, after which Constantine passed many years in retirement and study. He began to reign in 944. He wrote several works of some merit. Died in 959.

Constantine XIII., surnamed Palæologus, the last emperor of Constantinople, was born in 1394. He succeeded his brother, John VII., in 1448. The Turkish sultan, Mahomet II., besieged Constantinople with an army of 250,000 men, and took it by storm in 1453. Constantine was killed, fighting bravely to the last.

Constantine [Lat. *Constantinus*], Pope, a native of Syria, succeeded Sisinnius in 708 A. D. Died in 715.

Constantine (Nikolaevitch), grand duke of Russia, the second son of the emperor Nicholas, was born Sept. 21, 1827. He became grand admiral of the fleet and a favorite leader of the old Russian party. In the Crimean war (1854–55) he commanded the Baltic fleet and acted on the defensive. He married the princess Alexandra of Saxe-Altenburg in 1848. He was in 1862 governor-general of Poland, but resigned in 1863.

Constantine (Pavlovitch), grand duke, the second son of the emperor Paul of Russia, was born May 8, 1779. He commanded a corps at the battle of Austerlitz (1805), and displayed in several actions a courage bordering on rashness. In 1814 he was appointed generalissimo of the Polish troops and viceroy of Poland. When Alexander died without issue in 1825, Constantine was the legitimate heir, but he renounced the throne in favor of his younger brother, Nicholas. In the reign of Nicholas he was viceroy of Poland, and by his tyranny provoked the Poles to revolt in 1830. Died of cholera June 27, 1831.

Constantino'ple [Turk. *Stambool** or *Islambool* in common language, and *Constantinieh* in documentary writing; modern Gr. *Istampoli;* Gr. Κωνσταντινόπολις; Lat. *Constantinopolis, i. e.* "city of Constantine"], a celebrated city of Turkey in Europe, capital of the Ottoman empire, was originally called Byzantium (which see). It is beautifully situated on the Bosphorus where it enters the Sea of Marmora, and in the province of Room-Elee. Lat. 41° 1′ N., lon. 28° 59′ E. The site is a triangular peninsula, bounded on the N. by an inlet of the Bosphorus called the Golden Horn, and surrounded by water on all sides except the W. Few cities can boast so magnificent a position; commanding the two opposite shores of Europe and Asia, it combines the advantages of security and great facilities for trade with the choicest gifts of nature and exquisite beauty of scenery. It occupies seven hills, rising one above another as they recede from the water. This variety of surface, with the numerous gardens, mosques, minarets, and cypress trees, renders the external aspect of the city very picturesque and imposing. The Golden Horn, which is five or six miles long, and varies in width from one to four furlongs, forms a safe and very commodious harbor, which is sufficiently deep to admit the largest ships. As the tide is here scarcely felt, the constant depth of the water permits vessels to land their cargoes with convenience and ease. The Bosphorus, here nearly one mile wide, separates Constantinople from Scutari, and the Golden Horn separates the city from the large suburbs named Galata and Pera. Along the western border of the city proper a lofty stone wall four miles long, and now in a ruinous condition, extends from the Sea of Marmora to the Golden Horn. This wall was built during the Byzantine empire, and presents picturesque specimens of mural ruins. The streets of the city are mostly narrow, crooked, and dirty. It contains about 350 mosques, 180 hospitals, and numerous Christian churches. It is the see of Greek, Latin, and Armenian patriarchs.

The Seraglio, the palace of the sultan, stands on the shore of the Bosphorus at the N. E. point of the peninsula, and commands a beautiful view. This palace, with its gardens, groves, and governmental offices, includes an area of nearly three miles in circuit, which is washed on one side by the Golden Horn. The principal gate or entrance to the Seraglio is called the Sublime Porte, from which is derived the diplomatic name of the sultan's court. Within the precincts of the palace is the celebrated Divan and the Harem, with the "Garden of Delight." The mean annual temperature is about 56° F.

Among the remarkable edifices are the "Castle of the Seven Towers," built about 1000 A. D., and now partly ruined; the mosque of Solyman the Magnificent, a masterpiece of Saracenic architecture; the mosque of Selim II., and those of Mustapha III., Achmet, and Mahomet II. The mosque of Achmet has six minarets, more than any other in the world. Connected with the mosque of Mahomet II. are eight endowed academies. Near the Seraglio stands the celebrated and magnificent mosque of St. Sophia, once a Christian cathedral, built by the emperor Justinian between 531 and 538 A. D. It is in the form of a Greek cross, 269 feet long, and is surmounted by a flattened dome, which is 180 feet above the ground, and is much admired. It is adorned by 107 columns of fine porphyry, marble, and granite. A lofty minaret rises at each of the four corners of this mosque. Among the antiquities now visible here are the "Burnt Column," erected by Constan-

* The Turkish name *Istambool* (contracted into *Stambool*) is supposed by some a corruption of the Greek phrase εἰς τὴν πόλιν ("to the city"). More probably it is a corruption of Islambul (*islam*, "believers," and *bul*, "multitude").

tine the Great; the pillar of Marcian; vestiges of the Boucoleon palace; the aqueduct of Valens; and the Theban obelisk, on the site of the ancient Hippodrome.

The city proper is divided into separate quarters for the Jews, Armenians, and Greeks. The Greek quarter, called the *Fanar*, extends along the shore of the Golden Horn, which is always covered with merchant vessels and numerous small boats. A bridge of boats connects Fanar with Pera and Galata; the latter is the residence of European merchants, and contains a great number of warehouses. Pera is the residence of the foreign ambassadors, whose palaces are situated on a hill. The numerous cemeteries around Constantinople are among its greatest ornaments.

The city has an extensive foreign commerce, which is mostly in the hands of the Greeks, Italians, British, French, and Germans. The chief articles of export are silks, carpets, hides, wool, potash, linseed, madder, and valonea. Among the imports are grain, iron, coffee, sugar, cotton stuffs, woollen stuffs, metallic goods, drugs, gums, jewelry, furniture, and porcelain. The arrivals at this port in 1870 were 23,483 vessels, the tonnage of which was 4,998,754; departures, 23,151; tonnage, 5,091,871. Here are manufactures of silk and cotton goods, morocco, leather, saddlery, carpets, and meerschaum pipes.

It is stated that the city has been subjected to twenty-four memorable sieges. It was taken by the crusaders in 1204, and by the Turks in May, 1453; but in nearly all the other cases the siege ended in the success of the party which defended the city. Pop., including suburbs, estimated at 1,075,000, about one-half of whom are Mohammedans, 220,000 Greeks, 250,000 Orthodox Armenians, 30,000 United Armenians, and 55,000 Jews. (See KRAUSE, "Die Eroberungen Constantinopels," 1870; CONSTANTIUS, "Ancient and Modern Constantinople," 1834, translated by John P. Brown, 1868.)

Constan'tius I., called **Constantius Chlo'rus** (FLAVIUS VALERIUS), a Roman emperor, born about 250 A. D., was the father of Constantine the Great. The emperors Diocletian and Maximian chose Constantius and Galerius in 292 A. D., and gave to each the title of cæsar. Constantius ruled over Gaul, Britain, and Spain, and became emperor in 305, when Diocletian abdicated. Died in 306 A. D.

Constantius II. (FLAVIUS JULIUS), the second son of Constantine I. and Fausta, was born at Sirmium in 317 A. D. He inherited, in accordance with his father's will, the Asiatic provinces and Egypt in 337. He waged war against the Persians, by whom he was several times defeated. He defeated Magnentius on the Drave in 351, and in Gaul in 353. In 355 he gave the title of cæsar to his cousin Julian. He showed favor to the Arians. He died in 361 A. D., and was succeeded by Julian.

Constella'tion [from the Lat. *con*, "together," and *stella*, a "star"], a group of stars. From time immemorial it has been the practice of observers to form the stars into artificial groups, which have received the name of constellations. They are represented by the figures of men, animals, and other objects to which might be traced a fancied resemblance. Before the invention of almanacs the risings and settings of the constellations were looked to by husbandmen, shepherds, and seafaring men as the great landmarks (so to speak) of the seasons, and of the weather which each season was expected to bring with it. Thus, the risings and settings of Boötes, with the bright star Arcturus, which took place near the equinoxes, portended great tempests. The great heat in July was ascribed to the rising of Canis the dog, with its bright star Sirius. The appearance of Castor and Pollux was hailed as the harbinger of fair summer weather. Many nations have from early times arranged the stars into constellations, but our nomenclature is chiefly derived from that of the Greeks and Romans. Eudoxus, who lived about 360 B. C., gave a description of the heavens, with the names and characters of all the constellations recognized in his time. This work is lost, but a poetical paraphrase of it, written about a century later by Aratus, is extant. It describes twelve zodiacal constellations, twenty in the northern hemisphere, and thirteen in the southern. The "Almagest" of Ptolemy includes the preceding, with three additional constellations — one northern and two southern. These are the ancient stellar groups. Large additions to the nomenclature have been made in modern times, owing to the discovery of constellations in the southern hemisphere which were never visible to the world known to the ancient authors. Some stars of the northern heavens not included in the ancient groups have been formed into new ones. Lacaille went in 1751 to the Cape of Good Hope, where he spent nearly four years in making a catalogue of the southern stars and forming them into constellations. (The principal groups will be more fully noticed under their alphabetical heads.)

The following list comprises all the constellations now generally recognized, although some of the more recent ones are understood to be temporary. The first twenty are known as Ptolemy's northern constellations; next come the twelve zodiacal, and then the fifteen southern constellations of Ptolemy; the forty-eighth was added by Tycho Brahe, though first named by Conon the Samian; the next ten are from Hevelius. All after the fifty-fifth are S. of the equator. Those from Indus to Apus inclusive were named by Bayer; the next thirteen are from Lacaille, and the last two from Royer.

1. Ursa Minor, the Lesser Bear.
2. Ursa Major, the Greater Bear.
3. Draco, the Dragon.
4. Cepheus.
5. Boötes, the Herdsman.
6. Corona Borealis, the Northern Crown.
7. Hercules.
8. Lyra, the Lyre.
9. Cygnus, the Swan.
10. Cassiopeia.
11. Perseus.
12. Auriga.
13. Ophiuchus or Serpentarius, the Serpent-bearer.
14. Serpens, the Serpent.
15. Sagitta, the Arrow.
16. Delphinus, the Dolphin.
17. Equuleus, the Little Horse.
18. Pegasus, the Winged Horse.
19. Andromeda.
20. Triangulum Boreale, the Northern Triangle.
21. Aries, the Ram.
22. Taurus, the Bull.
23. Gemini, the Twins.
24. Cancer, the Crab.
25. Leo, the Lion.
26. Virgo, the Virgin.
27. Libra, the Scales.
28. Scorpio, the Scorpion.
29. Sagittarius, the Archer.
30. Capricornus, the Goat.
31. Aquarius, the Water-bearer.
32. Pisces, the Fishes.
33. Cetus, the Whale.
34. Orion.
35. Eridanus, the River Po.
36. Lepus, the Hare.
37. Canis Major, the Greater Dog.
38. Canis Minor, the Lesser Dog.
39. Argo, the Ship Argo.
40. Hydra, the Water Serpent.
41. Crater, the Cup.
42. Corvus, the Crow.
43. Centaurus, the Centaur.
44. Lupus, the Wolf.
45. Ara, the Altar.
46. Corona Australis, the Southern Crown.
47. Piscis Australis, the Southern Fish.
48. Coma Berenices, the Hair of Berenice.
49. Canes Venatici (the Greyhounds, Asterion and Chara).
50. Lacerta, the Lizard.
51. Lynx, the Lynx.
52. Sextans Uraniæ, Tycho's Sextant.
53. Camelopardalis, the Giraffe.
54. Vulpecula et Anser, the Fox and Goose.
55. Leo Minor, the Lesser Lion.
56. Monoceros, the Unicorn.
57. Indus, the Indian.
58. Grus, the Crane.
59. Phœnix, the Phœnix.
60. Musca, the Fly.
61. Pavo, the Peacock.
62. Toucan, the Toucan.
63. Hydrus, the Water-snake.
64. Dorado, the Sword-fish.
65. Piscis Volans, the Flying-fish.
66. Chamæleon, the Chamæleon.
67. Triangulum Australe, the Southern Triangle.
68. Apus, the Bird of Paradise.
69. Apparatus Sculptoris, or Sculptor, the Sculptor's workshop.
70. Fornax Chemica, the Chemical Furnace.
71. Horologium, the Clock.
72. Recticulum Rhomboidale, the Rhomboidal Net.
73. Cœla Sculptoris, the Graving tools.
74. Equus Pictorius, the Painter's Easel.
75. Antlia Pneumatica, the Air-pump.
76. Octans, the Octant.
77. Norma, the Square-rule.
78. Circinus, the Compasses.
79. Telescopium, the Telescope.
80. Microscopium, the Microscope.
81. Mons Mensæ, the Table-Mountain.
82. Crux Australis, the Southern Cross.
83. Columba Noachi, Noah's Dove.

There have been many more constellations proposed, and some others are needed, especially S. of the equator. Indeed, were it not for the great difficulties attending a change, and the seeming fixity of the present nomenclature, sanctioned by the usage of ages, it is not unlikely that a new arrangement of all the stars would be attempted, and many of the present monstrous figures banished from the maps of the celestial globe.

Constipa'tion [from the Lat. *con*, intensive, and *stipo*, to "stow," to "crowd," referring to that state of the rectum in which it is impacted with fecal matter], a condition of the system marked by sluggish action of the bowels upon their contents, due either to diminished secretion of the juices of the mucous membrane or to a want of action of the muscular coat of the intestines. Sedentary habits predispose to constipation, and so does too large a proportion of animal food. Brown bread, ripe fruits, fresh vegetables, and active exercise tend to avert this disorder. An abdominal compress of cold water, covered with a flannel bandage, sometimes proves beneficial. For many cases the use of mild cathartics is necessary. They may be taken in proper doses for many years without bad effects. The use of nux vomica in small daily doses is often useful, and the same is true of belladonna in some constitutions. It is frequently advisable to employ enemata of warm or cold water, and also kneading or careful manipulation of the abdomen. But perhaps the most rational treatment is a careful readjustment of the diet, and the adoption of active habits of life. Ill-chosen and ill-cooked food, perhaps the most frequent cause of intestinal troubles, should be especially avoided. There is no doubt also that habitual constipation may in some instances be overcome by the persistent and systematic attempt to perform the impaired function at a regular time each day.

Constitution [from the Lat. *con*, "together," and *statuo*, to "place"], in American law, a written statement of the fundamental rules of government, either of a State or of the United States. The word as here used has a widely different signification from that which prevails in England. There it simply means the leading rules of government, without reference to any formal statement. The "constitution" thus consists of documents emanating from time to time from the king or from Parliament, and of traditions and customs. These may be collected in treatises and reduced to a systematic form, but have never received the legal sanction indispensable in America—that of recognition by the nation as distinguished from Parliament. In this country "the people," consisting in each State of those who hold the elective franchise, are by prescribed forms called upon at intervals either to establish the constitution or to amend it. It thus has an authority superior to that of the government organized under it. One extremely important result is, that if any of the departments exceed the limits marked out in the constitution, the act is irregular and void. An illustration of the doctrine is found in an act of the legislature which transcends the constitution; the judicial department will declare it void. The courts have no such power in England. An act of Parliament is commonly said to be "omnipotent;" there is no judicial power which can exercise the function of arresting the regular operation of the act. The power of the courts in the U. S. is, in the best sense of the word, a "veto"—forbidding a direction which has actually been clothed with legislative forms from being carried into effect, on account of its repugnance to the will of the people. The further examination of the subject may be conducted under the following general divisions; I. The mode of originating an American constitution; II. The relation between a State and the U. S. Constitution, and the office of each; III. Principal provisions in American constitutions, including "constitutional limitations."

I. The prevailing method of generating or amending a constitution is the "constitutional convention." It is certainly not the only method, since it sometimes happens that a constitution provides special and different modes of amendment, as is the case with the U. S. Constitution and some others. A distinction has been taken between a "constitutional" and a "revolutionary" convention. These do not differ necessarily in their internal character or in their modes of conducting business, but in their origin. A constitutional convention originates by orderly processes—is the creature of law. A revolutionary convention is irregular in its origin. Its ordinances may have a *de facto* validity, and become law on receiving the sanction of the people. The regular method is to have a law of the legislature or a constitutional provision as a basis for the existence of the convention. When a body of delegates of this kind is assembled by legal methods, its powers become a subject of much importance, and are not yet definitely ascertained. Some would hold that the convention holds within its grasp all the powers which inhere in the "people" that created it. In other words, it is sovereign. This is startling doctrine, and will scarcely command general assent. Another extreme view in the other direction is, that it is a mere deliberative body, having power to discuss propositions, to agree upon them, and to recommend them for adoption. Under this view the convention is but little more than a debating society, with very limited powers for preserving order or securing itself from the intrusion of strangers. The true view would seem to be that while the convention is itself acting in subordination to law, yet it has, as *incidental* to the accomplishment of its purposes, such powers as are necessary to carry them into effect. It may accordingly preserve order, punish contempts of its authority, provide for submission to the vote of the people of its proposed ordinances, and do such other acts as reasonably serve to make deliberation free and complete, and also to secure the full expression of the popular will. There are cases where the constitution of the State itself or the act of the legislature provides for the calling of a convention in a prescribed manner and with specified powers. While the restrictions of a constitution must be accepted as binding, it may well be doubted whether an act of the legislature can deprive a convention sanctioned by the people of powers which have been already referred to as incidental to its complete working.

The common method of transacting business is to parcel out among different standing committees the various topics to be provided for, such as a committee on "the Bill of Rights," "the Judiciary," "the Legislative Department," etc. These committees, after due consideration of the subjects entrusted to them, report to the convention, when the matter is taken up by the entire body, discussed, approved, or rejected. (For detailed information see JAMESON, "On Constitutional Conventions.") The debates in conventions are frequently published in a permanent form, and contain much information of great value on legal and constitutional topics. (Reference may be made to the "Madison Papers," containing debates on the U. S. Constitution, ELLIOTT'S "Debates," and those published in New York, Virginia, Massachusetts, Illinois, and Pennsylvania.)

II. *The Relation between a State and the U. S. Constitution, and the office of each.*—A State constitution is adopted to regulate the action of the various departments of the government and to secure the rights of the people. It is a common statement that a State government has all the powers possessed by the English Parliament, except so far as it is restrained either by the State or national constitution. The object of a State constitution is not so much to confer power, as it is to restrict and define that which already exists. It is to subject the will of the people to prescribed forms, which cannot be overcome by an ordinary act of legislation, but only by an amendment of the constitution itself. On the other hand, the U. S. government is called into existence by a written instrument. It has no powers except those which are contained within it, either in express terms or by reasonable implication. The acts done under its legitimate powers, such as the laws of Congress or treaties with foreign nations, are the supreme law of the land, and all State laws or State constitutions are so far subordinate. It is plain, however, that a State constitution or law may be in conflict with some provision of the U. S. Constitution or law or treaty, or an act of Congress may trench upon legitimate State authority. There must be some power entrusted with the function of deciding these questions in such a way as to keep the two governments within their proper sphere of action. This power appertains to the Supreme Court of the U. S., and in the exercise of its appellate jurisdiction it may review the decisions of State courts for this purpose, under clauses of the "judiciary acts" of Congress passed under the provisions of the Constitution. It thus becomes the final interpreter of the Constitution, and may declare a State law or constitutional provision void as being repugnant to the U. S. Constitution or the laws of Congress or treaties with foreign powers. So, when an act of Congress is not warranted by constitutional rules, it will be declared void. In this way the complex system of government works harmoniously, sound judgment dictating that the rights of the States should be preserved by the court with the same jealous and scrupulous care as those of the U. S. The court cannot exercise this power by the promulgation of an edict or ordinance, but only through the medium of a "case" or controversy between litigating parties. In deciding the case it may proceed upon principles which become a rule for the future, and a body of constitutional law is thus formed which either truly expounds the Constitution or departs from it. If an error be committed, it can only be rectified by a subsequent act of the court overruling the decision or by an amendment of the Constitution. Another point may be adverted to. A State law may be opposed to a State constitution. The duty of deciding this point regularly devolves upon the courts of the particular State, and the U. S. court follows their lead. However, having once acceded to the State interpretation, if that be subsequently reversed in the State court, it will not feel bound to change its view, but may adhere to the first construction. There is thus to be collected from the decisions of State courts a mass of what may be called "State constitutional law." Much of this is special in its nature, having but little value beyond State limits. Other parts of it are general in their character, while some portions of it are coincident with decisions in the U. S. court, as in some instances the same restrictions are found in both instruments.

III. It is not intended under this head to advert to the general scheme of the various State and U. S. constitutions. The text of the latter is given hereafter in full. (See CONSTITUTION OF THE U. S.) Reference will only be made to such provisions in the nature of restrictions as are of a general nature. These are restrictions upon unsound legislation, such as prohibitions of bills of attainder and ex-post facto laws, or laws impairing the obligation of contracts; some of the States in the same spirit prohibit divorces by the legislature. Or they may be limitations upon legislation opposed to the spirit of American institutions. Under this head may be ranked prohibitions against granting titles of nobility. There are also limitations for the protection of individual rights addressed to all departments of government. They tend to secure liberty of speech and of the press, religious freedom, to prevent deprivation of rights except through orderly processes in courts of justice, including trial by jury; also to prevent renewed trials for the same offence, to check excessive punishments, etc. A number of such provisions are found in the earlier amendments to the U. S. Constitution. It is an important remark that these were only intended to bind the action of

Congress or other departments of the general government. For this reason like clauses are inserted in the State constitutions. The last three amendments (thirteenth, fourteenth, and fifteenth) are operative upon the States as well as upon Congress. Many of the provisions now considered are taken from the English law, and in the very words of statutes or text-writers. They thus become fundamental law in the sense in which they were used in the country whence they were derived. The last three amendments of the U. S. Constitution were especially intended to secure rights to citizens of African descent, though not confined to them. (See CITIZEN.) Fundamental provisions of this sort, when considered together, are frequently termed a "Bill of Rights." (See BILL OF RIGHTS.) There is in some instances a tendency to insert in the State constitutions matters which are more properly the subject of legislation. Sometimes a political party desires to make its policy on a question like that of internal improvements a permanent one, and secures to that end a provision in the constitution; or perhaps legislatures prove themselves to be unwise or even corrupt, and it is thought well to reduce their capacity to do mischief by shearing them of their legitimate powers. Provisions framed to accomplish such objects do not long prevail, and a reaction in public sentiment soon leads to an amendment of the constitution. The better view is, that constitutions should only deal with fundamental law. When legislators are ignorant or vicious, the true remedy is at the ballot-box, where the voters may show their will to have more suitable men. (See on the general subject COOLEY, "On Constitutional Limitations;" HOUGH'S "Collection of State Constitutions;" also the same author's "Annotated New York Constitution of 1846;" STORY, "On the U. S. Constitution;" KENT'S "Commentaries;" and the treatises of RAWLE, SARGENT, and PASCHAL. The most complete view of the principles governing the whole subject may be obtained from the opinions written by the judges of the Supreme Court of the U. S. in deciding specific cases involving the construction of the Constitution. These are collected in the reports of DALLAS, CRANCH, WHEATON, PETERS, HOWARD, BLACK, WALLACE, etc. Abstracts of the points decided may be found in BRIGHTLY'S "Digest" and ABBOTT'S "National Digests." These works may be used for easy reference to the volumes of the reports above named. Full expositions of questions arising under the various State constitutions will in like manner be found in the published reports of the decisions of the courts of the respective States.) T. W. DWIGHT.

Constitution of the United States, the fundamental or organic law of the union of the States, thereby united. This, with all acts of the States in Congress assembled, and all treaties made in pursuance of its provisions, constitutes the supreme law of the land throughout the Union. The first Constitution of the U. S. was the Articles of Confederation, adopted by the States during the war for their independence. (See CONFEDERATION, ARTICLES OF: also see CURTIS, "History Constitution U. S.," p. 139; SPARKS, "Writings of Washington," letter to Henry Lee, 22d Sept., 1788, to Benjamin Lincoln, 26th Oct., 1788, and to James Monroe, 22d Feb., 1789.) The first Articles proving inefficient for the accomplishment of the objects of the Union, mainly upon the grounds that they conferred no power upon the central head to regulate commerce with foreign nations, nor to act directly upon the citizens of the several States respectively in the collection of the *quotas* levied upon the States to meet the public expenditures and to sustain the public credit, etc., the Congress, being urged by appeals from several quarters, took up the subject of amendment and general revision on the 21st of Feb., 1787, and then came to the following resolution upon it:

"*Resolved*, That, in the opinion of Congress, it is expedient that, on the second Monday in May next, a convention of delegates, who shall have been appointed by the several States, be held at Philadelphia, for the sole and express purpose of revising the Articles of Confederation, and reporting to Congress and the several State legislatures such alterations and provisions therein as shall, when agreed to in Congress and confirmed by the States, render the Federal Constitution adequate to the exigencies of government and the preservation of the Union." (See ELLIOTT'S "Debates on the Federal Constitution," vol. i., p. 120.)

It was under this resolution of Congress, and in response to it by eleven of the States in choosing and sending delegates, that the ever-memorable Federal Convention assembled in Philadelphia the 14th of May, 1787. Each of the old thirteen States then composing the Union was represented in it, except Rhode Island. George Washington, almost universally styled the "Father of his Country," was unanimously chosen president of the convention. As a whole, it was unquestionably the ablest body of jurists, legislators, and statesmen that had ever assembled on the continent of America. The convention remained in session from the 14th of May till the 17th of September ensuing. Their entire deliberations and proceedings were with closed doors. The journal of these proceedings was not published until over forty years afterwards. The actual and practical result, however, of their labors in the execution of the high trust committed to them was immediately communicated to Congress, and, being approved by that body, was speedily communicated to the respective States. This was their grand work in framing and proposing that matchless system of Federal government set forth and embodied in the new Constitution for the government of the U. S. of America, which was adopted and ratified by eleven States before the close of the year 1788; so that it went into operation between the States ratifying at the time appointed in 1789. The other two, North Carolina and Rhode Island, adopted and ratified it in less than two years afterwards. The last of the old thirteen which came into the Union, so remodelled in its Federal structure, was Rhode Island. Several features in this new form and constitution of government for separate states and communities are without a parallel in ancient or modern times. It was in contemplation of one of these peculiar features that the learned De Tocqueville, a profound philosopher of France, and one thoroughly versed in the science of politics, made the following commentary: "This Constitution, which may at first be confounded with the federal constitutions which have preceded it, rests, in truth, upon a wholly novel theory, which may be considered as a great discovery in modern political science. In all the confederations which preceded the American Constitution of 1789 the allied States, for a common object, agreed to obey the injunctions of a federal government, but they reserved to themselves the right of ordaining and enforcing the laws of the union. The American States which combined in 1789 agreed that the Federal government should not only dictate, but should execute, its own enactments. In both cases the right is the same, but the exercise of the right is different, and this difference produced the most momentous consequences." (See DE TOCQUEVILLE'S "Democracy in America," vol. i., p. 198.)

It was in view of the same peculiar, specific difference between the Constitution of the Federal republic of the U. S. and that of all others of a similar general type which caused Lord Brougham, in his "Political Philosophy," thus to speak of the wonderful machinery of the government of the U. S.: "It is," says he (vol. iii., p. 336), "not at all a refinement that a federal union should be formed; this is the natural result of men's joint operations in a very rude state of society. But the regulation of such a union upon pre-established principles, the formation of a system of government and legislation in which the different subjects shall be, not individuals, but States, the application of legislative principles to such a body of States, and the devising means for keeping its integrity as a federacy, while the rights and powers of the individual States are maintained entire, is the very greatest refinement in social policy to which any state of circumstances has ever given rise, or to which any age has ever given birth."

The following is the text of the new Constitution proposed by the Convention of 1787, and adopted by a number of the States sufficient for it to go into operation in 1789; beginning with the preamble, and ending with the last of the Amendments. A. H. STEPHENS.

CONSTITUTION OF THE UNITED STATES. We, the people of the United States, in order to form a more perfect union, establish justice, ensure domestic tranquillity, provide for the common defence, promote the general welfare, and secure the blessings of liberty to ourselves and our posterity, do ordain and establish this Constitution for the United States of America.

ARTICLE I., Sec. 1. All legislative powers herein granted shall be vested in a Congress of the United States, which shall consist of a Senate and House of Representatives.

Sec. 2. The House of Representatives shall be composed of members chosen every second year by the people of the several States, and the electors in each State shall have the qualifications requisite for electors of the most numerous branch of the State legislature.

No person shall be a representative who shall not have attained to the age of twenty-five years, and been seven years a citizen of the United States, and who shall not, when elected, be an inhabitant of that State in which he shall be chosen.

Representatives and direct taxes shall be apportioned among the several States which may be included within this Union according to their respective numbers, which shall be determined by adding to the whole number of free persons, including those bound to service for a term of years, and excluding Indians not taxed, three-fifths of all other persons. The actual enumeration shall be made within three years after the first meeting of the Congress of the

United States, and within every subsequent term of ten years, in such manner as they shall by law direct. The number of representatives shall not exceed one for every thirty thousand, but each State shall have at least one representative; and until such enumeration shall be made, the State of New Hampshire shall be entitled to choose three, Massachusetts eight, Rhode Island and Providence Plantations one, Connecticut five, New York six, New Jersey four, Pennsylvania eight, Delaware one, Maryland six, Virginia ten, North Carolina five, South Carolina five, and Georgia three.

When vacancies happen in the representation from any State, the executive authority thereof shall issue writs of election to fill such vacancies.

The House of Representatives shall choose their Speaker and other officers; and shall have the sole power of impeachment.

Sec. 3. The Senate of the United States shall be composed of two senators from each State, chosen by the legislature thereof, for six years; and each senator shall have one vote.

Immediately after they shall be assembled in consequence of the first election, they shall be divided as equally as may be into three classes. The seats of the senators of the first class shall be vacated at the expiration of the second year, of the second class at the expiration of the fourth year, and of the third class at the expiration of the sixth year, so that one-third may be chosen every second year; and if vacancies happen by resignation, or otherwise, during the recess of the legislature of any State, the executive thereof may make temporary appointments until the next meeting of the legislature, which shall then fill such vacancies.

No person shall be a senator who shall not have attained to the age of thirty years, and been nine years a citizen of the United States, and who shall not, when elected, be an inhabitant of that State for which he shall be chosen.

The Vice-President of the United States shall be president of the Senate, but shall have no vote, unless they be equally divided.

The Senate shall choose their other officers, and also a president *pro tempore*, in the absence of the Vice-President, or when he shall exercise the office of President of the United States.

The Senate shall have the sole power to try all impeachments; when sitting for that purpose, they shall be on oath or affirmation. When the President of the United States is tried, the Chief-Justice shall preside; and no person shall be convicted without the concurrence of two-thirds of the members present.

Judgment in cases of impeachment shall not extend further than to removal from office, and disqualification to hold and enjoy any office of honor, trust, or profit under the United States; but the party convicted shall nevertheless be liable and subject to indictment, trial, judgment, and punishment, according to law.

Sec. 4. The times, places, and manner of holding elections for senators and representatives shall be prescribed in each State by the legislature thereof; but the Congress may at any time, by law, make or alter such regulations, except as to the places of choosing senators.

The Congress shall assemble at least once in every year, and such meeting shall be on the first Monday in December, unless they shall, by law, appoint a different day.

Sec. 5. Each house shall be the judge of the elections, returns, and qualifications of its own members, and a majority of each shall constitute a quorum to do business; but a smaller number may adjourn from day to day, and may be authorized to compel the attendance of absent members, in such manner and under such penalties as each house may provide.

Each house may determine the rules of its proceedings, punish its members for disorderly behavior, and, with the concurrence of two-thirds, expel a member.

Each house shall keep a journal of its proceedings, and from time to time publish the same, excepting such parts as may in their judgment require secresy, and the yeas and nays of the members of either house on any question shall, at the desire of one-fifth of those present, be entered on the journal.

Neither house, during the session of Congress, shall, without the consent of the other, adjourn for more than three days, nor to any other place than that in which the two houses shall be sitting.

Sec. 6. The senators and representatives shall receive a compensation for their services, to be ascertained by law, and paid out of the treasury of the United States. They shall in all cases, except treason, felony, and breach of the peace, be privileged from arrest during their attendance at the session of their respective houses, and in going to and returning from the same; and for any speech or debate in either house they shall not be questioned in any other place.

No senator or representative shall, during the time for which he was elected, be appointed to any civil office under the authority of the United States, which shall have been created, or the emoluments whereof shall have been increased during such time; and no person holding any office under the United States shall be a member of either house during his continuance in office.

Sec. 7. All bills for raising revenue shall originate in the House of Representatives; but the Senate may propose or concur with amendments, as on other bills.

Every bill which shall have passed the House of Representatives and the Senate, shall, before it become a law, be presented to the President of the United States; if he approve, he shall sign it; but if not, he shall return it, with his objections, to that house in which it shall have originated, who shall enter the objections at large on their journal, and proceed to reconsider it. If after such reconsideration two-thirds of that house shall agree to pass the bill, it shall be sent, together with the objections, to the other house, by which it shall likewise be reconsidered; and if approved by two-thirds of that house, it shall become a law. But in all such cases, the votes of both houses shall be determined by yeas and nays, and the names of the persons voting for and against the bill shall be entered on the journal of each house respectively. If any bill shall not be returned by the President within ten days (Sunday excepted) after it shall have been presented to him, the same shall be a law in like manner as if he had signed it, unless the Congress by their adjournment prevent its return; in which case it shall not be a law.

Every order, resolution, or vote to which the concurrence of the Senate and the House of Representatives may be necessary (except on a question of adjournment) shall be presented to the President of the United States; and before the same shall take effect, shall be approved by him, or, being disapproved by him, shall be repassed by two-thirds of the Senate and House of Representatives, according to the rules and limitations prescribed in the case of a bill.

Sec. 8. The Congress shall have power to lay and collect taxes, duties, imposts, and excises, to pay the debts and provide for the common defence and general welfare of the United States; but all duties, imposts, and excises shall be uniform throughout the United States;

To borrow money on the credit of the United States;

To regulate commerce with foreign nations, and among the several States, and with the Indian tribes;

To establish an uniform rule of naturalization, and uniform laws on the subject of bankruptcies throughout the United States;

To coin money, regulate the value thereof, and of foreign coin, and fix the standard of weights and measures;

To provide for the punishment of counterfeiting the securities and current coin of the United States;

To establish post-offices and post-roads;

To promote the progress of science and useful arts, by securing for limited times, to authors and inventors, the exclusive right to their respective writings and discoveries;

To constitute tribunals inferior to the Supreme Court;

To define and punish piracies and felonies committed on the high seas, and offences against the law of nations;

To declare war, grant letters of marque and reprisal, and make rules concerning captures on land and water;

To raise and support armies, but no appropriation of money to that use shall be for a longer term than two years;

To provide and maintain a navy;

To make rules for the government and regulation of the land and naval forces;

To provide for calling forth the militia to execute the laws of the Union, suppress insurrections, and repel invasions;

To provide for organizing, arming, and disciplining the militia, and for governing such part of them as may be employed in the service of the United States, reserving to the States respectively the appointment of the officers, and the authority of training the militia according to the discipline prescribed by Congress;

To exercise exclusive legislation in all cases whatsoever over such district (not exceeding ten miles square) as may, by cession of particular States, and the acceptance of Congress, become the seat of the government of the United States, and to exercise like authority over all places purchased by the consent of the legislature of the State in which the same shall be, for the erection of forts, magazines, arsenals, dockyards, and other needful buildings; and

To make all laws which shall be necessary and proper for carrying into execution the foregoing powers, and all other powers vested by this constitution in the government of the United States, or in any department or officer thereof.

Sec. 9. The migration or importation of such persons as any of the States now existing shall think proper to admit shall not be prohibited by the Congress prior to the year one thousand eight hundred and eight; but a tax or duty may be imposed on such importation, not exceeding ten dollars for each person.

The privilege of the writ of *habeas corpus* shall not be suspended, unless when in cases of rebellion or invasion the public safety may require it.

No bill of attainder or *ex post facto* law shall be passed.

No capitation or other direct tax shall be laid, unless in proportion to the census or enumeration hereinbefore directed to be taken.

No tax or duty shall be laid on articles exported from any State.

No preference shall be given by any regulation of commerce or revenue to the ports of one State over those of another; nor shall vessels bound to or from one State be obliged to enter, clear, or pay duties in another.

No money shall be drawn from the treasury but in consequence of appropriations made by law; and a regular statement and account of the receipts and expenditures of all public money shall be published from time to time.

No title of nobility shall be granted by the United States: and no person holding any office of profit or trust under them shall, without the consent of the Congress, accept of any present, emolument, office, or title, of any kind whatever, from any king, prince, or foreign state.

Sec. 10. No State shall enter into any treaty, alliance, or confederation; grant letters of marque and reprisal; coin money; emit bills of credit; make anything but gold and silver coin a tender in payment of debts; pass any bill of attainder, *ex post facto* law, or law impairing the obligation of contracts, or grant any title of nobility.

No State shall, without the consent of the Congress, lay any impost or duties on imports or exports, except what may be absolutely necessary for executing its inspection laws; and the net produce of all duties and imposts, laid by any State on imports or exports, shall be for the use of the treasury of the United States; and all such laws shall be subject to the revision and control of the Congress.

No State shall, without the consent of Congress, lay any duty of tonnage, keep troops, or ships of war in time of peace, enter into any agreement or compact with another State, or with a foreign power, or engage in war, unless actually invaded, or in such imminent danger as will not admit of delay.

ARTICLE II., Sec. 1. The executive power shall be vested in a President of the United States of America. He shall hold his office during the term of four years, and, together with the Vice-President, chosen for the same term, be elected as follows:

Each State shall appoint, in such manner as the legislature thereof may direct, a number of electors, equal to the whole number of senators and representatives to which the State may be entitled in the Congress; but no senator or representative, or persons holding an office of trust or profit under the United States, shall be appointed an elector.*

The Congress may determine the time of choosing the electors, and the day on which they shall give their votes; which day shall be the same throughout the United States.

No person, except a natural-born citizen, or a citizen of the United States at the time of the adoption of this constitution, shall be eligible to the office of President; neither shall any person be eligible to that office who shall not have attained to the age of thirty-five years, and been fourteen years resident within the United States.

In case of the removal of the President from office, or of his death, resignation, or inability to discharge the powers and duties of the said office, the same shall devolve on the Vice-President, and the Congress may by law provide for the case of removal, death, resignation, or inability, both of the President and Vice-President, declaring what officer shall then act as President, and such officer shall act accordingly, until the disability be removed, or a President shall be elected.

The President shall, at stated times, receive for his services a compensation, which shall neither be increased nor diminished during the period for which he shall have been elected, and he shall not receive within that period any other emolument from the United States, or any of them.

Before he enter on the execution of his office, he shall take the following oath or affirmation: "I do solemnly swear (or affirm) that I will faithfully execute the office of President of the United States, and will, to the best of my ability, preserve, protect, and defend the Constitution of the United States."

Sec. 2. The President shall be Commander-in-Chief of the Army and Navy of the United States, and of the militia of the several States, when called into the actual service of the United States; he may require the opinion, in writing, of the principal officer in each of the executive departments upon any subject relating to the duties of their respective offices, and he shall have power to grant reprieves and pardons for offences against the United States, except in cases of impeachment.

He shall have power, by and with the advice and consent of the Senate, to make treaties, provided two thirds of the senators present concur; and he shall nominate, and by and with the advice and consent of the Senate, shall appoint ambassadors, other public ministers and consuls, judges of the Supreme Court, and all other officers of the United States, whose appointments are not herein otherwise provided for, and which shall be established by law; but the Congress may by law vest the appointment of such inferior officers as they think proper in the President alone, in the courts of law, or in the heads of departments.

The President shall have power to fill up all vacancies that may happen during the recess of the Senate, by granting commissions which shall expire at the end of their next session.

Sec. 3. He shall from time to time give to the Congress information of the state of the Union, and recommend to their consideration such measures as he shall judge necessary and expedient; he may on extraordinary occasions convene both houses, or either of them, and in case of disagreement between them, with respect to the time of adjournment, he may adjourn them to such time as he shall think proper; he shall receive ambassadors and other public ministers; he shall take care that the laws be faithfully executed, and shall commission all the officers of the United States.

Sec. 4. The President, Vice-President, and all civil officers of the United States, shall be removed from office on impeachment for, and conviction of, treason, bribery, or other high crimes and misdemeanors.

ARTICLE III., Sec. 1. The judicial power of the United States shall be vested in one Supreme Court, and in such inferior courts as the Congress may from time to time ordain and establish. The judges, both of the supreme and inferior courts, shall hold their offices during good behavior, and shall, at stated times, receive for their services a compensation, which shall not be diminished during their continuance in office.

Sec. 2. The judicial power shall extend to all cases, in law and equity, arising under this constitution, the laws of the United States, and treaties made, or which shall be made, under their authority; to all cases affecting ambassadors, other public ministers, and consuls; to all cases of admiralty and maritime jurisdiction; to controversies to which the United States shall be a party; to controversies between two or more States; between a State and citizens of another State; between citizens of different States; between citizens of the same State claiming lands under grants of different States, and between a State, or the citizens thereof, and foreign states, citizens, or subjects.

In all cases affecting ambassadors, other public ministers, and consuls, and those in which a State shall be party, the Supreme Court shall have original jurisdiction. In all the other cases before mentioned, the supreme court shall have appellate jurisdiction, both as to law and fact, with such exceptions and under such regulations as the Congress shall make.

The trial of all crimes, except in cases of impeachment, shall be by jury; and such trial shall be held in the State where the said crimes shall have been committed; but when not committed within any State, the trial shall be at such place or places as the Congress may by law have directed.

Sec. 3. Treason against the United States shall consist only in levying war against them, or in adhering to their enemies, giving them aid and comfort.

No person shall be convicted of treason unless on the testimony of two witnesses to the same overt act, or on confession in open court.

The Congress shall have power to declare the punishment of treason; but no attainder of treason shall work corruption of blood, or forfeiture except during the life of the person attainted.

ARTICLE IV., Sec. 1. Full faith and credit shall be given in each State to the public acts, records, and judicial proceedings of every other State. And the Congress may by general laws prescribe the manner in which such acts, records, and proceedings shall be proved, and the effect thereof.

Sec. 2. The citizens of each State shall be entitled to all privileges and immunities of citizens in the several States.

A person charged in any State with treason, felony, or other crime, who shall flee from justice, and be found in another State, shall, on demand of the executive authority of the State from which he fled, be delivered up, to be removed to the State having jurisdiction of the crime.

No person held to service or labor in one State, under

* This mode of election of President and Vice-President has been modified by the Twelfth Amendment, *post*.

the laws thereof, escaping into another, shall, in consequence of any law or regulation therein, be discharged from such service or labor, but shall be delivered up on claim of the party to whom such service or labor may be due.

Sec. 3. New States may be admitted by the Congress into this Union; but no new State shall be formed or erected within the jurisdiction of any other State; nor any State be formed by the junction of two or more States, or parts of States, without the consent of the legislatures of the States concerned as well as of the Congress.

The Congress shall have power to dispose of and make all needful rules and regulations respecting the territory or other property belonging to the United States; and nothing in this constitution shall be so construed as to prejudice any claims of the United States, or of any particular State.

Sec. 4. The United States shall guarantee to every State in this Union a republican form of government, and shall protect each of them against invasion, and, on application of the legislature, or of the executive (when the legislature cannot be convened), against domestic violence.

ARTICLE V. The Congress, whenever two-thirds of both houses shall deem it necessary, shall propose amendments to this constitution, or, on the application of the legislatures of two-thirds of the several States, shall call a convention for proposing amendments, which, in either case, shall be valid to all intents and purposes as part of this constitution, when ratified by the legislatures of three-fourths of the several States, or by conventions in three-fourths thereof, as the one or the other mode of ratification may be proposed by the Congress; provided, that no amendment which may be made prior to the year one thousand eight hundred and eight shall in any manner affect the first and fourth clauses in the ninth section of the first article; and that no State, without its consent, shall be deprived of its equal suffrage in the Senate.

ARTICLE VI. All debts contracted and engagements entered into before the adoption of this constitution shall be as valid against the United States under this constitution, as under the Confederation.

This constitution, and the laws of the United States which shall be made in pursuance thereof, and all treaties made, or which shall be made, under the authority of the United States, shall be the supreme law of the land; and the judges in every State shall be bound thereby, anything in the constitution or laws of any State to the contrary notwithstanding.

The senators and representatives before mentioned, and the members of the several State legislatures, and all executive and judicial officers, both of the United States and of the several States, shall be bound by oath or affirmation to support this constitution; but no religious test shall ever be required as a qualification to any office or public trust under the United States.

ARTICLE VII. The ratification of the conventions of nine States shall be sufficient for the establishment of this constitution between the States so ratifying the same.

Done in convention, by the unanimous consent of the States present, the seventeenth day of September, in the year of our Lord one thousand seven hundred and eighty-seven, and of the independence of the United States of America the twelfth. In witness whereof we have hereunto subscribed our names.

AMENDMENTS.*

ARTICLE I. Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech or of the press; or the right of the people peaceably to assemble, and to petition the government for redress of grievances.

ARTICLE II. A well-regulated militia being necessary to the security of a free state, the right of the people to keep and bear arms shall not be infringed.

ARTICLE III. No soldier shall, in time of peace, be quartered in any house without the consent of the owner, nor in time of war but in a manner to be prescribed by law.

ARTICLE IV. The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated; and no warrants shall issue but upon probable cause, supported by oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized.

ARTICLE V. No person shall be held to answer for a capital or otherwise infamous crime, unless on a presentment or indictment of a grand jury, except in cases arising in the land or naval forces, or in the militia, when in actual service, in time of war and public danger; nor shall any person be subject for the same offence to be twice put in jeopardy of life or limb, nor shall be compelled in any criminal case to be a witness against himself; nor to be deprived of life, liberty, or property, without due process of law; nor shall private property be taken for public use without just compensation.

ARTICLE VI. In all criminal prosecutions, the accused shall enjoy the right to a speedy and public trial, by an impartial jury of the State and district wherein the crime shall have been committed, which district shall have been previously ascertained by law, and to be informed of the nature and cause of the accusation; to be confronted with the witnesses against him; to have compulsory process for obtaining witnesses in his favor, and to have the assistance of counsel for his defence.

ARTICLE VII. In suits at common law, where the value in controversy shall exceed twenty dollars, the right of trial by jury shall be preserved, and no fact tried by a jury shall be otherwise re-examined in any court of the United States than according to the rules of the common law.

ARTICLE VIII. Excessive bail shall not be required, nor excessive fines imposed, nor cruel and unusual punishment inflicted.

ARTICLE IX. The enumeration in the constitution of certain rights shall not be construed to deny or disparage others retained by the people.

ARTICLE X. The powers not delegated to the United States by the constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people.

ARTICLE XI. The judicial power of the United States shall not be construed to extend to any suit in law or equity commenced or prosecuted against one of the United States by citizens of another State, or by citizens or subjects of any foreign state.

ARTICLE XII. The electors shall meet in their respective States, and vote by ballot for President and Vice-President, one of whom at least shall not be an inhabitant of the same State with themselves. They shall name in their ballots the person voted for as President, and in distinct ballots the person voted for as Vice-President; and they shall make distinct lists of all persons voted for as President, and of all persons voted for as Vice-President, and of the number of votes for each, which lists they shall sign and certify, and transmit, sealed, to the seat of the government of the United State, directed to the president of the Senate. The president of the Senate shall, in the presence of the Senate and House of Representatives, open all the certificates, and the votes shall then be counted; the person having the greatest number of votes for President shall be the President, if such number be a majority of the whole number of electors appointed; and if no person have such majority, then from the persons having the highest numbers, not exceeding three, on the list of those voted for as President, the House of Representatives shall choose immediately, by ballot, the President. But in choosing the President, the votes shall be taken by States, the representation from each State having one vote; a quorum for this purpose shall consist of a member or members from two-thirds of the States, and a majority of all the States shall be necessary to a choice. And if the House of Representatives shall not choose a President, whenever the right of choice shall devolve upon them, before the fourth day of March next following, then the Vice-President shall act as President, as in the case of the death or other constitutional disability of the President. The person having the greatest number of votes as Vice-President shall be the Vice-President, if such number be a majority of the whole number of electors appointed; and if no person have a majority, then from the two highest numbers on the list the Senate shall choose the Vice-President; a quorum for the purpose shall consist of two-thirds of the whole number of senators, and a majority of the

* Articles I. to X., inclusive, were proposed by the First Congress in 1789–90, Article XI. in 1793, Article XII. in 1803, Article XIII. in 1865, Article XIV. in 1868, and Article XV. in 1870.

whole number shall be necessary to a choice. But no person constitutionally ineligible to the office of President shall be eligible to that of Vice-President of the United States.

ARTICLE XIII., Sec. 1. Neither slavery nor involuntary servitude, except as a punishment for crime whereof the party shall have been duly convicted, shall exist within the United States, or any place subject to their jurisdiction.

Sec. 2. Congress shall have power to enforce this article by appropriate legislation.

ARTICLE XIV., Sec. 1. All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States, and of the State wherein they reside. No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property without due process of law, nor deny to any person within its jurisdiction the equal protection of the laws.

Sec. 2. Representatives shall be apportioned among the several States according to their respective numbers, counting the whole number of persons in each State, excluding Indians not taxed. But when the right to vote at any election for the choice of electors for President and Vice-President of the United States, representatives in Congress, the executive and judicial officers of a State, or the members of the legislature thereof, is denied to any of the male inhabitants of such State being twenty-one years of age, and citizens of the United States, or in any way abridged, except for participation in rebellion or other crime, the basis of representation therein shall be reduced in the proportion which the number of such male citizens shall bear to the whole number of male citizens twenty-one years of age in such State.

Sec. 3. No person shall be a senator or representative in Congress, or elector of President and Vice-President, or hold any office, civil or military, under the United States, or under any State, who, having previously taken an oath as a member of Congress, or as an officer of the United States, or as a member of any State legislature, or as an executive or judicial officer of any State, to support the constitution of the United States, shall have engaged in insurrection or rebellion against the same, or given aid or comfort to the enemies thereof. But Congress may, by a vote of two-thirds of each house, remove such disability.

Sec. 4. The validity of the public debt of the United States authorized by law, including debts incurred for payment of pensions and bounties for services in suppressing insurrection or rebellion, shall not be questioned. But neither the United States nor any State shall assume or pay any debt or obligation incurred in aid of insurrection or rebellion against the United States, or any claim for the loss or emancipation of any slave; but all such debts, obligations, and claims shall be held illegal and void.

Sec. 5. The Congress shall have power to enforce, by appropriate legislation, the provisions of this article.

ARTICLE XV., Sec. 1. The right of the citizens of the United States to vote shall not be denied or abridged by the United States, or by any State, on account of race, color, or previous condition of servitude.

Sec. 2. The Congress shall have power to enforce this article by appropriate legislation. (See CONSTITUTION, by PROF. T. W. DWIGHT, LL.D.)

Constitutions of Clarendon. See CLARENDON.

Construc'tion [Lat. *constructio*, from *con*, "together," and *struo, structum*, to "build"], the act of building; fabrication, structure; the mode of putting together the parts of a building or system. In grammar, it signifies syntax, or the arrangement and connection of words in a sentence; their meaning or interpretation. In architecture and engineering, construction is that branch of the science which relates to the practical execution of the works required to realize the artist's design; it is immediately connected with the distribution of the different forces, the strains of the parts and materials of a building, and the properties of the various materials used.

Construction. See INTERPRETATION, by PROF. T. W. DWIGHT, LL.D.

Consubstantia'tion [from the Lat. *con*, "together," and *substantia*, "substance"], the transformation, transition, or union of substances originally distinct into a common substance—substantial conjunction; a term used in antithesis to TRANSUBSTANTIATION (which see), which means the transition of one substance into another, either by transmutation or by annihilation and substitution—one substance *in place* of two; while consubstantiation results in one substance *out of* two. The term consubstantiation has been used in the controversies on the REAL PRESENCE (which see), the mode of the presence of the body and blood of Christ in the EUCHARIST (which see). The theories of presence may be thus classified:

I. SUBJECTIVE: 1. Natural—Zwingli;
2. Supernatural—Calvin.

II. OBJECTIVE: 1. *Monistic; one* substance only really present; the body and blood: Roman Catholic *transubstantiation.*

2. *Dualistic;* the two substances really present—bread and wine, body and blood.

a. Substantial conjunction of the two—consubstantiation, IMPANATION (which see), as held by John of Paris and Rupert; falsely charged on the Lutheran Church.

b. Sacramental conjunction—mystical mediating relation of the natural (bread and wine) to the supernatural (body and blood), each unchanged in its substance, and without substantial conjunction; the *Lutheran* view.

This tabular view at once accounts for the fact that the charge of holding this doctrine has been so commonly made against the Lutheran Church, and shows how groundless the charge is. (See KRAUTH'S "Conservative Reformation," 757–775.) The same charge, with an equal want of accuracy, has been made against Dr. Pusey and his school.

C. P. KRAUTH.

Consue'gra, a Spanish town, in the province of Toledo, 38 miles S. E. of Toledo. It is an old place with steep, narrow streets, and a ruined fortress of supposed Roman origin. It manufactures coarse stuffs. Pop. 6870.

Con'sul [from the Lat. *consulo*, to "consult" or "advise"], the supreme magistrate of ancient Rome after the expulsion of the kings. The number was two, and the period of office one year, but there was no restriction as to the number of times the same individual might be elected, although a certain interval was at length required before again holding the office. Consuls were the supreme executive officers, but had no legislative authority. They were originally chosen only from the patricians, but afterwards from the plebeians also. The age required by law was forty-three years, but besides this it was requisite to have passed through the inferior offices of quæstor, ædile, and prætor. They were elected at the *comitia centuriata* some months before their entrance into office, which took place at different periods of the year at different times, but finally in January. During the interval they were termed *consules designati*, or "appointed consuls." Soon after the entrance into office they cast lots for the provinces to fall to the share of each, the superintendence of which was conferred on them by the senate. Under the emperors the nominal office of the consulate was preserved, but its substantial power destroyed; the elections became mere forms, the emperor appointing whom he pleased. Then, too, the custom was introduced of having several sets of consuls in one year; those admitted on the first day gave their name to the year, and were distinguished from the others, who were termed *suffecti* ("substituted"), by the title *ordinarii* ("regular"). Persons also were sometimes dignified with the title without enjoying the office, and were then styled *honorary consuls.* Under Justinian the year ceased to be called by the name of the consul.

Consuls in French history were the persons to whom, after the dissolution of the Directory in Nov., 1799, was entrusted the provisional government of the country. According to the constitution thus framed, Bonaparte, Cambacérès, and Lebrun, called first, second, and third consuls, were elected at the same time by the conservative senate, each for ten years, and invested with different degrees of authority. But the senate having passed various decrees which curtailed the powers of the second and third consuls, and augmented those of the first, the government was gradually assimilated to a monarchy, and after the lapse of four years and a half an easy transition was made from the consular to the imperial form; the title of emperor was substituted for that of consul, and the exercise of the sovereign authority was delegated exclusively to Napoleon Bonaparte.

Con'sul* [Fr. *consul;* It. *console*], a public officer appointed by a government to reside in foreign seaports and other places for the purpose of protecting the interests of commerce and performing administrative, and sometimes judicial, duties in regard to his countrymen who may be in the place where he resides. Consuls also aid in authenticating documents, in protecting the rights of seamen, and in various other minor duties. There are consuls-general, vice-consuls, deputy-consuls, consular and commercial agents, etc. They are not in general considered as diplomatic officers. They are, as a rule, under obligation to obey the laws of the place where they reside. Consuls of the U. S. are governed by detailed provisions of statutes

* Not only the chief magistrates of ancient Rome, but those of other Italian cities, were in a later time called consuls; the Italian republics, it appears, applied the title to those magistrates whom they sent to the colonies in the Levant, and afterwards to their representatives at other ports.

passed by Congress, which are collected in Brightly's "Digest and Supplements." These statutes regulate their appointment and compensation, their duties towards seamen and masters of vessels, their power to take possession of the estates of deceased persons, to administer oaths, perform the acts of a notary, etc. In some countries, such as China, Japan, Turkey, and Persia, they are empowered to exercise judicial functions, both criminal and civil, and to inflict specified punishments. The details of the laws are too voluminous to be stated. An important provision, however, is worthy of special reference. By the act of 22d June, 1860, all marriages in the presence of any consular officer in a foreign country, between persons who would be authorized to marry if residing in the District of Columbia, shall have the same validity as if the marriage had been solemnized in the U. S. The officer is directed to give to each of the parties a certificate of marriage, stating their names, ages, places of birth, and residence, and to forward a duplicate to the department of state at Washington. The general powers of consuls are discussed in the treatises on international law. (See INTERNATIONAL LAW, by PRES. T. D. WOOLSEY, S. T. D., LL.D.)

Consump'tion [Lat. *consumo, consumptum*, to "wear away"], the popular name of various diseases characterized by a wasting of the body, such, for example, as "anæmia" (known as "consumption of the blood"), but applied especially to *phthisis pulmonalis*, a very common and very fatal disease of the lungs. It has long been taught, upon the authority of Laennec, Louis, and Andral, that the characteristic symptoms of pulmonary consumption depend upon the presence in the lung-tissue of a new growth, or neoplasm, called TUBERCLE (which see); but the studies of Virchow, Niemeyer, and other recent pathologists have demonstrated that cases of originally tuberculous consumption are quite rare, although they do occur, the presence of the tubercles giving rise to local pneumonic inflammation in their neighborhood; while ordinary consumption is generally characterized by (1) local consolidation, (2) cheesy degeneration of the solidified spot, and (3) destruction of the degenerated tissue and formation of a cavity. This is the direct result, in most cases, of a "catarrhal" inflammation—that is, of an inflammation of an epithelial surface, such as lines the air-passages—the inflammation being associated with a free discharge of mucus from the surface of the membrane. Next, the air-vesicles of the lungs become filled by inhalation and by other means with the young cells of the secretion. If, as in non-fatal cases of ordinary pneumonia, these cells soon undergo liquefaction and absorption, the patient recovers. But if the accumulation of cells remains unabsorbed in the air-vesicles, it suffers a cheesy degeneration, a sort of slow decay. It appears that an inflammatory process is set up around this caseous degenerate mass, and that the cheesy degeneration is soon present in the inflamed lung-tissue itself. After a time the degenerate mass may assume a more or less complete purulent form, and may be discharged by coughing. This, however, does not always happen. The mass may be absorbed, the pulmonary tissue become indurated and callous, without a trace of tubercle; the bronchial tubes may become dilated, and the disease, spreading slowly, may disorganize but not consume the lungs. This is a very common condition in old consumptive cases. Meanwhile, the less changed bronchi near the seat of the disease pour forth a profuse catarrhal secretion, causing copious expectoration. The pleura near the seat of the disease becomes thickened, and adheres by organized exudations to the wall of the chest. In the majority of cases these changes begin at the apex of one or both lungs.

The first subjective symptoms are usually dull pains about the collar-bones, tightness across the chest, and there is not unfrequently a dry, hacking cough, not very severe in the morning and late at night. Headache, weariness, dyspepsia, and loss of appetite are often present. The pulse increases permanently, in most cases exceeding 90 or 100 beats in a minute. The rapidity of breathing is usually increased. An early symptom is a high evening temperature—103° or 104° F. In the second stage night-sweats are often extremely severe, pus is freely expectorated, hectic fever is decidedly present, the pulse is more frequent. In the third stage, when considerable cavities often form in the lung, the preceding symptoms are much intensified; colliquative diarrhœa supervenes, and yet in many cases the patient continues serene and hopeful, and the mind is remarkably clear and active.

The causes of consumption are very numerous. Niemeyer assigns the first place as a cause to that depraved, ill-nourished state (called the scrofulous diathesis) in which there is a tendency to the increased production of young cells. Any depressing circumstance may tend to the establishment of consumption. An hereditary tendency is one of the most important of these circumstances, but any depressed state of the parent, especially of the mother, whether consumption, starvation, anæmia, scrofula, or any other dyscrasia, appears to have a nearly equal effect on the offspring. Bowditch and others have shown that, other things being equal, it is most frequently observed in places where the air and soil are charged with moisture. Cold weather in itself appears to have little or no tendency to produce the disease, but a very changeable temperature is one of its most fruitful causes.

There has been considerable discussion as to whether consumption is or is not a contagious disease; and facts are not wanting which appear to show a danger of infection, especially to those who take care of and intimately associate with consumptives. Another interesting question is whether consumption is ever caused or promoted by habitual drunkenness, either in the case of the drunkard or of his offspring. The best opinion among physicians appears to be that while in selected cases alcoholic stimulants may be useful adjuvants, the remedy is a dangerous one, since there is no doubt that many more consumptives are injured than are benefited by it. On the offspring of the consumptive the effect of hard drinking is confessedly deplorable. Over-study at school appears to develop the disease in some young people. Overwork, factory-life, the grinding of metals, cabinetmaking, and all kinds of dusty or sedentary work are undoubtedly prolific sources of the disease. Mental trouble, excessive care, too frequent child-bearing, and sexual excess are to be reckoned in the list of causes. Consumption frequently follows measles, typhoid fever, and whooping cough, not improbably resulting from the bronchitis which accompanies those diseases.

It is also thought that pregnancy will check the disease in the female; and while there are numerous observations which go to show that for the time the disease is sometimes (but not always) held in abeyance, it is certain that this abeyance is often followed by a period of greatly increased activity; and the probability that a child born in such circumstances will be sickly and short-lived ought to prevent the resort to any such practice as a curative measure.

The physical signs of consumption are those which are determined by inspection, palpation, auscultation, and percussion of the chest. Their relative importance can be appreciated by none except the well-trained and experienced diagnostician.

The treatment of consumption cannot be discussed except in the most general terms, for no disease is less amenable to mere routine treatment. Yet there is no reasonable question that, especially in its earlier stages, this disease is a curable one. One of the first requisites is the establishment, if possible, of normal nutrition—a process which is usually much impaired in those liable to this disease. The use of such tonics as quinia and strychnia in some conditions, the administration of cod-liver oil, either as food or for its assumed alterative powers, and judicious change of climate, are among the most useful measures. Alcoholic stimulants benefit some patients and injure others, and on the whole do more harm than good; the hypophosphites of soda and lime appear to cause increase of weight and diminution of cough and expectoration in many cases; thorough counter-irritation of the chest-walls is a very important adjuvant; the wearing of sufficient clothing to protect the body from sudden changes of temperature is not less important. Systematic, and even severe, physical labor benefits some patients, but others appear to be injured by any but the gentlest exercise. Special symptoms, like diarrhœa and night-sweats, will require palliative treatment. Life in the open air is advisable, except in wet and bleak weather. The dry air of the Western plains and of the Rocky Mountain region, the equable weather of Florida, and the dry, sandy soil and balsamic exhalations of the great pine forests of the South, are believed to afford favorable conditions for recovery in many cases. Much depends on the peculiar history and temperament of individual cases, and the proper appreciation of these conditions in any case is likely to tax severely the judgment of even the ablest practitioner. CHARLES W. GREENE.

Consumption, in political economy, the converse of production. Although frequently used by political economists, the word has never had a definite meaning. It may be said that everything which is produced by human labor is to cease in its turn to exist. There is a consumption which may be termed annihilation, and a consumption which is gain or an addition to the wealth of the world. Food is an article of production immediately consumed, but the food of the working man sustains him while he is producing more than he consumes. A thousand dollars spent in building a house produces something which lasts for many years. The same sum spent in raising a wheat-crop will seem to be immediately consumed, but it may have in reality been laid out more beneficially than the

other, through the process of reproduction. If a thousand dollars laid out on land increases its value, and makes it worth eleven hundred, while the wheat raised by the expenditure of the other thousand is sold for fifteen hundred dollars, there is less consumption in the latter expenditure than in the former.

Con'tact [Lat. *contactus*, from *con*, "together," and *tango*, to "touch"]. In geometry, two lines, one of which at least is curved, are said to be in contact when they have a common point, from which they recede in such a way that the deflection of the one from the other will, if a sufficiently small departure be taken, become as small a fraction as we please of that departure.

CONTACT, ANGLE OF, the angle made by a curve line with its tangent. It is also called *angle of contingency*, and is equal to the angle of curvature.

Conta'gion [from the Lat. *con*, "with," "together," and *tango*, to "touch"], the transmission, direct or indirect, from one person to another, of disease. If of a given number of healthy persons exposed to association with the sick, a larger proportion becomes ill than is observed among persons not exposed to this cause of disease, it is said to be propagated by contagion. It was formerly called "common contagion" when the disease might possibly arise from some cause other than direct or indirect personal contact; while, if the characters of the disease are well marked, and traceable to no cause except infectious contact, it is said to be due to a specific contagion, which may be in some cases shown to be capable of reproducing the primary disease to an illimitable extent, being conveyed either through the secretions or through exhalations. Contagious diseases are sometimes epidemic, travelling from place to place, but there are epidemic diseases which are by no means contagious. No question in the etiology of disease is more difficult than that of the boundary line between contagious and non-contagious diseases; and, simple as the definition of the term may appear, the nature, conditions, and limitations of contagious influence are as yet almost unknown.

REVISED BY WILLARD PARKER.

Contari'ni, the name of a noble family of Venice that produced numerous doges and senators, of whom the most famous were—AMBROGIO, a senator, who was sent as ambassador to the king of Persia in 1473. He returned in 1477, and published in 1487 a curious account of his mission and travels.—ANDREA, elected doge in 1367. He gained in 1380 an important victory over the Genoese, and saved Venice from imminent danger. Died in 1382.—DOMENICO, elected doge in 1659, waged war against the Turks, who took Candia in 1667 after a famous siege. Died in 1674.—GASPARO, a cardinal and writer, was born at Venice in 1483. He was sent as ambassador to the court of Charles V., and was papal legate at the Diet of Ratisbon in 1541. Died in 1542.

Contempt' [Lat. *contemptus*, from *contemno*, *contemptum*, to "despise"], in law, is a wilful disregard or disobedience of a public authority. By the Constitution of the U. S. each house of Congress may punish its members for disorderly behavior, and with the concurrence of two-thirds expel a member. The power to punish for contempt is also possessed by either house of Congress, as incidental to the complete exercise of the authority granted by the Constitution, and extends to strangers or persons who are not members. This power of punishing for contempt must be exercised during the session of Congress, and the punishment itself cannot extend beyond the existence of the Congress.

CONTEMPT OF COURT. Courts of justice have an inherent power to punish all persons for contempt of their rules and orders, for disobedience of process, and for disturbing them in their proceedings. When a person is regularly adjudged to be in contempt he cannot be discharged by another court or judge on a writ of *habeas corpus*. In some of the States the law of contempt is carefully regulated by statute.

Contentnea, a township of Pitt co., N. C. Pop. 2118.

Conti, de (ARMAND DE BOURBON), PRINCE, born in Paris in 1629, was a brother of the great prince of Condé. In the civil war of the Fronde he commanded a royalist army against the prince of Condé. He married a niece of Cardinal Mazarin. Died in 1666.

Conti, de (FRANÇOIS LOUIS DE BOURBON), PRINCE, a French general, a son of the preceding, was born in Paris in 1664. He had so high a reputation for valor and other popular qualities that he was chosen king of Poland by a large party in 1697, but Augustus of Saxony obtained the throne. He served with distinction at Steenkerke in 1698, and received the command of an army in Flanders in 1709, but he died in the same year. According to Saint-Simon, he was the "idol of the soldiers and the hero of the officers." (See SAINT-SIMON, "Mémoires.")

Con'tinent [from the Lat. *continco*, to "continue" (from *con*, "together," and *teneo*, to "hold"), because it has an unbroken extent], a large, unbroken tract of land, greater than an island. The portion of the solid crust of the earth rising above the surface of the ocean is divided into six great bodies, the continents, besides innumerable smaller ones, the islands. A continent is not simply a larger piece of land; it has a general structure found in all, but not in islands, and which may be called the continental structure. Moreover, each continent has special traits of configuration and a diversity of climate, plants, and animals which distinguish it from every other, and stamp upon it a real individuality. Every large body of land has a form more or less triangular. North and South America are triangular; Europe, together with Asia, forms another large triangle; and the main body of Africa is also triangular. In Australia alone the square form seems to predominate, though the tendency to the triangular appears when we consider the continent as prolonged to the southern point of Tasmania. This remarkable coincidence in the fundamental form evidently points to a general law of structure which geology may some time discover. In the two Americas and in the southern continents of the Old World the sharper point of the triangle is turned towards the south, in Asia and Europe towards the W. In the Western World, therefore, the greatest extension of land is from N. to S., 9000 miles, passing through all zones of climate, with great changes in plants and animals; in Asia and Europe the land extends about 9000 miles from E. to W. along the parallels, and the temperature and vegetable and animal forms are very similar.

Notwithstanding their resemblance in general form, the outlines of the continents offer striking differences, some being deeply indented with gulfs, bays, inland seas, and projecting peninsulas, while others present a massive form with simpler outlines, without indentations worthy of notice. Carl Ritter has called attention to the vast importance of this kind of configuration to civilization. Such indentations greatly increase the length of the coast-line, and the contact of land and water favors the formation of convenient harbors, opens the interior of the continents to commerce by the paths of the sea, and facilitates communication with the outer world. The sea penetrating into the land moderates the extremes of heat and cold, and gives moisture and fertility. This subdivision of the continents into peninsulas, which make as many peculiar physical regions, secures a richer development by assisting in the formation of distinct nationalities, such as those reared in the great peninsulas of India and Arabia on the Asiatic, and Greece, Italy, and Spain on the European, portion of the great eastern land-mass. In this respect there is among the continents a significant gradation. No other part of the world has so large a number of indentations, compared to its extent, as Europe has. The triangle which makes the body of this continent has three peninsulas on each of its maritime sides—Greece, Italy, and Spain projecting into the blue waters of the Mediterranean; the peninsulas of Bretagne, Denmark, and Scandinavia on the shores of the Atlantic; while the British Isles themselves are hardly less than a projection of the mainland. Numerous indentations are also found in the large Asiatic continent, though not so many in proportion to its size. Arabia, India, Indo-China in the S., on the shores of the Indian Ocean, and China, Manchooria, with Corea and Kamtchatka, in the extreme eastern point of Asia, on the waters of the Pacific Ocean, form a necklace of rich lands surrounding two-thirds, and containing the most valuable portions of its domain. North America, although less indented, still has the peninsulas of Florida and Nova Scotia on the Atlantic; Labrador and Melville Peninsula on its northern Arctic shore; and California and Alaska on the Pacific. In these three continents the gulfs, bays, and inland seas abound correspondingly. In Europe the large peninsular appendages are to the total area of the continent as 1 to 4; in Asia, as 1 to 5.5; in North America as 1 to 14. In Africa, South America, and Australia the waters of the ocean nowhere penetrate deeply into the heart of the continents. The so-called gulfs or bays—like that of Arica in South America, the Gulf of Guinea in Africa, and the great South Australian Bay—are only slight bends in the coasts; and the projection of the Atlas lands and of Cape Guardafui in Africa, and of York Peninsula in North Australia, are hardly to be counted among the true peninsulas. These three continents are trunks without branches, as Ritter expresses himself, or bodies without members: while the northern continents are beautiful trees with trunks and abundant branches, or bodies richly articulated with useful members.

There are upon the entire globe three bands of land and six continents—the two American continents forming one band; Europe and Africa another; Asia and Australia a

third; the last two pairs being clustered together on one side of the globe, the first isolated on the opposite side. As two of the three bands of land, or four continents, are crowded together in the eastern hemisphere, it contains two-thirds, and the western hemisphere only one-third of the lands. The Old World is thus double the size of the New World. (See EARTH.) ARNOLD GUYOT.

Continen'tal [originally applied in contradistinction to *provincial;* belonging to the whole American continent, and not to any one province or colony], a term applied to the money and troops of the revolting colonies during the Revolutionary war. It was introduced in the early part of that contest by the colonists, to distinguish their own forces from those of the British government. The latter were called "ministerial forces," being under the control of the British ministry. The "Continental Congress" was the Congress of the colonies, and after the Declaration of Independence it was the Congress of the U. S. previous to 1788, when the Constitution came into force. It had only one house.

Continen'tal Sys'tem, a name given to Napoleon's plan for excluding British merchandise from all parts of the continent of Europe. It commenced with the Berlin Decree (issued by Napoleon Nov. 21, 1806), which declared the British Islands in a state of blockade, and treated as prisoners of war all Englishmen found in the territories occupied by the French armies or by the allies of France. The French government was not able to render this blockade complete. The British ministers retaliated by an "Order in Council," which was issued in Jan., 1807, and prohibited all neutral vessels from entering any port belonging to France or her allies; vessels that violated this order were confiscated if captured.

Contin'gency [from the Lat. *contingo*, to "happen"], a fortuitous event; a casualty. In law, contingency is an event the occurrence of which, though uncertain, is sufficiently probable to be provided for.

Contin'gent, fortuitous, occurring without design; in law, depending on an uncertainty. The term is also applied to the quota of troops furnished to the common army by each member of a confederation; the proportion of troops or money furnished by each party to an alliance.

Contin'ued Frac'tions, expressions which arise from the approximate valuation of fractions whose terms are large. For example, the ratio of the circumference to the diameter, $\frac{314159}{100000}$, may be represented by the continued fraction—

$$3+\cfrac{1}{7+\cfrac{1}{15+\cfrac{1}{1+\cfrac{1}{25+\cfrac{1}{1+\cfrac{1}{7\frac{1}{4}}}}}}}$$

For convenience, the fraction may be written thus:

$$3+\frac{1}{7}+\frac{1}{15}+\frac{1}{25}+\frac{1}{1}+\frac{1}{7}+\frac{1}{4}.$$

To convert a proper fraction into a continued fraction, divide the denominator by the numerator, and make of the mixed-number quotient a new denominator to the numerator, 1. Proceed in like manner with the fractional part of this new denominator, and so continue as long as the division leaves a remainder, or as long as is necessary for the object in view. If the given fractional number is, as in the foregoing case, an improper fraction, it must first be reduced to a mixed number, after which the above rule applies to the fractional part. F. A. P. BARNARD.

Continu'ity, Law of, a principle of considerable use in investigating the laws of motion and of change in general, and which may be thus enunciated: *Nothing passes from one state to another without passing through all the intermediate states.* Leibnitz claims the merit of having first made known this law; but, in so far as motion at least is concerned, it is distinctly laid down by Galileo, and ascribed by him to Plato. But, though a perception of its truth seems to have been felt long before, Leibnitz was certainly the first who applied the principle to test the consistency of theories or supposed laws of nature. The argument on which he attempted to establish it *a priori* is, that if any change were to happen without the intervention of time, the thing changed must be in two different conditions at one and the same instant, which is obviously impossible. A remarkable application of the law of continuity was made by John Bernoulli in an "Essay on the Laws and Communication of Motion," which gained the prize of the Academy of Sciences in Paris (1724), to prove that perfectly hard bodies cannot exist, because in the collision of such bodies a finite change of motion must take place in an instant—an event which, by the law now explained, is impossible. This conclusion was objected to by D'Alembert and Maclaurin, who, on account of it, were disposed to reject the law of continuity altogether; but the difficulty is got over by supposing (which on various grounds is extremely probable) that there is no real contact, and that bodies begin to act on each other when their surfaces, or what seem to be their surfaces, are yet at a distance.

Continuity, Principle of (in math.). See PROJECTION.

Con'toocook, a post-village of Hopkinton township, Merrimack co., N. H., at the junction of the Concord and Claremont and the Contoocook River R. Rs., 11 miles S. W. of Concord. It has four churches, an academy, and manufactures of carriages, lumber, tubs, and woollens.

Contour', in the fine arts, the external lines which bound and terminate a figure. The beauty of contour consists in those lines being flowing, lightly drawn, and sinuous. They must be scientifically drawn, and this cannot be done without a good knowledge of anatomy.

Con'tra, a Latin preposition signifying "against," "opposite to;" also a musical term meaning opposite, lower, and applied to the alto and tenor parts when they form the lowest part in harmony. When a part lower than the usual bass is employed, it is called *contra-basso.*

Con'traband [It. *contrabando*, from the Late Lat. *contra bannum*, "contrary to proclamation"], in commercial language, goods exported from or imported into a country against its laws. *Contraband of war* are such articles as a belligerent has by the law of nations the right of preventing a neutral from furnishing to his enemy. Articles contraband of war are, in general, arms and munitions of war and those out of which munitions of war are made. All these are liable to be seized; but very arbitrary interpretations have been affixed to the term by powerful states when able to enforce them by arms. Thus, provisions have been held to be contraband of war when it is the object of a belligerent to reduce his enemy by famine. Where the primary use of goods is military, they would seem to be plainly contraband; where the use is of a doubtful character, and they are suited either for a state of war or peace, their character leaves open an inquiry as to the objects of the shipment and the use to which the goods may be put. The act of carrying contraband goods is not, in general, good ground for confiscation of the ship; the contraband goods only are subject to seizure. The uncertainty respecting the law concerning this whole subject is due to the natural conflict between the necessities of war and the laws of trade. The remark of Calvo appears to be justified, that international law has not yet been able to establish a rule universally accepted and respected concerning the distinctive character of contraband of war. The act of carrying despatches to or for a belligerent, or the act of transporting his ambassadors in a neutral vessel, has given rise to grave discussions involving principles resembling those applied to contraband, though requiring separate consideration. Such acts may become serious violations of the law of nations, substantially identifying the neutral with the belligerent, and subjecting his ship to confiscation by the opposing party to the war. A question of great magnitude arose in the recent civil war in the U. S. in connection with the seizure by an American officer of the Trent, an English ship, then engaged in carrying Messrs. Mason and Slidell, ministers of the insurgents, to a neutral country. The result of the controversy was an assumption by both parties to it that the law of nations does not allow a belligerent at sea to take into his control, from a neutral vessel, such persons. The regular course is to have the ship brought before a prize court of the captor for condemnation. It is, however, claimed by some writers that there is ground for maintaining that a belligerent may take noxious persons, such as military men belonging to the enemy, from a neutral vessel without any prize proceedings, and after their removal release the ship. The exercise of such a right, if it exist, is so delicate and likely to cause irritation on the part of the neutral, that it seems to demand regulation by treaty. (Consult WHEATON, KENT, CALVO, and other text-writers. See INTERNATIONAL LAW No. II., by PRES. T. D. WOOLSEY, S. T. D., LL.D.) REVISED BY T. W. DWIGHT.

Con'tra Cos'ta, a county near the central part of California. Area, 800 square miles. It is bounded on the N. by San Pablo and Suisun bays, and on the W. by the Bay of San Francisco. It is partly occupied by mountains of the Coast Range. Here is Monte Diablo, the central landmark of the State. The county contains valuable lignitic coal and saline springs. Limestone, sandstone, and gypsum are found. Grain, cattle, and wool are raised. The soil is in general productive. Capital, Martinez. Pop. 8461.

Con'tract [Lat. *contrahо*, to "draw together"], an agreement in which a party undertakes to do or not to do a particular thing. Contracts are distinguished, according to their form, either as contracts of record, specialties, or simple contracts. Contracts of record are such obligations as are evidenced by judicial records, as, for example, recognizances and judgments. (See these titles severally.) Specialties are contracts under seal, such as deeds, bonds, and covenants. Simple or parol contracts include those agreements which are not comprised within the first two classes, and may be either oral or in writing. As regards the mode of their creation, contracts are further distinguished as express or implied. They are express when stated by the parties thereto consenting in direct and formal terms; implied, when they derive their origin and validity from construction of law, as being of such a nature that reason and justice dictate their fulfilment. Contracts are still differently classified in reference to the time of their performance, as executed and executory. They are said to be executed when the obligations therein created have been already carried out; executory, when their fulfilment is yet to be accomplished. Contracts of every variety include four essential constituent elements: First, there must be appropriate parties; second, there must be mutual consent to the terms of the agreement; third, there must be a valid consideration, either actual or presumed; and, fourth, there must be a definite subject-matter to be acted upon. As regards the first point, all persons are capable of binding themselves by their contracts except certain important classes of individuals who labor under some natural infirmity, either from want of sufficient age (as infants), or from lack of requisite mental soundness (as idiots and lunatics), or who are placed arbitrarily under disability in consequence of their legal status (as married women). Drunkards, seamen, aliens, and bankrupts are also incapacitated in certain instances. Infancy at law is the condition of persons under the age of twenty-one, though in some States females are considered to arrive at majority at eighteen. It is a general principle, though subject to exceptions, in accordance with modern judicial decisions, that an infant's contracts are not void, but voidable; *i. e.* they may be confirmed or disavowed by him, either, in some instances, before majority, or, in all cases, within a reasonable time afterwards. The chief important exception to this rule is an infant's contracts for necessaries, which are considered binding upon him. The import of the term "necessaries" is not invariable, as different articles would be comprised within the designation according to the wealth and station of various persons. The validity of these obligations is established for the same reason that others are considered voidable—that the infant's welfare may be ensured until he arrives at years of discretion. Moreover, the contract of marriage may be entered into by males at the age of fourteen, and by females at the age of twelve, unless there is some statutory provision to the contrary. Idiots and lunatics are relieved from responsibility for their contracts, because they are incapable of understanding the nature of the promises they make, and of giving a valid assent. But it is likewise true of them, as of infants, that contracts for necessaries suitable to their station, if entered into with other parties who act in good faith, are obligatory. Insane persons may also have lucid intervals, and would be liable for agreements made under such circumstances. Temporary mental weakness resulting from intoxication will relieve from liability when it is sufficient in degree to preclude reasonable action, and is not contracted purposely to defraud others. Mere mental feebleness, however originating, which is not so excessive as to prevent a comprehension of the nature of a contract, will be no ground of exemption unless a person affected by it is led into a contract by imposition. Married women, at common law, are placed under an almost entire inability to contract. Their legal existence is deemed to be merged in that of their husbands. In some instances they have power to bind their husbands, as when they act as agents or make engagements for necessaries which their husbands refuse to supply; but agreements of this kind are not their own personal obligations. Courts of equity and recent statutory provisions have considerably extended the powers of married women to enter into engagements which will be binding upon their property. This result in equity has been accomplished through the medium of trusts. The incapacity of aliens extends mainly to their ability to acquire a valid title to real estate, and in some States has been removed. Seamen are relieved, in certain instances, from their stipulations, to protect them from the consequences of their own improvidence; while the engagements of bankrupts are in some instances nullified to prevent injury to their creditors. Persons who are forced into contracts by duress, either through imprisonment or reasonable fear of injury to life or limb, are excused from their fulfilment.

As regards the nature of the obligations which they assume, parties to contracts may act either severally or jointly, or jointly and severally. When any joint liability exists, as in the last two instances, and one of the parties discharges it by paying more than his share of the indebtedness, he may, under the notion of an implied contract, recover from the others their just proportion. This is termed "contribution." It rests on a doctrine of natural justice, and is more completely enforced in a court of equity. The right to enforce agreements against others may also be either several or joint; that is, it may inhere in a single individual or in two or more collectively. No right of this kind, however, can be both joint and several at the same time, and in this respect it differs from the corresponding liability. Parties may also act on their own behalf, or in a representative capacity as agents or partners. For the purpose of making a contract, a corporation, however numerous its members may be, is regarded as a single person. The second element of contracts, assent, is necessarily implied in the term "agreement"—a meeting of minds. Assent must be mutual, and have reference to exactly the same stipulations. There must not only be a proposal, but an acceptance, and if any modification in the terms of the original offer is made by the party by whom it is received, no contract is established. The entire concurrence of all the parties concerned is indispensable. Such proposed change would be, in itself, a new offer, which would need acceptance. It is not necessary that a proposal when made should be acceded to at once. An offerer may contemplate a continuance of the offer for a certain definite or understood period, within which assent may be expressed by the offeree and a valid contract created; or an offer to enter into an agreement may be sent to a person at a distance, who must reply by mail. In cases of this kind the contract, according to the prevailing opinion, though with weighty dissent, is deemed to be completely formed from the time when the letter of acceptance is posted, without regard to the fact of its being received.

The element of consideration is that which gives contracts a legal, as distinguished from a moral, validity, for, as a rule, promises are not enforceable in law which do not rest on such a basis. The consideration is the cause of a contract, the return for a stipulation, the price for a promise. It may be something actually rendered, as is requisite in nearly all simple contracts, or its existence may be conclusively presumed, as in negotiable paper which has passed into circulation, and in contracts under seal. The care and deliberation with which the latter are usually formed are considered a sufficient substitute for an actual consideration. In the case of negotiable paper, a proper consideration will only be conclusively presumed when it is necessary to protect the interests of innocent, unsuspecting third parties into whose hands the paper has passed before maturity. The requisites of a valid consideration are that it shall either be some benefit to the party promising or some disadvantage or injury to the party to whom the promise is made. Considerations are distinguished as good or valuable. The former term is applied to inducements of relationship and natural affection; the latter, to some mode of making return which is either directly pecuniary or estimable pecuniarily through its probable consequences in occasioning profit or loss. Marriage also is included within this latter designation. A good consideration will only support an executed contract, and then simply between the parties themselves. As illustrations of a valuable consideration may be mentioned the payment of money, the performance of work, the forbearance to sue, the delivery of property, the making of a promise for a promise, and the like. In such cases it is not necessary that the consideration be an equivalent for the agreement made. A moral obligation will constitute no legal consideration for a promise, except in cases where there has been a pre-existing legal obligation which is no longer enforceable in a court of justice, as where a debt has existed, but is barred by lapse of time under the provisions of statutes of limitation. If a consideration be illegal or impossible, the contract founded upon it will, in consequence, be rendered nugatory. Considerations are also distinguished, as regards the time of their fulfilment, as executed, executory, and concurrent. They are said to be executed when performed before the promise founded upon them is made, and are insufficient to support such promise unless they grew out of a previous request, since the agreement cannot be the reason of their accomplishment; executory, when they are to be performed in the future; concurrent, when they and the promises based upon them are simultaneous. The last two forms of consideration are sufficient to support all agreements otherwise unobjectionable.

The general principle in regard to the subject-matter of contracts is, that parties may enter into agreements of any character they may choose. Certain important exceptions

are, however, established on grounds of public policy. Thus, the subject-matter must not contemplate any illegal or immoral undertaking. Such agreements are necessarily nugatory, and if attempted to be enforced their illegality may be alleged as a valid defence. But when the terms of the parties' stipulations are not thus contravened, it is the object of the courts to arrive at the exact meaning of the language employed as expressing the intentions of the persons contracting, and to enforce all unfulfilled obligations thence resulting. For this purpose certain definite rules of interpretation and construction have been established, which are adapted to remove ambiguities and resolve uncertainties. These are principally applicable to agreements in writing. If the application of these shows a comprehensible agreement, and no defences alleged prove its invalidity or that its terms have been satisfied either wholly or in part, an adequate remedy will be given for its violation. In courts of law this consists of pecuniary recompense or damages for the injury sustained, while courts of equity, in proper instances, will decree a specific performance of the engagements undertaken.

Certain contracts are required to be in writing, for the better prevention of fraud and convenience in proving their stipulations. This requirement depends upon the so-called "statute of frauds." The principal classes of agreements within its provisions are contracts made upon consideration of marriage, contracts to answer for the debt, default, or wrongful act of another, contracts which are not to be performed within one year, contracts for the sale of any interest in land, and contracts for the sale of personal property of a specified value—usually fifty dollars and upwards. In all these cases the agreement, or some memorandum thereof, when written, must also be signed, or in some States subscribed, by the party charged therewith or his agent. In the sale of goods, the delivery by the seller and the acceptance by the purchaser of a portion of the goods will render a reduction of the contract to writing unnecessary.

The remedy upon contracts by action at law is confined by "statutes of limitations" within certain prescribed periods after their maturity. The provisions generally made are that no action can be brought upon a simple contract after the lapse of six years, or upon sealed instruments after twenty years, from the time when they become due. (See LIMITATIONS, STATUTES OF.) Important and difficult questions also arise as to the effect of the laws of different States upon contracts when obligations are assumed in one country and sought to be enforced in another (for which see INTERNATIONAL LAW, PRIVATE, and MARRIAGE).

The Constitution of the U. S. provides that "no State shall pass any law impairing the obligation of contracts." Much discussion has arisen upon the effect of this prohibition. It has been decided that it applies as well to executed contracts or grants as to those which are executory. Not only agreements between individuals, but with States, as the charters of corporations, confer privileges which are inviolable, unless there is some prior reservation of a power to make alterations. An exception is, however, established in the case of municipal corporations, which are considered mere instruments of government, and continually subject to legislative authority. Moreover, contracts by which States undertake to resign necessary governmental functions are not generally deemed unchangeable by subsequent legislation, though an exception to this rule has been established in the case of taxation. A deprivation by a State of all remedy to enforce contracts is held to be an impairment of their obligation, and therefore unlawful; this is not true, however, when, on a change of remedies, one that is substantial and sufficiently convenient remains or is supplied.

(Reference must be made for different forms of contracts to such topics as AGENCY, BILLS OF EXCHANGE, PARTNERSHIP, SALE, GUARANTY, BAILMENT, SHIPPING, INSURANCE, etc., and for defences to PAYMENT, PERFORMANCE, ACCORD, AWARD, RELEASE, SET-OFF, USURY, etc., etc. Convenient books of reference are the works of PARSONS, ADDISON, CHITTY, HILLIARD, METCALF, SMITH, STORY, POTHIER, "On Obligations," KENT'S "Commentaries," and DOMAT, "On Civil Law.") T. W. DWIGHT.

Contractil'ity [Lat. *contractilitas*, from *con*, "together," and *traho*, *tractum*, to "draw"], a property by which the particles of some bodies resume their original position when the force applied to separate them is withdrawn; also the vital property which gives to certain parts (muscles, for example) the power of contracting, by means of which animals perform their motions. Contractility, in the latter sense, is a property confined to living organisms. It is not peculiar to animals, but is shared by the vegetable kingdom; being, among plants, most apparent, as a rule, in the protophytes, which are microscopic plants of a low grade. Among the lowest forms of animals the whole substance of the organism usually possesses contractility, but in the higher animals this property is, by differentiation, limited more or less completely to the organs called muscles. But such motions as those of cilia are common to both the vegetable and the animal kingdoms; and among animals are common to man as well as to the protozoon. The existence of this important class of motions shows that in no organism is contractility entirely limited to the muscles. Contractility in such cases is quite independent of any will or self-determining power. But at a very low point—if not at the very lowest—in the animal scale we begin to find signs of a self-determining power, or will, residing within the organism, and having a certain degree of control over that contractile quality of the tissues. Upon the exercise of this control depends the power of voluntary motion. Contraction of a muscle may indeed be quite independent of volition or consciousness, as in the beating of the heart and in all motions of non-striated muscles. But all organic motion or contractile action appears to depend upon some stimulus, whether it be the mysterious nervous force or the not less mysterious influences called heat and electricity. The immediate cause of muscular contraction is quite unknown. The theory, that it depends solely upon the oxidation of muscular tissue, is quite exploded. It is now held by many theorists that oxidation of non-organized blood-plasma within the capillaries of the muscles is one of the causes of muscular contraction, and that this oxidation liberates heat, which by the nervous influence is transmuted into kinetic energy. Electricity also appears to have intimate relations with some forms, at least, of organic contraction.

Contrac'tion [for etymology see CONTRACT], the act of contracting or reducing to a smaller volume; the reverse of EXPANSION (which see). In grammar, the abbreviation of a word, the reduction of two syllables into one by the omission of a letter or letters, as *can't* for *cannot*.

Contraction, in surgery, is the diminution or obliteration of the calibre of any hollow vessel, and is more frequently called STRICTURE (which see). But frequently contraction denotes the permanent shrinkage in bulk (of an organ), in area (of a surface), or in length (of a muscle, tendon, or other elongated part). Contraction may result (1) from acute inflammation, with the formation of neoplasms; the latter afterwards degenerating, or rather drying up, into ordinary connective tissue, which occupies less than the space of the original intrusive tissue. This is well illustrated in the case of burns which destroy much skin: the scar contracts, and often causes shocking deformity. Yet it is the result of a process which is essentially reparative, and which is necessary to the recovery of a healthy condition. (2) From nervous irritation, direct or reflex. Thus, the pain of a severe accident to the ankle has been known to be immediately followed by permanent strabismus. (3) From paralysis. Thus, when only one of a pair of antagonistic muscles loses its functional contractility, the other by its normal exercise may produce a permanent deformity.

Contral'to, an Italian word, is a term used in vocal music to denote the part immediately below the treble, formerly called also the *counter-tenor*. It is often popularly called *alto*.

Con'trast, opposition of things or qualities. In the fine arts, contrast is an opposition of lines or colors to each other, so contrived that the one gives greater effect to the other. By means of contrast, energy and expression are given to a subject even when employed on inanimate forms. All art indeed may be said to be a system of contrasts; lights should contrast with shadows, figures with figures, and groups with groups. It is this which gives life, soul, and motion to a composition.

Contravalla'tion [from the Lat. *contra*, "against," and *vallum*, a "rampart"], in fortification, an intrenchment formed by the besiegers between their camp and the place besieged, to secure themselves and check the sallies of the garrison. The line of *contravallation* is thus, as the name implies, a sort of counter-fortification.

Contrayer'va [Sp. *contrayerba*, a "counter-herb" or "antidote"], a drug once in repute as a diaphoretic and stimulant, derived from the root-stocks of four different species of *Dorstenia*, of the order Urticaceæ. The genus is remarkable for the roughly quadrangular receptacle on which the numerous small flowers appear; the staminate flowers in shallow depressions, the pistillate flowers in deeper ones. *Dorstenia Contrayerva* is a perennial Mexican herb with irregularly-lobed leaves. *Dorstenia Houstonia* and *Dorstenia Drakena* also grow in Mexico. The root-stock is about half an inch thick, sending out on all sides many slender fibres covered with small knots. It has an aromatic odor, and a bitter, astringent taste. *Dorstenia Brasiliensis*, a stemless species, with heart-shaped leaves and a circular receptacle, a native of the West Indies and

Brazil, furnishes much of the contrayerva of commerce. These plants have been represented as efficacious for serpent bites, and hence the name contrayerva, an "antidote," like our "snake-root," is given to many different plants.

Contre'ras, a battle-field 14 miles S. of the city of Mexico. The battle was fought Aug. 19 and 20, 1847, between the U. S. forces of Gen. Scott and the Mexican division of Gen. Valencia. (See CHURUBUSCO.)

Contreras, de (JUAN SENEN), a gallant Spanish general, born in 1760 at Madrid, entered the Spanish service in early youth, and in 1727 visited France, England, and Germany on public affairs. In 1788 he fought against the Turks. In 1795 he began to serve against the French. He fought at Talavera in 1809; as a captain-general he defended Tarragona obstinately, but without success. He was taken prisoner and sent to France in 1811, escaped in 1812, returned to Spain in 1814, and died in his native city in 1826. He wrote several books, chiefly military.

Contribu'tion [Lat. *contribuo*, to "impart mutually"], in common law, an obligation imposed upon several persons who are under a common duty, or who own estates subject to a common burden, to share between them the charge of performing the duty of relieving their property of the burden. It is emphatically a rule of equity jurisprudence, and an illustration of the familiar maxim that "equality is equity." The illustrations of it are numerous. Such instances may be cited as general average in the law of shipping; the case of co-sureties, including insurers; that of owners of parcels of land subject to a single mortgage or other lien, where there are no special reasons for casting the burden of payment on one owner more than another; of joint debtors, etc. Contribution is sometimes exacted in a court of law on the theory of an implied contract, but the remedy is not so complete as in equity. It is usually said that there is no contribution among wrong-doers. This proposition must be received with some qualification, for while the rule must be rigidly applied to wilful wrong-doers, and perhaps to such as are guilty of negligence, it could not be properly extended to persons who, acting in good faith, commit a technical wrong, as, *e. g.*, to sureties who execute a bond of indemnity to a sheriff to secure him against the consequences of a trespass in selling property which he has reasonable grounds for supposing belongs to a debtor against whose property he has an execution, while it turns out that the property does not belong to the debtor. T. W. DWIGHT.

Contri''tion [Lat. *con*, intensive, and *tero*, *tritum*, to "rub," to "wear away" by rubbing], in ordinary usage, denotes thorough repentance for sin. In the Roman Catholic Church contrition (*contritio cordis*) is the complete sorrow and utter detestation which the penitent feels for past sin, joined with the purpose to sin no more. Contrition, confession, and satisfaction are essential parts of the sacrament of penance. ("Canons of Trent," s. xiv., c. 4.) But some, with Dens ("Theol.," vi., 51), hold that *attrition*, or imperfect repentance, joined with confession, satisfaction, and absolution, is sufficient. Others teach that attrition is but a step leading towards contrition.

Control'ler (originally written **Comptroller**), [Fr. *contrôleur*], an officer appointed to control or supervise the accounts of other officers, and to certify whether the matters confided to his care have been controlled or examined. The minister of finance in France was formerly called *contrôleur-général*. In the State of New York a controller is elected by the people. His title is written COMPTROLLER (which see).

Con'tumacy [Lat. *contumacia*, from *con*, intensive, and *tumeo*, to "swell" (with pride)], in civil and ecclesiastical law, a wilful disobedience to any lawful summons or judicial order. In a criminal process contumacy is punished by a sentence of fugitation; in a civil process the only consequence is that the case will be proceeded with and a decree pronounced against the contumacious party.

Con'vent [Lat. *conventus*, from *con*, "together," and *venio*, *ventum*, to "come"], literally, a "meeting;" a religious house inhabited by a society of monks or nuns, or, more strictly, the society itself. But in exact language the term "convent" designates a meeting (*conventus*) of all the members of a religious community, or, more properly, of those who can vote in the assembly. These voters are called "conventuals," though the latter term is often used in other senses. On certain questions it is customary in some congregations to assemble the convent either for the counsel to be obtained from the brethren or for their consent to some ordinance. All the abbots of a congregation may be called upon in like manner to meet in a "provincial" or "general convent." (See MONACHISM.)

Con'vent, a post-village, capital of St. James parish, La., on the left bank of the Mississippi River, about 50 miles W. of New Orleans. It has one weekly newspaper.

Con'venticle [Lat. *conventiculum*, a diminutive of *conventus*, a "meeting"], a term originally applied to a cabal among the monks of a monastery, formed to secure the election of a favorite as abbot. It was given to the assemblies of Wickliffe's followers as a term of reproach, and was afterwards applied to the meetings of the English and Scottish non-conformists. Severe laws were passed for the suppression of conventicles. The most celebrated is that of 1664, passed by the British Parliament, which forbade persons over five in number and over sixteen years of age, unless of one family, to meet for domestic or social worship. For the first offence the leader and the occupier of the premises received three months' imprisonment or were fined five pounds. The second offence was followed by twofold punishment. Married women found at a conventicle were imprisoned one year, unless their husbands paid a ransom of forty shillings sterling. The third offence was punishable by transportation or by a mulct of £100 sterling. No jury was required for the trial, and a justice of the peace might enforce the act upon the testimony of one person. This act was modified in 1670, and repealed in 1689. An act of Elizabeth's reign (1593) made the frequenting of conventicles punishable by imprisonment and death.

Conven'tion [from the Lat. *con*, "together," and *venio*, *ventum*, to "come"], a term applied in political language to assemblies of national representatives meeting on extraordinary occasions without being convoked by the legal authority. (See CONVENTION-PARLIAMENT.) In French history the name convention is applied to that assembly which met after the legislative assembly had pronounced the suppression of the royal functions (Sept., 1792), and proclaimed the republic at its first sitting. This body dissolved itself on the establishment of the Directory in Oct., 1796. The Scottish assembly which met on the flight of James II. of England was entitled the Convention of Estates. In the U. S. meetings of representatives specially chosen by the people of separate States to revise and amend the State constitutions are termed State conventions.

CONVENTION, in the language of diplomacy, is generally synonymous with treaty, with the vague distinction that a convention relates to a few or unimportant or non-political points. Contracts between belligerents as to certain rules to be adopted on both sides in carrying on the war are technically termed general conventions. Treaties between the pope and Protestant powers have been often termed conventions.

CONVENTION, in military affairs, a treaty between military commanders concerning terms for a temporary cessation of hostilities, generally between a victor and a defeated general for the evacuation of a district or position by the latter. The two most celebrated conventions of modern times were that of Closter-Seven (1757), between the dukes of Cumberland and Richelieu, and that of Cintra (1808), between Junot and the English generals.

CONVENTION, CONSTITUTIONAL. See CONSTITUTION, by PROF. T. W. DWIGHT, LL.D.

Conven'tion-Parliament, in Great Britain, a parliament convened without the authority of the sovereign, when the crown is in abeyance. As parliaments have no right to assemble without royal authority, the acts of convention-parliaments must afterwards be ratified by a parliament summoned in accordance with the provisions of the constitution. Two convention-parliaments have occurred in English history—the first, that which met in April, 1660, and restored Charles II. to the throne, the Lords assembling by their own authority, and the Commons by virtue of writs issued in the name of the keepers of the liberties of England, by the authority of Parliament; the second, that which met in 1688, each house by its own authority and on the summons of the prince of Orange, and declared that King James II. had abdicated the crown, which was transferred to William and Mary. (See CONVENTION.)

Conver'gent Fraction, the ordinary fraction which is equal to any portion of a continued fraction obtained by neglecting all that follows any particular quotient. Thus,

$1;\ 1+\frac{1}{2}=\frac{3}{2};\ 1+\frac{1}{2+\frac{1}{3}}=\frac{10}{7};\ 1+\frac{1}{2+\frac{1}{3+\frac{1}{4}}}=\frac{43}{30}$, etc., are

three successive convergents of $1+\frac{1}{2+\frac{1}{3+\frac{1}{4+\frac{1}{5+\frac{1}{6}}}}}$, etc.

To obtain the numerator (or denominator) of any convergent corresponding to a certain quotient, multiply the numerator (or denominator) of the preceding convergent by that quotient, and to the product add the numerator (or denominator) of the next preceding convergent; thus $43=10\times4+3$; $30=7\times4+2$. F. A. P. BARNARD.

Converging Series, in mathematics, a series in which each term is less than the term next preceding. Thus, the

geometrical series descending, $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$, $\frac{1}{16}$, etc., is a convergent or converging series. An infinite series is said to be *convergent* when, however many of its terms may be added together, the sum never exceeds numerically some finite quantity. On the other hand, it is said to be *divergent* when by adding a sufficient number of terms a sum can be obtained which numerically exceeds any given finite quantity, however great. A series is not necessarily convergent when its terms continually decrease in magnitude. If, however, besides decreasing numerically, the terms have alternate signs, the series will be convergent; thus, $1-\frac{1}{2}+\frac{1}{3}-\frac{1}{4}$, etc. A series will be convergent if the quotient obtained by dividing each term by the preceding one is numerically less than some assignable *proper* fraction, or if this property obtains from and after a certain term. On the other hand, the terms being all of the same sign, the series will be divergent if the quotient in question is equal to or greater than unity. This test of convergency and divergency cannot be always applied, and recourse must be had to others. For instance, the ratio of the n^{th} to the $(n-1)^{th}$ term of the series $1+\frac{1}{2}+\frac{1}{3}$, etc. being $\frac{n-1}{n}$, is always less than 1, but no proper fraction can be *assigned* than which it is always less, for it approaches unity without limit as n increases. The series is in fact divergent; for the third and fourth terms are together greater than $\frac{2}{4}$; the four following terms are greater than four times the last, or $\frac{4}{8}$; the eight following terms are together greater than $\frac{8}{16}$, and so on; so that the whole series has a greater sum than $1+\frac{1}{2}+\frac{1}{2}+$, etc., which is manifestly divergent. (See CAUCHY, "Cours d'Analyse.")

F. A. P. BARNARD.

Conversa'no, a town of Italy, province of Bari, 20 miles S. E. of Bari, is defended by a Norman castle, has a cathedral, bishop's palace, and several convents. Pop. 9731.

Conver'sion [from the Lat. *con*, intensive, and *verto*, *versum*, to "turn"], in metallurgy, the process by which steel is produced from iron or from iron carbide (cast iron). Iron is converted into steel by long heating in contact with carbon. Cast iron is converted by "puddling," or by the well-known process of Bessemer. The theory in both cases is the same—viz. to oxidize the excess of carbon in the carbide, and so remove it in the form of carbonic acid gas.

Conversion in Logic. See LOGIC.

Conversion, in law. This word has two significations: 1. In equity jurisprudence it means the theoretical change of land into money or money into land. The will of an owner of property thus to change it, expressed in legal forms, is in some instances equivalent to an actual change, as where a testator directs his land to be sold and converted into money. It is deemed to be sold from the moment of his death, and to have the qualities of personal property. This is termed *equitable conversion*. 2. In the law-courts the word "conversion" is applied to an unauthorized exercise of acts of ownership over the personal property of another. It is deemed to be a wrong or "tort," and the owner of the property may either reclaim it or treat the wrong-doer as having become owner and recover the value of it. Conversion lies at the foundation of the common-law action of trover, which word is derived from the French word *trouver*, to find. There is a legal fiction that the defendant found the plaintiff's property and converted it to his own use. The material part of the case is the conversion. To constitute a case of conversion it is not necessary that there should have been any intent to deprive the owner of his interest. It is enough if there were an intent to appropriate the goods or to exercise an act of ownership over them, even though that were done in entire ignorance of the owner's right. Thus, if an auctioneer should sell stolen goods, not knowing of the theft, he would be deemed to have converted the goods to his own use. As the intent is a main ingredient in the case, it has been considered that a mere trespass, or an accidental loss of property by a carrier, or the use of property as an act of kindness to the owner without any intent to convert it, does not amount to a conversion. There is an important distinction between the case where the original taking of the goods is lawful and where it is not. In the former case there must in general be a demand and a refusal before the conversion takes place. Thus, if I lend a book to another to be returned on request, there is plainly no conversion until I demand it and there is a refusal to return it, since until that time there is no exercise of ownership. When the original taking is unlawful, no demand is necessary. The better opinion is, when an action is brought for conversion, that the title to the chattel does not pass to the wrong-doer by mere force of the judgment of the court, but that there must be actual satisfaction of the judgment on his behalf.

T. W. DWIGHT.

Conver'ter, in metallurgy, the receptacle used to hold the iron or carbide of iron which is subjected to the process of conversion into steel. The Bessemer converter is a large, approximately spherical vessel, lined with fire-clay or brick, the bottom of which is perforated with many holes, through which a powerful blast of air is driven during the process. The vessel is suspended on pivots, and controlled by a hydraulic apparatus; by means of which, when the appearance of the escaping flame shows that the process is complete, it is turned over, and the liquid steel is received into moulds.

Convey'ance, in law, is a deed transferring property from one person to another. In the transference of personal property the term, though strictly applicable, is not generally used.

Con'vict [from the Lat. *con*, intensive, and *vinco*, *victum*, to "conquer" or "overcome," in allusion to the culprit being completely overcome or overwhelmed by the proofs brought against him], a term applied to a person proved guilty of a crime. The name came by custom to be applied to persons subject to punishment for the more serious class of offences; of late its meaning has been often restricted in Great Britain to criminals who were transported to the distant colonies. Criminals condemned to penal servitude for longer or shorter periods are termed convicts under penal discipline; offenders sentenced to short periods of detention in the ordinary jails are called prisoners. The system of transportation to New South Wales was suspended in the year 1840. In France, however, transportation of convicts still prevails, especially in the case of political offenders. Among the penal colonies of France are Cayenne and New Caledonia.

Con'vis, a township of Calhoun co., Mich. Pop. 1015.

Convoca'tion [from the Lat. *con*, "together," and *voco*, *vocatum*, to "call"], a meeting of the clergy of the Church of England to discuss ecclesiastical matters in time of Parliament. There is one convocation for the province of Canterbury, and one for the province of York, but the voice of the latter is only a feeble echo of that of the former. Each convocation has two houses—the upper consisting of bishops, and the lower of deans, archdeacons, and proctors. Acts of convocation were formerly of great importance in the canon law, but since the time of Henry VIII. they have no force when opposed to statute law. The convocations have been recently revived, but with little or none of their ancient importance. There is an Irish convocation, with even smaller powers than those of the English Church.

Convolvula'ceæ [from *Convolvulus*, one of the genera], a natural order of exogenous plants which mostly have twining stems and a milky juice. It comprises nearly 700 known species, many of which are natives of tropical countries, and have beautiful flowers with five stamens. The corolla is monopetalous, and the fruit a capsule. The roots of some species possess purgative qualities, as jalap (*Exogonium Purga*). Among the valuable products of this order is the sweet potato. Some of the species are cultivated for the sake of the flowers, as the *Ipomœa purpurea*, or morning glory, a native of tropical America.

Convol'vulus [from the Lat. *con*, "together," and *volvo*, to "roll"], a genus of plants of the natural order Convolvulaceæ, containing many species, herbaceous or shrubby. The stems are usually twining, the flowers often large and of various beautiful colors; calyx 5-parted, corolla monopetalous, with regular 5-lobed and plaited limb; five stamens; the ovary free, with one to four cells and few ovules; the fruit a capsule somewhat succulent. Some are cultivated as ornamental plants. The *Convolvulus Scammonia* yields scammony. *Convolvulus scoparius*, a shrubby species, native of the Canary Isles, yields the "oil of rhodium" and one of the kinds of wood called rosewood, which has an odor somewhat like that of roses. The original genus is for convenience divided into several sub-genera. Most of the genuine species belong to the Old World. The showy morning glories, etc., chiefly American, belong to *Ipomœa*.

Con'voy [Fr. *convoi*, from *convoyer*, to "carry" or "conduct"], a name given to one or more ships of war employed to protect a fleet of merchant-vessels against an enemy in time of war or against pirates. If a ship part company with the convoy or neglect to obey the signals, all claims for insurance are forfeited. (See INTERNATIONAL LAW No. II., by PRES. T. D. WOOLSEY, S. T. D., LL.D.)

CONVOY, in the military service, is a train of wagons laden with provisions or warlike stores, or a detachment of troops appointed to guard such a train.

Convul'sions [from the Lat. *convello*, *convulsum*, to "pull violently"], (synonyms *Eclampsia*, *Acute Epilepsy*), an acute nervous affection occurring in paroxysms, during which the patient loses consciousness, the muscles of the body are spasmodically contracted, and the limbs first stif-

foned and twisted, then agitated by irregular involuntary movements. The face is distorted, the eyeballs rolled upward, the teeth clenched, biting the tongue, which protrudes at the beginning of the attack. Respiration is arrested by the stiffening of the chest-muscles and by closure of the glottis; the patient grows black in the face, and froth oozes from the mouth, and sometimes from the nostrils; the veins of the neck swell. After some time the muscles relax again, respiration is restored, the agitation of the limbs ceases, the patient either returns entirely to consciousness or falls into a heavy sleep, which may last several hours. The appearance and the nature of the attack are the same in the convulsions of epilepsy and in the so-called eclamptic convulsions of children or of women in childbirth. They may result from any cause that first irritates and then suddenly abolishes the functions of the brain and spinal cord. Convulsions occur, therefore, in diseases of the nervous centres; in diseases of other organs of the body, that transmit irritation to these centres; finally, in morbid conditions of the blood which interfere with their nutrition. Under the first head may be mentioned congestion or anæmia (bloodlessness) of the brain, inflammations, tumors, finally premature ossification of the bones of the head, by which the brain becomes subject to abnormal pressure. In other cases more obscure there seems to exist in the brain and cord a congenital susceptibility to irritation, and consequent exhaustion of functions, so that the most trifling circumstance may occasion a convulsion. It is then that are observed the convulsions of hysteria and of epilepsy. The latter is only distinguished by the constitutional tendency that persists during the intervals of the attacks, and suffices to cause their removal. The hysterical convulsion, however, offers some peculiarities, and consciousness, though perverted, is not abolished, the interference with respiration is less complete than in typical eclampsia, and leads to involuntary laughing and crying; there is no lividity of the face or frothing at the mouth; the return to consciousness is immediate, without the transition stage of heavy sleep. Neither the irregular convulsive movements of chorea ("St. Vitus' dance," "clonic" muscular contractions) nor the rigidity of tenanus ("tonic" muscular contractions) are sufficient to constitute a convulsion, in which the two forms of muscular contraction are combined, the last occurring at the beginning, the first at the end of the attack.

Convulsions dependent on transmitted irritations occur principally in children. They may occur spontaneously, owing to a congenital predisposition by which normal physiological processes become irritating, or they may be excited by inflammation of the gums in dentition, by indigestion, by worms, by the invasion of acute diseases, as pneumonia or eruptive fevers; by some accidents, as extensive burns. Women in childbirth are liable to convulsions of a similar character, which may be excited by the mere act of parturition. This dangerous complication (puerperal eclampsia) is more frequently, however, associated with an alteration of the blood that is liable to occur during pregnancy, and due to transient kidney disease (nephritis). The kidneys act imperfectly, and hence part of the elements of the urine that should be secreted by them are retained in the blood, poisoning it, while at the same time part of the albumen of the blood passes off in the urine. These convulsions are therefore called albuminuric or uræmic, and afford most striking illustrations of the morbid influence of altered blood upon the nerve-centres. They occur also in genuine nephritis or Bright's disease, and in that which often complicates the second and third stages of scarlet fever. Various mineral or narcotic poisons introduced into the blood have a similar effect to uræmia in causing convulsions. Finally, a great diminution in the mass of blood, caused by exhausting hæmorrhages or by diarrhœa, has been shown to determine convulsions as certainly as if the blood had been poisoned.

Any convulsion may prove fatal if the arrest of respiration be sufficiently prolonged. The danger varies very much according to the cause, the uræmic convulsions of women in childbirth (*puerperal eclampsia*) being far the most frequently fatal. After them may be successively ranked, 2, uræmic convulsions in primary nephritis, or that complicating scarlet fever; 3, those caused by narcotics (opium) or mineral poisons (lead); 4, by the anæmia resulting from hæmorrhage or diarrhœa; 5, by the irritation of morbid dentition, worms, or indigestion in young children; 6, by diseases of the nervous centres or disorders in their circulation (congestion, anæmia); 7, the convulsions of epilepsy; 8, those that mark the invasion of acute diseases.

The treatment of convulsions may sometimes be addressed exclusively to the cause, as in the last three cases just mentioned, where the danger of the paroxysm itself is known to be small. In the other cases, where life is liable to be endangered by the duration or rapid repetition of convulsive attacks, these urgently demand relief. Means of relief are—1st, compression of the carotids; 2d, alcoholic stimulants; 3d, venesection; 4th, chloral; 5th, chloroform; 6th, antihysterical medicines; 7th, warm baths; 8th, cold applications to head. Each is adapted to a special case. Compression of the carotids has been used principally in idiopathic epilepsy (where, as said, the paroxysm itself is often left without treatment). It is intended to relieve the congestion existing at the base of the brain, and has sometimes proved successful. Cold applications are used for the same purpose, and may be combined with the other methods of treatment. Stimulants are only used where the convulsion results from hæmorrhage or inanition. Venesection may be required in cases of intense venous congestion of the brain, as indicated by extreme lividity of the face and distension of the veins of the neck. It is most often needed in puerperal convulsions. Large doses of chloral (15–30–60 grains) are especially useful for infantile convulsions, or for those of scarlet fever, or during the interval of attacks to prevent their renewal. The sedative action of chloral is entirely analogous to that of inhaled chloroform, but the latter is much more powerful, and may be used in more severe cases, or where the patient is unable to swallow. *Veratrum viride* is a powerful agent to lower the pulse and increase the force of the heart's impulse; hence it may be used in the same cases as venesection, to dissipate the stagnation of blood in the veins. Finally, the warm bath, with or without mustard, may be used in nearly all cases, except perhaps in puerperal convulsions, where it may be contraindicated by the difficulty, and even danger, of moving the patient. On the other hand, the facility of its use with young children makes it especially applicable to them.

An hysterical convulsion may be treated with the nervous stimulants formerly called antispasmodics, especially assafœtida, valerian, ether (internally). In the interval of the attacks galvanism should be applied to the spine. Apart from special indications, therefore, treat the average convulsions as follows: 1st, place the patient in a warm bath, and keep cloths wrung out in cold water on the head; 2d, if the paroxysm begins to rapidly abate, give hydrate of chloral, 3–5 grains to an infant, 10–15 grains to a child, 30 grains to an adult; 3d, if the paroxysm be more severe, administer chloroform by inhalation; 4th, if suffocation be imminent, bleed to a few ounces. ABRAHAM JACOBI.

Con'way, a small seaport-town of Wales, in Carnarvon county, is on the estuary of the river Conway, here crossed by a suspension bridge 327 feet long, 13 miles E. N. E. of Bangor. Here is Conway Castle, a grand feudal structure built by Edward I. in 1283 on a steep rock, with eight vast towers. Conway is enclosed by embattled walls twelve feet thick. It is on the Chester and Holyhead Railway. Pop. 2523.

Conway, a county near the centre of Arkansas. Area, 1000 square miles. It is bounded on the S. W. by the Arkansas River. The surface is diversified and well timbered, the soil productive. Tobacco, grain, cattle, cotton, and fruit are raised. Coal is found here. It is intersected by the Little Rock and Fort Smith R. R. Capital, Springfield. Pop. 8112.

Conway, a township of Izard co., Ark. Pop. 768.

Conway, a post-village of Franklin co., Mass., about 100 miles W. of Boston. It has an academy, a national bank, a fire insurance company, and important manufactures. Pop. of Conway township, 1460.

Conway, a post-township of Livingston co., Mich. Pop. 1020.

Conway, a post-village and township of Carroll co., N. H., on the Saco River, at the N. terminus of the Portsmouth Great Falls and Conway R. R., has a savings bank and manufactures of straw-board, lumber, leather, etc. North Conway, 5 miles distant, on the Portland and Ogdensburg R. R., 60 miles N. W. of Portland, is a beautiful place, much frequented in summer. It has an academy and manufactures of pottery, lumber, etc. Pop. of township, 1607.

Conway (HENRY SEYMOUR), an English general, born in 1720. He had a high command in Germany in 1761, and became secretary of state in the Whig cabinet in 1765. In 1782 he was appointed commander-in-chief, and made a motion in Parliament to terminate hostilities against the U. S. He was a field-marshal. Died July 10, 1795.

Conway (MONCURE DANIEL). See APPENDIX.

Conway (THOMAS), COUNT DE, a general, born in Ireland in 1733, removed to the U. S. in 1777. He became a brigadier-general in the American army. He was a partisan of Gen. Gates, and took an active part in the intrigues against Gen. Washington. He afterwards entered the French service, became a count, a field-marshal, and governor of the French East Indies. Died about 1800.

Con'wayborough, a post-village, capital of Horry co., S. C., on the Waccamaw River, about 120 miles E. by S. from Columbia, has a weekly newspaper. Pop. 606; of township, 1610.

Co'ny, an animal mentioned in the Bible, is supposed to be the same with the HYRAX (which see).

Cony (SAMUEL), a lawyer, born at Augusta, Me., Feb. 27, 1811, graduated at Brown University in 1829, was a judge of probate (1840–47), and governor of Maine (1864–67). Died Sept. 5, 1870.

Con'ybeare (HENRY), son of W. D. Conybeare, noticed below, an engineer and architect, born in Somersetshire, England, Feb. 22, 1823, has acquired great professional distinction in England and in India.

Conybeare (JOHN), born at Pinhay, England, Jan. 31, 1692, became bishop of Bristol in 1750. He wrote a "Defence of Revealed Religion" (1732), in answer to Tindal. Died July 13, 1755.

Conybeare (Rev. WILLIAM DANIEL), F. R. S., an English geologist, born near London June 7, 1787. He discovered the plesiosaurus, and wrote several treatises on the coal-fields and other strata of Great Britain. In 1845 he was appointed dean of Llandaff. Died Aug. 12, 1857.

Conybeare (W. J.), a son of the preceding, was a fellow of Trinity College, Cambridge. In conjunction with Dean Howson he published "The Life and Epistles of Saint Paul" (1852). Died in 1857.

Con'yers, a post-village, capital of Rockdale co., Ga., on the Georgia R. R., 30 miles E. by S. from Atlanta. It has two weekly newspapers.

Con'yngham, a township of Columbia co., Pa. Pop. 1943.

Conyngham, MARQUESSES OF (1816), Earls Conyngham (1797), earls of Mount Charles (1816), Viscounts Mount Charles (1797), Viscounts Conyngham (1789), Viscounts Slane (1816), Barons Conyngham (Ireland, 1789), and Barons Minster (United Kingdom, 1821).—FRANCIS NATHANIEL CONYNGHAM, second marquess, K. P., G. C. H., P. C., lieut.-gen., born June 11, 1799, succeeded his father Dec. 28, 1832. Died July, 1876.

Coo'dle Creek, a township of Iredell co., N. C. Pop. 1629.

Cook, a county of Illinois, bordering on Indiana. Area, 1027 square miles. It is bounded on the E. by Lake Michigan and the State of Indiana, and is intersected by the Chicago and Des Plaines rivers. The surface is nearly level; the soil is deep and very productive. Cattle, grain, tobacco, wool, and garden products are raised. It is traversed by a number of railroads, which terminate at Chicago, the county-seat. Cook is the most populous county in the State. Pop. 349,966.

Cook, a township of Westmoreland co., Pa. Pop. 875.

Cook (CHARLES), D. D., an eminent Wesleyan divine, chief founder of Methodism in France, was born in London in 1787, entered the Wesleyan ministry in 1817, went to France in 1818, travelled there, founding Methodist societies and aiding in the revival of the Huguenot churches, till his death in 1858. "He was to France, Switzerland, and Sardinia," wrote Merle d'Aubigné, "what Wesley was to England in his day."

Cook (CLARENCE CHATHAM), an American journalist and art-critic, born at Dorchester, Mass., Sept. 8, 1828, was the son of Zebedee Cook, noticed below. He graduated at Harvard in 1849, and studied architecture in the office of A. J. Downing (his brother-in-law) and Calvert Vaux at Newburg, and afterwards pursued for many years the profession of teaching. In 1863, Mr. Cook contributed to the New York "Tribune" a series of articles on American art, based upon the exhibition of pictures at the New York Sanitary Fair of that year. He continued the profession of teacher until 1869, at the same time contributing the art criticisms which appeared in the "Tribune," besides occasional articles to magazines. In 1869 he went as correspondent of the "Tribune" to Paris, but resigned that position upon the outbreak of the Franco-Prussian war, passed some time in Italy, and on his return to America resumed his former connection with the "Tribune." Mr. Cook has published "The Central Park," New York, F. & J. Huntington, 1868, and the text to accompany a reproduction by heliotypy of Dürer's "Life of the Virgin," published by J. R. Osgood & Co., Boston, 1874.

Cook (ELIZA), an English poetess, born in London in 1817, was the daughter of a respectable tradesman. She began literary life as a contributor to various journals. Her first volume of poems appeared in 1840, and was highly successful. She has published, besides other works, "New Echoes" (1864), and was long editor of the "Journal" which bore her name.

Cook (Captain JAMES), a celebrated English navigator, born of very poor parents at Marton, in Yorkshire, Oct. 27, 1728. He entered the navy in 1755, and served as master of a sloop at the capture of Quebec in 1759. He commanded an expedition sent to the South Pacific Ocean in 1768 to observe the transit of Venus. After he had observed the transit with success on the island of Tahiti, he visited New Zealand and explored the coast of New South Wales. Having made important discoveries in geography, he returned by the Cape of Good Hope, and arrived in England in June, 1771. In 1772 he conducted another exploring expedition in the Resolution and Adventure, in order to discover the *Terra Australis*, a continent supposed to exist in high southern latitudes. He circumnavigated the globe, discovered the island of New Caledonia, and penetrated southward as far as 71° S. lat., but did not find the Terra Australis. He returned to England in July, 1775, having lost only one man by disease during the voyage. He published a well-written journal of his voyage (2 vols., 1777). In July, 1776, he sailed on a third voyage, the object of which was to discover a north-west passage by way of Behring Strait. He discovered the Sandwich Islands in 1778, and explored Behring Strait. Having returned to Hawaii to pass the winter, the natives of that island stole one of his boats. Captain Cook with a few men went on shore to recover it, and was killed by the savages Feb. 14, 1779. (See A. KIPPIS, "Life of Captain James Cook," 1788; HARTLEY COLERIDGE, "Lives of Distinguished Northerns," vol. iii.)

Cook (RUSSELL STURGIS), a Congregational clergyman, born at New Marlborough, Mass., Mar. 6, 1811. From 1839 to 1856 he was one of the secretaries of the American Tract Society, and was the originator of its system of colportage. Died at Pleasant Valley, N. Y., Sept. 4, 1864.

Cook (ZEBEDEE), son of Zebedee Cook and Sarah Knight, was born in Newburyport, Mass., Jan. 11, 1786. His ancestors came from Devonshire, England. Born of parents in humble circumstances, he had few advantages in the way of schooling, and went early to Boston to seek his fortune, and from about 1815 to 1838 was engaged there in the business of insurance. He was among the first to introduce into this country the system of mutual insurance, and in 1838 was invited to New York to be the president of the first company established in that city on the system of a division of the profits between the insurers and the insured. This company was called the Mutual Safety Insurance Company, and was engaged entirely in marine business. While living in Boston, Mr. Cook, always much interested in rural pursuits, gave the first impulse to the formation of the Horticultural Society by an article in the "New England Farmer" for Jan. 9, 1829. On Feb. 24th of the same year a meeting was held in Mr. Cook's office to found a horticultural society, and as the result of this and subsequent efforts the Massachusetts Horticultural Society was incorporated June 12, 1829. Gen. Dearborn was the first president and Mr. Cook first vice-president. In 1834, on the resignation of Gen. Dearborn, Mr. Cook was elected president in his place. He introduced the Isabella grape into New England from cuttings. To Mr. Cook as much as to any one belongs the credit of founding the cemetery of Mount Auburn, the first of these institutions, we believe, in the country. Mr. Cook was twice married. Caroline Tuttle, his first wife, was a granddaughter of Col. David Mason, one of Washington's aides—a man distinguished for his courage and patriotism, and for his interest in the scientific discoveries of his time. By this lady Mr. Cook had nine children. His second wife was Ann Somes, daughter of Hon. Israel Trask. She brought him no children, and still survives him. Died in Framingham, Mass., Jan. 24, 1858.

Cooke, a county in the N. of Texas. Area, 900 square miles. It is bounded on the N. by Red River. The soil is mostly fertile, and is extensively covered with forests. Grain and some cotton are raised. Capital, Gainsville. Pop. 5315.

Cooke (AMOS STARR), REV., a Congregational missionary, born in Danbury, Conn., in 1810, graduated at Yale in 1834. He sailed from Boston in the service of the American Board of Foreign Missions in 1836, and arrived at the Sandwich Islands in April, 1837. In that year he took charge of the education of the royalty and nobility of the realm. He remained in charge of the royal school for twelve years, and exerted a controlling influence in shaping the character of the rising kings and nobles; and the last three Kamehamehas were educated by him. Died at Honolulu Mar. 20, 1871.

Cooke (EDWARD), D. D., an American clergyman and educator, born at Bethlehem, N. H., Jan. 19, 1812, graduated with honor at Middletown in 1838. He was teacher of natural science in the Amenia Seminary, in Dutchess

county, N. Y., and afterwards principal of the newly-founded seminary at Pennington, N. J., 1840–47, and minister in various Methodist Episcopal churches at Boston and elsewhere until 1853. He took the direction of the institute now known as Lawrence University in Appleton, Wis., the presidency of which in its more prosperous days was again offered him, but declined. Returning to the East in 1861, he was two years pastor of the Harvard street church in Cambridge, Mass., where he was one of the board of examiners of Harvard College, which conferred upon him the degree of D. D. in 1855. In 1864, Dr. Cooke was elected to the principalship of the Wesleyan Academy at Wilbraham, Mass., one of the oldest Methodist literary institutes in America.

Cooke (George Frederick), a popular English actor, born in Westminster in 1755. He performed in Dublin and London for many years, was successful in both tragedy and comedy, and was a rival of John Kemble. In 1810 he visited New York, where he died in 1812.

Cooke (Jay), an American financier, born in Sandusky, O., Aug. 10, 1821, went to Philadelphia in 1838, and became a clerk in the banking-house of E. W. Clark & Co., of which he became a partner at the age of twenty-one. He established the firm of "Jay Cooke & Co." in 1861, and became well known as a successful government agent for the war-loans during the civil war of 1861–65. The firm to which he belonged subsequently became agents for the Northern Pacific R. R., and their suspension in 1873 was one of the causes of the financial panic of that year.

Cooke (John Esten). See Appendix.

Cooke (John Esten), a novelist and lawyer, born at Winchester, Va., Nov. 3, 1830. He published, besides other works, "Leather Stocking and Silk" (1854), "The Virginia Comedians" (1854), and a "Life of General Robert E. Lee" (1871). He served as an officer in the Confederate army in the civil war.

Cooke (John R.), an American lawyer, a brother of General P. St. G. Cooke (noticed below), born in Bermuda in 1788, became a prominent and influential member of the Virginia bar. He was greatly beloved in private life, and was called "a model of lofty courtesy, chivalry, and generosity." Died at Richmond, Va., Dec. 10, 1854.

Cooke (Josiah Parsons, Jr.), an American chemist, was born at Boston, Mass., Oct. 12, 1827, and graduated at Harvard in 1848. He became in 1851 Erving professor of chemistry and mineralogy in Harvard University. He has published "Chemical Physics" (1860), an admirable work entitled "Religion and Chemistry" (1864), "Principles of Chemical Philosophy" (1870), and many valuable monographs.

Cooke (Nicholas), born at Providence, R. I., Feb. 3, 1717, was deputy-governor of his native State in 1775, and governor of the State (1775–78). He was a personal friend of General Washington. Died Sept. 14, 1782.

Cooke (Parsons), D. D., born at Hadley, Mass., Feb. 18, 1800, graduated at Williams College in 1822. He is best known as an able controversialist, and was for many years (from 1840) editor-in-chief of the "New England Puritan" and the "Boston Recorder." Died at Lynn, Mass., Feb. 12, 1864.

Cooke (Philip St. George), an American officer, born 1809 in Berkeley co., Va., graduated at West Point in 1827, and Nov. 12, 1861, brigadier-general U. S. A. He served as infantry officer on the Western frontier 1827–33; in Black Hawk war 1832, engaged in the battle of Bad Axe; and adjutant Sixth Infantry 1832–33. As a dragoon officer he served on frontier duty 1833–46; on expedition to California during the war with Mexico 1846–47 (brevet lieutenant-colonel); as superintendent of cavalry recruiting 1848–52; on frontier duty and scouting 1852–56, engaged in skirmishes against hostile Indian tribes; quelling the Kansas disturbances 1856–57; on Utah expedition, in command of the cavalry, 1857–58; preparing cavalry tactics 1859; and in command of Utah 1860–61. In the civil war he was in Virginia Peninsula 1862, engaged at Yorktown, Williamsburg, Gaines' Mill, and Glendale; in command of Baton Rouge district, La., 1863–64; superintendent of recruiting 1864–66; in command of the department of the Platte 1866–67, and afterwards of the department of the Lakes. Brevet major-general Mar. 13, 1865. He studied law and was admitted to practice, and is the author of "Scenes and Adventures in the Army," 1856. Retired from active service Oct. 29, 1873. George W. Cullum, *U. S. Army.*

Cook'ery [Fr. *la cuisine*; Ger. *Kochen* or *Kochkunst*; Lat. *ars culinaria*] is the art of preparing food for the table by dressing and by the agency of fire. We have no record of a time when cooking was wholly unknown, and it is highly probable that the practice began soon after the discovery of fire. So universal is the art that some writers have regarded it as the distinguishing trait of the human family, and have defined man as "a cooking animal." In its rudimentary form, as seen among the lower races of men, no utensils are employed, but the food is either laid directly upon the fire or suspended above it from poles. The degree of skill and taste manifested by a nation in the preparation of food may be regarded as to a very considerable extent proportioned to its culture and refinement. We read in the Scriptures that Abraham prepared "cakes of fine meal" and "a calf, tender and good," which, with butter and milk, he set before the three angels in the plains of Mamre. We are told of the chief butler and chief baker as officers in the household of Pharaoh. The ancient Egyptians appear to have eaten the flesh of a few animals, together with bread made of barley, wheat, or the centre of the lotus (see Nelumbium), and great quantities of vegetables. In the Homeric age of simplicity, royal Greeks were content to cook their own meats, but before the time of Pericles professional cooks of great skill were known in Greece. These cooks stood in the market at Athens ready to be hired for particular occasions. Magnificent banquets were prepared at an enormous expense, and poets and philosophers appear to have thought it no unworthy ambition to be distinguished as the inventors of a new cake or a popular sauce. The names of many authors of cook-books are preserved, that of Archestratus, a poet of Syracuse, being the most famous. Among all classes of Greeks fish was a principal article of food. Large quantities of salt fish were brought from the shores of the Euxine and Hellespont. These, with meal, cheese, and onions, are said to have formed the chief food of the armies and navies when on service. The Greeks ate the flesh of sheep, pigs, lambs, and goats, though vegetables appear to have constituted their principal food. They had also poultry, game, and sausages made of blood.

In the early days of Rome a gruel made of barley was the chief food of the people, and with vegetables was, till later times, the usual fare of the inferior classes, meat being used but sparingly. By degrees, however, a taste for luxury was imported. Lucullus introduced habits of epicurism from Asia; the gourmand Apicius earned for himself a deathless name by the costliness of his dishes. The wealthy Romans paid especial attention to the elegant serving of their table, as well as to the quality of the viands. With them, as with the Greeks, fish was a necessity as well as a luxury; they took great pains to procure their oysters, and gave large sums for other fish. In the later days of the republic and under the empire a taste for extravagant and eccentric cookery was indulged at an unheard-of expense. Lucullus gave banquets at a cost of 50,000 denarii each.* A single dish composed of nightingales' tongues, the brains of peacocks and pheasants, and the livers of the most costly fish, is said to have cost Vitellius the sum of 1000 sestercia, equal to nearly $40,000, and probably equivalent to $300,000 at the present time. Many similar absurdities might be mentioned. The favorite meat at this time among the Romans was pork, and "hog in Trojan style" was looked upon as the *chef-d'œuvre* of a good cook. This dish was derived from the Greeks. The animal was served whole, being roasted on one side and boiled on the other, and its interior was filled with numbers of ortolans, thrushes, and beccaficoes.

The *pistor* (baker), who made the bread and pastry, and the *structor*, who composed artificial figures of fruit or flesh, and who also arranged the dishes, seem to have shared the duties of the cook. The Romans made a free use of oil in the preparation of their food. The Greeks and Romans used honey for the purposes for which we use sugar. It was an ancient saying that the number of persons at a repast should not be less than that of the Graces nor more than that of the Muses.

With the invasions of the northern barbarians in the fifth century the art of cookery retired into the convents, and was only revived five hundred years later with the rising power of the free cities of Italy—Venice, Florence, etc.

Catharine de Médicis introduced the luxuries of Italian cookery into France during the reign of Henry II. England is said to have been indebted to William the Norman for her first lessons in the refinements of gastronomy. At a later period the taste for luxurious living had become so common in English monasteries that it was found necessary to limit the excesses of the monks and clergy by an ediet.

In modern times the French have excelled all other nations in cookery, considered as an art. In the reign of Louis XIV. sumptuous and extravagant cookery was in vogue among the higher classes, but during the succeeding reigns its character was greatly modified and refined.

* More than $7000 of our money, but, if we take into consideration the relative scarcity of the precious metals, probably equivalent to $60,000 at the present time.

American cookery may be said to be derived in about equal measure from the English and the French. From the former we have derived our simpler and more substantial dishes, such as roasts, steaks, and some kinds of pastry—from the latter the more delicate and complicated side-dishes and desserts.

Cook'man (GEORGE G.), an eminent pulpit-orator of the Methodist Episcopal Church, was born at Hull, England, in 1800. While engaged in business he was a local preacher in the U. S., and afterwards in England. Having returned to the U. S. in 1825, he entered the itinerant ranks in 1826, and soon became distinguished as a preacher of great ability and success. He was chaplain to the House of Representatives (1838–39). He was lost at sea on the steamer President while on a voyage to Europe in 1841.

Cook'shire, a post-village, capital of Compton co., Quebec (Canada). It is in Eaton township. Pop. about 400.

Cook's In'let, a part of the Pacific Ocean, is in Alaska, opposite the island of Kodiak, between lat. 58° and 61° N., and lon. 151° and 154° W. It is 130 miles long.

Cooks'town, a post-village of Simcoe co., Ontario (Canada), has an active trade and a postal savings bank. Pop. about 500.

Cook'ville, a post-village, capital of Putnam co., Tenn., about 80 miles E. of Nashville. It has one weekly newspaper. Pop. 156. J. BUCK, JR., ED. "NEWS."

Cool'baugh, a post-township of Monroe co., Pa. Pop. 1028.

Coo'ley (LEROY C.), born in Lyme, N. Y., in 1833, graduated at the New York State Normal School in 1855 and at Union College in 1858. He was a teacher in seminaries at Lockport, Fairfield, and Cooperstown, N. Y., and in 1861 became professor of natural sciences in New York State Normal School at Albany. He is the author of text-books of natural philosophy, physics, and chemistry.

Cooley (THOMAS M.), a jurist, born at Attica, N. Y., Jan. 6, 1824, removed to Michigan in 1843, and became a lawyer in 1846. He has published many volumes of legal reports, digests, and compilations. He became professor of law in Michigan University in 1850, and a justice in the supreme court of Michigan in 1864, and chief-justice in 1867.

Coo'lidge (CARLOS), LL.D., was born at Windsor, Vt., in 1792, graduated at Middlebury in 1811, became a prominent lawyer and State politician, and governor of Vermont (1849–51). Died Aug. 15, 1866.

Cool Spring, a township of La Porte co., Ind. Pop. 1328.

Cool Spring, a post-township of Iredell co., N. C. Pop. 711.

Cool Spring, a township and village of Washington co., N. C. The village is about 125 miles E. of Raleigh. Pop. of township, 1561.

Cool Spring, a township of Mercer co., Pa. Pop. 865.

Cool Springs, a township of Rutherford co., N. C. Pop. 1031.

Cool'ville, a post-village of Troy township, Athens co., O. Pop. 334.

Coo'ly, or **Coo'lie,** a Hindostanee word of Arabic origin, signifying a "slave" or "common laborer," has of late been applied especially to emigrants from India and China, who have superseded the negroes in large numbers since the abolition of slavery in the West Indies. Coolies are said to have been employed in the Mauritius as early as 1834, and were afterwards introduced into the West Indian colonies, Cuba, Peru, British Guiana, and other countries. (See EMIGRATION.)

Coomas'sie, the capital of the kingdom of Ashantee, in Western Africa, is about 120 miles N. N. W. of Cape Coast Castle; lat. 6° 35′ N., lon. 2° 12′ W. It has a fortified royal palace. Pop. estimated at 20,000.

Coombe (WILLIAM), an English humorous and satirical writer, born at Bristol in 1741. Among his works are a "Tour of Doctor Syntax in Search of the Picturesque" (1812), and "Tour of Doctor Syntax in Search of a Wife," both in verse. Died Jan. 19, 1823.

Coon, a township of Buena Vista co., Ia. Pop. 385.

Coon, a township of Vernon co., Wis. Pop. 708.

Coon'tie, or **Coon'ta** [an Indian word], the popular name of the *Zamia integrifolia*, a plant of the natural order Cycadaceæ, a native of Southern Florida. Its stem abounds in starch, from which a part of the Florida arrow-root is prepared. Other species of the genus are cultivated in the Bahamas and in Asia for their starch, which, however, is usually classed as SAGO (which see). Florida once produced great quantities of this commodity, of which the quality is often excellent.

Coop'er, a county in Central Missouri. Area, 558 square miles. It is bounded on the N. by the Missouri River and intersected by the Lamine River. The surface is undulating and hilly; the soil is very fertile. Grain, tobacco, and wool are raised. It contains rich mines of iron, coal, and lead, and quarries of marble and limestone. It is traversed by a branch of the Missouri Pacific R. R. Capital, Boonville. Pop. 20,692.

Cooper, a township of Sangamon co., Ill. Pop. 785.

Cooper, a post-township of Washington co., Me. Pop. 360.

Cooper, a township and post-village of Kalamazoo co., Mich. Total pop. 1254.

Cooper, a township of Gentry co., Mo. Pop. 1498.

Cooper, a township of Montour co., Pa. Pop. 414.

Cooper, a post-village, capital of Delta co., Tex., near the geographical centre of the county.

Cooper, a township of Mason co., West Va. P. 1204.

Cooper (ANTHONY ASHLEY). See SHAFTESBURY.

Coop'er (Sir ASTLEY PASTON), F. R. S., LL.D., D. C. L., an eminent English surgeon, born at Brooke, in Norfolk, Aug. 23, 1768. He began to study surgery under Mr. Cline in London in 1784. He became professor of anatomy at Surgeon's Hall in 1792, and surgeon to Guy's Hospital in 1800. In 1805 he was chosen a fellow of the Royal Society. He gained distinction by a valuable work on hernia (1804–07), and practised surgery with great success in London. His annual income is said to have amounted to £21,000. He was appointed surgeon to the king in 1828. Among his works are "The Principles and Practice of Surgery" (1836–37), a treatise "On Dislocations and Fractures" (1822), and one on the "Anatomy and Diseases of the Breast" (1829–40). Died Feb. 12, 1841. (See B. B. COOPER, "Life of Sir Astley P. Cooper," 1843.)

Cooper (JAMES), GENERAL, was born in Frederick co., Md., May 8, 1810, graduated at Washington College, Pa., in 1831, studied law with Thaddeus Stevens, was a Whig member of Congress from Pennsylvania (1839–43), and was a leading opponent of the repudiation movement in Pennsylvania in 1847. He was attorney-general of Pennsylvania in 1848, U. S. Senator from 1849–55, appointed brigadier-general of Union volunteers in 1861, served in Virginia, and died at Columbus, O., Mar. 28, 1863.

Cooper (JAMES FENIMORE), a popular American novelist, born at Burlington, N. J., Sept. 15, 1789, was a son of Judge William Cooper. The latter removed to Otsego co., N. Y., about 1790, and founded Cooperstown. Young Cooper entered Yale College in 1802, and became a midshipman in the U. S. navy in 1806. In 1811 he quitted the naval service and married Susan de Lancey, a sister of Bishop de Lancey. He published anonymously, in 1819, "Precaution," a novel, which was considered a failure. In 1822 he produced "The Spy, a Tale of the Neutral Ground," which had great success, was republished in various parts of Europe, and translated into several languages. "The Spy" opened a new and fresh field of national and imaginative literature. His next work was the "Pioneers" (1823), in which he gave a graphic description of American scenery and the adventures of life on the frontier of civilization. He published in 1823 "The Pilot," a tale of the sea, which was very popular. He represented with great success in this work the character of sailors and peculiar phases of maritime life and scenery. In the "Last of the Mohicans" (1826) he gave a vivid picture of the life and character of American savages and trappers. In 1827 he visited Europe, where he remained nearly six years, during which he published "The Prairie" (1827), "The Red Rover," an admired tale of the sea, and other works. He criticised and satirized the national defects and foibles of the Americans in "The Monikins" (1835), "Homeward Bound" (1838), and "Home as Found" (1838). Among his other works are a "History of the Navy of the United States" (1839), "The Pathfinder" (1840), "Wing-and-Wing" (1842), "Afloat and Ashore" (1844), "The Chain-Bearer" (1845), and "Oak Openings" (1848). Died at Cooperstown Sept. 14, 1851. "He wrote for mankind at large," says W. C. Bryant; "hence it is that he has earned a fame wider than any [American] author of modern times. The creations of his genius shall survive through centuries to come, and only perish with our language." "His writings," says Prescott, "are instinct with the spirit of nationality. In his productions every American must take an honest pride; for surely no one has succeeded like Cooper in the portraiture of American character, or has given such glowing and eminently truthful pictures of American scenery." In

person he was well formed, dignified, and had an imposing presence. (See "North American Review" for July, 1822, July, 1826, April, 1831, and Oct., 1859; ALLIBONE, "Dictionary of Authors.")

Cooper (MYLES), LL.D., OXON., an accomplished scholar, second president of King's College (now called Columbia College), New York City, born in England in 1735, and educated at Oxford, became a fellow in Queen's College. He came to America in 1762, as assistant to Dr. Samuel Johnson, first president of King's College, and was made president in May, 1763. In the revolt of the colonies he remained loyal to the Crown, and was compelled to flee the country. He became one of the ministers of the English chapel in Edinburgh. Died at Edinburgh May 1, 1785.

Cooper (PETER), an American manufacturer, inventor, and philanthropist, was born in the city of New York Feb. 12, 1791. His early life was one of labor and struggle, as it is with most of our successful men in this country. He commenced in early boyhood to help his father as a manufacturer of hats. He attended school only for half of each day for a single year, and beyond this very humble instruction his acquisitions were all his own. At the age of seventeen he was placed with John Woodward to learn the trade of coachmaking. In this trade he served his apprenticeship so much to the satisfaction of his master that the latter offered to set him up in business, but this he declined, on account of the debt and obligation it would involve.

The foundation of Mr. Cooper's fortune was laid in the opportune invention of an improvement in machines for shearing cloth. This was largely called into use during the war of 1812 with England, when all importations of cloth from that country were stopped. The machines lost their value, however, on the declaration of peace. Mr. Cooper then turned his shop into the manufacture of cabinet-ware. He afterwards went into the grocery business in New York, and finally he engaged in the manufacture of glue and isinglass, which he has carried on for more than fifty years. Mr. Cooper in three particulars—as a capitalist and manufacturer, as an inventor, and as a philanthropist—is connected with some of the most important and useful accessions to the industrial arts of this country, its progress in invention, and the promotion of educational and benevolent institutions intended for the people at large. His attention was early called to the great resources of this country for the manufacture of iron. In 1830 he erected works in Canton, near Baltimore. Subsequently he erected a rolling and a wire mill in the city of New York, in which he first successfully applied anthracite to the puddling of iron. In 1845 he removed the machinery to Trenton, N. J., where he erected the largest rolling-mill at that time in the U. S. for the manufacture of railroad iron. In these works he was the first to roll wrought-iron beams for fireproof buildings. These works have now grown to be very extensive, including mines, blast furnaces, and water-power.

While in Baltimore, Mr. Cooper built, in 1830, after his own designs, the first locomotive engine ever constructed on this continent. It was successfully operated on the Baltimore and Ohio R. R. Next we find Mr. Cooper taking great interest and investing large capital in the extension of the electric telegraph. He was the first and only president of the New York Newfoundland and London Telegraph Company, which continued its operations for eighteen years. He was honorary director of the Atlantic Telegraph Company, president of the American Telegraph Company, and president of the North American Telegraph Association, which at one time represented more than two-thirds of all the lines in the U. S. He took part actively in the first expedition that laid the Atlantic cable in 1854.

Mr. Cooper interested himself early in the New York State canals. Before the water was let into the Erie Canal it was an anxious question what was the best propelling power for the boats to be employed on the canal. Mr. Cooper then made an interesting experiment of propelling a boat by means of an endless chain two miles long, supported on posts and rollers, which was driven by the force of elevated water, and might be driven by any other power. By means of this he propelled a boat two miles in eleven minutes, carrying with him the governor, De Witt Clinton, and other distinguished men at that time. Although this method of propulsion was not adopted at that time, it has since been successfully and very usefully applied by Mr. Welch in passing boats through the locks of the Delaware and Raritan Canal.

Mr. Cooper has served in both branches of the New York common council. He was a trustee in the Public School Society, first formed to promote public schools in New York, and when that was merged in the board of education he became a school commissioner.

But the most cherished object of Mr. Cooper's life, early conceived and faithfully carried out as soon as his means permitted, was the establishment of an institution for the instruction of the industrial classes. He desired to furnish this instruction during their leisure from work or in the evenings, when they might obtain higher attainments in the practical arts in which they happened to be engaged, or learn some industrial pursuit they might desire. Having felt the need of this sort of instruction during his own early and laborious life, and knowing that neither the common school nor the academy and college can supply the technical knowledge and practical education needed by the great mass of youth, Mr. Cooper determined to set an example in supplying this want of practical instruction for the working classes, that should prove not only useful in his own city, but be contagious throughout our republican land. He saw, with that wise forecast as well as broad philanthropy which characterizes his mind, that the youth must be trained to industry under an advancing and higher order of work which machinery was introducing. Accordingly, in the year 1854 he laid the corner-stone of a large building at the junction of the Third and Fourth avenues in New York, "to be devoted for ever to the union of art and science in their application to the useful purposes of life." This institution has grown under the fostering care of the trustees appointed by Mr. Cooper and his own watchful and unremitting attention, until at the present time it counts over 1500 pupils in the course of the year. It has a school of art for women, taught in the daytime, in which free instruction is given in all branches of drawing, in painting, wood-engraving, and photography. It has likewise a free school of telegraphy for young women. These schools for the daytime accommodate about 200.

In the evening are opened the free schools of science and art for young men and women. Here the mathematics, practical engineering, and practical chemistry are thoroughly taught, and free lectures are given in natural philosophy and the elements of chemistry. In the art department every branch of drawing and painting is taught. Besides these free schools, there is a large free reading-room and library at the disposal of all comers. About 1500 resort to this daily, where they have free access to 280 periodicals and papers, foreign and domestic, and about 10,000 volumes. Besides this, there is a free course of lectures given every Saturday evening during the winter in the large hall of the Cooper Union, that will seat 2000. Last year there was spent over $56,000 for the support of the different departments.

Mr. Cooper has retired from active business. On May 18, 1876, the Independent party nominated him for President of the U. S., and at the following election he received nearly 100,000 votes.

J. C. ZACHOS, *Curator of Cooper Union.*

Cooper (PHILIP H.), born Aug. 5, 1844, in the State of New York, graduated at the Naval Academy in 1863, became a master in 1865, a lieutenant in 1866, and a lieutenant-commander in 1868. He served in the steam-sloop Richmond at the battle of Mobile Bay, Aug. 5, 1864, and was commended "for coolness and courage" on that occasion by his commanding officer, Captain Thornton A. Jenkins.

FOXHALL A. PARKER, U. S. N.

Cooper (SAMUEL), D.D., an eloquent and learned American divine, born at Boston Mar. 28, 1725, graduated at Harvard in 1743. He became pastor of the church in Brattle street, Boston, in 1746, and was intimate with Doctor Franklin. He was an efficient promoter of the popular cause in the Revolution. Died Dec. 29, 1783.

Cooper (SAMUEL), an American general, born in the State of New York about 1795, graduated at West Point in 1815. He became a captain in 1836, and served in the Mexican war (1846–47). In 1852 he was appointed adjutant-general with the rank of colonel. Having resigned his commission in Mar., 1861, he soon became adjutant-general of the Confederate army, and was promoted to the rank of full general. He served as such until the end of the war.

Cooper (SUSAN FENIMORE), the eldest daughter of the great novelist, was born in 1815, and has published "Rural Hours" (1850), "Rhyme and Reason of Country Life" (1854), "Country Rambles," and other works characterized by refined taste and admirable style.

Cooper (THOMAS APTHORPE), an actor, born in London in 1776, played with much applause in London and the U. S. His daughter married a son of President Tyler, under whom Cooper held various government offices. Died at Bristol, Pa., April 21, 1849.

Cooper (THOMAS), M. D., LL.D., a natural philosopher, physician, and lawyer, born in London Oct. 22, 1759. He accompanied Dr. Priestley to the U. S. in 1792, became a Democrat, and took an active part in politics. In 1820 he was chosen president of South Carolina College at Columbia. He published many learned and vigorous pamph-

lets on politics, and several important legal works. Died May 11, 1839.

Cooper (THOMAS SIDNEY), an English painter, born at Canterbury Sept. 26, 1803. He has painted cattle and sheep with great success.

Coop'erage [from *cooper*, a "barrel-maker;" in Old English *coop* (Ger. *Kufe*) signified a "cask"], the art of making various wooden vessels, such as barrels, casks, etc., the sides of which are formed of upright pieces called staves, so skilfully shaped that when all are built and hooped together, their edges shall exactly coincide; the staves are made broadest in the middle, and narrowed in a curved line towards each end; they are made to meet at their inner edges, and by driving the hoops are compressed until the outside gaps are closed, and thus slight inaccuracies of fitting are remedied. The hoops are hammered down from the narrow to the wide part of the vessel by means of a mallet striking a piece of wood held against the hoop. Both wood and iron are used for hoops. The cutting of staves is largely done by machinery. Iron hoops are sometimes put on hot, in order that their contraction on cooling may bind the work together.

Co-opera'tion [from the Lat. *co* (*con*), "together," and *operor, operatus*, to "work"] is the name given to the attempts made within the last forty years, both in Europe and the U. S., but chiefly in France and England, to introduce into the relations under which ordinary and indispensable operations of industry, production, and distribution are carried on, principles which may

> "Ring out the feud of rich and poor
> Ring in redress for all mankind,"

and thus realize gradually, without any violent shock to existing customs, those brilliant anticipations of a "good time coming," and attainable by man through his own exertions, which in the earlier part of the century the efforts and teaching of three remarkable men—Claude Henri Conte de Saint-Simon, Charles Fourier, and Robert Owen—kindled in the imaginations of their disciples. It would occupy far more space than we can spare to give even an outline of the principles by which the divergent theories of these illustrious social reformers are distinguished. (For a literally full, fair, and very readable account of them we may refer those who are interested in such studies to the "Les Réformateurs Contemporains" of LOUIS REYBEAUD, Paris, 1841.) Still less can we give here the history of the schools of thought which arise out of their teachings, or attempt to trace the variety of social systems produced by the successors of these breakers of the fallow ground—men such as J. P. Greaves in England and Pierre Leroux, Cabet, and Proudhon in France. One exception only we must make in favor of M. Louis Blanc, from the influence exercised by his work, "L'organisation du Travail," published in 1840, on the subsequent progress of co-operation.

The systems of Saint-Simon, of Fourier, and of Owen have the common character of claiming to be revelations of a code of principles or laws by which the whole life of man shall be transformed as by an enchanter's wand, and a new-created world of moral order and material prosperity spring up in place of our present civilization. Louis Blanc proposed to start from things as they are, and for that purpose suggested a scheme of which he gives the following outline: The government should take upon itself the supreme regulation of production and the task of putting an end to competition, in which it must slay the evil genius of society by arms borrowed from competition itself. To effect this task the government shall raise a loan, of which the proceeds shall be applied to the creation, in all the more important branches of national industry, of a number of social factories, originally rigorously circumscribed on account of the considerable outlay required for their construction, but organized so as to have an unlimited power of expansion. The government shall draw up the regulations of these factories, which shall be discussed and voted by the representatives of the nation, and thus have the force of law. All workmen who can offer guarantees for their character shall be admitted to work in them up to the limits of the number for whom the original capital can furnish the means of work. And (notwithstanding the difficulty caused by the false education given to the existing generation, which furnishes no motives for energy and emulation except an increase of reward) the salaries shall be equal, for the new education may be trusted to change ideas and customs. During the first year after the establishment of any factory the government shall regulate the hierarchy of functions. At its termination a hierarchy shall be formed by the election of the workers, who will then have had time enough to appreciate each other, and will all be equally interested in the success of the association. For in every year the profits of the work shall be divided into three parts: one to be equally distributed among all the members; a second to be devoted, first, to the support of the aged, the sick, and the infirm; second, to the alleviation of any crisis affecting any other industry, since all the industries should aid each other; while the third shall be consecrated to furnish the means of work to those who desire to join the association, so that it may grow indefinitely. Workers engaged in occupations naturally disposed to scatter and localize themselves shall be admissible into the associations formed for industries which can be carried on upon a large scale; so that each social factory may be composed of different businesses grouped round some great industry, parts of the same whole, obeying the same laws, and sharing in the same advantages. Each member of a social factory shall be entitled to dispose of his salary at his own pleasure, for the evident economy and incontestable excellence of life in common will ere long produce from the association of labor a voluntary association for necessities and pleasures. Capitalists may be admitted into these associations, and draw the interest upon the capital contributed by them, which shall be guaranteed by the budget, but shall not be allowed to share in profits except as workers. (*Organisation du Travail*, Paris, 1848, pp. 103–105.)

Such was the scheme of which Louis Blanc anticipated that were it tried it would lead to the suppression of competition by the absorption of all industries carried on upon any other system, and prepare the way "for the realization of the principle of fraternity, which must be the work of instruction." "Thus would the day arrive when it would be recognized that he owes more to his kind who has received from God a large measure of strength or intelligence. Then would genius assert its legitimate empire not by the importance of the tribute levied on society, but by the importance of the services rendered to it." "For the inequality of capacities has as its true object not the inequality of rights, but the inequality of duties." (*Ib.*, p. 118.)

It will be seen that this remarkable scheme is characterized by that tendency too common in many French proposals, of relying upon the government to do for the people what they despair of being able to do for themselves. Nevertheless, it marks a great epoch in the history of social reform, by the clearness with which it pointed out three principles ever since more or less distinctly felt to be the life-blood of co-operative efforts: 1st, the looking to the association of workers carrying on their accustomed work in common as the true means of raising their social condition through the use of the profits arising from their work; 2d, the restricting the payment of capital to a fixed rate of interest, and giving the capitalist security for his principal in lieu of profit; 3d, the elimination of the ruinous effects of competition, and the substitution of a healthy emulation in its place, by the union of different establishments carrying on the same industry by common centres, by means of which diverse industries may also be united. Thus, setting aside the arbitrary rule of an absolute equality of salaries, which experience has not justified where the attempt to act upon it has been tried, and which seems to us to err as much by sacrificing the individual to the body as the present inequality of payment errs in sacrificing the body to the individual,—this *organisation du travail* may still be regarded as the prolific egg out of which the ideas of co-operation sprang in France, and which has had no inconsiderable influence on the ideas of co-operators in England. There the scheme of united action, which Louis Blanc proposed to realize through the intervention of the government, has been gradually realizing itself through the voluntary action of individuals, who, however, have attacked the problem from another side, on which practically it is more accessible. The new societies imagined by Fourier or Owen rested upon associations where the residents, raising their own food by the cultivation of their own lands, and to a great extent supplying their other wants by their own labor, would have been substantially independent of each other, and not have needed to trouble themselves much about the mutual exchange of their surplus produce. But if the workers are to sustain themselves by the sale of articles which they cannot eat, as M. Louis Blanc proposed, the command of a market through which these sales may be effected becomes an indispensable condition of success. Hence arises the importance of the distributive association or store in any scheme of social improvement founded upon the union of artisans to carry on their accustomed work. But how are these stores to be formed? The answer practically given has been, By unions of consumers, who shall contribute the capital necessary to obtain the articles for their own supply, and divide among themselves the profits arising from this sale, which the shopkeeper, if he supplies that capital, puts into his own pocket. Stores of this nature can be formed by the workers for themselves without any alteration in their

accustomed methods of employment. They can be formed by a very small expenditure of capital in proportion to the business done if the rule of cash payment for all articles supplied by them is adopted. They have in themselves a natural tendency to expansion, since there is no class of persons in them interested in restricting the number of members, while the larger the store the greater is the security for the capital invested in it, and the smaller the proportionate cost of distribution. They are attractive not only by the economy which they realize, but also by the protection against adulteration afforded through their means, since they contain no body of persons benefited by adulteration. They are instruments by which the workers may gradually save up the capital needed to set themselves to work, without feeling any burden from the operation, since the savings are made out of a fund before inaccessible to them—viz. the profits on their own consumption. And this fund enables them to pay interest on the accumulations while they are in process of being made, so that the worker, while preparing the means of becoming his own employer, derives a safe and increasing income from the operation. Again, by the practice of selling at ordinary prices and dividing the accruing profit from time to time, the store is converted into a self-acting savings bank, by which the frittering away of the profits in small expenses is prevented. Thus, by laying his hands upon the thing nearest to him, within his own reach, the supply of his own consumption, the artisan may see the prospect held out to him by Louis Blanc continually drawing nearer, distribution constructing the road leading to production. But to complete this road a further operation is necessary—viz. that the local centres of supply shall be collected under some common head, by which the aggregate wants of large districts may be ascertained, and so a market be obtained for the productive associations, when formed, sufficiently large to absorb their productions. Now this operation is facilitated by the system of distribution existing in society as it is—the well-known division of retail and wholesale trade. Between the consumer and the actual producer there intervene at present not only the retailer, but the dealer from whom this retailer obtains the goods he supplies, and if those goods are not produced at home, but imported, a further set of importers and dealers from whom they buy, and brokers through whom these purchases are made, which we need not specify. For their own advantage, to make the system of self-supply complete, the consumers must therefore form for themselves wholesale centres, whence their local stores may obtain the goods supplied by them, and these centres, when formed, furnish natural channels through which the articles produced by co-operative manufacturing societies may be distributed to the consumers, with a certainty that the proportion between supply and demand shall always be duly preserved, since the production will be founded upon the ascertained wants of the districts supplied. Upon the system thus sketched co-operation has grown up in the United Kingdom with a rapidity of which the following statistics will give an idea: At the close of 1844 the celebrated Rochdale Pioneers' Society was founded by seventeen weavers, with a total capital of £28. At the present time its share capital has risen to £133,000, of which £46,000 is applied to carry on the business, £20,000 being represented by business premises, machinery, and fixtures, and the remainder is invested in the shares of or loans to various other societies, or in land or cottage buildings, of which it owns 122. At Christmas, 1872, it had 6444 members; its business during the year 1872 was £267,000; its income from all sources, £33,646; and its average dividend to its members on their purchases 2*s.* 3*d.* in the pound. The extent to which the example set by Rochdale has been followed is shown by a statement compiled from the latest official returns, published in 1872 for the year 1871, laid before the Co-operative Congress held in April, 1873, at Newcastle-on-Tyne, and showing also the localities in which co-operation has spread most widely in England:

	Lancashire and Yorkshire.	All other counties.	Total of England and Wales.
Property and stock ins'd	£701,570	£484,991	£1,186,564
Members end of 1871.....	157,225	104,963	262,188

" to non-members	10,706	51,542	16,248
Applied to education.....	4,126	671	5,097

The statement, indeed, is not perfect, since it takes no notice of Scotland, where there were 255 registered societies, but of which 70 only had made returns to the registrar; and it relates only to about nine-tenths of the societies believed to exist in England and Wales, because no returns had been made from the other tenth. But of these 746, twenty-two only were formed for manufacturing purposes other than the preparation of flour. The collective share capital of these societies (excluding a cotton-factory at Rochdale, within the immediate influence of the Equitable Pioneers, which possessed £98,656) was only £22,195, giving an average of about £1050, while the share capital of the 724 other societies gives an average of about £3050, although the successful conduct of manufacturing operations demands a much larger capital than is needed by a store, which deals for ready money. This fact seems to us a striking proof of the advantage possessed by the method of beginning by organizing distribution, and thus accumulating the capital required for productive enterprise, over that which seeks to obtain the capital at once out of the contributions of the intended workers. A confirmation of this view is afforded by the experience of the Continent: 1st, in the history of French co-operation; 2d, that of the system of co-operative banks introduced by Mr. Schultze Delitzsch into Germany. In France a number of societies sprung up in 1848 under the influence of the ideas of which M. Louis Blanc's *organisation du travail* is the most brilliant expression; and of these many appear still to subsist; indeed, the number is said to have increased of late, and of those which subsisted at the outbreak of the German war, none failed either from the pressure of the siege or the action of the Commune. (*Letters of M. Merlot, and Monsieur Herbart Vallerovi's report to Bolton Congress*, 1872, p. 99.) But they do not appear to have made any striking progress. Monsieur Merlot speaks of the want of capital to obtain the instruments of manufacture and a reserve fund to meet embarrassments as the great obstacles to their success. M. C. Limousin, in a monthly journal recently established at Paris, called "Le Bulletin du Mouvement Social," ascribes it—1st, to a refusal to use capital supplied by persons outside; 2d, to the not giving any share of profits to the workers not members; and 3d, to an extreme distrust of those elected to direct the undertakings, so that they are constantly removed. Now, for all these evils an appropriate remedy appears to be provided in the creation of a central fund for the promotion of such productive establishments through the accumulative savings of the consumers to whom the articles manufactured may be sold; for of this capital the workman can feel no jealousy, since it is really supplied by himself. The consumer may counteract the spirit of exclusiveness proper to the factory by the spirit of free admission natural to the store when profits are divided upon purchases; and they may regulate, by the governing action of the distributive stomach, the distrustful impatience of the producing members.

While France has thus been slowly groping her way to productive union, in Germany a peculiar form of combined action has sprung up, suited to the condition of labor in that country. It consists in the formation of local associations for the joint purchase of raw materials, or for obtaining advances of capital by the poorer classes, on terms as advantageous as those at the command of the richer, introduced in 1859 at the suggestion of Mr. Schultze Delitzsch. This movement so prospered that at the end of 1871 it numbered 2059 societies with 1,200,000 members, a subscribed capital of £4,700,000, a loan capital of £12,750,000, and a turn-over of £60,000,000; while in association with it there existed 404 societies connected with manufactures, and 827 stores. (*Report for* 1871, by Mr. Schultze Delitzsch, published 1872.) A similar system has recently grown up with great promise of success in Italy.

To complete this sketch, we must add that both in Germany and in England central associations adapted to bring the separate societies into collective action are in operation, and are beginning to exercise a powerful influence. In Germany the function of the central body appears at present confined to the collection and diffusion of accurate information as to the condition of the local societies, by which they may be guided in their dealing with each other, and to the discussion of any matters affecting generally the interests of the members. In England, while this function has been discharged for the last four years by an annual congress of delegates from various co-operative societies, and by a central board appointed by them to keep alive the sacred fire during the rest of the year, this central board, by the resolutions of the congress held at Newcastle in 1873, was reorganized with the view of giving it increased efficiency. A great advance towards the practical combination of the local distributive stores into a common action for the supply of the wants of large districts has been made by the

formation in 1864, at Manchester, of the North of England Wholesale Society, now called "The Wholesale Society," as the federal head of a mass of co-operative societies, by whom its capital is subscribed, and by whose delegates at their quarterly meetings its governing body is appointed and its operations controlled. Commencing with a capital of £1000 and a business in its first year of little more than £40,000, "The Wholesale" has grown year by year, till in April, 1873, it embraced 277 shareholding societies with 134,276 members, and had made sales amounting during the last quarter to £303,697, and during the year to £1,153,132—an increase of nearly 52 per cent. on the sales of the year preceding. (*Report of Congress at Newcastle.*)

The time has arrived, in the opinion of English co-operators, when the step may safely be taken through this wholesale organization to manufacture articles which the consumers commonly require. Accordingly, "The Wholesale" has recently commenced the manufacture of biscuits, and has decided to begin that of boots and shoes, in which 59 societies only in connection with it had, according to their accounts, an annual trade of £66,876. They are also arranging to enter upon the Manchester trade for the supply of drapery, hosiery, etc., articles constituting no inconsiderable part of the large amount of business done by the stores, which does not now pass through "The Wholesale." This step therefore will probably open the way to other productive fields of manufacturing enterprise.

During the last year also a very promising beginning has been made in uniting banking business to the other modes of co-operative effort, thus making the large accumulated balances of the stores available for the extension of co-operation.

The brief sketch given above may suffice to show how noble a prospect lies beyond the gentle unimposing pass leading from the world where man is the slave of capital to the world where capital shall become the servant of man. The housewives who watched that the kettle did not boil over during ages past little imagined the part that steam was one day to play, and the heads of poor families who have joined in buying a chest of tea and dividing it amongst them, have as little foreseen that they were playing with a power which could turn the worker into his own employer, and rearrange the distribution of wealth among mankind.

The student of social science will find the first act legalizing co-operative societies in England in the statute-book of 1852 (15 Vict., c. 31), and may trace the development of the movement in the subsequent acts 17 and 18 Vict., c. 25, 19 and 20 Vict., c. 40, 25 and 26 Vict., c. 87, 30 and 31 Vict., c. 117, and 34 and 35 Vict., c. 80.

THOS. HUGHES, M. P.

Coop'er Riv'er, in South Carolina, rises in Charleston co., and flowing south-eastwardly unites with Ashley River to form Charleston Harbor.

Coop'er's, a township of Edgefield co., S. C. P. 1795.

Coop'er's Creek, a stream in the interior of Australia, formed in Queensland by the junction of the Victoria and Thomson creeks, flows southward, and empties itself into the salt lake Gregory. Cooper's Creek has a tragic interest, from the fact of the explorers Burke and Wills having perished in its vicinity.

Coop'er's Gap, a township of Polk co., N. C. Pop. 797.

Coop'er's Plains, a post-village of Erwin township, Steuben co., N. Y., on the Rochester division of the Erie R. R., 5 miles N. W. of Corning.

Coop'erstown, a post-township of Brown co., Ill. Pop. 1522.

Cooperstown, a post-village, capital of Otsego co., N. Y., is pleasantly situated at the S. end of Otsego Lake, 69 miles W. of Albany. The lake is 9 miles long, and has two steamboats. Cooperstown has six churches, two weekly newspapers, a union school and academy, a hospital, an orphan asylum, and two national banks. The Cooperstown and Susquehanna Valley R. R., 16 miles long, connects it with the Albany and Susquehanna R. R. Pop. of Otsego township, 4590.

J. L. HENDRIX & SON,
PROPS. "REPUBLICAN AND DEMOCRAT."

Cooperstown, a post-village of Jackson township, Venango co., Pa. Pop. 264.

Cooperstown, a township and post-village of Manitowoc co., Wis. The village is 85 miles N. of Milwaukee. Pop. of township, 1563.

Cooper Union. See COOPER (PETER), by J. C. ZACHOS, Curator of Cooper Union.

Coop'ersville, or **Corbeau,** a post-village of Champlain township, Clinton co., N. Y., on Chazy River. Pop. 205.

Cooper's Well, an artesian mineral spring, 4 miles from Raymond, Hinds co., Miss. Its water is an active saline chalybeate, and is much visited for the cure of chronic diarrhœa, dyspepsia, and many other diseases.

Co-or'dinates, in mathematics, a system of lines or surfaces by which the position of a point is determined. If, for example, three lines, x, y, z, be so drawn that each is perpendicular to the plane of the other two, lines may be drawn from any point in space perpendicular to each of the intersecting planes, and the length of the perpendiculars being known, the position of the point will also be known. Two rectilinear co-ordinates are sufficient to determine any point in a plane. If the co-ordinates are so inclined to each other as to form any oblique angles, determining lines may be drawn at similar angles from the point. In polar co-ordinates an initial axis is assumed (one extremity of which is called the pole), and an initial plane passing through the axis. The co-ordinates of any point are the radius vector, its angle with the polar axis, and the angle between the vectorial and initial planes. Various other systems of co-ordinates are employed in analytical geometry; *e. g., trilinear, triangular, tetrahedral, tangential, elliptic, spherical,* etc.

Coorg, a district of India, bounded by the Mysore territories and the presidency of Madras, is between lat. 12° and 13° N. Area, 2116 square miles. The surface is hilly and covered with forests. Porcelain clay is obtained in abundance. Sandal and other valuable woods are found. The geological formation of the country is syenite, granite, and greenstone. The botany and zoology of the country comprise a great variety of species. The laws of hereditary rights differ in this rajahship from those of neighboring nations, inheritances passing by the male line. The manufactures are confined to the blankets which the people wear. In the valleys, which are very fertile, rice is grown. The amount of land under tillage is comparatively small. It is drained by the river Cávery. The inhabitants are a warlike Nair tribe. The country was annexed to the British dominions in 1832. It is now placed, with Mysore, under the administration of a special commissioner. Pop. in 1869, 118,187.

Co'os [Κώως], a New Testament name of the island of Cos (which see).

Coos, ko-ōs', a county which forms the N. extremity of New Hampshire. Area, 1950 square miles. It is bounded on the W. by the Connecticut River, and is drained by the Androscoggin. The surface is mostly mountainous and rugged. Mount Washington, the highest peak of the White Mountains, is in the southern part of this county. It is intersected by the Grand Trunk R. R. Cattle, potatoes, grain, and wool are raised. Lumber and starch are the chief manufactures. Capital, Lancaster. Pop. 14,932.

Coos, koos, a county in the W. of Oregon. Area, about 1300 square miles. It is bounded on the W. by the Pacific Ocean, and drained by the Coquille and Coos rivers. The surface is partly mountainous; much of the soil is very fertile. Coal and lumber are exported from this county, which also contains gold. Capital, Empire City. P. 1644.

Coo'sa, a river of the U. S., is formed by the Etowah and Oostenaula, which unite at Rome in Georgia. It crosses the eastern boundary of Alabama, flows south-westward, and then southward, until it unites with the Tallapoosa on the southern border of Elmore co., Ala. The stream thus formed is the Alabama River. The length of the Coosa is estimated at 350 miles.

Coosa, a county of E. Central Alabama. Area, 650 square miles. It is bounded on the W. by the Coosa River. The surface is diversified; the soil fertile. Corn, tobacco, cotton, and wool are raised. Quarries of fine marble and statuary granite have been opened here. The granite is of a beautiful gray tint, and is said to be the best in the U. S. for statuary. Iron and lead ores are also found. The county is well watered, and especially adapted to pasturage. Water-power is abundant. Capital, Rockford. P. 11,945.

Coosawat'chie, a post-township of Beaufort co., S. C. Pop. 2573.

Coos Bay, the principal seaport of Southern Oregon. Its entrance, just N. E. of Cape Arago (lat. 43° 20′ 38″ N., lon. 124° 22′ 11″ W.), is very good, and its bar has fourteen feet of water at high tide. The Coos River flows into it. Four miles from the bar, on the S. shore, is Empire City, the capital of Coos co.; and four miles from the mouth of the river is Marshfield, an important coal-mining centre. The bay is important chiefly for its vast quantities of tertiary lignitic coal, which is found on the S. side over a large area. It is by many regarded as the best coal on the Pacific coast, but is inferior to the bituminous coals. The bay is surrounded by an elevated and densely timbered region.

Coot, a name applied in America to several birds, chiefly ducks of the genus *Fuligula*. Among these are the box coot, or surf duck, of the E. and W. coasts of North America, the broad-billed coot, the white-winged coot or velvet duck, and other species. In the South the name is given to the sora rail (*Ortygometra Carolina*). The name coot in England is generally applied to the *Fulica atra*, a wading bird allied to the rails. The *Fulica Americana*, found in nearly all parts of North America, is the bird to which the name coot should be restricted in this country.

Common European Coot.

Coote (Sir Eyre), K. B., an able general, born in Ireland in 1726, went to India in 1754, became governor of Calcutta (1757), fought at Plassey in the same year, took Pondicherry in 1761, became commander-in-chief in India (1769), and defeated Hyder Ali in 1781. Died April 26, 1783. His nephew, of the same name, served against the Americans in the Revolutionary war.

Copaï'ba [a word of Brazilian origin], **Balsam of,** a stimulant, diuretic, oleo-resinous drug, which has decided value in diseases of the mucous membrane, is obtained chiefly from Pará in Brazil, though the trees which produce it grow extensively in many parts of tropical America. These trees are of many species or varieties, belonging to the genus *Copaifera* and the order Leguminosæ.

Copa'is [Gr. Κωπαΐς], the ancient name of a lake of Bœotia, now called **Topolias.** It receives the river Gavrios, the ancient Cephissus. The extent of the lake varies at different seasons, and in summer it nearly all disappears. It is drained by artificial and natural subterranean channels into the sea. It was once famous for its eels.

Co'pake, a township and post-village of Columbia co., N. Y. The village is on the New York and Harlem R. R., 106 miles N. of New York. Iron of excellent quality is manufactured here. Total pop. 1847.

Co'pal [a term of Mexican origin], a name applied to several resins used in preparing varnishes. The copal of commerce is usually a nearly colorless, translucent substance, which is imported from tropical America, India, and Eastern and Western Africa. The American copal comes from leguminous trees of the genus *Hymenæa* and allied genera. Zanzibar copal is the best. It is from *Trachylobium Hornmannianum*.

Copan', a ruined city of Central America, in Honduras, on the Copan River, about 30 miles E. of Chuquimula. The remains, which extend nearly two miles along the river, comprise a temple 624 feet long and several pyramidal structures, with sculptured idols resembling those of the ancient Egyptians. (See Stephens, "Central America.")

Copartnership. See Partnership, by Prof. T. W. Dwight, LL.D.

Cope [Lat. *capa;* Fr. *chape*], a sacerdotal cloak reaching from the neck to the ankles, and open in front. It appears to have been modelled by Pope Stephen in 286, on the Roman *lacerna*, or hood. It is one of the vestments of the English Church, but is now seldom worn.

Cope (Charles West), R. A., an English historical painter, born at Leeds in 1811, was the son of an artist. He was elected a Royal Academician in 1848. Among his works are "Lear and Cordelia" (1850), "Royal Prisoners" (1855), "Departure of the Pilgrim Fathers" (1856), and frescoes in the Parliament House.

Cope (Edward Drinker), an American naturalist, a grandson of Thomas P. Cope, noticed below, was born in Philadelphia July 28, 1840. Before he reached the age of twenty he had distinguished himself in herpetology. In 1864 he was appointed professor of natural science in Haverford College, which position he resigned on account of ill health in 1867.

Professor Cope has made numerous contributions to the "Proceedings of the Academy of Natural Sciences of Philadelphia," to the "Transactions of the American Philosophical Society," to Silliman's "American Journal of Science," and other similar journals. Among his most important publications are the following: "Primary Groups of Batrachian Anura" (1865); "Systematic Arrangement of the Lacertilia and Ophidia" and of the Class "Reptilia" (1854–70); "Systematic Relations of the Fishes" (1871)—the two former based on a careful examination of the specimens in all the principal museums of Europe; the last on the unequalled collection made by Professor Hyrtl of Vienna (now in the possession of Professor Cope)—"On the Origin of Genera" (1868); "Synopsis of the Extinct Batrachian Reptilia and Aves of North America" (1869–70); "On the Hypothesis of Evolution, Physical and Metaphysical" (1870); "Extinct Reptilia and Fishes of the Cretaceous Beds of Kansas" (1872); "Systematic Relations of the Tailed Batrachia" (1872), based on Doctor Baird's admirable preparations (the finest ever made in that department); and a work entitled "The Extinct Vertebrata of the Eocene Formations of Wyoming" (1873), describing many of the most remarkable types of Mammalia ever discovered, being the oldest known from the tertiary formations.

Cope (Thomas Pym), a distinguished merchant of Philadelphia, born in Lancaster co., Pa., in 1768. He commenced business in Philadelphia in 1790, and in 1821 established the first line of packets between that city and Liverpool. To his energy Philadelphia was chiefly indebted for the supply of water from the Schuylkill and for the establishment of the Mercantile Library. He was a member of the Society of Friends. Died Nov. 22, 1854.

Copec', or **Copeck,** a Russian coin, said to be the first ever used in that country as currency. The copecs were originally made of silver, but copper copecs were afterwards coined. The value of the copec at present is equal to one one-hundredth part of a ruble.

Copeley, a township of Knox co., Ill. Pop. 1219.

Copenha'gen [Dan. *Kjöbenhavn, i. e.* "merchants' haven"], the capital of Denmark, is situated partly on the eastern coast of the island of Seeland and partly on the island of Amager. It is a seaport on the Sound, near its junction with the Baltic. Lat. 55° 40′ N., lon. 12° 34′ 7″ E. The site is flat, and very little elevated above the level of the sea. It was formerly a strong fortress, and the polygonal citadel on the north-eastern side of the city was deemed impregnable. But that was one hundred years ago. Now the walls are cut through and partially broken down; the ditches are filled, and where formerly stood a fortress, stands now a spacious, elegant promenade. In spite of its old age, Copenhagen is a thoroughly modern city, busy, gay, rapidly progressing in every respect. And in spite of its comparatively small size, it is a great city on account of the life led in it. Among its buildings must first be named Rosenberg, the "Castle of Roses," which, on account of the audacious but perfect harmony of its lines, belongs to first-class architecture. The royal palace, Christiansborg, is an immense but somewhat clumsy pile of buildings. The university and the royal theatre, not yet finished, are very fine buildings; also the metropolitan church called Frue Kirke; St. Peter's, or the German church, with a spire 250 feet high; and the church of the Saviour, with a spire of 288 feet. The University of Copenhagen, founded in 1478, is well endowed, has nearly forty professors, about 900 students, and a library of about 125,000 volumes. A museum for natural objects has just been erected, and is one of the most elegant buildings in Scandinavia. Connected with it are two observatories and a botanic garden. Here is a royal library containing 400,000

volumes, besides 15,000 manuscripts. This city is the great centre of Northern literature and art, and has several museums and collections of antiquities. The Museum of Northern Antiquities is unique, and so is Thorwaldsen's Museum, a mausoleum consisting of four buildings, in the middle of which Thorwaldsen is buried under a rosebush, while all his works are exhibited in the halls around it. The city has a deep, spacious, and secure harbor, formed by the channel between the islands of Seeland and Amager. Here is the great naval station of Denmark. Copenhagen has some manufactures of woollen and linen cloths, porcelain, sail-cloth, watches, leather, etc. Steam-packets ply regularly between this place and the ports of the Baltic. This site was occupied by a small village when Bishop Absalon founded a town here in 1168, and erected a fort. It became the capital of Denmark in 1443. It was most horribly bombarded, during three days, by the British fleet (1807), and suffered great damage. Pop. in 1860, 155,143; in 1870, 181,291.

Copenhagen, a post-village of Denmark township, Lewis co., N. Y., on Deer River, has three churches and a number of manufactories. Pop. 575.

Coper'nican Sys'tem, The, is that astronomical theory which represents the sun to be in the centre, and the earth and planets to move round it. The name is derived from Copernicus, who, though not the first suggester of the theory, contributed far more than any other astronomer to make it popular. The merit of having first formed the general idea of the system is believed to be due to Pythagoras; Copernicus, after the lapse of centuries, again drew attention to it, and greatly increased the probability of its truth by his calculations and arguments; the glory of having matured the idea belongs to Kepler, Galileo, and others, and especially to Newton, who, through the discovery of the law of gravitation, completely demonstrated its truth. Many who reverence the name of Copernicus in connection with this system would be surprised to find, on perusing his work "De Orbium Revolutionibus," how much of error, unsound reasoning, and happy conjecture combined to secure for him the association of his name with that system the complete development of which may be considered as the most wonderful achievement of astronomical science.

Coper'nicus, the Latinized form of **Kopernigk** (Nicolas), a celebrated astronomer, was born at Thorn, in Poland, Feb. 19 (O. S.), 1473. His father, a German merchant from Cracow, died early, leaving his children in the care of Lucas Watzelrode, their maternal uncle, who became bishop of Ermeland in 1489. Nicolas studied in the high school of his town, and then in the University of Cracow. He applied himself eagerly to mathematics under Albert Brudzevski for four years, and then went to Italy, visiting first Bologna, where Dominico Maria taught astronomy, and afterwards Padua, where he became doctor of medicine in 1499. He became intimate with Regiomontanus. Through his uncle he was appointed canon in Frauenburg, 1499. He remained in Italy until 1503, and was professor of mathematics at Rome in 1501. He then entered upon his office of canon, and is found (1517–19) entrusted with the conduct of the episcopal possessions in Allenstein, and on other occasions ably conducting the cathedral's concerns. He never refused the poor his advice and care as physician. His great discovery, that the planets move around the sun, he spent many years in observations and calculations in order to verify. He expounded it in his work "De Orbium Celestium Revolutionibus," finished in 1530, but not published until 1543, from a fear of persecution. He dedicated his book to the pope, and cautiously propounded his system as a mere hypothesis. According to tradition, he received the first copy of his book on the day that he died. It was published in Nuremberg (1543), in Bâle (1566), and in Amsterdam (1617). His theory was rejected not only by the clergy, but by astronomers. "The whole weight of Aristotle's name," says Hallam, "which in the sixteenth century not only biassed the judgment, but engaged the passions, connected as it was with general orthodoxy and preservation of established systems, was thrown into the scale against Copernicus. It must be confessed that the strongest presumptions in favor of his system were not discovered by himself. One of the most remarkable passages in Copernicus is his conjecture that gravitation is not a central tendency, but an attraction common to matter, and probably extending to the heavenly bodies." Died June 11, 1543. (See Gassendi, "Vita Copernici," 1654; Westphal, "N. Copernicus," 1822; D. F. Arago, "Éloge de Copernic;" L. Prowe, "Zur Biographie von N. Copernicus," 1853.)

Copi'ah, a county in the S. W. of Mississippi. Area, 700 square miles. It is bounded on the E. by Pearl River and drained by Bayou Pierre. The soil is productive and adapted to cotton. Corn, rice, wool, and cattle are also raised. Lumber is largely produced. It is intersected by the New Orleans Jackson and Great Northern R. R. Capital, Gallatin. Pop. 20,608.

Copia'po, or **San Francisco de Sel'va,** a town of Chili, capital of the province of Atacama, is on the river Copaipo, 30 miles from its mouth. It is connected with Caldera by a railway. Mines of gold, silver, and other metals occur in the vicinity. Earthquakes are here of frequent occurrence, and have sometimes caused great damage. Pop. 13,381.

Copio'ma, a township of Nemaha co., Kan. Pop. 424.

Cop'land (James), M. D., F. R. S., a Scottish physician and writer, born at Deerness, in the Orkneys, in 1793. He settled in London in 1821. His most important work is a "Dictionary of Practical Medicine" (3 vols., 1833–58). Died July 12, 1870.

Co'ple, a township of Westmoreland co., Va. Pop. 3353.

Cop'ley, a post-village of North Whitehall township, Lehigh co., Pa. Pop. 728.

Copley, a township and post-village of Summit co., O. Pop. 1233.

Copley (John Singleton), an historical and portrait painter, born in Boston, Mass., July 3, 1737. He visited Italy in 1774, settled in London in 1776, and became a member of the Royal Academy in 1783. "The Death of Lord Chatham" is called his masterpiece. Died Sept. 25, 1815. His son became Lord Lyndhurst and chancellor of England. Copley's portraits are among the few significant art-memorials of the past in this country. The possession of one of them, it has been said, is an American's best title of nobility. He was the only native painter of real skill which the New World could boast prior to the Revolution. The heads of leading families, especially in New England, sat to him, and the prices he commanded and the fame he reached were remarkable for the period. His chief defect was in his coloring, but he had the hand of a master. His knowledge was acquired under great disadvantages. Till he was thirty years old he never saw a good picture, yet his portraits are prized as heirlooms. They have a life which only genius could impart. O. B. Frothingham.

Coppée (Henry), LL.D., an American officer and author, born Oct. 15, 1821, at Savannah, Ga., graduated at West Point 1845, was lieutenant of artillery till he resigned, June 30, 1855. He served in the war with Mexico 1846–48, engaged at Vera Cruz, Cerro Gordo, La Hoya, Contreras, and Churubusco (brevet captain), Chapultepec, and the city of Mexico, and as assistant professor at the Military Academy 1848–49, 1850–55. Professor of English literature and history in the University of Pennsylvania 1855–56; author of "Elements of Logic," 1858, and of "Rhetoric," 1859, of "Grant and his Campaigns," 1866, and of several military works, 1858–73; editor of a "Gallery of Famous Poets," 1858, of "Distinguished Poetesses," 1861, and of the "United Service Magazine," 1864–66; contributor to the principal reviews and magazines of the U. S., 1848–73; compiler of "Songs of Praise in the Christian Centuries," 1866, and president of Lehigh University, Bethlehem, Pa., since 1866.
George W. Cullum, *U. S. Army.*

Cop'per [Lat. *cuprum;* Ger. *Kupfer;* Fr. *cuivre*], an elementary metallic substance, was known at a very early period. Before iron was used it was the principal ingredient in domestic utensils and weapons of war. The Romans obtained the best copper from the island of Cyprus, whence its Latin name, *cuprum,* was derived. Copper is distinguished from all other metals by its peculiar reddish color. It is very ductile and malleable, and requires a temperature somewhat lower than gold, but higher than silver (estimated above 2000° F.), for its fusion. Next to silver, it is the best known conductor of electricity, being in the pure state 93.08, while silver is 100. The specific gravity of copper is between 8.91 and 8.95; atomic weight, 63.5; its symbol is Cu. It is very hard, elastic, and tough, with a tenacity only less than that of iron. It crystallizes in the regular system, forming cubes, octahedrons, etc. The principal ores of copper, besides the native metal, are the sulphides of copper, either alone or combined with other metals, such as copper glance (Cu_2S), indigo copper (CuS), copper pyrites (Cu_2S,Fe_2S_3), variegated copper ore ($3Cu_2S,Fe_2S_3$); Fahl ores, containing admixtures of sulphides of copper, iron, zinc, silver, mercury, etc.; enargite, containing sulphides of copper and arsenic; oxidized copper ores, such as red copper (Cu_2O) and black oxide of copper; and copper salts, such as malachite (which is carbonate of copper), silicate of copper, dioptase, chloride of copper, atacamite, phosphate of copper, and arseniate of copper. All these ores contain copper; it is found also in small quantities in

most soils, in seaweed, and in the animal body. Copper forms two oxides, the protoxide (CuO) and the suboxide (Cu_2O); the former is found native in dark steel-gray crystals, with a specific gravity of 5.9; the latter occurs in red, translucent crystals having a specific gravity of 5.8; prepared artificially, it forms a beautiful crimson powder. Protochloride of copper is brown in the anhydrous state, and green when hydrated; it is very soluble in water. There are several sulphides of copper, the principal being the protosulphide and the disulphide, corresponding in composition to the two oxides. They are both found native, and are worked as copper ores. The carbonate of copper is sold as a pigment under the name of blue verditer, and from the subchloride of copper Brunswick green is obtained. The blue and green verdigris of commerce are made by the action of acetic acid upon oxide of copper. The blue vitriol so extensively used in dyeing and calico-printing is sulphate of copper. The smelting of copper is not a complicated process when ores are used which do not contain sulphur, but when the latter is present the operation is very tedious and difficult. The alloys of copper are of great value. Brass is copper alloyed with from 28 to 34 per cent. of zinc; gun-metal consists of 90 parts of copper and 10 of tin; bell and speculum metals contain a larger proportion of tin. Bronze is sometimes made of 91 parts of copper, 2 parts of tin, 6 parts of zinc, and 1 part of lead. Copper is found in Great Britain, Australia, South America, and Cuba. It exists in great quantities on the shores of Lake Superior, where a mass of native copper was found weighing nearly 500 tons. Metallic copper is of very great value in the arts, being especially valuable for ships' sheathing and bolts, and is also the material used in the manufacture of a great variety of wares.

Cop'peras, the commercial name of the hydrated protosulphate of iron, sometimes called "green vitriol." It is composed of 28.9 per cent. of sulphuric acid, 25.7 of protoxide of iron, and 45.4 of water. It is used in medicine, in the dyeing of black, and in the manufacture of ink.

Copper Creek, a twp. of Russell co., Va. Pop. 1339.

Copper Falls Mine, a post-village of Eagle Harbor township, Keweenaw co., Mich. Pop. 454.

Copper Harbor, a post-township of Keweenaw co., Mich., on Keweenaw Point, Lake Superior. It has extensive mines of copper, and a good harbor, which is, however, difficult of approach. Pop. 359.

Cop'perhead (*Ancistrodon contortrix*), a venomous serpent of the rattlesnake family, furnished with loral plates on the head, but without rattles. When full grown it is about three feet long, of a light copper color, with darker transverse bars. It has many local names, is nowhere abundant, but is more common in the Southern than in the Northern States. Its bite is much dreaded and often fatal.

Copperhead, a name which was applied to a party in the Northern States of America supposed to favor the secessionists during the civil war which divided the U. S. from 1861 to 1865. The epithet was given because this party was regarded as an insidious and secret foe to the Union.

Copper-Mines. See MINES AND MINING, by PROF. F. L. VINTON, E. M.

Copperop'olis, a post-village of Calaveras co., Cal., 36 miles E. by N. from Stockton. Here is the Union copper-mine, one of the richest in the State. Gold also is found in the vicinity. It is on the Stockton and Copperopolis R.R.

Copper-Smelting. See METALLURGY, by PROF. J. A. CHURCH, E. M.

Copp's Creek, a township of Barry co., Mo. P. 984.

Cop'rolite [from the Gr. *κόπρος*, "dung," and *λίθος*, a "stone"], a name given to the fossil excrement of animals. It was originally applied by Dr. Buckland to certain deposits which he found in the lias, and determined to be the fecal remains of the gigantic saurians of that period. The term has since come into universal use, owing to the discovery of similar large deposits in rocks of various ages. The true coprolites of the lias are formed like kidney potatoes, of earthy texture, black or ash-gray color, and glassy fracture. They are twisted, showing the mark of the intestine. They are generally found in heaps in particular parts of the deposit. Besides the coprolites of the lias, phosphatic nodules bearing the same name, but far more abundant, have been found. The value of these minerals is derived from the phosphate of lime of which they are partly composed. It is used with great advantage as mineral manure, after having undergone cheap chemical treatment. It is converted into a soluble superphosphate by the action of sulphuric acid. The trade in Great Britain is of great importance, and the production large. Some specimens yield when washed and powdered over 85 per cent. of phosphates. The greensand varieties yield about 60 per cent. of phosphates. The annual yield of England is from 30,000 to 40,000 tons. These coprolites contain from 4 to 5 per cent. of organic matter and a little silica, but from 70 to 80 per cent. of their whole substance is a mixed phosphate and carbonate of lime. Coprolites are not very abundant in the U. S.

Copse, or Cop'pice [from the root of the word *chop*, and the Gr. *κόπτω*, to "cut"], a name given in Great Britain to plantations of trees which are occasionally cut down for firewood, charcoal, or other purposes. There is considerable rough and rocky land in that country which yields more profit as copse-wood than by any other plan. Hop-poles, hoops, tanner's bark, etc. are among the products of copses.

Copt [Arabic, *Ghipt* and *Koobt*; Coptic, *Kibt*; Fr. *Copte* or *Cophte*; Ger. *Kopt*; probably derived from the root of the last syllable of *Egypt*.] The Copts are a Christian people of Egypt, descended from the ancient inhabitants of that country, whose blood, however, is mingled with that of Greeks, Arabs, Nubians, etc. According to an official estimate in 1868–69 they then numbered 500,000. They are largely employed as clerks and government functionaries, while others are merchants and mechanics, and some are peasants. All Copts but the very poorest class have the title of *moallim* ("instructors").

The Coptic Church is monophysite, holds seven sacraments, of which prayer and faith are two, practises trine immersion of infants, and also circumcises male children. The liturgy is in the Coptic language, which few even of the priests understand. Rosaries of beads are used in prayer. Cymbals are employed in public worship. This Church, with that of Abyssinia, is under the Coptic patriarch of Alexandria, who, however, since the eleventh century, has resided in Cairo. It has also thirteen dioceses, one of which, Khartum (embracing all Nubia), was established in 1834. The Copts are extremely intolerant towards Christians of other churches, except the Syrian Jacobites and the Abyssinians.

Besides the above are the United Copts, who are Roman Catholics of the Eastern rite. They are nominally under the patriarch of Alexandria, who resides at Rome and is of the Latin rite. They are governed by a vicar-apostolic, and number about 13,000.

The Greek Copts (Coptic Melchites) are under a patriarch of Alexandria and four nominal bishops. They are few in numbers. Their patriarch bears the title of "Holy and blessed patriarch of the great city of Alexandria, of all Egypt, of Pentapolis, Libya, and Ethiopia, pope and œcumenical judge." That of the Coptic patriarch is "Most holy father, archbishop of the great city of Alexandria, of Babylon, of the Nomes of Egypt, and the Thebaid."

The American Presbyterian mission among the Copts has met with much success.

Cop'tic, a language supposed to be derived from the sacred language of ancient Egypt, with a pretty large admixture of Greek, and in its later form of Arabic words. It prevailed from the time of the Ptolemies till about the tenth century, when it was generally displaced by the Arabic, except in the monasteries. It had three chief dialects, the Memphitic, the Sahidic, and the Bashmuric. The Coptic literature consists to a great extent of homilies, the lives of saints, etc., with some Gnostic works and versions of the Scriptures.

The Coptic letters are chiefly taken from the Greek, though they have added to the Greek alphabet a number of characters representing sounds not found in the classic languages; among these may be mentioned one for *kh*, one for *sh*, and one for *j*. (Those seeking further information on this subject are referred to the Egyptian grammar of the celebrated Champollion, and Peyron's and Benfey's grammars of the Coptic language; to which may be added Quatremère's "Critical and Historical Researches on the Language and Literature of Egypt," 1808.)

Cop'ula [a Latin word signifying a "band"], in logic, is that part of a proposition which affirms or denies the predicate of the subject, or the word which unites the two notions of a sentence—viz. the subject and the predicate. In the sentence, "Art is long," *is* forms the copula.

Cop'way (GEORGE), a chief of the Chippeway tribe of Indians, published the "Acts of the Apostles" (in 1838), an autobiography, a "History of the Ojibway Nation" (1851), and other works.

Cop'y [probably from the Lat. *copia*, "plenty," "abundance," because by multiplying copies of it a work ceases to be a rarity], in the fine arts, a transcript of an original work, a reproduction of a picture or statue by another artist. A copy made by the original artist is called a duplicate, replica, or repetition; in French, a *doublette*. A copy of a statue or other piece of sculpture taken from a mould is called a *cast*.

COPY, in printing, is the subject-matter to be printed, whether it be an original work in manuscript or reprint; in

the first case it is termed *manuscript copy* or written copy; in the second, *printed copy*.

Copyright. See LITERARY PROPERTY, by PROF. T. W. DWIGHT, LL.D.

Coqua'go, the main branch of the Delaware River, rises in the Catskill Mountains in New York. It flows first south-westward, and then south-eastward, until it unites with the Popacton at Hancock, on the line between New York and Pennsylvania. Length, nearly 100 miles.

Coquerel (ATHANASE LAURENT CHARLES), a Protestant minister, born in Paris Aug. 27, 1795. He preached in Paris, and gained distinction as a pulpit orator. In 1848 he was a moderate republican member of the Constituent Assembly. Among his works is "Modern Orthodoxy" (1842) and many volumes of sermons. He was liberal in theology. Died Jan. 12, 1868.—His son ATHANASE became an eminent Protestant pulpit orator, and the leader of the liberal party that seceded when a schism occurred in the Protestant synod in June, 1872. D. July, 1875.

Coquil'la-Nuts [Sp. *coquillo*, a diminutive of *coco*, "cocoa-nut"], the seeds of *Attalea funifera*, a South American palm. The shells of the seeds or nuts are hard, have a close texture, and are susceptible of a fine polish. This shell is much used in turnery for the heads or handles of umbrellas, for toys and ornamental articles.

Coquim'bo, a province of Chili, is bounded on the E. by the Andes and on the W. by the Pacific Ocean. Area, 19,113 square miles. It contains mines of copper and other metals. Capital, Coquimbo. Pop. in 1870, 159,698.

Coquimbo, or **La Serena,** a seaport-town of Chili, capital of the above province, is on the Coquimbo River near its mouth. It has a good harbor, six or seven miles distant, brick houses with gardens, and a serene climate. Copper, gold, and silver are exported from it. Pop. 7138.

Co'ra, an ancient city of Italy, in Latium, about 36 miles S. E. of Rome. Livy mentions it as being a *colonia Latina* in 503 B. C. Few cities of Latium have more considerable remains of antiquity than Cora. Here are relics of ancient walls built of massive polygonal blocks. The site is now occupied by the town of *Cori*.

Cor'acoid Bone [from the Gr. κόραξ, a "crow," and εἶδος, "form," "resemblance," referring to some fancied resemblance between the coracoid process and a crow's beak], a bone which exists in the skeleton of most birds, of the saurians and chelonians, and also in monotrematous mammals. In the higher mammals it exists as the *coracoid process* of the scapula or shoulder-blade. In transcendental anatomy it has been considered as the hæmapophysis of the fourth (occipital) cephalic vertebra. In birds the coracoid bone is firmly articulated with the sternum on the one side and the scapula on the other, and gives attachment to certain muscles used in flying.

Coracoid Process. See CORACOID BONE.

Cor'al [Gr. κοράλλιον, said by some to be derived from κόρη, a "maiden," and ἅλς, the "sea," *i. e.* "daughter of the sea;" Lat. *corallum;* Fr. *corail;* Ger. *Koralle*], a hard, stony, or calcareous substance, chiefly of marine origin, consisting of the aggregate skeletons of various polyps (alcyonarians, actinarians, and madrepores), and of certain tabulate acalephs, all belonging to the Cuvierian subkingdom Radiata.* The number of species is very great, and the variety of forms and hues is almost endless. Many of them rival in beauty the finest flowers. Carbonate of lime constitutes their principal chemical ingredient. Many kinds are found along the American coasts of the Atlantic and Pacific, especially about the West Indies and Florida (which, with its reefs, is based upon coral), and along parts of the coast of Brazil, where the reefs are very dangerous to navigation; but it is in the Pacific and Indian oceans that the coral formation is most important. Among the more remarkable kinds may be mentioned the red coral (*Corallium rubrum*) of the Mediterranean and Red Sea, which is of value in the manufacture of ornaments; the still more valuable black coral (*Antipathes*); the *Millepora*, etc. (produced by acalephs, and not by polyps); the tree corals; the Meandrinæ, etc., called brain corals, the Astræas or star corals, the Madrepores, and many others.

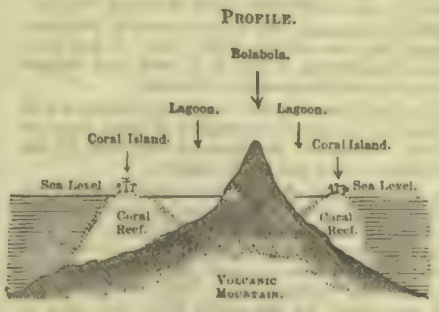
Red Coral.

Cor'al, a township and post-village of McHenry co., Ill. Pop. of township, 1345.

Coral Islands are among the most striking phenomena of the tropical seas. Whitsunday Island, in the Low Archipelago in the midst of the Pacific, may serve as an example. Rising a few feet above the surface of the ocean, it forms a narrow unbroken ring, nearly circular, which surrounds a central lagoon of shallow water. When approaching it from the windward side, the voyager first perceives the line of angry surf breaking on the white beach of coral sand, in strong contrast with the deep-blue color of the sea. Behind, a garland of luxuriant verdure, its tropical forms enhanced by the noble cocoa-nut palm, extends around the island, enclosing the quiet waters of the lagoon; beyond, the broad ocean again. The island of Natupe, in the same archipelago, is likewise unbroken, but elongated and much larger, the longer axis measuring some twelve miles. Usually, however, the ring is broken by numerous channels, affording entrances into the lagoon, and transforming the ring into a circular line of islands enclosing the lagoon. Such a group is called an *atoll*, a local name in the East Indies, which has been adopted to designate these curious structures. Soundings have proved that the lagoon is always shallow, seldom exceeding a few scores or hundreds of feet in depth, while outside of the atoll the depth rapidly increases to thousands of feet at a short distance from the shore, showing that such an atoll is only the top of a large submarine mountain. Atolls are often clustered together in great numbers, and form archipelagoes. That of Paumotu, or Low Archipelago, counts eighty coral islands, having nearly all central lagoons. The Caroline (together with the Tarawan and Marshall) Islands contain eighty-four atolls. The Laccadives and Maldives are two long series of atolls, in a double row, stretching 800 miles from north to south, from the south-western extremity of India, and continued still farther south in the Chagos Archipelago. The chief of the Maldives calls himself the sultan of the Twelve Thousand Isles, and Admiral Owen says that, counting the single islands in the atolls, this is no exaggeration.

The low islands are associated with the high in a peculiar and very interesting way. A large number of volcanic islands in the Pacific are girdled by coral reef, forming either a fringe near the shore or a barrier around the island at a distance in the sea, leaving between a lagoon often miles broad, and communicating with the outer ocean by deep channels. Bolabola, one of the Society Islands, offers a beautiful example of such a combination. From its high volcanic top the eye, stretching over the quiet waters of the surrounding lagoon to the outer garland of green islands which separates it from the ocean beyond, beholds a spectacle as strange as it is lovely. Tahiti, in the same group, Hogoleu and Pouinipete Islands in the Carolines, and many others, show the same arrangement, which, in fact, differs from an atoll only in having the centre of the lagoon occupied by one or more mountain-tops.

The mode of formation of the coral islands readily explains all these peculiarities. Coral reefs are the work of minute marine animals called polyps which live in countless numbers in the tropical seas. Their structure is of the simplest kind. It is a cylindrical skin with an inside sac, the stomach, and a central opening surrounded by thread-like appendages on the top, which is the mouth, the lower end being attached to the ground. When expanded the animal resembles a flower in form and beauty of color. Between the two skins the coral substance, which is limestone, is secreted, as are the bones in the higher animals. Polyps multiply not only by eggs, but also by budding, like plants, and grow into large societies, in which generation succeeds generation, each leaving behind the solid limestone secreted by the living animal. Thus masses of organized rock are formed, which gradually expand and accumulate upward into a solid wall or reef, reaching the level of low tide. Soon, however, the process of disintegration begins. The more brittle branching corals which abound near the surface are easily broken and crushed by animals feeding on them. Boring shells and small sponges penetrate the solid reef and disintegrate it. Tidal currents and surging waves do their part in the work of destruction, and taking hold of these débris and of the coral sand, throw them on the top of the reef, thus forming the soil of an island which rises to eight or ten feet above the water, but rarely reaches fifteen feet.



Seeds of a few plants which from their hardy nature

* Nothing could be more incorrect than the name "coral insects" often applied to these animals; and it is scarcely correct to speak of them as "builders" of reefs and islands; for instead of working, like the bee in building her cells of wax, the coral is a part of the growth of the polyp, which the latter no more builds than the oak tree builds its own wood. It is also incorrect to speak of the coral as the "home" of these little animals, for the coral is wholly produced inside the polyp, somewhat as bones grow in the higher animals.

escape being spoiled by sea-water are transported by the waves and washed on the shore, or are brought by birds, and under the influence of the warm and moist climate soon grow into a luxuriant vegetation. Variety, however, is wanting, as hardly more than a score of species compose the whole flora. Pandanus trees, and especially the majestic cocoa-nut palms, are the most characteristic ornaments as well as the most useful representatives of the vegetable kingdom in the coral islands.

Bolabola, with Barrier, Reef, Lagoon, and Coral Islands.

But all the conditions necessary for the formation of such an island do not exist in every part of the reef. Some portions remain covered by a shallow sea, which breaks in long, white lines over the invisible barrier. In others the reef is interrupted by deep channels, due to strong tidal currents or to the depth of the sea, which deprives the animals of a proper foundation for their structure, for it has been ascertained that the reef-building polyps cannot live in a depth greater than 100 or 120 feet. The coral reefs, therefore, cannot start from deep water; they need a foundation near the surface, and they find it in submarine mountain-peaks and volcanic cones which form most of the high islands. Growing upward, they repeat at the surface the outlines of the mountain-slopes on which they rest. To this cause the circular form of the atolls and barrier reefs is to be ascribed, and not to any organic law or instinct of the polyps, as was formerly believed, or to their situation on the brim of subaqueous craters.

The formation of the fringing reefs offers no difficulty; but it is not easy to understand why the barrier reefs are so far removed from the islands they surround. This fact, however, has been satisfactorily explained by Darwin. Having found by soundings that the base of the barrier reefs reaches sometimes as low as a thousand or fifteen hundred feet, while it is known that the polyps cannot live at such a depth, he justly infers that the mountains on which they stand have gradually sunk since the structure was begun. During the sinking process the reef, growing perpendicularly to the water's edge, preserves its form and extent, while the island is growing smaller and the surrounding lagoon larger at every step. Finally, the mountain disappearing, the growing reef becomes an atoll with an empty lagoon. Dana's extensive observations entirely confirm this view.

However full of interest and strange beauty the coral islands may be, they offer but scanty resources for man's support. They are still more deficient in means for the higher culture which is the true end of man's existence. With only one kind of rock and no metal for tools; a land without mountains, valleys, or rivers, the arable portion of which is hardly the hundredth part of its area; with a flora reduced to a few species, a fauna wanting in all large animals,—man in that isolated domain, depending for food upon the cocoa-nut and the animals of the sea, has indeed but a poor chance. Starvation, but too frequent, engenders infanticide, war, and cannibalism—evils which intercourse with civilized nations can partially prevent, but Christianity alone radically cure. Arnold Guyot.

Cor'alline [so called from their resemblance to the corals, to which they were formerly referred], the name of certain plants classed with the red algæ, and usually referred to the order Corallinaceæ. They constitute the genus *Corallina*, and several other genera. These plants differ from all others in being of a rigid, stony character, and from the presence (in most species) of a large proportion of carbonate of lime. They are not abundant on our Atlantic coasts, but probably are of much more frequent occurrence in the Pacific. Their fructification and botanical characters are not well known. They occur abundantly as fossils. The *Corallina officinalis* is common on the northern shores of Europe, and also occurs on the Atlantic coast of British America and the U. S. The name coralline is often given to various marine polyps, but should be restricted to coral-like plants.

Cora'to, a town of Italy, in the province of Bari, 24 miles W. of Bari, is situated in a fertile plain. It has a fine church, several convents, and an orphan asylum. Pop. in 1871, 26,220.

Coray, or **Koray** (Diamant), [Gr. Ἀδαμάντιος Κοραῆς], a Greek philologist and patriot, born at Smyrna April 7, 1748. He studied medicine at Montpellier, in France, and became a resident of Paris in 1788. To promote the regeneration of Greece and the revival of the Greek nationality, he published editions of ancient Greek authors and wrote several political tracts. He was eminent as a Hellenist. Died April 6, 1833.

Corbaux (Fanny), an English painter and author, born in 1812, the daughter of a well-known statistician. She painted portraits and historical pieces with success, and wrote on Hebrew archæology.

Corbeil, a town of France, department of Seine-et-Oise, on the river Seine and on a branch of the Paris and Orleans Railway, 18 miles S. S. E. of Paris. It has a public library, a theatre, and a corn-hall. It sends flour to Paris. Pop. 5541.

Cor'bel [from the Fr. *corbeille*, a "basket;" Fr. *corbeau*], in architecture, a projecting bracket, often sculptured like a modillion, sometimes in the form of a basket, for the purpose of supporting a superincumbent object or for receiving the springing of an arch. A corbel-table is a projecting battlement, parapet, or cornice resting on a series of corbels.

Cor'bin (Thomas G.), U. S. N., born Aug. 13, 1820, in Virginia, became a passed midshipman in 1844, a lieutenant in 1852, a commander in 1862, and a captain in 1866. He served as executive officer of the steam-frigate Wabash at the battle of Port Royal, Nov. 7, 1861, and is thus honorably mentioned by Flag-Officer Dupont in his official report of that battle: "I had also an opportunity to remark the admirable coolness and discrimination of the first lieutenant, T. G. Corbin. The good order, discipline, and efficiency, in every respect, of this ship are, to a great extent, the results of his labors as executive officer, and they were conspicuous on this occasion." Referring to the same action, Commander C. R. P. Rodgers writes: "It remains only for me to speak of the executive officer, Lieutenant Corbin, who has filled that post since the Wabash was commissioned. The admirable training of the crew may, in a high degree, be attributed to his professional merit; and his gallant bearing and conspicuous conduct throughout the whole action were good illustrations of the best type of a sea-officer."

Foxhall A. Parker, U. S. N.

Cor'bulo (Cn. Domitius), an able Roman general who flourished under Claudius and Nero. He commanded the Roman army in a war against the Parthians, whom he defeated. Nero, who was jealous of him, ordered him to be put to death in 67 A. D.

Cor'coran, a post-township of Hennepin co., Minn. Pop. 914.

Corcoran (Michael), a brigadier-general of U. S. volunteers, born in Carrowkeel, Ireland, Sept. 21, 1827, died Dec. 22, 1863. He emigrated to this country in 1849, and settled in New York City. At the commencement of the civil war he departed for Washington with his regiment,

the Sixty-ninth New York, and participated in the first battle of Bull Run, where he was taken prisoner and confined at Richmond, Va., and Charleston, S. C., nearly a year. On being exchanged he organized the Corcoran Legion, and was made a brigadier-general of volunteers, to date from the day of his capture, July 21, 1861. He was thrown from his horse near Fairfax Court-house, Va., Dec. 22, 1863, and fatally injured, never again recovering consciousness. G. C. Simmons, *Clerk Board of Eng'rs.*

Corcy'ra [Gr. Κόρκυρα], the ancient name of an island in the Ionian Sea, now Corfù (which see). It was colonized by the Corinthians in 734 B. C., and soon became one of the chief maritime powers of Greece.

Cord [so called because it was originally measured with a cord or line] (of wood) is a quantity of wood equal to 128 cubic feet. Firewood is measured and sold by the cord; also tanners' bark and stable manure.

Corday d'Armans, de (Marie Anne Charlotte), born in Normandy in 1768, and educated in a convent, was pious, intellectual, and enthusiastic. Her features were beautiful and her deportment dignified. She favored the popular cause in the Revolution, and sympathized with the Girondists, who were proscribed in May, 1793. Having resolved to kill Marat for the public good, she came to Paris, and with much difficulty obtained admission to his house. She found him in a bath, and plunged a knife into his heart July 13, 1793. She was guillotined a few days after this event. "In beholding her act of assassination," says Lamartine, "history dares not applaud; nor yet, while contemplating her sublime self-devotion, can it stigmatize or condemn." (See Chéron de Villiers, "M. A. Charlotte de Corday d'Armans, sa Vie, etc.," 1865.)

Cordeliers', or **Cord-wear'ers** [from Old French *cordel*, a "cord" or "rope," so called from their girdles of knotted cord], a minor order of Franciscan or Gray Friars, was founded by Saint Francis of Assisi in 1223, and was sanctioned by Pope Honorius III.

Cordeliers' Club, a society of republicans formed at Paris in Dec., 1790, received this name because their meetings were held in a chapel which had been built by the Cordeliers. Danton was the first president, and among the more celebrated members were Marat, Camille Desmoulins, and Hébert. The Cordeliers clamored for the death of the king in 1793, and in conjunction with the Jacobins conspired for the overthrow of the Girondists in the same year. The society was dissolved in 1794.

Cordia'ceæ, a natural order of exogenous trees and shrubs, mostly natives of tropical countries. They have a drupaceous fruit, an inverted embryo, and plaited cotyledons. They are generally referred to the Boraginaceæ. The order comprises several species of *Cordia*, one of which produces the sebesten plum. The *Cordia bullata* grows in Florida, and is cultivated as an ornamental tree. This genus takes its name from Cordus, a German botanist (1515–44).

Cordille'ra, a Spanish word signifying a "mountain-chain." (See Andes, by Prof. A. J. Schem.)

Cor'don, a word of French origin signifying a string, a line, or band, applied in fortification to the coping of the escarpment or inner wall of the ditch. It usually projects one foot over the masonry of the scarp. A line of troops placed round a town or tract so as to prevent ingress and egress is also called a cordon.

Cór'dova, a province of Spain, is bounded on the N. by Badajos and Ciudad Real, on the E. by Jaen, on the S. by Malaga, and on the S. W. and W. by Seville. It is intersected by the Guadalquivir. The surface in some parts is mountainous. Area, 5189 square miles. Capital, Córdova. Pop. 379,464.

Cordova [Span. *Cordoba*, or *Cordova;* anc. *Colonia Patricia*], a city of Spain, capital of the province of its own name, is situated in a plain on the river Guadalquivir, 71 miles N. E. of Seville, with which it is connected by a railway. The river is here crossed by a noble stone bridge of sixteen arches built by the Moors in the eighth century, and defended by a Saracenic castle. The cathedral, which was originally a beautiful Mohammedan mosque, founded in 786 A. D., presents in the interior a labyrinth of columns of many orders and materials, brought from various ancient temples. Cordova contains a bishop's palace, three colleges, a city-hall, and numerous hospitals. It was formerly noted for the preparation of goat leather, called *cordovan.** Here are manufactures of silk fabrics, paper, silver-ware, hats, etc. The ancient *Carduba*, sometimes called *Patricia*, built 152 B. C. by the Romans, was second only to Gades among the cities of Hispania, and the birthplace of the two Senecas, of the poet Lucan, and of the Arabic physician Averroes. This place was captured by the Moors in 672 A. D., after which it was for several centuries the splendid capital of the Western caliphs. In the tenth century it contained nearly a million inhabitants and 300 mosques. In 1236 it was taken and almost destroyed by Ferdinand III. of Castile. Pop. in 1860, 35,606.

Cordo'va, a township and post-village of Rock Island co., Ill. The village is on the Western Union R. R., 22 miles N. E. of Rock Island. Total pop. 935.

Cordova, a post-township of Le Sueur co., Minn. Pop. 539.

Cór'dova, a town of Mexico, about 50 miles W. S. W. of Vera Cruz. It is well built, and has an active trade in sugar, coffee, and tobacco; also manufactures of cotton and woollen fabrics. Pop. about 7000.

Córdova, a province of the Argentine Republic, is bounded on the N. by Santiago del Estero and Catamarca, on the E. by Santa Fé and by the territory of the Indians, and on the W. by Rioja and San Luis. It is traversed by the Sierra de Córdova, from which flows the principal river of the province, the Tercero, an affluent of the Paraná. The province is celebrated for its superior pastures. Area, 58,999 square miles. Capital, Cordova. Pop. in 1869, 210,508.

Córdova, capital of the above province, on the river Primero, 387 miles N. W. of Buenos Ayres. It has a fine Gothic cathedral and a university. Córdova exports hides and wool to Buenos Ayres. Pop. in 1869, 28,523.

Cor'dova (José), a South American general, born at Antioquía, in Colombia, in 1797. He served under Bolivar in 1820, and fought against the Spaniards at Ayacucho in 1824. Having revolted against Bolivar, he was defeated and killed Oct. 17, 1829.

Cordova, de (Fernando Fernandez), a Spanish general, born at Madrid in 1792. He was an opponent of Espartero in 1841, and became captain-general of Cuba in 1851. He was driven into exile by the revolution of July, 1854, and returned to Spain in 1856.

Core'a [native *Gaolee* or *Gauli;* Chinese *Kowlee;* Japanese *Koorai*], a kingdom tributary to China, is the peninsula situated S. of Manchooria, between 34° and 43° N. lat. Its area is 87,764 square miles, and population about 9,000,000. It is bounded on the N. by the rivers Ya-Loo and Tunmen, and the mountain Pe-Ten-Shan. Principal capital, Siool. The Hang-Kiang rises in the mountains and flows into the Yellow Sea. On the southern and western sides are numerous small islands. The climate on the eastern coast and among the mountains is inclement. In the lower parts of the western region and in the valleys of the southern provinces the climate is mild and the soil fertile, producing cotton, rice, fruit, wine, tobacco, etc. The sides of the mountains are rich in vegetation and covered with fine timber. The country abounds in gold, and iron is found in considerable quantities. Silver and copper also abound. The forests abound in wild-boars, tigers, sables, etc. The inhabitants are rude and warlike, and are feared as pirates. Polygamy is general, and a corrupt Booddhism is the prevailing religion. The language is Mongolian in its origin. In 1857 there were 15,200 who professed Catholicism, but the missionaries of that faith have suffered much persecution. The principal exports are cotton fabrics of excellent quality, ginseng, tiger-skins, oxen, etc. The government is virtually an absolute monarchy; the army is in an imperfect condition; the navy consists of twenty-one larger and ninety-two smaller ships of war. Corea is divided into eight provinces. The inner part of the country is but little known. Foreigners are not allowed to land in the country. In 1871 the U. S. sent an expedition against Corea to avenge the murder of the crew of a merchantman (the General Sherman). Fort Condé was bombarded, and taken with little loss on the side of the Americans.

Core'lla, a town of Spain, in Navarre, on the Alama, 13 miles W. of Tudela. It has several oil-mills and liquorice-factories. Pop. 5023.

Corel'li (Arcangelo), an Italian musician and composer, born near Imola Feb., 1653. He produced, besides other works, "Concerti Grossi" (1712). Died Jan. 18, 1713.

Coreop'sis [from the Gr. κόρις, a "bug," and ὄψις, "appearance"], a genus of herbaceous plants of the natural order Compositæ, is named with reference to the form of the fruit. It has neutral ray florets and a double involucre. Many species of this genus are natives of the U. S., and are popularly called tickseed. The *Coreopsis tinctoria* grows wild in the plains beyond the Mississippi, and is commonly cultivated in gardens for the beauty of its flowers, which are yellow with a brown-purple centre.

*From this word are derived the old English *cordwainer* and the French *cordonnier*, a "shoemaker."

Corfû, or **Korkyra,** one of the thirteen nomarchies into which the kingdom of Greece was in 1872 divided. It embraces the islands of Corfû, Paxo, Leucadia, and several smaller islands. Area, 427 square miles. Pop. in 1871, 96,940.

Corfû [an Italian corruption of Κορυφώ, the Byzantine name for the island, from the two "peaks" (*κορυφαί*) on which the citadel stands; modern Gr. Κορφοι; anc. *Corcyra*], one of the Ionian Islands, belonging since Mar. 29, 1864, to the kingdom of Greece, is separated from Albania by a channel which varies in breadth from two to twelve miles. It is 38 miles long, and has an area of 227 square miles. Pop. in 1871, 75,466. The surface is hilly and picturesque, the highest points being about 3000 feet above the sea. The soil is very fertile. Olive oil is the chief article of export. Capital, Corfû. The people of ancient Coreyra waged war against Corinth. A naval battle which occurred between these powers in 665 B. C. is mentioned by Thucydides as the first sea-fight on record. Coreyra was in alliance with the Athenians in the Peloponnesian war.

Corfû, a fortified seaport-town, capital of the above island, is on the E. coast, 10 miles S. W. of Butrinto; lat. 39° 37′ N., lon. 20° 6′ 2″ E. It has a safe and convenient harbor, and is defended by a citadel and two castles. It has a university founded in 1823, a cathedral, and numerous Greek and Roman Catholic churches, and a lighthouse. An archbishop of the Greek Church resides here. Corfû stands near the site of the ancient town of *Coreyra*. Pop. in 1871, 15,452.

Cor'fu, a post-village of Pembroke township, Genesee co., N. Y. It is a station on the New York Central R. R., 12 miles W. by S. of Batavia.

Coriglia'no, a town of Italy, in Cosenza, is 4 miles from the Gulf of Taranto and about 28 miles N. E. of Cosenza. It has a fine castle, and manufactures of woollen cloth and soap. It is near the site of the ancient *Sybaris*. Pop. 10,624.

Corin'na [Gr. Κόρινα], a celebrated Greek lyric poetess, born at Tanagra, in Bœotia, flourished about 500 B. C. She is said to have instructed Pindar in the art of poetry, and she was a successful competitor of that poet in five poetical contests. Only small fragments of her works are extant.

Corinna, a township and post-village of Penobscot co., Me. The village is on a branch of the Maine Central R. R., 20 miles S. of Dover. It has four churches, an academy, a library association, and manufactures of lumber, boots and shoes, etc. Total pop. 1513.

Corinna, a post-township of Wright co., Minn. P. 220.

Corinne, a city of Box Elder co., Ut., on the Central Pacific R. R., and on the W. bank of the navigable Bear River, 8 miles from its mouth and 80 miles N. of Salt Lake City. It has a large trade with Montana and Idaho, some manufactures, two banks, and one daily paper. The surrounding region is pastoral and agricultural. Pop. 783.

Cor'inth [Lat. *Corinthus;* Gr. Κόρινθος], an ancient and celebrated city of Greece, on the Isthmus of Corinth and near the *Sinus Corinthiacus* (Gulf of Lepanto), about 50 miles W. by S. from Athens. The isthmus is a sterile plain enclosed on several sides by mountains. It is subject to frequent earthquakes. Corinth commanded all the passes between the Peloponnesus and Northern Greece. It had a very favorable position for commerce, and seemed to be destined by nature to be a great maritime power. In consequence of its position it formed the most direct communication between the two principal Grecian seas—the Ionian and the Ægean—and became the emporium of the trade between the East and the West. It was one of the most populous cities of Greece. Its early history is obscure and mixed with fabulous legends. The family of the Bacchiadæ ruled here from 747 to 657 B. C. The Corinthians founded the colonies of Corcyra and Syracuse in 734 B. C. Periander, one of the Seven Wise Men of Greece, became tyrant (prince) of Corinth about 625 B. C., and reigned forty-four years. Soon after his death Corinth became an ally of Sparta, and was ruled by an oligarchy. The Corinthians were defeated by the Athenian general Myronides in 457 B. C. As the ally of Sparta, Corinth fought against Athens throughout the long Peloponnesian war (431–404 B. C.). In 395 B. C. Corinth united with other Greek states in a war against the Spartans, who defeated the allies in several battles. This war, called the Corinthian war, was ended by the peace of Antalcidas in 387 B. C., and Corinth then returned to the alliance with Sparta. Timophanes attempted to make himself tyrant of Corinth, but he was killed by his brother Timoleon in 344 B. C. The battle of Chæronea (338 B. C.) rendered Philip of Macedon master of Corinth, which was subject to his successors until it was annexed to the Achæan league in 243. At this period Corinth was the richest and most luxurious city of Greece, and abounded in statues, paintings, and other works of art. The patron-goddess of Corinth was Aphrodite (Venus), who had a splendid temple on the Acrocorinthus. The numerous fine temples which the wealth of the Corinthians enabled them to erect gave an impulse to architecture, and the most elaborate order of ancient architecture derived its name from Corinth, which was one of the principal seats of Grecian art, but produced no eminent poets or orators.

Having been captured by the Roman consul Mummius in 146 B. C., Corinth was pillaged by his army, and nearly destroyed by fire. The most valuable work of art were carried to Rome. It remained in ruins for a century, and was rebuilt in the year 46 by Julius Cæsar, who planted there a colony of his veterans and freedmen. It soon rose again to be a populous and prosperous city, which was called *Colonia Julia Corinthus*. Saint Paul preached here, and founded a Christian church, to which two of his Epistles were addressed. Pausanias, who visited it between 150 and 200 A. D., says that it contained many things worthy of notice, some being the relics of the ancient city, but the greater part executed in the flourishing period after it was rebuilt by Cæsar. The principal monument of antiquity now remaining here is the citadel, built on a hill called Acrocorinthus, which rises 1886 feet above the level of the sea, and is abrupt and isolated. The view from its summit is singularly magnificent, and comprehends a greater number of celebrated objects than any other in Greece. The Parthenon of Athens is distinctly seen at a distance of nearly fifty English miles. According to Col. Mure, "Neither the Acropolis of Athens nor the Larissa of Argos, nor any of the more celebrated mountain-fortresses of Western Europe can enter into the remotest competition with this gigantic citadel. It is one of those objects, more frequently perhaps to be met with in Greece than in any other country of Europe, of which no drawing can convey other than a very faint notion." Among the few relics of the Greek city are seven Doric columns of a temple standing on the western outskirts of the modern town. These are five feet ten inches in diameter. Lechæum, the port of Corinth, on the Sinus Corinthiacus, was nearly one mile and a half from the city. The site of Corinth is occupied by a small town which the natives call *Gortho*. It was severely injured by an earthquake in Feb., 1858. Pop. in 1861, 4248.

Corinth, a post-township of Penobscot co., Me. Pop. 1462.

Corinth, a post-village, capital of Alcorn co., Miss., is at the junction of the great lines of railroads connecting the Atlantic with the Mississippi and Gulf of Mexico, and the key of the system of Mississippi and Tennessee railroad communications. It has two weekly newspapers. P. 1512.

After the battle of Shiloh, April 6–7, 1862, the Confederate army retreated to Corinth. The national army being reorganized and strongly reinforced, Halleck, who had arrived and taken command, slowly advanced on Corinth by regular approaches, arriving May 21 to within 3 miles of the place, expecting to meet with an obstinate resistance; but Beauregard, deeming it impossible for him to successfully resist, commenced (May 26) secretly evacuating, and by the 29th had removed or destroyed everything of value, retreating with his army southward to Tupelo. Halleck occupied Corinth May 30, and pursuit was given to the Confederates, but without overtaking them.

After his defeat at Iuka, the Confederate general Price retreated to Ripley, Miss., where he was joined by Gen. Van Dorn, raising the force to about 30,000, Van Dorn assuming command, and an attempt to take Corinth by surprise or force was determined upon. This movement began Oct. 2.

Gen. Rosecrans was now in command at Corinth with 20,000 men; to the former extensive line of defences inner lines had been added. Grant's head-quarters were at Jackson, Tenn., Ord's division was at Bolivar.

Van Dorn moved northward to Pocahontas on the Memphis R. R., thence down to Chewalla. Rosecrans, apprised of this advance, deemed it a feint on Corinth, and that the real object was to attack Grant or Ord, but to meet any emergency threw his forces well out to the west, in and beyond the outer line of fortifications; Hamilton on the right, Davies held the centre, McKean on the left. Col. Oliver, with three regiments, held a strong position in advance. Gen. Mansfield Lovell, with one division, held the Confederate right, Price, with Maury's and Herbert's divisions, the left, Maury's division forming the centre.

On the morning of Oct. 3, Lovell's division encountered Oliver's advance: Gen. McArthur was sent forward to develop the Confederate strength, and being vigorously attacked, was reinforced by four regiments from McKean's division. A determined fight was maintained till a successful charge between McArthur's right and Davies' left

forced him from the hill, with a loss of two guns, Davies giving ground a little also.

No doubt now existing as to the design of the Confederates, Rosecrans prepared to resist. He had barely withdrawn and rearranged his line when a furious attack on the centre forced Davies back a short distance, darkness closing the engagement.

On the morning of the 4th the attack was renewed. The advance, which was made in column by division, was subjected to a most severe direct and cross fire, sweeping it through and through; but, undismayed, the advance steadily continued, the men marching "with their faces averted, like men striving to protect themselves against a driving storm of hail." At last they reached the crest of the hill, and, charging the right centre, Davies' division gave way. Fort Richardson, and even Rosecrans' headquarters, were taken; but Rosecrans rallying the troops in person, the fort was retaken, and Hamilton's division advancing on the right, Price's column was shattered and driven in confusion.

Van Dorn's attack was intended to be simultaneous with that of Price, but the nature of the ground over which he had to advance delayed him, and, besides, he was confronted by two batteries (Williams and Robinett). His advance was, however, made, under fire of these two batteries, in the most heroic manner, by the Texas and Mississippi troops. Advancing within fifty yards of Battery Robinett through a murderous fire of grape and canister, they were met by an overwhelming musketry fire from the Ohio brigade, which drove them back to the woods. They were re-formed, and, returning to the charge, led by Col. Rogers, Second Texas, reached the ditch, only to be met again by the deadly fire of the Ohio brigade, which again broke them, and a charge was now made by the Eleventh Missouri and the Twenty-seventh Ohio, which pursued their scattered columns to the woods. By noon the battle was ended. The heroic bravery here displayed called forth the admiration of all. The remains of the gallant Col. Rogers, who fell at the ditch, were carefully buried in a separate grave by his late foe.

The national loss in this sanguinary conflict was 315 killed, 1812 wounded, and 232 prisoners. The Confederate loss was much greater.

Corinth, a post-township of Saratoga co., N. Y. It has manufactures of lumber, leather, etc. Pop. 1500.

Corinth, a post-township of Orange co., Vt., 25 miles S. E. of Montpelier. It has copper-mines and manufactures of linen, and is the seat of an academy. Pop. 1470.

Corinth, Gulf of, or **Gulf of Lepanto** (anc. *Corinthiacus Sinus*), an inlet of the Mediterranean, extends between Hellas proper, or Northern Greece, and the Peloponnesus (Morea). This gulf resembles a large inland lake. In beauty of scenery it equals or surpasses the most picturesque lakes of Northern Italy. "Its coasts," says Leake, "broken into an infinite variety of outline by the ever-changing mixture of bold promontory, gentle slope, and cultivated level, are crowned on every side by lofty mountains of the most majestic forms." It extends E. and W. nearly 80 miles, without including the part called the Gulf of Patras, which is connected with the other portion by a strait less than two miles wide.

Corinth, Isthmus of, a neck of land connecting Attica with the Morea, and separating the Gulf of Corinth from that of Ægina. Its width varies from four to eight miles. This isthmus was the scene of the celebrated Isthmian games and the site of a famous temple of Neptune. (See Isthmian Games.) It has been proposed to cut a ship-canal through the isthmus.

Corin'thian Order. This order gets its name from Callicrates, a Corinthian architect, who was said to have invented it. It is more probable that it was an importation from Asia Minor. It was not generally used in Greece before the age of Alexander the Great, and the few examples remaining there do not agree sufficiently with one another to enable us to deduce rules from them for its construction. In these examples volutes are sometimes used with the acanthus leaf, as in the Choragic Monument of Lysicrates, and sometimes not, as on the Tower of the Winds. In one example found in Asia Minor the acanthus leaf is found combined with the ancient honeysuckle ornament. In the Choragic Monument the column rests upon a spreading base, while that of the Tower of the Winds has no base. The Romans greatly affected the Corinthian order, and brought it to perfection. Yet even with them it was not always the same thing, and there are more than fifty varieties of the Corinthian capital to be found either in Rome itself or in various parts of the Roman empire, all executed within the three centuries during which Rome continued to be the imperial city. From these various but not discordant examples the following general rules may be deduced: The capital resembles a vase covered with an abacus and surrounded by one tier of acanthus leaves above another, from amongst which stalks spring out, terminating in small volutes at the angles of the abacus and in the centre of each of its sides. The column is sometimes fluted,

Corinthian Capital.

as in the temple of Jupiter Stator in Rome, or as in the fine example here given from the Porta Aurea of Pola in Istria, and sometimes without flutings, as in the Pantheon. The flutings are separated by a fillet. The column stands upon a base. Its height varies from nine and one-third to ten and one-quarter times the diameter, and the capital from one to one and a half times. The entablature is variously decorated. The architrave is usually profiled with three fasciæ of unequal height, though sometimes there are only two. The frieze is often sculptured with foliage and animals, but it is sometimes left quite plain, as in the temple of Jupiter Stator. The cornice is richly decorated with modillions, dentils, and carving upon the mouldings. Among the principal remaining examples of the order at Rome are the temple of Mars Ultor and Jupiter Stator, and the Pantheon. The celebrated little temple at Nîmes in France, called the Maison Carrée, is a beautiful specimen of the Corinthian, though it probably owes its excellence to having been built by Greek hands. Clarence Cook.

Corinthians, the First Epistle of Saint Paul to the, one of the canonical books of the New Testament, written from Ephesus in the spring of the year 57, to rebuke the church at Corinth for party spirit, disrespect to the apostle's authority, licentiousness, impropriety at public meetings (and especially at the Holy Communion), vanity, and self-seeking. The apostle also settles some cases of conscience as to eating idol-sacrifices, and a point of doctrine as to the resurrection.

The Second Epistle of Saint Paul to the Corinthians. Before writing the first Epistle the apostle had sent Timothy to Corinth (1 Cor. iv. 17). Timothy probably brought back a bad report; Titus was then sent, and he reported discontent at the authoritative tone of the first Epistle. The second letter is a sober and conciliatory but earnest statement of the apostle's true and just authority. When he wrote he had reached Macedonia on his way to Achaia, late in the autumn of the year 57.

Two Apocryphal Epistles (of the Corinthians to Saint Paul, and of Saint Paul to the Corinthians), existing in the Armenian, are worthless productions. English translations are to be seen in Whiston's "Authentic Records."

The Epistle of Clement of Rome to the Corinthians has been regarded as spurious by some, but without sufficient reason, and its genuineness is now conceded. The so-called Second Epistle of Clement to the Corinthians is doubtless a part of the pseudo-Clementine Homilies, to which it is now generally referred.

Coriola'nus (Caius Marcius), an ancient Roman and patrician hero, who, according to tradition, received the surname *Coriolanus* because he defeated the Volsci at Corioli about 490 B. C. During a famine he advised that grain should not be distributed gratis among the plebeians unless they abandoned the right or privilege of electing tribunes of the people. For this offence he was banished. Having obtained command of a Volscian army, he marched against Rome, the citizens of which were unable to resist

him. He was at length appeased by a deputation of Roman matrons, led by his mother Veturia and his wife Volumnia. The story of Coriolanus forms the subject of one of Shakspeare's most celebrated dramas. (See ARNOLD, "History of Rome.")

Corip'pus (FLAVIUS CRESCONIUS), a literary man (*grammaticus*) who was born in Africa and flourished probably in the sixth century, is known as the author of an extravagant panegyric upon Justin the Younger, who was Byzantine emperor from 565 to 578 A. D., and of a poem called "Johannis," celebrating the exploits of Johannes, a proconsul in Africa in Justinian's time. It is believed by some, but without full evidence, that he was the same Cresconius who wrote large and important collections of the canon law, and who was an African bishop of uncertain age. Coripppus was a writer of ability, and those parts of his work which are now perfect are highly prized. Much mystery formerly existed with regard to the authorship of his writings, but the discovery of a fairly preserved MS. in 1814 cleared away most of the difficulties which had beset this vexed question. The above works have been often reprinted.

Cork [from the Lat. *cortex*, "bark;" Sp. *corcho*], the bark of the *Quercus Suber*, a species of oak growing in Spain, Italy, and the south of France. The bark may be removed annually without injuring the tree. Cork is extensively used in the form of stoppers for glass bottles, and in the construction of life-preservers and life-boats. When rasped cork is digested in water and alcohol, it leaves about 75 per cent. of insoluble matter, called *suberine*. The cork tree has been introduced successfully in the Southern States, and cork might probably be grown there with profit.

Cork, the most southern county of Ireland, borders on the Atlantic Ocean. Area, 2873 square miles. It is drained by the rivers Blackwater, Lee, and Bandon. The surface is diversified, and presents picturesque scenery. The coast is deeply indented with several bays and inlets, which form excellent harbors. Among these are Bantry Bay and the harbors of Cork and Kinsale. The predominant rocks are old red sandstone and mountain limestone. Here are mines of copper and coal. Capital, Cork. Pop. in 1871, 516,046.

Cork, a city and river-port of Ireland, capital of Cork county, is on the river Lee, 11 miles from the sea and 136 miles S. W. of Dublin by rail. It is the third city of Ireland in population. It is partly built on an island of the river, which is here crossed by nine modern bridges. Many of the houses are built of limestone, red sandstone, and brick, and the main streets are wide and well paved, but the suburbs are mean. Among the principal edifices are the court-house, mansion-house, the exchange, a custom-house, a lunatic asylum, and an episcopal palace. It contains a Protestant and a Catholic cathedral and two large Roman Catholic churches, Queen's College, the Cork Library, a medical school, two or three theatres, a fever hospital, and several convents. Here are manufactures of glass, paper, gingham, iron, gloves, etc. Cork has a large, safe, and landlocked harbor, and derives much of its prosperity from commerce. It is connected by railway with Dublin and other cities. Steam-packets ply between this port and Dublin, Liverpool, Bristol, etc. Cork returns two members to Parliament. It is supposed to have been founded in the sixth century. It is regarded as a county by itself. Pop. in 1871, 78,382.

Cork, EARLS OF (1620), earls of Orrery (1660), Barons Boyle of Youghal (1616), Barons Broghill, Viscounts Kinalmealy, and barons of Bandon Bridge (Ireland, 1628), Barons Boyle of Marston, Somerset (Great Britain, 1711). —RICHARD BOYLE, ninth earl, K. P., P. C., master of the buckhounds, born April 19, 1829, succeeded his grandfather June 29, 1856.

Cork (RICHARD BOYLE), FIRST EARL OF, a British statesman, was born at Canterbury Oct. 3, 1566. He was made privy councillor for Ireland in 1612, raised to the peerage in 1616, became earl of Cork in 1620, lord justice of Ireland in 1629, and lord treasurer in 1631. Died Sept. 15, 1643. He is known as "the great earl of Cork," and was father of Robert Boyle, the philosopher.

Cork Har'bor, an excellent landlocked harbor of Ireland, is formed by the estuary of the river Lee. It is large and deep enough to contain the whole British navy. The entrance, which is one mile wide, is 11 miles from the city of Cork. The harbor expands to eight miles in width. Queenstown is on an island in this harbor.

Corleo'ne, a town of Sicily, province of Palermo, on a hill 21 miles S. of Palermo. It has a royal college, a hospital, and several churches and convents. Pop. 14,600.

Cor Leo'nis (*i. e.* "heart of the lion"), a name of the star α in the constellation Leo. It is also called *Regulus*.

Corm [Gr. κόρμος, a "trunk" or "stem"], in botany, a short, roundish, bulb-like underground stem, solid, and not scaly; as in the crocus and gladiolus. Corms are sometimes called solid bulbs.

Cormenin, de (LOUIS MARIE DE LA HAYE), VICOMTE, a French political writer, born in Paris Jan. 6, 1788. He became in 1828 a liberal member of the Chamber of Deputies, and under the pseudonym of "Timon" wrote political pamphlets which were successful. He was president of the committee which formed a new constitution in 1848. Among his works "Droit Administratif" (1831; 5th ed. 1840) is the most important. After the *coup d'état* of Dec., 1851, he was a member of the council of state. In 1855 he was admitted into the Institute. Died May 6, 1868.

Cormontaigne, de (LOUIS), a French military engineer, born in 1696. He made improvements in the art of fortification, on which he wrote several treatises. He planned the fortifications which were constructed at Metz and Thionville in the reign of Louis XV. Died Oct. 20, 1752.

Cor'morant [Fr. *cormorant;* It. *corvomarino, i. e.* "sea crow;" Ger. *Wasserrabe*], (*Phalacrocorax* or *Graculus*), a genus of aquatic web-footed birds of the family Pelecanidæ, characterized by a bare dilatable membrane beneath the lower mandible, extending to the upper part of the throat. The cormorant has a compressed bill, with a strong hook at the point of the upper mandible, wings of moderate length, and stiff tail feathers, used in walking. The species are distributed along the coasts of various countries of Europe, Asia, and America, and feed on fish almost exclusively. They are proverbial for their voracity. They pursue their prey by swimming and diving, and, it is said, sometimes descend to the depth of 100 feet or more. The common cormorant (*Phalacrocorax carbo*) is found on the eastern coast of North America, is mostly of a black plumage, and is about thirty-three inches long. Several other species are found in the U. S. The cormorant is trained by the Chinese, who employ it in catching fish.

Cormorant.

Corn [Anglo-Saxon, *corn;* Ger. *Korn;* Lat. *far* or *frumentum*], a general name given to various seeds, especially to cereal and farinaceous grains which grow in ears and are used for food, as wheat, barley, rye, and maize. In England, corn signifies "wheat," which is the grain most extensively used for breadstuff. In the U. S. the term is commonly applied to maize or INDIAN CORN (which see).

Corn (*clavus*), [from *cornu*, a "horn"], a horny accumulation of epidermic cells upon the surface of the human foot, produced by the pressure of the boot or shoe. Corns may be softened by hot water or poultices, and the horny part can be carefully removed with the knife. When painful, they may be generally much relieved by the occasional application of a solution of nitrate of silver. Various surgical appliances have been devised for the relief of corns, which when neglected may give rise to serious trouble.

Corns in horses are inflamed spots in the sole just above the horny portion. They are often caused by bad shoeing, and are very liable to suppuration. When this occurs the matter should be evacuated, the part poulticed, the surface of the corn exposed by cutting, and the foot dressed with a solution of chloride of zinc—one grain to the ounce of water.

Cor'naceæ [from *Cornus*, one of the genera], a small natural order of exogenous plants, mostly trees or shrubs. They have four-parted flowers, the corolla valvate in the bud, and four stamens borne on the margin of an epigynous disk in the perfect flowers. The fruit is a one or two seeded drupe. The *Cornus florida* (dogwood) and some other species are indigenous in the U. S. The bark of *Cornus* is recommended as a tonic.

Cor'narists, a name applied in the sixteenth century to the followers of DIEDRIK CORNHERT (which see.) After the rise of the Arminian party in the Dutch Church, the Cornarists, who nearly agreed with them, disappear from history.

Corn'bury (EDWARD **Hyde**), LORD, afterwards third earl of Clarendon. He deserted the service of James II. in 1688, and became an adherent of the prince of Orange (William III.), who appointed him governor of New York in 1702. He was censured for rapacity and tyrannical conduct, and was removed in 1708. Died April 1, 1723.

Corn-Crake, or **Land Rail,** the *Crex pratensis,* a European bird, a rare visitant of the U. S. It is a wader,

Corn-Crake, or Land Rail.

seven inches long, of a brown-gray color, haunting corn and grass lands and osier-beds. It is a game bird, quite hard to flush, as it runs rapidly away from a dog.

Cor'nea [*i. e.* "horny," from the Lat. *cornu,* a "horn"], the transparent horny membrane which forms the anterior part of the eyeball. In vertebrates it is simple; in insects it is divided into numerous hexagonal segments. (See EYE.)

Corneille (PIERRE), a celebrated French dramatic author, born at Rouen June 6, 1606, is called the founder of the French drama. He was educated by the Jesuits, and studied law, which he practised for several years without success. In 1629 he produced "Mélite," a comedy, which was performed with applause. Between 1629 and 1635 he wrote several comedies, which are inferior to his later works. His "Médea" (1635), a tragedy, although somewhat bombastic, contains eloquent passages and reveals the dawning of his genius. His reputation was greatly increased by the tragedy of the "Cid" (1636), an imitation of the Spanish drama of the same name. The "Cid" was performed with great applause, and surpassed everything that had appeared on the French stage. He produced in 1639 "Les Horaces" and "Cinna," which are excellent in invention and style. "Cinna" and "Polyeucte" (1640) are considered by some critics as his masterpieces. He was admitted into the French Academy in 1647. Among his other works are "Le Menteur" (1642), a comedy of character and intrigue, and an opera, "Toison d'Or" (1661). He died in Paris Oct. 1, 1684, and left several children. He was an uncle of Fontenelle. The French call him the "grand Corneille," partly to distinguish him from his brother Thomas. In the opinion of many critics he excelled other French dramatists in impressive declamation, sublime thoughts, and a condensed and noble style. (See FONTENELLE, "Eloge de Corneille;" GUIZOT, "Corneille et son Temps," 1852; TASCHEREAU, "Histoire de la Vie et des Ouvrages de Corneille," 1829.)

Corneille (THOMAS), a French dramatist, a brother of the preceding, born at Rouen Aug. 20, 1625. His first work was a comedy entitled "Engagements du Hasard" (1647). He produced in 1656 "Timocrate," "Ariane," the "Earl of Essex," and several encyclopædic works. Died Dec. 8, 1709.

Corne'lia, a Roman matron of patrician family, was a daughter of P. Scipio Africanus, and the mother of Tiberius and Caius Gracchus. After the death of her husband, T. Sempronius Gracchus, she declined an offer of marriage made by Ptolemy, king of Egypt. She was eminent for virtue and mental endowments, and was versed in Greek literature. When a rich Campanian lady expressed a curiosity to see her jewels, she pointed to her two sons, saying, "These are my jewels and ornaments." She lived in the second century B. C.

Cornelian. See CARNELIAN.

Corne'lius (ELIAS), D. D., an eloquent and influential clergyman, was born at Somers, Westchester co., N. Y., July 31, 1794. As secretary of the American Education Society (from 1826 to 1832) he gave a notable impulse to the work of training men for the Christian ministry. Died at Hartford, Conn., Feb. 12, 1832. A few weeks before his death he succeeded Jeremiah Evarts as one of the secretaries of the A. B. C. F. M. His life was written by B. B. Edwards (1833).

Cornelius Nepos. See NEPOS.

Corne'lius, von (PETER), a celebrated German painter, born at Düsseldorf Sept. 23, 1787. He studied and worked in Rome (1811–19), and formed there an intimate friendship with the artist Overbeck. While he was at Rome he produced his "Illustrations of Faust." He manifested his original genius in a series of designs illustrating the "Niebelungen Lied." In 1819 he was made director of the Academy at Düsseldorf, and in 1826 he went to Munich, where he was patronized by King Louis. He devoted himself to fresco-painting, which had long been neglected, and adorned with frescoes of subjects from the "Iliad" the Glyptothek of Munich. Among his greatest works is a picture of the "Last Judgment" in the church of St. Louis in Munich. In the Pinakothek of Munich he painted a series of frescoes to illustrate the "History of Painting" (1841). Invited by the king of Prussia, he went to Berlin in 1840, and painted in the Campo Santo "The Four Horsemen of the Apocalypse" (1848) and other works. Died at Berlin Mar. 7, 1867. (See RIEGEL, "Cornelius, der Meister der Deutschen Malerei," 1866; WOLZOGEN, "Peter von Cornelius," 1867; "Peter von Cornelius, ein Gedenkbuch aus seinem Leben und Wirken, von ERNST FÖRSTER," Berlin, 1874.)

Cornell', a post-village of Livingston co., Ill., on the Chicago and Paducah R. R., 9 miles N. W. of Pontiac. It has one weekly newspaper.

Cornell (EZEKIEL), a brigadier-general of the Revolutionary war, born at Scituate, R. I., was a member of the Continental Congress from Rhode Island (1780–83). He founded a library in his native town.

Cornell (EZRA) was born at Westchester Landing, N. Y., Jan. 11, 1807. Soon after the invention of the telegraph he devoted his attention to that enterprise, became very wealthy, and in 1865 founded the CORNELL UNIVERSITY (which see). Died Dec. 9, 1874 at Ithaca, N. Y.

Cornell (WILLIAM MASON), M. D., D. D., LL.D., a Congregational divine, was born at Berkley, Mass., Oct. 16, 1802, graduated at Brown University in 1827. He left the ministry in 1839 on account of feeble health, studied medicine, and commenced its practice in 1845. He has contributed largely to periodical and other literature.

Cornell College, Mount Vernon, Ia., is under the auspices of the Methodist Episcopal Church. It was established in 1850, and first called the Iowa Conference Seminary. In 1854 the name was changed to Cornell College. It is built in one of the handsomest spots in beautiful Iowa, on a campus of twenty acres, and consists of three massive brick structures: one, the ladies' boarding hall, 72 by 40 feet, and three stories high; another, the gentlemen's boarding hall, 56 by 40, and four stories high; and the third, the main college building, 100 by 60, and five stories high. They have been built at a cost of $80,000, principally small gifts from the pioneer citizens of Iowa. It has a permanent endowment of $86,000, which the friends of the institution are laboring to increase to $200,000. The faculty, headed by the Rev. William F. King, D.D., consists of fifteen professors and teachers. Three of its chairs are endowed: the chair of mental and moral philosophy by the late Bishop Hamline; the chair of civil engineering by Hon. Judge Cooley of Dubuque, Ia.; and the chair of mathematics by the alumni of the institution. The Washington government has selected this college as the one in Iowa to which to detail a professor of military science and civil engineering, thus bringing West Point advantages into the heart of Iowa. Over 7000 students have attended this college, and about 140 of the number have graduated. Mount Vernon, the seat of the institution, is a small town of 1500 inhabitants, who have been drawn together here principally for educational purposes. It is on the C. and N. W. Railway, 66 miles W. of the Mississippi, thus being in the very centre of Iowa's population. About 360 students, from twenty-one different States, make up the annual list in the catalogue. The college is out of debt. J. W. CLINTON, *Agent Cornell College.*

Cornell University, a collegiate institution at Ithaca, Tompkins co., N. Y. In July, 1862, Congress granted to each State 30,000 acres of public land for every Senator and representative it was entitled to; the income to be applied for ever to colleges "where the leading object shall be, without excluding other scientific and classical studies, and including military tactics, to teach such branches of learning as are related to agriculture and the mechanic arts, . . . in order to promote the liberal and practical education of the industrial classes in the several pursuits and professions in life." One-tenth of this may be used for experimental farms, but no portion for buildings. New York's share was 990,000 acres. By charter of 1865 and 1867 she established the Cornell University with a foundation of $500,000, given it by Hon. Ezra Cornell of Ithaca, and secured to it the entire income of the land-grant so long as it should use the whole effectively in aid of the objects intended by Congress. It has since received nearly $1,000,000 more, from the founder, from the president, Hon. Andrew D. White, and from Trustees McGraw, Kelley, Sibley, Sage, and others. Its valuable collections and its library of 35,000 volumes are rapidly increasing. Opened Oct., 1868, it had in Oct., 1872, 33 resident professors and instructors, 8 non-resident professors and lecturers, 494 students, including 5 resident graduates and 16 ladies, and 109 alumni.

By the charter no officer or student can be admitted or excluded for any political or religious opinions, but "at no time shall a majority [of the trustees] be of one religious sect or of no religious sect." All departments of study shall be open at the lowest rates consistent with efficiency. Each of the State's 128 assembly districts may send yearly one student for four years' free tuition; the choice to be made by competitive examination from the best scholars, male and female, in the different academies and public schools, but subject to the usual entrance-examination at the university. Since June, 1872, both sexes are admitted on equal terms, except that lady students must be at least eighteen years of age, while boys may enter at sixteen, and must, unless excused, receive military instruction.

The university values "practical" and "scholarly" studies alike when the work in each is equally good. It aims to afford the best facilities for each, to encourage their combination, and, by giving wide liberty of choice, to secure the student's mental discipline through studies which, while of varied character, shall bear directly upon his chosen life-work. Especial provision is made for instruction connected with political, social, and industrial science, and with modern and English classics; thus in history are five professors; in rhetoric and literature, two; in chemistry, three; in mathematics, seven teachers; in modern languages, seven. The engineering school is very large. But instruction is offered as well in Hebrew, Persian, transcendental anatomy, quantics, etc. To promote variety of culture, and to guard against academic seclusion from the world's actual interests, the resident faculty is supplemented by non-resident lecturers, men eminent in their special departments, and often in public life.

There are three "general courses." That in arts has the usual classical curriculum; that in literature replaces Greek, and that in science, Greek and Latin, by other studies. Some "electives" are allowed, and the natural sciences are studied at the outset. These three courses, and "special courses" like civil engineering, architecture, veterinary medicine, zoology, etc., lead to bachelors' degrees, but the masters' degrees require further study. Or the student may select an "optional course," leading to no degree. But in all courses the equivalent of fifteen hours' recitation per week is required. A certain proficiency, as shown by the frequent examinations, is necessary to continue a student in his class, and a certain higher proficiency to graduate him. No "marking list" is kept at daily recitations. There is no college police. Much is left to the student's earnestness and to free and manly intercourse between teachers and taught, but when these fail he is dismissed.

JAMES E. OLIVER, *of the University.*

Cor'net [It. *cornetto*, diminutive for *corno*; Lat. *cornu*, a "horn," because horns were anciently used as musical instruments], a musical instrument usually of brass, and originally of a curved, horn-like shape. Cornets are of various kinds, but the best form is that known as the *cornet-à-pistons* (a French term signifying a "cornet with pistons," because modifications of sound are produced by small pistons moved by the player's fingers). Cornet music is popular and brilliant, but is not considered "high art" by musical critics. Among the most famous cornet-players of the present time may be mentioned the celebrated Levy and Mr. Arbuckle.

Cor'net [It. *cornetta*, a "small flag"], a commissioned officer of cavalry, corresponding in rank with the ensign of infantry. The standard was formerly carried by the cornet, hence the name. There are no cornets in the U. S. army.

Corn'hert, or **Koornhert** (DIEDRIK), an eminent Dutch author and reformer, born at Amsterdam in 1522. He efficiently promoted the Protestant Reformation, but opposed Calvinism. More liberal than the most of his contemporaries, he wrote a "Treatise against the Capital Punishment of Heretics." He gave valuable assistance to the prince of Orange in his contest against Spain, and became secretary of state in Holland in 1572. Among his works is a poem "On the Use and Abuse of Fortune." Died Oct. 20, 1590. His followers in theology were called CORNARISTS.

Cor'nice [Fr. *corniche*; It. *cornice*], in architecture, the upper great division of an entablature, consists of several members, which vary in the different orders. (See ENTABLATURE.)

Cor'nie, a township of Columbia co., Ark. Pop. 413.

Cornie, a township of Union co., Ark. Pop. 752.

Cornif'erous Pe'riod [from the Lat. *cornu*, a "horn," and *fero*, to "produce," referring to the "hornstone" or imperfect flint found in its strata], in American geology, the second of the five great divisions of the DEVONIAN AGE (which see).

Corn, Indian. See MAIZE.

Corn'ing, a half shire and post-town of Steuben co., N. Y., on the Chemung River and Erie R. R., at the junction of the Rochester division, 290 miles N. W. of New York and 17½ W. of Elmira. It is the terminus of the Chemung Canal feeder and of the Corning and Blossburg R. R. It has two newspapers, a school building costing $70,000, a public library, several iron-foundries, flint glass-works, and a manufactory of railroad cars. Pop. 4018; of township, 6502. ED. "JOURNAL."

Corning, a post-village and cap. of Adams co., Ia., on Burlington and Missouri River R. R., 211 miles W. of Burlington. It has two weekly newspapers.

Corning (ERASTUS), born at Norwich, Conn., Dec. 14, 1794, became a wealthy iron-merchant and capitalist of Albany, N. Y., and was a member of Congress from the last-named State 1857–63 and 1865–67. He was one of the leading railroad capitalists of the U. S., was one of the regents of the university, and was greatly interested in the cause of popular education. Personally, he was greatly beloved on account of his genial and kindly disposition. Died April 9, 1872.

Cor'nish, a township and post-village of York co., Me., on the Portland and Ogdensburg R. R. and on the Saco River, 30 miles N. W. of Portland. Carriages are manufactured here. Pop. 1100.

Cornish, a township and post-village of Sullivan co., N. H., on the left bank of the Connecticut River, opposite Windsor, Vt., 25 miles N. of Bellows Falls. The township has four churches and manufactures of lumber and leather. Pop. of township, 1334.

Cor'nish Lan'guage, a language closely akin to the Breton (Armorican) and to the Welsh. It ceased to be a spoken language about the beginning of the present century. Its use within historic times appears to have been limited to Cornwall and Western Devonshire, in England. Among the extant remains of this language are a poem on the "Passion of our Lord" (published in 1864 by the Philological Society), and a mystery entitled the "Creation of the World" (Berlin, 1865). (See NORRIS, "Cornish Grammar," Clarendon Press, 1859.)

Corn Laws, in England, the name given to certain former statutes for the regulation of the trade in grain. The corn laws are of ancient origin, dating as far back as 1360. There appears to have been no prohibition against importation till in 1463 an act was passed prohibiting it so long as the price at home was below 6*s.* 8*d.* a quarter. Soon after the accession of Charles II. the policy of increasing duties on importation, for protecting the agricultural and landed interest, began to prevail. An act was passed in 1670 prohibiting importation till the price had reached 53*s.* 4*d.* a quarter, and laying a heavy duty on it above that point. This law was of little benefit to the landed interest, for then and long afterwards Great Britain generally produced more grain than its population required. The price at which importation might begin was raised in 1814. There had been a tendency to what is called a "sliding scale" in the duties on importation, and this arrangement, by the act of 1828, reached what was regarded as a state of perfection. There were, however, writers and speakers who opposed the corn laws, while a powerful party maintained that they were identified with the interests of the country. They argued that protection was

necessary to keep certain poor lands in cultivation, and that it was desirable to cultivate as much land as possible, in order to improve the country. If improvement by that means were to cease, the country would be dependent on foreigners for a large portion of food. Such dependence would be fraught with great danger; in war, supplies might be stopped or the ports blockaded, the result being famine and bread-riots. Protection enabled the landed proprietors and their tenants to encourage manufactures and trade. If the corn laws were abolished half the shopkeepers would be ruined, and that would be followed by the stoppage of many mills and factories. These arguments had great influence over the shopkeepers, the laboring classes, and the learned professions. Ignorance and timidity were combined with selfishness for the support of the corn laws. Statesmen could introduce no change into the existing laws other than to reduce the import duty as the price of grain rose, in order virtually to prohibit importation when the price was low, and encourage it when high, so that at famine-prices grain might come in duty free. The effect of this fluctuation was to render the trade a gambling one; the supplies required being so irregular, foreign countries did not grow corn habitually for the British market. In 1843, Sir Robert Peel tried a modification of the sliding scale, which did not lessen the opposition to the corn laws, the nature of which was now better understood. The people, roused by Cobden, Bright, and other leaders of the Anti-Corn Law League, poured in petitions to Parliament, and at length Sir Robert Peel, now a convert to free trade, carried a measure in 1846 to abolish the corn laws. Every evil prognostication has proved false. There has been no stoppage of imports by war; manufacturers and tradesmen have been more prosperous than before the repeal; the rent of land has risen, and both tenants and proprietors are satisfied; the working-classes find more employment than before. The benefits arising from the repeal of these laws consist in the stimulus given to trade, the removal of anxiety as to the effects of scanty harvests, and less fluctuation of price. Another result was the decline of Chartism, and other schemes for radical social changes.

Corn'planter [Iroquois, *Gariawachia*, the "planter"], a half-breed Seneca Indian and chief of the Six Nations, born about 1732, was the son of John Abeel, a white trader. He fought the English at Braddock's defeat, and was a deadly foe to the colonists during the Revolutionary war, but afterwards became the steady friend of the white people. He was a man of great intelligence, dignity, and moral worth. Died in Warren co., Pa., Feb. 18, 1836. A monument was erected in his honor by the State of Pennsylvania in 1867. (See SNOWDEN'S "Historical Sketch of Cornplanter," 1867.)

Cornplanter, a township of Venango co., Pa. Here are numerous oil-wells. Pop. 10,100.

Corn Snake, the *Scotophis guttatus*, a colubrine, non-venomous serpent of the Southern States, of a brown color, and often five feet long. It is generally not seen except mornings and evenings. It enters houses, devours young chickens and other small animals, but is of gentle and familiar disposition.

Corn'stone, the lower member of the old red sandstone or middle palæozoic series of rocks, as developed in Herefordshire, England, and the adjoining counties. The name cornstone is said to have been given because the soil derived from this stratum is fertile and adapted to the production of corn (wheat).

Cor'nu Ammo'nis, in anatomy, a white prominence within the brain near the middle of each lateral ventricle.

Cornuco'pia [Lat. *cornucopiæ* (*i. e.* "horn of plenty"), from *cornu*, a "horn," and *copiæ*, the gen. of *copia*, "plenty"], in the fine arts, an ornament representing a horn, from which issue flowers, fruits, and leaves. The fable accounting for the origin of this emblem of plenty is, that Amalthæa, when one of her goats had broken off a horn, presented it to the infant Jupiter wreathed with flowers and filled with fruit.

Corn'ville, a post-township of Somerset co., Me. P. 959.

Corn'wall, a county forming the S. W. extremity of England, is bounded by the ocean on all sides except the E. It constitutes a duchy, which is the appanage of the prince of Wales. Area of the county, 1786 square miles, but the duchy is larger, and includes a part of Devonshire. The surface is partly occupied by rugged hills, with some fertile valleys. The river Tamar forms the eastern boundary of Cornwall, which it separates from Devonshire. The extreme western point of the county is a promontory called Land's End. Cornwall is rich in metals, especially tin and copper. The annual average product of the tin-mines is 5000 tons. The quantity of copper obtained here annually is nearly 12,000 tons. The mining of kaolin and felspar is also important. Silver, lead, zinc, antimony, cobalt, bismuth, and iron are found here. The chief towns are Falmouth, Penzance, Bodmin, and Truro. There are in Cornwall many dolmens and other pre-historic remains. The ancient language of Cornwall, called the Cornish language, ceased to be spoken about the beginning of the present century. (See CORNISH LANGUAGE.) Capitals, Bodmin and Launceston. Pop. in 1871, 362,098.

Cornwall, a port of entry, capital of Stormont co., Ontario (Canada), on the N. side of the St. Lawrence River, at the foot of the Long Sault Rapids and Canal, 67 miles above Montreal, and on the Grand Trunk Railway. It has great water-power, and manufactures of woollen goods, flour, etc. It has two weekly papers. Pop. about 3000.

Cornwall, a township and post-village of Litchfield co., Conn. It has important mines of iron ore. The village is 45 miles N. W. of New Haven. Pop. 1772.

Cornwall, a township of Henry co., Ill. Pop. 952.

Cornwall, a post-township of Orange co., N. Y., on the W. bank of the Hudson River, contains the village and U. S. Military Academy of WEST POINT (which see); also Canterbury, Highland Falls, Cozzens' Landing, and other villages. It has seventeen churches, several excellent boarding schools, and many manufactories. The scenery here is very attractive. Pop. of township, 5989.

Cornwall, a post-township of Lebanon co., Pa. P. 2008.

Cornwall, a post-township of Addison co., Vt. P. 969.

Cornwall (BARRY). See PROCTER (BRYAN W.).

Cornwal'lis (CAROLINE FRANCES), an English writer, born in July, 1786. She learned Latin and Greek, and attained a good proficiency in philosophy, history, and natural science. She published a series of twenty-two essays entitled "Small Books on Great Subjects," which are highly esteemed. Among her works, which were all anonymous, was "Pericles, a Tale of Athens" (1847). Died in 1858. A volume of her letters and remains appeared in 1864.

Cornwallis (CHARLES), MARQUIS OF, a British general, born Dec. 31, 1738, was the eldest son of the first earl, whose title and estate he inherited in 1762. He became a favorite aide-de-camp of the king, but he opposed the measures that provoked the American war. With the rank of major-general he took part in the battles of Brandywine and Germantown in 1777. Having obtained the command of an army in South Carolina, he defeated Gen. Gates at Camden Aug. 16, 1780. Mar. 15, 1781, he gained some advantage over Gen. Greene at Guilford Court-house, and invaded Virginia. He occupied Yorktown, which he intrenched, and remained on the defensive. Gen. Washington besieged Yorktown, and compelled Lord Cornwallis to surrender his army of about 8000 men, Oct. 19, 1781. He is regarded as the ablest of the British generals who commanded in this war. In 1786 he was appointed governor-general of Bengal and commander-in-chief of the army in India. He waged war against Tippoo Saib, whom he defeated at Seringapatam in 1792. Having returned to England in 1793, he was raised to the rank of marquis. He became in 1798 lord lieutenant of Ireland, which was then the scene of a rebellion, and he pacified the Irish by moderate measures. He negotiated the treaty of Amiens in 1802, and was appointed governor-general of India in 1805. He died in India in the same year, Oct. 5. His "Correspondence" was published by Ross (3 vols.; 2d ed. 1859).

Cornwall on the Hudson, a post-village of Cornwall township, Orange co., N. Y., has a savings bank, a public library, some manufactures, and is a place of summer resort. Pop. 200.

Coro, a province of Venezuela, is bounded on the N. and E. by the Caribbean Sea, on the S. by Carabobo and Barquisimeto, and on the W. by Maracaibo. Area, 11,250 square miles. The larger part of the province is a low plain. In the interior the Sierra de Coro rises to an elevation of 4250 feet. The form of the province is very irregular, owing to the large peninsula of Paraguaná in its northern part, which is connected with the mainland by a long, narrow isthmus. The soil is in general unfruitful, and in parts poorly watered. The more elevated portions of the mountains are covered with fine forests. The rivers are all small, except the Tocuyo and the Aroa. The chief employments of the inhabitants are cattle-raising and agriculture. It is the most sparsely peopled province of the republic. The principal products are cattle, coffee, cacao, and cotton. Capital, Coro. Pop. 72,321.

Co'ro, a maritime town of South America, in Venezuela, near the Gulf of Maracaibo, 155 miles W. N. W. of Valencia. It is the capital of the province of the same name. Pop. about 7000.

Corœ'bus [Κόροιβος], one of the half-mythical characters of early Greek history, an Elean chiefly noted for

his victory in the foot-race at the Olympian games in 776 B. C. From this victory the Olympiads were reckoned. He slew the monster Poene, whom Apollo sent to afflict the Argives.—Another Corœbus was a Phrygian hero of the Trojan war, and a suitor of Cassandra.—In Pericles' time there was a famous architect named Corœbus.

Coro'lla [a diminutive of the Lat. *corona*, a "crown"], in botany, the inner floral envelope of a plant. It is usually more richly colored than the calyx. Theoretically considered, the corolla is composed of modified leaves (called petals). Corollas are divisible into two classes, monopetalous and polypetalous, the latter of which have several distinct petals. The monopetalous corolla has only one petal, formed by the union of several modified leaves. The corolla is much employed by botanists in their systematic arrangements, and by the French school has been taken as the means of forming fundamental characters of the subclasses in the grand division of exogenous plants.

Cor'ollary [Lat. *corollarium*, from *corolla*, a "little crown" or "garland" given in addition to wages, hence anything over and above], in mathematics, denotes something in addition to the demonstration—viz. an inference or consequence immediately deducible from the demonstration of a proposition. All the corollaries in our editions of Euclid have been inserted by editors; they may be said to constitute so many new propositions, differing from the original ones merely in the fact that the demonstrations have been omitted.

Coroman'del Coast, of India, extends along the E. side of the peninsula from Point Calymere to the mouth of the river Kistnah. It has no good harbor, and is heavily surf-beaten. The cities of Madras, Tranquebar, and Pondicherry are on this coast.

Coro'na [a Latin word signifying a "crown"], a term applied in astronomy to the glory of light seen around the sun when totally eclipsed. Halley regarded the phenomenon as owing to the existence of a lunar atmosphere, but this idea was rejected by Newton, and has since been entirely disproved. Delisle's theory, that it is due to the diffraction of the sun's light in passing tangentially by the moon's sphere, has been asserted by Sir David Brewster to

Corona as seen at Syracuse, in Sicily, Dec., 1870. R is the bright "inner corona," in which may be seen a "sierra" of glowing hydrogen. C is the "outer corona."

be untenable, since any diffraction ring thus occasioned would be too narrow to be visible from the earth. There remains only the conclusion that the corona is a true solar appendage. It appears probable, from various experiments, that the particles forming the corona are prevented from pressing towards the sun by their own motions. It is therefore supposed that they may be members of meteoric systems whose perihelia exist in the sun's neighborhood.

Corona, in architecture, the flat, square, massive member of a cornice, often called the drift or larmier, is situated between the cymatium and the bed-moulding. Its use is to carry the water, drop by drop, from the building.

Corona, Coronet, or **Crown,** a botanical term applied to certain appendages of the corolla, which are modifications of sterile stamens. The corona is in the interior of the corolla, and in some cases has the form of a cup, as in the narcissus. The five hooded bodies seated on the tube of the stamens of the asclepias are called the *crown*.

Coro'na Austra'lis, or **Southern Crown,** a constellation of the southern hemisphere.

Coro'na Borea'lis, or **Northern Crown,** a constellation of the northern hemisphere.

Cor'onach [a Gaelic word], a dirge or lament, mingled with the shrieks and wailings of women, which is still often heard at wakes and funerals, especially in the more primitive parts of Ireland and Scotland. Traces of the same practice are found among many primitive peoples.

Corona'tion [from the Lat. *corona*, a "crown"], the act of crowning a monarch; the ceremony performed on the accession of a sovereign to the throne. In some countries of Europe it is customary for a bishop to place the crown on the head of the sovereign. The ceremony of coronation is a very ancient one, at least as old as King Solomon's time. Anointing often accompanies the coronation, and in Great Britain the sovereign also takes an oath to support the laws, customs, and statutes, the laws of God, the Protestant reformed religion, the Church of England, etc.; security for the Church of Scotland being promised in the oath of accession, which in some instances long precedes the coronation. For example, George IV.'s accession was Jan. 29, 1820, but his coronation was deferred nearly eighteen months—till July 19, 1821. The ceremony is performed in Westminster Abbey, but anciently took place at Kingston-on-Thames or at Winchester. The ancient customs have come down to our time with but little change.

Cor'oner, anciently **Crown'er** [Lat. *coronarius*, from *corona*, the "crown"], formerly an officer of high dignity, who served as a deputy of the Crown and as chief-justice of the king's bench in England. At present in England and most of the U. S. a coroner is an officer who in case of sudden or mysterious death summons a jury, which sits in sight of the body, to determine the cause and manner of death. Coroners may commit persons suspected of homicide after inquest, without warrant, for trial. They also hold inquests in regard to salvage from shipwrecks. They had anciently powers much greater than at present.

Cor'onet [from the Lat. *corona*, a "crown;" Ger. *Krone*], in heraldry, an inferior crown belonging to the nobility. The monument of John of Eltham (second son of Edward II.), who died in 1334, is said to afford the earliest English representation of this ornament.

Corot (Jean Baptiste Camille), a French landscape-painter, born at Paris in July, 1796. Corot has produced many works, which, after having been long little esteemed, are now much sought after and command very high prices. His work is strongly individual, and in his own peculiar field Corot is unsurpassed. D. Feb. 1875. Clarence Cook.

Cor'pi San'ti, formerly belonging to the suburbs of Milan, now forms a separate city. Pop. 62,976.

Cor'poral [corrupted from the Fr. *caporal*, which is derived from the It. *capo*, "head," "chief"], a non-commissioned military officer, next in rank below a sergeant. He is distinguished by two chevrons worn on the arm. A "lance corporal" is a private soldier who is allowed to wear one chevron as a mark of distinction. He may or may not perform the duties of a corporal, but he has no increase of rank or pay.

Corporal [Lat. *corporale*, from *corpus*, the "body," *i. e.* the "Host"], in the Greek and Roman Catholic churches the altar-cloth used for covering the Host, and emblematical of the grave-clothes of our Lord. A "corporal oath" is an oath sworn upon the corporal. The name is retained by the ritualistic party of the Anglican Church.

Corpora'tion [Lat. *corporatio*, an "embodiment," the assumption of a form], in law, an artificial person, consisting of one or more individuals, having certain legal capacities, such as succession of members, powers to sue or to be sued, and to act, no matter how numerous its membership may be, as a single individual. This new person is to be thought of without reference to the members of which it is composed. It must be carefully distinguished from a partnership, in which there is merely a collection of persons, no artificial person being constituted. A contract made with the corporation is not made with the members, nor do they, in a legal point of view, own its property, though they may have an interest in its management on the theory of a trust. Corporations may be considered under the following divisions: I. Their various kinds; II. Their mode of creation; III. Their powers; IV. Visitation; V. Dissolution.

I. They may be variously classified, as regard is had to the number of members, their objects, and the fulness of their powers. When considered as to numbers, they are either aggregate (more than one) or sole. When regarded as to the objects to be accomplished, they are ecclesiastical or lay, while lay corporations are either civil or eleemosynary. It can scarcely be said that there are any "ecclesiastical" corporations in the U. S., in the proper sense of the term. They rather belong to the English law under

the rules of an established Church. Our corporations may be said to be lay. The term "eleemosynary" is substantially equivalent to "charitable," and embraces all that large class of corporate institutions established to promote religion or learning, to relieve the sick or the poor, and in general to accomplish meritorious public objects. Another division of corporations is public and private. A public corporation is designed for governmental purposes, as a city or a village. Others are private. The importance of this distinction lies in the fact that a public corporation, being a mere instrument of government, can be created or dissolved by the law-making power at will, while a private corporation only comes into existence by *the conjunction* of the will of the sovereign power and that of the corporators. Its charter is in the nature of a contract, and it can only be dissolved by an observance of the rules governing the dissolution or impairment of the obligation of contracts. When a corporation is regarded as to the completeness of its powers, it may be either one of full powers or imperfect in its character. In the last case it is termed a *quasi* corporation. Towns in the New England States are true corporations; in New York they are political divisions with certain specified powers, being *quasi* corporations.

II. A corporation may be created either by prescription, royal charter (see CHARTER), or by legislative act. It is said to be created by prescription when it has exercised corporate powers for an indefinite period without interference on the part of the sovereign power. By a fiction of law it is then presumed to have had a charter. The method of creating corporations by royal charter was formerly in use in this country as a branch of the English law. Of course the leading mode of creation is an act of the legislature. It is not necessary that each institution should receive a distinct and separate organization. There may be a general formula provided by the legislature with which any particular body of men desiring to become a corporation may comply, and thus become incorporated. In other words, corporations may be created under general laws as well as organized under special acts. It may be added that the legislature may act indirectly as well as directly. It may confer upon some intermediate authority the power to incorporate. In this way in New York an organization known as "The Regents of the University, etc." has the power under certain conditions to incorporate colleges and academies. To the existence of a private corporation the consent of the members is necessary. This consent may be shown either by an express act of acceptance, or by implication from the exercise of powers under the charter, technically called "user." It should have a name whereby to act or to contract, which may be from time to time changed either by special legislative act or by general law.

III. A corporation, being by fiction of law a person, may have the power to make contracts and to do most other acts possessed by natural persons. In general, however, it has capacity to do such acts as are necessary and convenient to carry forward the special ends for which it was created. At the present time it is usually formed to accomplish a definite object, and it is reasonable that it should have the authority necessary to achieve it. A corporation, like a natural person, may transgress the rules prescribed by law for its action. This fact has caused many perplexing questions to arise as to the effect of an unauthorized act. This subject is known as the doctrine of *ultra vires*—transgression of power. In such a case the better opinion would seem to be that the corporate act, considered as a contract, would be void, though the corporation might be liable to an individual injured by its negligent mode of performing an act which it had no legal authority to undertake. The ordinary powers of a corporation are to make such contracts as are necessary to the accomplishment of its purposes, to hold and acquire property, both personal and real, to have a common seal, to make by-laws for the government of its members or of others, and to elect new members or officers in the place of such as may resign, die, or be removed. The act of removing a member is termed *disfranchisement;* the same act exercised towards an officer is called *amotion*. From early times in England there have been statutes termed "mortmain acts" (see MORTMAIN) to restrain corporations from acquiring lands without license from the king. Such statutes do not, in general, exist in this country. The common practice is to limit in the specific act of incorporation the value of the land which may be acquired. If this restriction be exceeded, the title is still valid, unless the State intervenes and institutes proceedings for a forfeiture. It is a general rule that a corporation cannot acquire land by will except for charitable purposes. It is not uncommon, even in that case, for a State statute to limit the amount which a testator may bestow, or to require that the will shall be made a certain time before his death. A corporation may, like a natural person, act through agents beyond the limits of the State where it is organized, unless restrained by law. It should be added that a corporation may commit a wrong for which it will be liable in damages, such as an act of negligence, publication of a libel, etc. It cannot, in general, commit a crime, except as resulting from a failure to perform a duty prescribed by law. In order to enforce its rights and to subject itself to its legal duties it may sue and be sued at home or abroad, although a proceeding *against* a non-resident corporation would in general be confined to the property within the jurisdiction. Corporations sometimes are made trustees for estates, guardians for minors, etc. In such a case they would be held accountable in a court of equity in the same way as other trustees or guardians.

IV. By "visitation" is meant the power of superintending the corporation and controlling its action. The subject is peculiarly applicable to the management of charitable corporations. The common law distinguishes between a founder of such a corporation, who supplies the funds for its practical working, and the sovereign power which gives it legal existence. The founder in the first sense is allowed to provide rules for the government and discipline of the college or other institution which he has established, and to designate some person or persons (visitors) who shall see that the rules are properly observed. The exercise of this power of visitation is summary, and in general without review by the courts of justice, though in extreme cases of manifest injustice it would be revised. This power in the U. S. is rarely lodged in a single person, as it frequently is in England. Boards of trustees are here entrusted with it. This doctrine does not prevent a court of equity from controlling the funds on the theory of a trust, so as to prevent waste, mismanagement, or perversion from the purposes intended by the donors. In this aspect a corporation is to be regarded as a trustee. The attorney-general, representing the State, may apply to the court to correct abuses in the management of funds which are in the eye of the law directed to public uses. When the case is sufficiently grave the charter of the corporation may be forfeited.

V. A corporation may be dissolved either by compulsory legislation, by surrender of its franchises, coupled with acceptance of it by the state, and by judicial decree. In England an act of Parliament is boundless in its operation, and a corporation may be arbitrarily dissolved by law. In the U. S. a distinction has been taken between private and public corporations. As has been already seen, a charter of a private corporation is a contract, and as, under the U. S. Constitution, no State can pass a law impairing the obligation of contracts, the power of the State legislature cannot be exercised so as to materially change the provisions of the charter without the consent of the corporators. This is the result of the celebrated "Dartmouth College case." (Dartmouth College *v.* Woodward, 4 Wheaton.) The effect of this decision is evaded in a number of the States by the insertion of a clause, either in the charter or some general law, or even in the State constitution, that corporate charters are to be held subject to alteration or repeal. This clause is valid as to all subsequent charters, which are of course accepted in reference to this legislative reservation of power. The most common mode of dissolving a corporation is by judicial decree. Every franchise is accepted on the implied condition that it shall be properly exercised. If there be abuse or neglect to make use of corporate powers, a proceeding may be instituted in behalf of the State to forfeit the charter. The abuse or neglect does not *of itself* destroy the charter, nor can the cause of forfeiture be presented to a court in an indirect manner. For example, it could not be urged by a debtor as creating an incapacity to sue, or by an heir as an incapacity to take an estate by will. A proceeding must be resorted to for the very purpose of forfeiting the charter. State law sometimes provides dissolution as a mode of enforcing the collection of debts, the property being regarded as a trust fund for that purpose, and a court of equity will administer it for the benefit of creditors. The U. S. statutes of bankruptcy are extended to business corporations. It was an old rule of the common law that a dissolution of the corporation extinguished its debts. Its claims could be no longer collected. Its personal property passed to the State, and its land reverted to the grantor. At present there is little room for the application of these rules. A court of equity would, in general, fasten a trust upon the property in favor of creditors, and in all business corporations for the stockholders. Charitable funds would be administered by other trustees.

(For further information consult the treatises of GRANT, ANGELL, and AMES; ABBOTT'S "Corporation Digest;" KYD "On Municipal Corporations;" DILLON "On Municipal Corporations;" KENT'S "Commentaries," lecture 33; MEREWETHER & STEPHENS, "History of Boroughs and Municipal Corporations;" REDFIELD "On Railways." Also the titles MUNICIPAL CORPORATIONS, STOCK CORPORATIONS, RELIGIOUS SOCIETIES, etc.)

T. W. DWIGHT.

Corps d'Armée [Fr.], kôr dar'mā', or **Army Corps,** in the modern system of warfare, is the "tactical" unit of a large army. The Division, in the management of large bodies of troops, has been found to be too small, and hence army corps have been organized, each containing several Divisions. The management of tactical units in the field constitutes the branch of the military art known as "grand tactics." Each army corps has its own system of internal administration, and usually consists of infantry and artillery, the cavalry constituting one or more corps by itself.

Corps Législatif, or **Legislative Body,** was the name of the lower house of the French legislature during the Second Empire. It was established in 1852, and abolished in 1870. The deputies were elected, by universal suffrage, for a term of six years.

Corpulency. See OBESITY.

Cor'pus Catholico'rum and **Cor'pus Evangelico'rum,** names given after the peace of Westphalia to the Catholic and Protestant divisions of the German empire. The elector of Mayence was the head of the Catholics, while the lead of the Protestant confederacy belonged successively to the rulers of Saxony, the elector palatine, and Sweden, and was restored to Saxony by the Diet of 1653. Both bodies were dissolved at the separation of the German empire in 1806.

Cor'pus Chris'ti [a Latin phrase signifying the "body of Christ;" Fr. *fête Dieu*], a festival of the Roman Catholic Church celebrated in honor of the Host (which is held by that Church to be the veritable body of our Lord). It was first established by a bull of Urban IV. in 1264, and is observed on the Thursday after Trinity Sunday.

Corpus Christi, the county-seat of Nueces co., Tex., is situated on a bay of the same name, 8 miles below the mouth of the Nueces River, about 200 miles S. W. from Galveston. Its harbor is not surpassed on the coast, and in commercial importance it ranks among the first cities in the State. It has one weekly newspaper. Pop. 2140.

BARNARD & SON, PUBS. "GAZETTE."

Cor'pus Doctri'næ, the name of certain collections of theological writings which have had especial authority in the German Protestant churches. The chief collection was "Corpus Philippicum" (1560, fol.), containing the Apostolic, Nicean, and Athanasian Creeds, the Confession of Augsburg, Melanchthon's "Loci Communes," etc. The strict Lutherans reject it as leaning towards Crypto-Calvinism, and the elector of Saxony pursued with rigorous measures those who refused to teach it. This, with many other Corpora Doctrinæ, was superseded by the Formula Concordiæ.

Corpus'cular Ac'tion, the power or influence which the minute particles or *corpuscles* of matter exercise on each other, and which, according to some writers, is the cause of all chemical changes.

Corpus'cular Mech'anism, that branch of mechanical science which is concerned with the phenomena of cohesion. These phenomena indicate some relation between the centres of the particles cohering. The exact nature and cause of this relation are not known. (See COHESION.)

Corpus'cular Philoso'phy, a name sometimes given to the atomic philosophy of DEMOCRITUS (which see).

Cor'pus Ju'ris Canon'ici [Lat., signifying "the body of canon law"], a comprehensive name for the original collections of the CANON LAW (which see), including the "Decretum Gratiani" (1151), the "Decretalia" of Gregory IX. (1234), the "Liber Sextus" (1298), the Clementine Decretals (1313), etc. The best edition is that of Richter, Leipsic, 1833–39.

Cor'pus Ju'ris Civi'lis [a Latin term signifying the "body of civil justice"], the name applied to the legal compilations made by order of JUSTINIAN (which see), consisting of the "Institutions," the "Codex," the "Pandects," and the "Novellæ." One of the best editions is that of the Kriegel Brothers, Leipsic, 1833–40.

Corre'a de Ser'ra (José FRANCISCO), LL.D., a Portuguese botanist, born at Serpa in 1750. He visited the U. S. in 1813, and became Portuguese minister at Washington in 1816. He wrote several treatises on vegetable physiology, etc. Died Sept. 11, 1823.

Correc'tionville, a post-township of Woodbury co., Ia. Pop. 600.

Correg'gio, da (ANTONIO ALLEGRI), a celebrated Italian painter, was born at Correggio, a small town between Modena and Reggio, most probably in 1494. His father, Pellegrino Allegri, was a small merchant, the owner of a moderate property in houses and lands. His mother, Bernardina Piazzoli, was of good family, belonging to the stock of the Ormani or Aromani. By his father's care Allegri was well educated, and afterwards put to study the arts of drawing and painting—first, with Antonio Bartolotti, master of a school of painting in Correggio, and afterwards with an uncle, Lorenzo Allegri. From these teachers he learned the rudiments of his art, but whence came the influences that formed his peculiar manner is a question not yet answered. At one time he was said to have studied with Andrea Mantegna, but this is not now believed, though it is possible he may have lived in Mantua in his younger days, and have studied Mantegna's pictures there; among them, the magnificent "Victory" now in the Louvre. Bigi considers it proved by documentary evidence that Allegri was in Mantua in 1511, and thinks it possible that at this time he may have worked as an assistant under Andrea Mantegna's son, Francesco. But the influence of Mantegna was widely spread through the north of Italy, and it is not necessary that Allegri should have lived in Mantua to have been moved by him. Nor does he inherit as strongly from the great Mantuan as from Leonardo, and perhaps from certain Venetians, notably, as Signor Cavalcaselle thinks, from Cima, Palma, Lotto, and Pordenone. The stories first told by Vasari, and since repeated by successive biographers, of the poverty and misery of Correggio's life, of his painful efforts to support his family, of the obscurity and neglect in which he lived, and of his death, brought on by drinking cold water when overheated in consequence of carrying home sixty crowns in copper that had been given him for a picture—all these stories are now believed to be false; yet they were long credited, and it is difficult to account for the persistence of the tradition. He was well paid for his work, which was much sought after, and he was in great favor with the duke of Mantua, for whom he painted several of his most famous pictures—the "Education of Cupid" in the British National Gallery, the "Io" and the "Leda" in the Berlin gallery, the "Danaë" in the Borghese gallery, Rome, and the "Antiope" in the Louvre. Whether Correggio ever visited Rome is uncertain; his work bears no evidence of his ever having been there, and it is most likely that he never went so far from home. The story, too, that he visited Bologna, and there exclaimed on seeing the picture of Saint Cecilia by Raphael, "Anch' io son pittore!" ("And I too am a painter!") cannot be traced to any authority, and seems to have no foundation in fact. In 1519 he married Girolama Francesca Merlini, by whom he had a son, Pomponio Quirino Allegri, who also became a painter, but never attained any distinction (born 1521, died ——?), and also three daughters. Correggio died in his native town suddenly of a malignant fever, Mar. 5, 1534, in the forty-first year of his age. The principal works of Correggio are the frescoes on the dome of the church of San Giovanni, and those on the dome of the cathedral at Parma, reckoned his greatest performances. The first was executed in 1520, and represents the ascension of Christ; the second, begun in 1522 and finished in 1530, represented the assumption of the Virgin. These works have given Correggio his splendid fame, but his smaller works have perhaps endeared him more to the world—his "Vierge au Panier;" his "Education of Cupid" in the British National Gallery; the "Reading Magdalen" of the Dresden gallery; and the beautiful "Notte," or "Night," a picture of the Nativity, called so because the light all streams from the head of the infant Christ; the "Marriage of Saint Catherine" in the Louvre; the "Madonna and Child" in the Uffizi gallery in Florence; and the "Madonna" in the Naples gallery, called the "Zingarella," or the Gypsy, because of her singular head-dress. (VASARI, "Lives of Painters and Sculptors," "Life of Antonio da Correggio," with additional notices in his life of Girolamo Carpi; PADRE LUIGI PUNGILEONI, "Memorie istoriche di Antonio Allegri," Parma, 1818; QUIRINO BIGI, "Discorso di Ant. Allegri," Parma, 1860, and a later work on the subject by the same author, "Notizii di Antonio Allegri e di Antonio Bartolotti, suo maestro," Modena, 1873. But chiefly for an exhaustive account of Correggio's life and works see the article (since reprinted as a separate work) "Antonio Allegri," by Dr. Julius Meyer, in his new edition of NAGLER, "Allgemeines Kunstler Lexicon," Leipsic, 1870.)

CLARENCE COOK.

Correla'tion [from the Lat. *correlatio*, "mutual relation"] **of Forces** (otherwise called **Transmutation of Force** or **Energy**), a phrase of recent origin employed to express the theory that any one of the various forms of physical force may be converted into one or more of the other forms. The cardinal point in this theory is the doctrine of heat and its relation to other agents, especially to mechanical motion—the doctrine commonly known as the mechanical theory of heat, and which is of very recent date. In the number for May, 1842, of a German scientific journal (*Annalen der Chemie und Pharmacie*) there appeared a short article of only thirteen pages by Julius Robert Mayer, a physician of Heilbronn, entitled "Observations concerning the Forces of Inanimate Nature." In

this article it was affirmed, for the first time, that there exists a connection between mechanical work and heat by which the one could be converted into the other, mechanical work being obtained by the expenditure of heat, and heat being also obtained by the expenditure of work; there being, under all circumstances, one constant ratio between the quantity of heat and the amount of work. Soon afterwards, though apparently without any connection with the German statement, an English physicist (Joule of Manchester) experimentally demonstrated what Mayer had only asserted, and the scientific world came into possession of a new principle, now technically known as the principle of the equivalence of heat and work.

In the light of this principle it has been demonstrated that heat is nothing more nor less than a certain mode of motion. The heat manifested, *e. g.*, when we rub two flat surfaces briskly against each other, is only our own muscular motion checked by the friction, and changed thereby into the heat which the surfaces reveal. On the other hand, this muscular motion is only the heat of our bodily frame expending itself in this way. In either case the energy has not been annihilated, but only transferred, and appears in a new form. It has long been known that the actual force of a moving body may be changed into the molecular energy of heat. Pieces of dry wood when rubbed together will become so hot as to ignite; the boring tools of a carpenter become hot by being used; when a piece of metal is rubbed vigorously on a rough surface, it becomes too hot to hold. Again, when a train in motion is brought to a stand-still by applying a brake, the rails become hot, and sparks are seen to fly from the wheels. Bullets shot at a target sometimes show signs of fusion after impact. In all these cases the energy of visible motion is transmuted into heat. The amount of the one form of energy which will produce a given amount of the other has been accurately calculated. If a weight of one pound be raised to a height of 772 feet and be let fall, on striking the ground it will generate as much heat as will raise 1 pound of water 1° F.

By a conception of Carnot, a principle which may be termed the reversibility of force has been established. If a certain amount (A) of one form of force produce in disappearing an amount (B) of another form, then B is the quantity of the latter which must disappear in order to the production of an amount A of the former. By Carnot's principle, if an engine, by consuming a certain amount of heat, does a given quantity of work, by the consumption of a similar amount of work it would restore to the source the quantity of heat taken from it. This principle of Carnot is, however, only true in abstract theory. Its verification in practice would exact conditions which cannot be realized; for, though mechanical force can be wholly transformed into heat, it is not possible, by any kind of engine, to transform the heat received from a given source wholly into work. Every such engine abandons by far the larger portion of the heat which it receives, totally unchanged, to a recipient suitable to absorb it (the condenser in the Watt engine—the atmosphere in the case of the high-pressure steam-engine); and if any such engine were "worked backward," to use Carnot's expression, it would not restore to the source all the heat drawn from it during the working forward, unless what was in the first instance an absorbent of heat should become in its turn a source, and should give up the large amount of heat previously abandoned, to be restored by transfer, and not as the result of transformed work. In the case of other forms of force, the process of reversal is attended with equal and sometimes with greater difficulties. The reciprocal interchange is perhaps best illustrated between electricity (dynamic) and chemical affinities.

Visible kinetic force is changed into the kinetic energy of electricity by a magneto-electric machine, and into the potential energy of electricity when a plate of glass is made to revolve against a surface of silk. Again, the actual energy of electricity is transformed into force (or energy) of visible motion when a piece of iron is drawn to the poles of an electro-magnet, when two wires conveying electric currents attract one another, or when a current is made to pass through a wire which is nearer a magnetic needle, and the needle is in consequence forcibly deflected by the current.

Suppose the strength of a current of electricity passing along a wire to be measured by its power to deflect a magnetic needle. Suppose the wire to be of copper, and the amount of deflection noted, and then let the copper be replaced by platinum, which offers a greater resistance to the current. It will be found that the wire becomes hot, and that the needle is deflected through a smaller angle. Energy of heat is here produced at the expense of the energy of electricity in motion. With powerful batteries all metals are fused, even iridium and platinum, which are the least fusible. A battery of thirty or forty Bunsen's cells will volatilize fine wires of lead, tin, zinc, copper, gold, and silver.

When a bar of antimony and a bar of bismuth are soldered together at one extremity, and the free ends united by a copper wire, on the application of heat a current of electricity is found to circulate through the wire, and the strength of the current is an exact and delicate measure of the heat applied. When a crystal of tourmaline changes temperature, its extremities assume opposite electric states, thus affording an example of the change of heat into the potential energy of electric separation. The voltaic arc is a brilliant example of the conversion of electricity into the actual energy of radiant heat and light.

The force of chemical action, or separation, and heat are convertible. A given amount of chemical action produces a definite amount of heat, and this quantity of heat is required to reverse the chemical changes which have produced it. It is difficult to determine accurately the amount of heat equivalent to a given amount of chemical action, chiefly because it is very difficult to confine the transformation of energy to these two forms only; nevertheless, the relation between the amount of heat evolved and the quantity of chemical action has been determined by several eminent physicists; for example, Rumford calculated that 1 gramme of charcoal in combining with 2⅔ grammes of oxygen to make carbonic acid would evolve heat sufficient to raise the temperature of 8000 grammes of water 1° C. Andrew made the quantity 7900 grammes, and Favre and Silbermann 8080 grammes. Hence, the true quantity must be near 8000 grammes. One gramme of hydrogen, in combining with 8 grammes of oxygen to form water, evolves heat sufficient to raise about 34,000 grammes of water 1° C. (Andrews, 33,881; Favre, 34,462). Similarly, the quantities of heat evolved in the combustion of other elements have been found with equal precision.

The chemical action in a voltaic battery produces electricity. Just as a definite amount of carbon, by its union with oxygen, produces a determined quantity of heat, so the consumption of a definite amount of zinc in the battery produces a definite quantity of electricity, which in its turn gives rise to an invariable amount of heat. When the poles of the battery are connected by a very good conductor, such as a short thick wire, the heat produced is confined to the battery itself; but when a less perfect conductor is used, heat manifests itself in the conductor. In this case part of the heat is in the wire and part in the battery, but the whole amount of heat produced in all the parts of the current by the consumption of a given quantity of zinc is the same in this case as in the other. If the electric current be used to do other work, a corresponding amount of heat is withdrawn from the battery.

Suppose two tubes of glass, closed at one end, to have pieces of platinum wire fused into the closed ends, and to be filled with water and placed with the open ends under water in the same vessel. Let the poles of a battery be connected with the platinum wires. The water will be decomposed, oxygen collecting in one tube and hydrogen in the other. The amount of gas set free in a given time will be proportional to the strength of the current. If the battery be taken away, and the ends of platinum be connected by a copper wire, the gas will soon disappear; and while it is passing into water, a current will be found to circulate through the wire in a direction opposite to that which produced the decomposition. Here, then, electricity in motion produces energy of chemical separation, and the latter again reproduces the former.

Although we may estimate the exact equivalents of the various forms of energy, we are not always able to reverse a given transmutation. A given quantity of mechanical work will produce an equivalent amount of heat, and if all this heat could be changed into mechanical work the original amount would be produced; but we are never able to reconvert all the heat into work. Energy which cannot be reconverted to its previous form is said to be dissipated. Dissipation of energy is constantly going on throughout the universe. Thus, the energy of the sun's rays produces streams of water, winds, and currents. By its action on plants it separates carbon from oxygen—a process which is reversed when wood is ignited. The moon and the sun give rise to tidal energy. *Through all these channels energy is being constantly dissipated.*

Actual force, of all forms, may be transformed into potential force, and may remain in this state for an indefinite period of time. The energy of heat, which is derived from the combustion of coal, was originally derived from radiant heat and light received from the sun, but has been remaining in store for ages.

It is sometimes affirmed that there can be neither creation nor annihilation of energy; but the inexactness of this statement appears from the profound mathematical demonstrations which Clausius of Bonn has recently applied to

the mechanical theory of heat. He has shown that while motion may be converted into heat, and the heat, *to a certain degree*, may be reconverted into motion, yet in the latter process there is always a residuum of heat which cannot be reconverted. Now, as mechanical motion is all the while in the process of conversion into heat, and this at a prodigious rate through the universe, there is thus going on continually an increase of heat and a diminution of motion; and unless this tendency is checked by the interposition of some power other than the forces now acting in the universe, it must result in an equalization of temperature everywhere, and the cessation of all mechanical motion. But such a condition is not yet reached, therefore the universe cannot be eternal, and must therefore have had its existence through some source other than itself. The universe thus starts with a miracle, and it of course follows that miracles are possible at any stage of its continuance. (Grove, "On the Correlation of Forces:" Fick, "Ueber die Naturkraefte in ihrer Wechselbeziehungen:" Clausius, "On the Mechanical Theory of Heat;" Sir John Herschel's "Lectures.")

Revised by J. H. Seelye.

Corrèze, a department of France near its centre, is a part of the former province of Limousin. Area, 2265 square miles. It is drained by the rivers Dordogne, Vezère, and Corrèze. The surface is hilly; the soil is mostly poor. The staple productions are grain, timber, coal, copper, lead, iron, and chestnuts. Capital, Tulle. Pop. 310,843.

Cor'rie (Frederick H.), U. S. M. C., entered the marine corps as a second lieutenant in 1861, became a first lieutenant in 1861, and a captain in 1870. He led the marines of the Powhatan in the assault on Fort Fisher of Jan. 15, 1865, and at the close of the war was brevetted a captain "for gallant and meritorious conduct."

Foxhall A. Parker, U. S. N.

Corrien'tes, a province of the Argentine Republic, is bounded on the N. by the river Paraná, on the S. E. by the Uruguay, which separates it from Brazil, and on the W. by the Paraná. Area, about 45,455 square miles. The surface is occupied by extensive forests and swamps; the soil is fertile. Capital, Corrientes. Pop. in 1869, 129,023.

Corrientes, the capital of the above province, is on the right bank of the Rio Paraná, here 2 miles broad, a few miles below the confluence of the Paraguay. It has a good harbor, and exports meat, wool, etc. Pop. in 1869, 11,218.

Corro'sive Sub'limate, a name given to mercuric chloride (bichloride of mercury), ($HgCl_2$), a virulent and corrosive poison. (See Sublimate.)

Corr's, a township of Pickens co., Ala. Pop. 495.

Cor'rugated [from the Lat. *con*, intensive, and *rugo, rugatum*, to "wrinkle" (from *ruga*, a "ridge" or "fold")] **Iron,** a name applied to iron in thin plates or sheets which are passed between rollers, producing grooves and ridges in the iron. In this manner the strength of the material is greatly increased, while the square surface of the iron is of course reduced. Corrugated iron is of great value in the construction of buildings, especially for roofs, where lightness and strength are to be combined. It is much used for covering the walls of frame buildings, both within and without. It is frequently "galvanized"—*i. e.* covered with a thin layer of zinc by dipping it in a bath of the fused metal.

Corruption of Blood. See Attainder.

Cor'ry, a city of Erie co., Pa., at the crossing of the Philadelphia and Erie and the Atlantic and Great Western R. Rs., and the terminus of the Oil Creek and Alleghany and the Buffalo Pittsburg and Corry R. Rs., 37 miles S. E. of Erie. It has two national and one savings bank, a daily and three weekly newspapers, a large oil refinery, and numerous large manufactories (making mowers and reapers, boring-machines, pails, furniture, barrels, brushes, and stationary engines), tanneries, blast furnace, etc. There are in the city nine churches, four schools, a park, and a library. Corry has grown up since 1860. Pop. 6809.

J. A. Pain, Ed. Corry "Daily Blade."

Cor'rytown, or **Flat Creek,** a post-village of Root township, Montgomery co., N. Y., 4 miles S. of Canajoharie. On July 9, 1781, a party of 500 Indians and Tories, under one Doxtader, attacked and burned Corrytown, killing many of the inhabitants and making prisoners of many more. Next day Col. Willet, with 150 men, surprised and defeated them with severe loss.

Corseul (anc. *Fanum Martis*), a village of France, department of Côtes-du-Nord, 26 miles E. of Saint-Brieuc. Here are many Roman remains. Pop. about 4500.

Cor'sica [anc. *Cyrnos*, afterwards *Corsica*; Fr. *La Corse*], an island in the Mediterranean, situated between lat. 41° 20′ and 43° N., and lon. 8° 30′ and 9° 30′ E., 55 miles from Italy and 110 from France. It is separated from Sardinia by the Strait of Bonifacio, 9 miles wide. It is 110 miles long N. and S., and is 53 miles wide at the broadest part. Area, 3367 square miles. The W. coast is deeply indented by the Gulfs of Calvi, Porto, Ajaccio, and Valinco. The interior is traversed by a mountain-chain, the highest peak of which, Monte Rotondo, rises near the centre of the island, 8504 feet above the level of the sea. The mountains are mostly covered with forests of oak, pine, cork tree, chestnut, beech, etc. The rearing of cattle and mules is the chief branch of industry. The orange, fig, almond, olive, and citron flourish here. Among the minerals of Corsica are iron, antimony, lead, granite, porphyry, marble, and limestone. The chief towns are Ajaccio, Bastia, and Calvi. Corsica was first colonized by the Phœnicians, who called it *Cyrnos*, was conquered by the Carthaginians, and wrested from them by the Romans soon after 237 B. C. The Genoese became masters of it in 1481. It was ceded by the Genoese to France (of which it forms the eighty-sixth department) in 1768. Pop. 259,861.

Corsica, a post-borough of Jefferson co., Pa. P. 372.

Corsica'na, a city, capital of Navarro co., Tex., on the Houston and Texas R. R., 180 miles N. N. E. of Austin City. Two weekly papers are issued here. It is the seat of Corsicana Military Institute. Pop. 80.

Cor'so, an Italian word for a "race-course" [from the Lat. *cursus*, a verbal noun from *curro, cursum*, to "run"], is often used in Italy as the name of the principal streets of the larger towns. The Corso of Rome is famous as the scene of the diversions of the Carnival.

Cor'son (Hiram), an American scholar, born in Philadelphia in 1828, became a teacher, and was (1849–53) connected with the Library of Congress and that of the Smithsonian Institution. He was professor of history and rhetoric in Girard College (1865–66), and held a similar position in St. John's College, Annapolis, Md., 1866–70, when he became professor of English language and literature, etc. in Cornell University. He has published Chaucer's "Legende of Goode Women," "Handbook of Anglo-Saxon and Early English," and other valuable works, and has also prepared with great labor a "Thesaurus of Early English."

Cors'sen (William Paul), an eminent German philologist and antiquary, born at Bremen in 1820, was for several years professor at the gymnasium at Stettin, and subsequently at the Landesschule at Pforta until 1866, when he resigned on account of his health. He published a highly important work on "The Pronunciation, Vocalism, and Accentuation of the Latin Language" (2 vols., 1858–59; 2d ed. 1867–69), which received a prize from the Berlin Academy of Science, and is regarded as the best work thus far published on this subject. His essays on the dialects of ancient Italy are also among the best that have been written. Died in 1875.

Cort (Cornelis), a Dutch engraver, born at Horn in 1536. He opened a school in Rome, and produced many good engravings after Titian, Raphael, and other masters. Among his works is "The Transfiguration," after Raphael. Died in 1578.

Cor'te, a fortified town in the interior of Corsica, is situated on the Tavignano. Pop. 6094.

Cor'tes [the plu. of the Sp. *corte*, a "court"], the name of the national assembly or legislature of Spain. The Cortes of Leon, Castile, and Aragon originated about the twelfth century, and were composed of the nobility, dignified clergy, and the representatives of the towns. In the fourteenth century the power of the Cortes seems to have been at its height, after which it gradually declined, and under the reign of Ferdinand and Isabella was reduced almost to a nullity. After the time of Philip II. the Cortes of Spain were only convoked occasionally on the accession of kings, and their sittings were a mere form. A Cortes elected by universal suffrage in 1869 adopted a new and liberal constitution. The Cortes at present consist of a senate, elected for twelve years, and a lower house of deputies, elected for three years, on the basis of one deputy for every 40,000 inhabitants. The number of senators is four for each province. The name is also applied to the legislature of Portugal.

Cor'tez (Hernando), the conqueror of Mexico, was born at Medellin, in Estremadura, Spain, in 1485. He studied law at the University of Salamanca, and sailed to the New World to seek his fortune in 1504. He served with distinction under Velasquez in the conquest of Cuba in 1511, after which he married Catalina Juarez, and became the owner of an estate in Cuba. In 1518 he was appointed by Velasquez to conduct an expedition against Mexico, which had recently been discovered. He sailed from Cuba with eleven vessels and about 700 men in Feb., 1519, his pro-

fessed object being the conversion of infidels. He defeated an army of the natives at Tabasco, and landed on the site of Vera Cruz, where he destroyed his ships, to induce his men to fight with more desperate courage when they knew that it was impossible to save themselves by retreat. He learned that he had entered the extensive empire of Montezuma, who reigned over Anahuac and possessed immense treasures of gold and silver. In Aug., 1519, he left the seacoast and marched against Mexico or Tenochtitlan, the capital of Anahuac. Having defeated the Tlascalans in several battles, he entered Mexico without resistance in Nov., 1519, and was received with friendly demonstrations by Montezuma. The audacious Spaniard seized Montezuma in his own palace, kept him as a prisoner, and extorted from him a large quantity of gold. The captive prince was persuaded or forced to swear allegiance to Charles V., but he refused to adopt the religion of the Spaniards. Velasquez, who was jealous of Cortez, sent Narvaez with about 1000 men to supersede Cortez, or operate against him in case he should not submit. Leaving a part of his force at Mexico, Cortez marched with 250 men to encounter Narvaez, whom he defeated and took prisoner at Zempoalla in 1520. He persuaded the soldiers of Narvaez to enlist in his service, and he returned to Mexico, the people of which, during his absence, had revolted against the Spaniards. In the fight, which continued several days, Montezuma was killed by his own subjects, and the Spaniards were driven out of the city. Cortez gained a victory at Otumba in July, 1520, and took Mexico in 1521. He treated the vanquished with great cruelty. In 1522 the king of Spain appointed him governor and captain-general of the conquered country, called New Spain. Cortez returned to Spain in 1528, in order to vindicate himself against the accusations of his enemies, and was received with favor at court. He returned to Mexico in 1530 with diminished power in civil affairs, but retained the command of the army. Having again sailed to Spain in 1540, he accompanied Charles V. in his expedition against Algiers in 1541. He died at Seville Dec. 2, 1547. (See PRESCOTT, "History of the Conquest of Mexico;" GOMARA, "Historia de F. Cortez," Rome, 1556.)

Cor'tile [It. *cortile*, from *corte*, a "court"], an open quadrangular or covered area in a dwelling-house, surrounded by the buildings or offices of the house itself. It means also a courtyard.

Cort'land, a county near the central part of New York. Area, 485 square miles. It is drained by the Otselic and Tioughnioga rivers. The surface is moderately uneven; the soil is fertile. Cattle, grain, wool, and dairy products are raised extensively. Lumber, flour, cheese, iron and other metallic wares, and carriages are the chief manufactures. It is intersected by the Syracuse Binghamton and New York and the Utica Ithaca and Elmira R. Rs. Capital, Cortland. Pop. 25,173.

Cortland, a village, the capital of the above county, is on the Tioughnioga River and on the Syracuse Binghamton and New York, the Midland, and the Utica Ithaca and Elmira R. Rs., 36 miles S. of Syracuse. It has six churches, a national and a State bank, a State normal school, a lecture association and reading-room, and three newspapers. It is in Cortlandville township. Pop. 3066.

W. HOOKER, ED. "STANDARD AND JOURNAL."

Cortland, a tp. of Spottsylvania co., Va. Pop. 2222.

Cort'landt, a township of Westchester co., N. Y., on the Hudson River, about 40 miles N. of New York City. It contains the large village of Peekskill. Pop. 11,694.

Cort'landville, a township of Cortland co., N. Y. It contains Cortland Village and McGrawville, and has extensive manufactures of lime, etc. Pop. 6082.

Corto'na (anc. *Corytum* or *Corythus*, afterwards *Cortona*), a town of Italy, in the province of Arezzo, is on a high hill near the Lake of Thrasymene, 50 miles S. E. of Florence. It is the seat of a bishop, and has an old cathedral, which contains fine works of art; a castle built by the Medici, a theatre, a museum of Etruscan curiosities, and a famous academy of sciences. Here was one of the twelve chief cities of ancient Etruria. Portions of its walls, supposed to have been erected 3000 years ago, remain. Etruscan bronzes of exquisite beauty have been found here. In the Museum is a very valuable antique, the comic Græco-Etruscan Muse, done in encaustic on slate.

Corun'dum, Sapphire, Ruby, Oriental Amethyst, Oriental Topaz, Adamantine Spar, Salamstone, or **Emery,** a mineral consisting, when pure, of native oxide of aluminum, which is, however, almost invariably mixed with magnetic oxide of iron. It occurs crystallized, massive, granular, in impalpable powder, and in layers. Mineralogically, corundum is divided into three varieties: (1) Sapphire, which includes the purer kinds, as sapphire, ruby, oriental topaz, etc.; (2) corundum proper, the duller kinds crystallized or semi-crystalline, including adamantine spar; and (3) emery, the darker and coarser kinds.

The specific gravity of corundum is about 4, while in hardness it is next to the diamond. It becomes strongly electrical by friction. Its crystalline form is rhombohedral. The ruby or red sapphire is valued next to the diamond, and beyond a certain size (three and a half carats) as equal to it in value. Its color is supposed to be due to chromic acid, but the amount of coloring-matter is so small that it eludes the ordinary tests. The crystals are seldom above half an inch in length. Two crystals an inch in diameter and about two inches long are said to be in the possession of the king of Burmah. The largest ruby known came from China, and after having been in the possession of Prince Mentzikoff, was finally made one of the jewels of the Russian crown. The largest rubies come from the Capelan Mountains, Ava. Smaller ones are found in Saxony and Bohemia, and occasionally in other localities in Europe and the U. S. The blue sapphire occurs much larger, crystals three inches in length being sometimes found. The crystals sometimes exhibit a radiated interior with a play of colors, when it is known as asteria or asteriated sapphire. Sapphires are brought from Ceylon, India, and China, principally from the first-named country. Fine specimens are often found in the beds of streams, whither they have been carried after the decomposition of the rock originally enclosing them. The light-blue sapphires are often exposed to fire by lapidaries to render them more brilliant. With those from Epailly in France heating deepens the color. White sapphires are sometimes cut and passed for diamonds, which they much resemble. The Brazil sapphire is a blue tourmaline.

The Greek σάπφειρος, from which the name was derived, was, according to Dana, not our sapphire, but the stone now known as lapis-lazuli. Rubies and sapphires contain about 1 per cent. of magnetic oxide of iron.

Adamantine spar occurs in brownish crystals. It was used by the ancients as a polishing material, and continues to be used for fine work. The chief supplies are brought from China and the Ural Mountains. Salamstone occurs in pale reddish or bluish transparent crystals. Corundum is found abundantly in Chester co., Pa.

Emery, or "Armenian stone," is mined in Naxos at Cape Emeri, in the vicinity of Smyrna, Asia Minor, in Saxony, the Ural Mountains, Greece, Spain, etc., and in the U. S. at Chester, Mass., and in North Carolina. It occurs in gneiss, granite, mica slates, and in some cases in limestone rocks. Small specimens are also found in several other localities. It is used as a polishing material. The rock is broken up by hammers, and then reduced to powder and sifted, after which, for the preparation of the finer kinds, elutriation is practised. Emery stones and wheels are made by pressing the powder, made into a paste with water, into moulds, and then exposing them to a high heat, no cementing material being required. Emery vulcanite for polishing wheels is made by mixing emery with rubber and sulphur, and vulcanizing in moulds. (See INDIA-RUBBER.) Emery contains from 13 to 30 per cent. of magnetic oxide of iron. The Naxos emery contains about 24 per cent., and the Chester emery, averaging about the same, contains from 9 to 50 per cent. The value of the samples is determined by the amount of glass which a given quantity will wear away. The Ceylon sapphire, which is taken as a standard, wears away four-fifths of its weight of glass. The consumption of emery in the United Kingdom is put at 2000 tons per annum. (See EMERY; also valuable papers on emery by J. Lawrence Smith and C. T. Jackson in Silliman's "American Journal of Science" [2d series], vii. 283; ix. 289; x. 354; xxxix. 87; xl. 112, 123.)

C. F. CHANDLER.

Corun'na, a province of North-western Spain, forming the N. W. part of Galicia, having the ocean W. and N., Lugo E., and Pontavedro S. It has fine forests and pastures and arable lands, besides iron-mines. Area, 3079 square miles. Capital, Corunna. Pop. 609,337.

Corunna [anc. *Adrobicum*; Sp. *Coruña*], a fortified city and seaport of Spain, capital of a province of its own name, is on the Atlantic Ocean, 320 miles N. W. of Madrid; lat. 43° 22′ N., lon. 8° 24′ W. It has a safe harbor defended by two forts, and a lighthouse, which is called the Tower of Hercules, and is ninety-two feet high. It has a citadel, court-house, custom-house, arsenal, theatre, and the palace of the captain-general. Here are manufactures of linen and hats, cordage, canvas, and cigars. On Jan. 16, 1809, a battle occurred here between the French marshal Soult and the British general Sir John Moore, who was killed. Pop. 27,354.

Corunna, a post-village, capital of Shiawassee co., Mich., on the Shiawassee River and the Detroit and Mil-

waukee R. R., 75 miles N. W. of Detroit. It has a national bank, two iron-foundries, and one weekly newspaper. Pop. 1408.

Corval'lis, the county-seat of Benton co., Or., on Willamette River, 100 miles S. of Portland, contains the State Agricultural College, an academy, two public schools, three large saw and planing mills, a number of brick stores, and two weekly newspapers. It is surrounded by a rich agricultural country, which is very healthful. Steamboats visit the town during two-thirds of the year. The principal export is wheat. R. G. Head, Ed. "Democrat."

Corvée [etymology doubtful], a French term denoting, in feudal law, the obligation of the inhabitants of a district to perform certain services for the sovereign or feudal lord. Some of these services were performed gratis, others for wages below the value of the labor.

Corvette [from the Lat. *corbis*, a "basket," probably so called from some fancied resemblance in shape], a small vessel of war having three masts, flush decks, and one tier of guns on the upper deck. The masts are square-rigged. A corvette rarely carries more than twenty-six guns.

Corvi'nus (Matthias) **I.,** king of Hungary, a son of John Huniades, was born at Klausenburg in 1443. He was elected king in 1458. He waged war against the emperor Ferdinand III., the Turkish sultan, and the king of Poland. In 1485 he captured Vienna. He had superior military talents and was an able ruler. Died in 1490. (See Wenzel, "Matthias Corvinus," 1810.)

Cor'vus (M. Valerius), a famous Roman general, born about 370 B. C., was elected consul in 348. He defeated the Samnites in 343, and was chosen dictator in 342 and in 301 B. C. In the year 299 he was elected consul for the sixth time. Died about 270 B. C.

Cor'win, a township of Ida co., Ia. It contains Ida, the county-seat. Pop. of township, 165.

Corwin (Thomas), an American statesman and orator, born in Bourbon co., Ky., July 29, 1794, removed to Ohio in early youth, and studied law, which he practised with distinction. He was elected a member of Congress in 1830, joined the Whig party, and advocated the election of Gen. Harrison in 1840 by effective public speeches. In the same year he was chosen governor of Ohio. He was elected to the Senate of the U. S. in 1845, and was appointed secretary of the treasury by President Fillmore in July, 1850. In 1858 he was chosen a member of Congress. He was sent as minister to Mexico in 1861, returned home in 1864, and died Dec. 18, 1865.

Cor'wine, a township of Logan co., Ill. Pop. 1069.

Coryban'tes [Gr. Κορύβαντες, the plural of Κορύβας; etymology doubtful], the name of the frantic priests of Cybele or Rhea. They were distinct from the Galli, who were eunuchs and priests of the same goddess. They celebrated the festivals of Cybele with orgiastic dances and loud cries, beating on timbrels, and cutting their flesh with knives.

Cor'ydon, a post-village, capital of Harrison co., Ind., is on Indian Creek, 115 miles S. of Indianapolis. It has two weekly newspapers, a furniture factory, two flour-mills, and an academy. It is a handsome place, has a sulphur spring, and is quite a summer resort. It was the capital of the State until 1824. Pop. 747.

Geo. W. Self, Ed. "Republican."

Corydon, a post-village, capital of Wayne co., Ia., about 65 miles S. by E. from Des Moines, has two weekly newspapers. Pop. 618; of Corydon township, 1277.

Corydon, a township of McKean co., Pa. Pop. 169.

Corydon, a post-township of Warren co., Pa. P. 411.

Coryell, a county of Central Texas. Area, 960 square miles. It is intersected by the Leon River and Cowhouse Creek. The surface is undulating; the soil fertile. Stock-raising is the chief pursuit. Corn and wool are raised. The county has some timber, and is rather dry, but very healthy. Capital, Gatesville. Pop. 4124.

Coryla'ceæ [from *Corylus*, one of the genera], a name given to a natural order of exogenous trees and shrubs, which some botanists call Cupuliferæ. It contains the oaks, chestnuts, beeches, hazels, etc.

Corylus. See Hazel-Nut.

Cor'ymb [Lat. *corymbus;* Gr. κόρυμβος, the "top" of anything; also a "cluster of flowers or fruit"], in botany, a form of inflorescence consisting of a central axis and lateral pedicels, of which the lower are longer than the upper, and the lengths of the pedicels are so graduated that the flowers are all on the same level, as in the *Spiræa, Kalmia,* and *Cratægus* (hawthorn).

Cor'ypha [from the Gr. κορυφή, "summit"], a genus of tropical fan-leaved palms, one of which, the *Corypha umbraculifera,* or talipot palm, grows in Ceylon to the height of sixty or seventy feet, and each leaf is about 30 feet in circumference.

Coryphæ'us [Gr. κορυφαῖος], sometimes written in English **Corypheus,** the leader of the chorus in ancient dramas, by whom the dialogue between the chorus and the other actors of the drama was carried on, and who led in the choric song. The name is metaphorically applied to any great leader; thus Dr. Samuel Johnson is sometimes called "the coryphæus of English literature."

Cos, or **Kos** [Gr. Κῶς], called also **Stan'chio,** an island of Asiatic Turkey, in the Mediterranean, is separated from the coast of ancient Caria by a channel about three miles wide. It was called *Lango* in the time of the Knights of Rhodes. It is nearly 22 miles long and 5 miles wide. Area, 85 square miles. The surface is partly hilly, the soil is fertile, and the climate delightful. Among the products are cotton, silk, wine, and fruits. In ancient times it contained a celebrated temple of Æsculapius, and was the native place of Hippocrates, Apelles the great painter, and Ariston the philosopher. Cos is also the name of a seaport-town on this island. Its port is visited by many merchant-vessels. Pop. about 8000, two-thirds of whom are Greeks.

Cosa'la, a Mexican mining-town in the state of Sinaloa, 200 miles S. E. of El Fuerte. Pop. about 7000.

Cosen'za, a province of Italy, bounded on the N. by Basilicata, on the S. by Catanzaro, and on the E. and W. by the sea. It is mountainous, and produces rice, saffron, honey, oil, and wine. Capital, Cosenza. It was formerly named Calabria Citeriore. Area, 2840 square miles. Pop. in 1871, 443,483.

Cosenza (anc. *Consentia*), a fortified city of Italy, capital of the above province, is at the confluence of the rivers Crati and Busento, 12 miles E. of the Mediterranean. It is the seat of a bishop, and contains a fine court-house, a cathedral, a royal college, a theatre, several convents, and an old castle which has been converted into barracks. It has manufactures of cutlery and earthenware, and an active trade in silk, wine, manna, rice, etc. Consentia was the ancient capital of the *Bruttii.* Pop. 11,649.

Coshoc'ton, a county of N. E. Central Ohio. Area, 516 square miles. It is drained by the Tuscarawas and Walhonding rivers, which unite here to form the Muskingum. The surface is partly hilly; the soil is fertile. Cattle, grain, and wool are largely raised, and manufactures are varied and quite important. Coal and iron are abundant here. It is intersected by the Pittsburg Cincinnati and St. Louis R. R. Capital, Coshocton. Pop. 23,600.

Coshocton, a post-village, capital of the above county, is on the Muskingum River just below the junction of the Tuscarawas and Walhonding, on the Ohio Canal and on the Pittsburg Cincinnati and St. Louis R. R., 69 miles E. N. E. of Columbus. A bridge across the river connects it with Roscoe. Coshocton has two weekly newspapers, iron and steel works for axles, springs, and iron bridges, a paper-mill, and one national bank. Pop. 1754.

T. W. Collier, Jr., Ed. Coshocton "Age."

Cosmog'ony [Gr. κοσμογονία, from κόσμος, the "world," and γένω, to "originate"], the science or theory which treats of the origin of the universe. If we except the cosmogony of the East Indians, the earliest extant is that of Hesiod, which is delivered in hexameter verse. The first prose cosmogonies were those of the early Ionic philosophers, of whom Thales, Anaximenes, Anaximander, and Anaxagoras are the most celebrated. In modern times a "Theory of the World" has been produced by Burnet. We do not include in this list of cosmogonies the researches of modern geologists, or the systems to which they have led. The different theories of the origin of the world may be comprehended under three classes: 1st. Those which suppose the world to have existed from eternity under its actual form. Aristotle embraced this doctrine, and, conceiving the universe to be the eternal effect of an eternal cause, maintained that not only the heavens and the earth, but all animate and inanimate beings, are without beginning. 2d. Those which consider the matter of the universe eternal, but not its form. This was the system of Epicurus and most of the ancient philosophers and poets, who imagined the world either to be produced by the fortuitous concourse of atoms existing from all eternity, or to have sprung out of the chaotic form which preceded its present state. 3d. Those which ascribe both its matter and its form to the direct agency of a spiritual cause.

The account given in Genesis of the creation is obviously not a scientific cosmogony, which would not only have been out of place in a divine revelation intended especially to impart religious truth, but would, if given in a scientific

form (since science is constantly progressing and therefore changing), have been adapted to a single age or period only. Or, supposing the highest and *ultimate* facts of science had been given, it would have been so far in advance of all scientific thought yet reached, or that will be reached perhaps for fifty thousand years to come, that it would be wholly unintelligible, and would in all probability appear utterly absurd even to the most advanced intellects. Therefore those few great facts which were necessary to be indicated in order to point out the relation between the Creator and his works have been presented in a popular rather than a scientific form. Nor can it be said that they are any the less true because not presented in scientific phraseology.* An excellent exposition of the harmony between the Mosaic and the geological record of creation is given by Prof. Dana at the end of his "Manual of Geology," to which the reader is referred. (See also TAYLER LEWIS'S "Six Days of Creation.")

Cosmos, a post-township of Renville co., Minn. P. 62.

Cosne (anc. *Condate*), a town of France, in the department of Nièvre, on the Loire, 29 miles N. N. W. of Nevers. It has manufactures of hardware, cutlery, and anchors. Pop. 6575.

Cos'sa, a township of Perry co., Ark. Pop. 240.

Cos'sack [a term of Turkish origin, said to signify "robber"]. The Cossacks are a Slavic race intermixed with Kalmucks and Tartars. They are divided into two classes—the Cossacks of the Don and the Cossacks of Little Russia, or Malo-Russian Cossacks. The latter were not known by the name of Cossacks until 1516. Stephen Bathori, king of Poland, formed them into regiments, under the control of a hetman or ataman, in 1592. They placed themselves under the protection of Russia in 1654, and revolted in 1708. The Cossacks of the Don entered the service of Russia in the sixteenth century. Their territory now constitutes a government (province) of European Russia, with an area of 59,654 square miles, and a population in 1867 of 1,010,135. Tscherkask, their capital, destroyed by fire in 1744, was rebuilt in 1805. They are extensively colonized in Siberia.

The principal hetman (ataman) of the Cossacks is the heir-apparent of the Russian empire. The Cossacks serve in the army both as irregular cavalry and as light artillery. In 1870 there were 183,007 Cossacks, including officers, enrolled in the Russian service. This enrolment includes all the males. More than 30,000 were in the latter year serving in the Russian line, chiefly in Siberia. They also serve to some extent in the Turkish army.

Cos'ta (Sir MICHAEL), a musical composer, born in Naples in Feb., 1810, manifested early a taste for music, and studied under Tritto. He became conductor of the London opera in 1831. He has written "Kenilworth" and "Sir Huon," ballets, "Malek Adel," which failed in Paris, and "Don Carlos," operas, and "Naaman" and "Eli," oratorios.

Costa-Cabral, da (ANTONIO BERNARDO), count of Thomar, a Portuguese statesman, born May 9, 1803, became a judge of Lisbon, and entered the ministry in 1836. He controlled the government, supported by the court, and by oppressive unconstitutional measures brought upon himself the hatred of all parties. He was obliged to retire in 1846 in consequence of a popular insurrection, was recalled in 1849, but was obliged to flee the country in 1851. His brother Silvo led the opposition.

Cos'ta Ri'ca (*i. e.* "rich coast"), the most southern state of Central America, is bounded on the N. by Nicaragua, on the E. by the Caribbean Sea, on the S. E. by Panamá, and on the S. W. by the Pacific Ocean. It lies between lat. 8° and 11° 30′ N. and lon. 83° and 85° 40′ W. Area, 21,495 square miles. The surface is mountainous, the state being traversed by a range which is a continuation of the Andes or Cordilleras. Among the peaks of this range are several active and extinct volcanoes. Mount Cartago (or Irasu) rises about 11,480 feet above the level of the sea. This region is subject to frequent earthquakes. The rainy season continues about six months, between April and October. The name of Costa Rica is said to be derived from the rich gold-mines which are found here. The soil of the table-lands and valleys is fertile. The staple productions are coffee, maize, tobacco, sugar, and dyewoods. The country is extensively covered with forests, in which the mahogany, cedar, and other valuable trees abound. Capital, San José. The government is called a republic, and was established in 1823. The president is elected for a term of three years. Costa Rica was one of the states of the Confederation of Central America, from which she seceded in 1840. Pop. in 1870, 165,000.

Coste (JEAN JACQUES CYPRIEN VICTOR), a French naturalist, born in Castries in 1807. He published, besides other works, a "Voyage of Exploration along the Coasts of France and Italy" (1855).

Cos'tello (LOUISA STUART), an authoress, born in Ireland in 1815. Among her works are a "Summer amongst the Bocages and Vines" (1840) and "Memoirs of Eminent Englishwomen" (4 vols., 1844). She produced a collection of translations from Persian poets entitled "The Rose-Garden of Persia" (1845); also "Jacques Cœur, the French Argonaut, and his Times" (1 vol., 1847). Died April 24, 1870.

Cos'ter (LAWRENCE JANSEN), mentioned by Adrian Junius in "Batavia" (Leyden, 1588), an historical work written 1565–69, following an account current in Haarlem, as the original inventor of movable types. He first cut letters out of wood and printed from them the Dutch "Hailspiegel." Afterwards he made his letters from lead and tin, and called in assistants, whom he swore to secresy. This was about 1440. One of the workmen, named Johann, stole his master's type and forms, and afterwards printed books in Mayence. This story has always been upheld by the Dutch.

Costi'lla, a county in the S. of Colorado, partly bounded on the W. by the Rio Grande del Norte. The main chain of the Rocky Mountains extends along the eastern border of this county, which includes a large part of the fertile valley called San Luis Park. Near the middle of this park is San Luis Lake. The sides of the mountains are covered with forests of pine, fir, cedar, spruce, etc. Gold and silver are found here. Water and timber are abundant. Cattle and wool raising are the chief pursuits. Capital, San Luis. Pop. 1779.

Cos'ton, a township of Worcester co., Md. Pop. 2832.

Cos'tume [from the Lat. *consuetudo*, "custom," "usage;" Fr. *costume*] signifies, in its wider sense, the external appearance which the life of a people presents, and in its more usual sense the modes of clothing and personal adornment which prevail in any period or country. In both senses it plays an important part in art and literature. Homer brings it into view in narrating the achievements of his heroes. In modern times Sir Walter Scott has introduced the fashion of minute description of external costume. In the arts of the painter and actor attention to costume becomes indispensable. The sculptor has been sorely tried by the wigs and breeches of former times, and by the hats and other monstrosities of our own. One way of escaping from the difficulty was to discard the modern dress altogether, and substitute the ancient toga; another was to conceal the figure as much as possible in a cloak. The first of these expedients violates what artists regard as the laws of costume, by which they feel bound to represent every object with appropriate accessories; the second is often open in a less degree to the same objection. The great attention to costume in the earlier stages of art, though sometimes injurious to artistic effect, has been of great value for historical purposes. Among the old masters of the Italian and German schools there is a tendency to exhibit costume with painful minuteness. The mediæval custom of representing historical and sacred characters in the costume peculiar to the country and period of the artist prevailed in the most flourishing age of Italian art. We may learn from Paul Veronese the aspect presented by a feast in the palace of a Venetian grandee, but we can have little conception of the costumes at the marriage in Cana and in other scriptural subjects treated by the Italian painters. The effort to avoid anachronism by antiquarian study belongs almost entirely to the modern schools of art. In dramatic representations attention to costume becomes imperative. When the religious mysteries were brought upon the stage in the Middle Ages, the costume adopted was that of the age and country in which the representation took place; and this state of things continued during the time of Shakspeare, Lope de Vega, and Molière. About 1750 the French actress Clairon introduced a reform, but Talma was the first to bring on the stage a costume really true to history. Garrick and other eminent English actors followed his example.

Cosum'nes, a township of El Dorado co., Cal. Pop. 542.

Cosumnes, a post-township of Sacramento co., Cal. Pop. 694.

Coteau St. Augustin, a suburb of Montreal, in Hochelaga co., province of Quebec (Canada), has iron-works, large tanneries, and a glass-factory. Pop. about 5000.—COTE ST. LOUIS, an extra-municipal suburb of Mon-

* When we remark in popular language, "The sun rises," who shall say that, though the expression is not astronomically true, we do not, for all practical purposes, utter as important a truth as when we say, "The earth by its revolution brings us to that point where the sun becomes visible"?

treal, has extensive quarries of building-stone. Pop. about 4000.—Coteau St. Pierre, Côte St. Antoine, Côte St. Catharine, Côte des Neiges, Côte St. Paul, Côte St. Luc, etc., are all suburbs within the municipality of Montreal (which see).

Côte-d'Or (*i. e.* "region of gold," named in allusion to the wealth of its vineyards), a department in the eastern part of France, formed of a portion of the old province of Burgundy. Area, 3383 square miles. The surface is diversified by hills and valleys, and partly traversed by a chain of low mountains called Côte-d'Or. It is drained by the rivers Seine, Aube, and Saône. Among its minerals are coal, iron, marble, and gypsum. A large part of this department is covered with forests. The soil is mostly fertile. It produces 18,500,000 gallons of wine annually. Here are raised the Burgundy wines. Capital, Dijon. Pop. 382,762.

Cotent'nea, a township of Lenoir co., N. C. P. 1470.

Co'terie [a word of French origin, supposed to be derived from the Lat. *quota*, a "share"], a word said to have been first applied to commercial associations in which each member contributed to the general fund. The name is now given to any circle of an exclusive character, whether social, literary, or political.

Cotes (Roger), an English clergyman, born at Burbage July 10, 1682, was a fellow of Trinity College, Cambridge. He became Plumian professor of astronomy in 1706, and published the second edition of Newton's "Principia," with a learned preface (1713). He wrote "Harmonia Mensurarum" (1722). Died June 5, 1716. Newton had so high an opinion of his abilities that he exclaimed, "If Cotes had lived, we should have known something."

Côte Sans Besoin, a post-township of Callaway co., Mo. Pop. 869.

Côtes-du-Nord (*i. e.* "northern coasts"), a maritime department of France, formed of part of the old province of Bretagne. It is bounded on the N. by the English Channel, on the E. by Ile-et-Vilaine, on the S. by Morbihan, and on the W. by Finistère. Area, 2268 square miles. The surface is partly mountainous; the soil is mostly fertile. Many horses and cattle are reared here. Large quantities of grain and linen goods are exported. Among the minerals are iron, lead, and granite. Capital, Saint-Brieuc. Pop. 641,210.

Co-tidal Lines, a system of lines drawn upon a map, terrestrial globe, or chart, to illustrate the course of the tidal wave. They were devised by Dr. Whewell, and are given in the present work in Map No. III. Each of these lines passes through the places which have high water at the same hour, thus tracing the crest of the wave, and enabling the eye to follow its course with all the modifications that it experiences in each ocean.

A glance at the map of co-tidal lines, which gives the position and shape of the crest of the tidal wave at intervals of an hour, will show that the parent wave from the South Pacific moves on most swiftly in the open and deep ocean S. of the continents. There, also, its motion preserves its normal direction westward, and its crest extends from N. to S., while in the interior of the three oceans both are considerably deflected to the N., and even turned back to the E. (See Tides, Oceanic Waves, and Currents, and Currents, Marine.) Arnold Guyot.

Cotopax'i, a volcano of South America, in Ecuador, in the eastern Cordillera of the Andes, 34 miles S. S. E. of Quito; lat. 0° 40′ S., lon. 78° 39′ W. Its form is almost perfectly conical. It rises 19,498 feet above the level of the sea, and 9800 feet above the adjacent valley, being the highest volcano in America that has been active in recent times. Its first recorded eruption occurred in 1532. In 1698 an eruption destroyed the city of Tacunga, and in 1738 the flames rose 3000 feet above the brink of the crater. A violent eruption occurred in 1768, when clouds of ashes and smoke darkened the air for a distance of many miles. During the eruption of 1803, Humboldt, who was at Guayaquil, about 135 miles distant, heard the explosions of this volcano. A belt about 4400 feet wide is covered with perpetual snow. It was first ascended in 1872 by Dr. W. Reiss.

Cotro'ne (anc. *Crotona*), a town of Italy, province of Catanzaro, on the Mediterranean Sea, 6 miles N. W. of Cape Nau. It is enclosed by walls and defended by a citadel. It is the seat of a bishop, and has a small harbor, a cathedral, and several hospitals and convents. Pop. 5807.

Cotta (Johann Friedrich), Baron von Cottendorf, an eminent publisher, born at Stuttgart April 27, 1764, founded at Tübingen in 1793 the "Allgemeine Zeitung," an able daily journal, afterwards published at Augsburg. He was a friend and liberal patron of Goethe and Schiller, whose works he published. He established a steam press at Augsburg in 1824. He was for many years a member of the Würtemberg Diet, and in 1824 was elected vice-president of the second chamber. Died Dec. 29, 1832.

Cotta (L. Aurelius), a Roman senator, became prætor in 70 B. C. He was consul for the third time in the year 65, and co-operated with Cicero against Catiline in 63 B. C. He was an adherent of Cæsar in the civil war which began in 49 B. C.

Cotta, von (Bernhard), an eminent German geologist, born in Thuringia Oct. 24, 1808, was appointed professor in the School of Mines at Freiberg in 1842. Among his important works are a geognostic map of Saxony in twelve sections, published conjointly with Naumann; "Geognostische Wanderungen" (2 vols., 1836–38); "Anleitung zum Studium der Geognosie und Geologie" (3d ed. 1849); "Geologische Bilder" (4th ed. 1861); "Deutschlands Boden" (2d ed. 1858); "Geologie der Gegenwart" (3d ed. 1871). He has also since 1847 been editing the "Ganenstudien." He favors the theory of evolution.

Cot'tage Grove, a township of Saline co., Ill. P. 713.

Cottage Grove, a township of Allen co., Kan. P. 794.

Cottage Grove, a post-township of Washington co., Minn., 13 miles S. E. of St. Paul. Pop. 705.

Cottage Grove, a post-township of Dane co., Wis. Pop. 955.

Cottage Hill College, for young ladies, at York, Pa., on the Northern Central R. R., 27 miles from Harrisburg and 58 miles from Baltimore, between which places there are five daily trains each way. There are also three daily trains to Wrightsville, making connection at Columbia for Reading and Philadelphia. The borough of York contains 11,003 inhabitants, and is noted for the healthfulness of its situation. The college grounds, upon which are several excellent springs of good water, contain nine acres, which are nicely ornamented with shade-trees and shrubbery. With the Codorus flowing near by the buildings, and with the beautiful scenery around, this is one of the most delightful and attractive locations in the State. Cottage Hill College was founded in 1850 by Rev. J. F. Hey, who for a number of years conducted it as a female college with great success. Under his charge it rapidly increased in distinction until it justly ranked among the best female schools in the State, enjoying a large and influential patronage. In Jan., 1866, the property was purchased from Prof. Hey, and the building has since been furnished with new furniture, new carpets, and new bedding; first-class musical instruments, a chemical and philosophical apparatus, globes, charts, and maps, have been procured; and many important improvements have been made, designed to secure the general comfort of the pupils. On the 21st of Feb., 1868, the institution was chartered by the legislature of the State, with full collegiate powers to confer all literary degrees and academic honors which are usually granted and conferred by other colleges for the education of young women. In 1863, Rev. J. F. Hey resigned the charge of this institution, and Prof. L. B. Heiges conducted the school for the three succeeding years very successfully. In 1866, Rev. D. Eberly succeeded Prof. Heiges, and under his direction the institution was chartered by the legislature of Pennsylvania, as already stated. In 1872, Rev. D. Eberly having resigned, Prof. J. Nelson Clark, M. D., was appointed president. Since the institution was chartered thirty young ladies have graduated.

J. Nelson Clark.

Cott'bus, or **Kottbus,** a town of Prussia, in Brandenburg, on the river Spree, 67 miles S. S. E. of Berlin, with which it is connected by a railway. It is enclosed by walls, and has a royal palace and a gymnasium; also manufactures of woollen cloths, linen goods, hosiery, tobacco, etc. Pop. in 1871, 18,916.

Cotting (John Ruggles), M. D., LL.D., born in Acton, Mass., in 1787, educated at Amherst, Dartmouth, and Cambridge. After spending fifty years of his life in New England, he was yet spared to enjoy thirty more in the valley of the Oconee, near Milledgeville, then the capital of Georgia, where he died, Oct. 13, 1867, and was buried, thus leaving the beautiful impress of that invisible but vital chain binding the hearts of this great people into one mighty nation. Dr. Cotting, having acquired reputation by his publications in chemistry and geology, was induced by cotton-planters of Georgia to make an agricultural survey of two or three counties of that State, the maps and drawings of which were magnificently executed, and were deposited in the museum of the medical college in Augusta; and their fame reached even Russia, whose emperor solicited a copy for the Royal Library of St. Petersburg. He was a Congregational minister, and had held professorships in Amherst College and at Pittsfield Medical School. Paul F. Eve.

Cot'ton [Fr. *coton;* Sp. *algodon;* Arab. *alqoton*], the fibre which surrounds the seeds of various species of cotton-plant, though the numerous cultivated varieties (mostly annual or biennial) are now referred to two or three species, the *Gossypium album*, *nigrum*, and perhaps *arboreum*, plants of the natural order Malvaceæ, to which an East Indian origin is assigned by the most recent authorities, though they have been grown from time immemorial in Africa and America. The first mention of cotton by any

Cotton-plant.

writer is by Herodotus, about 450 B. C. It is supposed that the cotton culture was first practised in India, but history furnishes no means of ascertaining when, or by what progressive stages of discovery and invention, cotton was first utilized by man. There is no record of any cotton being manufactured in Europe before the tenth century. Cotton is a tropical plant, and nearly all that is raised in the world is produced by the colored races. Its most northern limit is reached in Manchooria, where it is cultivated with success. Columbus found cotton in use among the natives of Hispaniola, but only in its most primitive form. In 1536 the cotton-plant was found growing in the country drained by the Mississippi and in Texas, but it was first planted as an experiment in the U. S. in the year 1621.

As early as the year 1736 the cotton-plant was known on the Eastern Shore of Maryland, in the lower counties of Delaware, and in other places in the Middle States, but it was chiefly regarded as an ornamental plant, and confined to gardens. It was not till after the Revolution that cotton culture was prosecuted with a view to export, though as early as 1739 it is reported that one bag of cotton was exported from Savannah, Ga., and about this time effort was made to bring cotton to perfection in South Carolina. In the year 1784 an American ship, which had on board eight bags of cotton for Liverpool, was seized, on the ground that so much cotton could not have been produced in the U. S. In 1785 the culture of short-staple cotton was commenced in the U. S., and 1,000,000 pounds in 1795 were exported from Charleston, S. C. Since that time the use of cotton, which previously had been for the most part limited to the hot climates where it grew, has marvellously extended, so that at present it constitutes not only the entire clothing of a large majority of the human race, but it has become a part of the material in which the people of all lands are clothed, excepting only the most debased and savage of races. For this great revolution the invention of improved machinery, and especially that of the saw cotton-gin, is the principal cause.

The green-seed or short-staple cotton (*Gossypium album*) is the kind principally used since the Revolution. The black-seed, or sea-island cotton (*Gossypium nigrum*), which is considered very much superior to the former, was introduced about the year 1788, though this can only be grown successfully in certain localities, requiring low and moist land. The Peeler cotton-seed is in more general use at the present day. This is an upland cotton, but will do well on the lowlands. Several other kinds of cotton-seed have been introduced, and fabulous prices have been paid for some of them.

In 1791 only 2,000,000 pounds of cotton were raised in the U. S., and 189,500 pounds exported; while in 1803 the amount exported from the U. S. was over 41,000,000 pounds. In 1791 a cotton-mill was erected at Providence, R. I., supposed to be the first one in America, and from this time cotton was used in this country, though for a few years to a very limited extent. During the year 1800, 500 bales, of 300 pounds each, were consumed in the U. S. Ten years later (1810) 10,000 bales, of 300 pounds each, were used in our own country, and we exported nearly 94,000,000 pounds. Sixty-two mills were in operation during this year. In 1820 the U. S. cotton crop amounted to 369,000 bales, of 300 pounds each, and we exported nearly 128,000,000 pounds. Ten years later (1830) the export of cotton from the U. S. was 271,000,000 pounds, and the amount grown was over 1,000,000 bales. In 1840 over 1,500,000 bales were raised in the U. S. Ten years later (1850) the home consumption of cotton in the U. S. was nearly 600,000 bales, while the amount raised was over 2,000,000 bales. In 1860 the total cotton crop of the U. S. was 4,675,000 bales; consumed here, 978,000 bales.

From the year 1860 to 1870 there was a large decrease in the amount of cotton raised, owing to the civil war, which caused almost entire stagnation in all kinds of business in the southern part of our country, and the consequent liberation of the slaves. In 1870 the total cotton crop of the U. S. was only 3,000,000 bales, of which 2,000,000 were exported. The last three years show a large increase, and we may look forward with confidence that under the new order of things the cotton-growing States will become more fully developed, and will astonish the world with their productions. Since the emancipation of the slaves in the U. S. a new impetus has been given to cotton-growing, and the business is so profitable that it is conducted very carelessly.

The extremes of the cotton-belt, where it may be grown with profit, may be included between the 28th and 40th degrees N. lat.; but the cotton States, properly speaking, are South Carolina, Georgia, Alabama, Mississippi, the northern part of Florida, the northern half of Louisiana, and the eastern half of Texas.

The principal cotton crop of the U. S., as of all other important cotton-regions, is of the short-staple variety. The long-staple sort is used for making the best sewing-thread, for mixing with silk, and for certain other special uses. It is very much higher priced than common cotton, but can be grown only in peculiar and very limited districts, such as the islands on the coast of South Carolina and parts of the mainland of Florida.

It is very unfortunate that better and more economical methods of planting, cultivating, and fertilizing cotton-lands have not been adopted in the U. S. Cotton is not naturally a very exhausting crop, but from the short-sighted policy of too many planters, great areas of what was once good cotton-land are now quite unproductive. A very serious drawback in the cultivation of cotton is the existence of so many insect enemies. In some regions the ravages of insects and their larvæ have led to the complete abandonment of the crop.

British India produces more cotton than any other country except the U. S., and there the industry is one of great importance; but the fibre is generally found to be inferior to that grown in the U. S. Egypt produces much cotton, its best product taking a high rank as regards quality and price. Brazil raises a considerable amount of fibre, and most other warm and tropical countries contribute more or less to the world's supply of the commodity.

Besides the uses of the cotton-fibre as a material for the manufacture of textile fabrics, and its secondary use in paper-making, the seed of cotton now furnishes a large supply of fixed oil obtained by expressing. The residue is useful for fattening stock, being used after the manner of oil-cake. It is also extensively employed in the South as a fertilizer. The cotton-seed oil and meal are exported to Europe in considerable quantities. The oil is used for soap-stock, for softening wool, lubricating machinery, dressing morocco, and for adulterating linseed and other more costly oils. It is considered to be a drying oil, and a small proportion may be used in paint. In the Southern States, when rectified, it is sometimes employed in pharmacy. Cotton-root is used to some extent in medicine, chiefly for its emmenagogue and abortifacient properties. In Brazil and other countries the leaves are believed to have highly important medicinal qualities.

A. T. Longley, *U. S. Agricultural Department.*

Cot'ton, a township of Switzerland co., Ind. Pop. 1700.

Cotton (Charles), an English humorous poet, born in Staffordshire in 1630, was an adopted son of Izaak Walton. He translated Montaigne's "Essays" into English, and wrote "Scarronides, or Virgil Travestied" (1687), a "Voyage to Ireland," and other works. He is best known by his continuation of Walton's "Complete Angler." Died in 1687.

Cotton (John), a learned English Puritan minister, born at Derby Dec. 4, 1585, preached over twenty years at Boston in England, emigrated to Massachusetts in 1633, was afterwards pastor of the First church in Boston (organized in 1630), and acquired such influence that he was called the patriarch of New England. Died Dec. 23, 1652.

Cotton (Sir Robert Bruce), an English antiquary, was born in Huntingdonshire Jan. 22, 1570. He graduated at Cambridge in 1585. Having a high reputation for prudence, he was often consulted and employed by King James I. and his ministers. He wrote several political and historical treatises. He died May 6, 1631, and left to his heirs a valuable library, which is now in the British Museum.

Cotton-gin, a machine for freeing cotton from its seeds, which adhere to the fibre with considerable tenacity. Originally, the cotton-gin was an apparatus in which the cotton was passed between two rollers revolving in opposite directions. This, the "roller-gin," is still used for ginning sea-island or black-seeded cotton, which is quite easily freed from its seeds. But green-seeded, upland, or short-staple cotton, the species most generally grown, cannot be ginned by such simple means. In 1793, Mr. Eli Whitney, a native of Massachusetts resident in Georgia, invented the saw-gin, consisting of a hopper, one side of which is composed of parallel wires, between which revolve circular saws, the teeth of which drag the fibre through the wires, leaving the seeds behind. This invention, which brought Mr. Whitney small profit and much litigation, has immensely increased the cotton industry of the world.

Cotton Grove, a township of Davidson co., N. C. Pop. 868.

Cotton, Gun. See Gun-Cotton, by Gen. H. L. Abbot, U. S. A.

Cotton Hill, a post-township of Sangamon co., Ill. Pop. 754.

Cot'ton Manufac'ture. Although the employment of the fibres of the cotton-plant for the production of a rude species of cloth can be traced to a remote antiquity in India, China, and Egypt, and was considered by the Spanish Conquistadores as one of the most notable characteristics of the indigenous civilizations of Mexico and Peru, the great industry which now furnishes clothing to four-fifths of the human race and affords employment to many millions of human beings is essentially a modern one, having grown up within little more than a century. Prior to the inventions of Hargreaves and Arkwright, the manufacture was wholly carried on by hand, one thread alone being spun at a time, and that so weak as never to be employed as warp, but only as woof, in combination with wool or flax. The twisted condition of the cotton fibre, as cleaned from the seed by hand, was a serious obstacle to the production of perfect thread; and the first in the series of modern inventions relating to cotton manufacture were accordingly directed to the preparation of the fibre for spinning. Lewis Paul made the first practical improvement in 1748. James Hargreaves invented a carding-machine in 1760, and the spinning-jenny in 1767 (not patented until 1770), by which he produced eight threads at a time. Richard Arkwright patented in 1769 a "water-frame" or "throstle," for spinning by rollers, thereby producing with great rapidity a stronger, finer, and firmer yarn. In 1779 Samuel Crompton produced the mule-jenny, combining the leading ideas of Hargreaves and Arkwright, and in 1785 Dr. Edmund Cartwright, a clergyman of Kent, invented the power-loom, which did for the weaving what the jenny had done for spinning industry. The introduction of the Cotton-Gin (which see) by Eli Whitney in 1793, coinciding with the application by James Watt of the steam-engine to mechanical purposes, completed an extraordinary cycle of inventions, which laid the foundations for the leading industry of the world. Among the recent improvements in cotton machinery may be mentioned the "opening-machine" for disentangling the tufts of cotton and expelling the sand and dirt, comprising, picker, beater, and wire-gauge cylinders; the automatical "scutching-machine," which completes the opening of the cotton and spreads it out into a layer of uniform thickness; the "lapping-machine," which separates the fibres still more completely and arranges them in a uniform lap; the "improved carding-machine," which brings the fibres parallel to each other by means of steel or iron teeth fixed in a rotatory iron cylinder; the "drawing-frame," which takes the cotton from the carding-machine in strips, doubles them, draws them out many times, and equalizes them from all irregularities; the "slubbing frame," which further equalizes them by many more doublings and drawings; the "intermediate frame," which carries the same process still further; the "roving-frame," which brings the cotton to the state of "roving," a soft, slightly-twisted cord; and lastly, the new "spinning-machine," in which many improvements have been introduced, and which sometimes comprehends 1000 spindles.

China has an immense manufacture of cotton goods, but nevertheless imports them largely from England and Russia. A large part of the Chinese cotton is grown at home, but much also comes from India and Burmah. Except the now comparatively unimportant production of the fabrics in India, most of the cotton manufacture of the present day is carried on in Europe and the U. S., Great Britain taking the lead, and France, Germany, Austria, Russia, Belgium, and Switzerland all having an extensive production of cotton goods. Many of the smaller European states have also considerable cotton manufacturing.

In the U. S. the first successful cotton-mill was that of Mr. Samuel Slater (an Englishman by birth), established at Pawtucket, R. I., in 1790, though at Beverly, Mass., there had been a cotton-manufacturing company in existence for several years, and similar attempts had been made, with small success, at East Bridgewater, Mass., and at Philadelphia. From these small beginnings this manufacture has grown to be one of the most important in the land. The chief seats of the American cotton manufacture are in the New England and Middle States, but the area of the manufacturing district is widening. Especially in Alabama, Georgia, and South Carolina there have been attempts made (and on the whole with very encouraging success) to organize a system of cotton manufacturing. If this attempt be fully realized, it would appear that the South, being the finest cotton-growing region in the world, and having abundant and constant water-power, might successfully compete with other regions which are obliged to transport the raw material for thousands of miles. The mills of the U. S. in 1870 were 958 in number, employing steam-engines with an aggregate horse-power of 47,117, water-wheels with the horse-power estimated at 99,191; running 157,310 looms, 3,694,477 frame spindles, and 3,437,938 mule spindles; and employing 135,369 persons, considerably more than half of whom were females. The capital employed was $140,706,291; wages paid, $39,044,132; cotton used, 398,308,257 pounds; total value of products, $477,489,739. Since the census of 1870 the manufacture of cotton goods in this country has enormously increased.

Cotton Plant, a post-village of Woodruff co., Ark., about 60 miles E. N. E. of Little Rock. Pop. of Cotton Plant township, 1007.

Cotton Valley, a township of Macon co., Ala. Pop. 2120.

Cot'tonwood, a county in the S. W. of Minnesota. Area, 720 square miles. It is drained by the Des Moines and Little Cottonwood rivers. The surface is undulating; the soil fertile. It is intersected by the Sioux City and St. Paul R. R. Pop. 534.

Cottonwood, a township of Siskiyou co., Cal. Pop. 421.

Cottonwood, a post-township of Tehama co., Cal. Pop. 240.

Cottonwood, a township of Yolo co., Cal. Pop. 1319.

Cottonwood, a twp. of Cumberland co., Ill. P. 1342.

Cottonwood, a township of Chase co., Kan., has a weekly newspaper. Pop. 315.

Cottonwood, a post-township of Brown co., Minn. Pop. 607.

Cottonwood Falls, a post-village, capital of Chase co., Kan., on the Cottonwood River and the Atchison Topeka and Santa Fé R. R., 65 miles S. W. of Topeka. Coal and ochre are found in the vicinity. It has good water-power and manufactures, and one weekly newspaper.

W. A. Morgan, Ed. Chase County "Leader."

Cottonwood Springs, a post-village of Lincoln co., Neb., on the Platte River.

Cot'tonwood Tree, a common name of the *Populus monilifera*, a species of poplar which grows on the margins of streams of the Western U. S. to the height of eighty feet or more. It has deltoid, taper-pointed, serrate leaves. The timber is soft and not very valuable.

Cot'trellville, a township of St. Clair co., Mich. Pop. 2372.

Cot'tus, a genus of acanthopterygian sea-fishes of the

Four-horned Cottus.

family Triglidæ, containing the "miller's thumb," the sea-bullhead, the sculpin, and numerous other fishes of remarkably repulsive appearance, though several are considered good eating. The four-horned cottus (*Cottus quadricornis*) is a species common to both sides of the Atlantic.

Cotu'it, a post-village of Barnstable co., Mass., on Cotuit River, in Barnstable township, and on the line of Mashpee.—Cotuit Port, in the same township, 2 miles to the S. E., is a port on Cotuit Harbor.

Cotyle'don [Gr. κοτυληδών], in botany, the seed-lobe or seminal leaf of a plant. This organ forms a part of the embryo, and nourishes the plumule and radicle at the first period of their development. Exogenous plants have generally two cotyledons, and hence are called *dicotyledonous*, and endogenous plants, having a single cotyledon, are called *monocotyledonous*. Cryptogamous plants are *acotyledonous*—*i. e.* destitute of a cotyledon.

Couch (Darius Nash), an American officer, born July 23, 1822, in Putnam co., N. Y., graduated at West Point in 1846; and as lieutenant of artillery he served in the war with Mexico 1847–48, engaged at Buena Vista (brevet first lieutenant); at various posts 1848–55; and in Florida hostilities 1849–50; resigned April 30, 1855; merchant and copper-manufacturer 1855–61. In the civil war he resumed his sword as colonel of the Seventh Massachusetts Volunteers, and July 4, 1862, became major-general U. S. volunteers. He served in the defences of Washington 1861–62; in Virginia Peninsula, engaged at Yorktown, Williamsburg, Fair Oaks, Oak Grove, and Malvern Hill; in the retreat from Manassas to Washington 1862; in Maryland campaign 1862, engaged at Harper's Ferry, and in pursuit from Antietam to the Potomac; in the Rappahannock campaign 1862–63, engaged at Fredericksburg and Chancellorsville; in command of the department of the Susquehanna 1863–64, engaged in defence of Chambersburg, which was evacuated; and in command of a division of the Twenty-third corps 1864–65, engaged in the battle of Nashville, and operations in North Carolina to effect a junction with Gen. Schofield. Resigned May 26, 1865, from volunteer service. He was the Democratic candidate for governor of Massachusetts in 1865, but was not elected; U. S. collector for port of Boston 1866–67, and has been president of the Virginia Mining and Manufacturing Company since 1867. George W. Cullum, *U. S. Army.*

Couch'ant [from the Fr. *coucher*, to "lay down" or "lie down"]. In heraldry, a beast lying down, with his head raised, is couchant. If the head is down, he is *dormant*.

Cou'dersport, a post-borough, capital of Potter co., Pa., 174 miles W. N. W. of Harrisburg, has a weekly paper, a tannery, a foundry, several mills, a public library, and graded schools. Pop. 471.

John S. Mann, Ed. "Potter Journal."

Cougar. See Puma.

Cough [Lat. *tussis*], a physiological act or operation, which consists in the sudden expulsion of air from the lungs, at the beginning of which act the glottis is closed. Coughing is designed for the expulsion of foreign or secreted matters from the air-passages. It is largely a reflex action, generally arising from local irritation. When the irritation is the result of disease, coughing may be a very important symptom. It is partly voluntary and partly involuntary. A cough may sometimes be relieved by expectorant remedies, by mucilaginous diluent draughts, by warm foot-baths, by stimulants, and very often by small doses of opium or of other sedatives.

Revised by Willard Parker.

Cough'lan (Lawrence), an English Wesleyan preacher, born about 1760, was one of the principal founders of Methodism in Nova Scotia and the neighboring provinces. His labors were great, and he has been called the "Apostle of Nova Scotia." Died in that province in 1834.

Coulin (F——), D. D., born at Geneva Nov. 17, 1828, is a distinguished preacher and writer of the Swiss Free Church, residing at Genthod. He was a delegate to the meeting of the Evangelical Alliance at New York in 1873.

Council, a township of Crittenden co., Ark. Pop. 312.

Council Bluffs, the capital of Pottawattamie co., and the metropolis of Western Iowa, is situated 135 miles W. of Des Moines and 4 miles E. of Omaha. It is the western terminus of the Chicago Burlington and Quincy, Chicago Rock Island and Pacific, and Chicago and North-western R. Rs., the eastern terminus of the Union Pacific, the southern terminus of the Sioux City and Pacific, and the northern terminus of the Kansas City St. Joseph and Council Bluffs R. Rs. The city is built principally upon a plain at the base of the high bluffs from which it derives its name, although not a few of the finest residences are to be found in the numerous "glens" which intersect the bluffs in every direction. The town is connected with Omaha by an iron bridge almost a mile in length, over which street-cars drawn by dummy engines, and regular passenger and freight trains, pass every fifteen minutes. One monthly, four weekly, and two daily papers are published here. Among the public buildings worthy of mention is the institution for the deaf and dumb, a large court-house, and an imposing high-school building. Council Bluffs contains 9 churches, 21 hotels, 17 telegraph-offices, 1 savings, 1 private, and 2 national banks, 2 public libraries, and a free reading-room. A horse railway 5 miles in length connects its eastern, western, and southern extremes. Owing to its superior shipping facilities, Council Bluffs is fast becoming an important manufacturing centre. Steam-engines in large numbers, milling and mining machinery, fanning-mills, agricultural implements of all kinds, cigars, cigar-boxes, and brooms are made here to good advantage. Pop. 10,020. S. W. Moorehead, Ed. "Daily Globe."

Council Grove, a city, capital of Morris co., Kan., on the Neosho River and the Missouri Kansas and Texas R. R., 25 miles from Emporia. It has two churches, three schools, a national bank, two newspapers, and a coal-mine. Pop. 712; of Council Grove township, 1080.

John Maloy, Ed. Council Grove "Democrat."

Council Hill, a township and post-village of Jo Daviess co., Ill. The village is on the Illinois Central R. R., 7 miles N. E. of Galena. Pop. of township, 725.

Coun'cil, Œcumen'ical [from the Gr. οἰκουμένη (γῆ), *i. e.* the "habitable" (world); because the whole Christian world is, in theory, assembled], otherwise called **General** or **Universal Council,** a title given to certain great ecclesiastical assemblies, so called in distinction from diocesan, provincial, and national councils, which are more limited meetings of the same kind. The Greek and Latin churches acknowledge seven councils—viz.: (1) the first Council of Nice, 325 A. D.; (2) the first of Constantinople, 381 A. D.; (3) the first of Ephesus, 431 A. D.; (4) that of Chalcedon, 451 A. D.; (5) the second of Constantinople, 553 A. D.; (6) the third of Constantinople, 681 A. D.; (7) the second of Nice, 787 A. D. To these the Roman Catholics add the following: (8) the fourth of Constantinople, 869 A. D.; (9) the first of Lateran, 1123; (10) the second of Lateran, 1139; (11) the third of Lateran, 1179; (12) the fourth of Lateran, 1215; (13) the first of Lyons, 1245; (14) the second of Lyons, 1274; (15) that of Vienne, in France, 1311; (16) that of Constance, 1414–18 (in part); (17) that of Bâle, 1431–38; (18) the fifth Lateran, 1512–17; (19) that of Trent, 1545–63; and (20) that of the Vatican, 1869–70. The most important of these are noticed under their alphabetical heads.

Council of War, a conference of military or naval officers, called by the commander-in-chief to advise him in relation to some important business or movement. The commandant of a garrison often solicits the opinion of a council of war before surrendering to the enemy. But in the end the military code leaves these matters to the discretion of the commander.

Coun'over, a post-village of Calmar township, Winneshiek co., Ia. It is on the Iowa division of the Chicago Milwaukee and St. Paul R. R., at the junction of the Decorah Branch R. R.

Counsellor. See Advocate and Barrister.

Count [from the Lat. *comes* (gen. *comitis*), a "companion;" Fr. *comte;* It. *conte;* Ger. *Graf*], a nobleman of an order of nobility inferior to dukes and marquises, but superior to viscounts and barons. Counts had anciently territorial jurisdiction, but at present they are simply noblemen having this hereditary title. The use of the word *comes* in this sense dates from the reign of the Roman emperor Augustus, who conferred it upon the senators who immediately surrounded him, and was afterwards commonly applied to their companions by other Roman em-

perors. It was used in Spain about 650 A. D., and for a long period seems to have been of equal dignity with that of duke, no distinction being made till 1297. In the British empire the title of earl is always used instead of count.

COUNTS-PALATINE were originally "officers of the imperial palace" in Germany, who possessed high judicial functions. The term was afterwards applied to feudatories who had palatine jurisdiction (see PALATINE) over outlying territories, where they maintained a palace and the other machinery of a court. The term came still later to be applied as a title of honor by several princes, but is now obsolete.

Coun'ter [from the Lat. *contra*, "against:" Fr. *contre*], a word often used as a prefix to other words, and signifying "against," "corresponding to," or "in answer to." (See etymology of COUNTERFEIT.)

Coun'terfeit [Fr. *contrefait;* literally, "made against"], a term applied chiefly to spurious coin or bank notes, or other factitious currency. The uttering of such coin or notes is a felony punishable by imprisonment, or even by death in some countries. To guard against counterfeiting, bank notes are engraved with designs which cannot be reproduced except at great expense. There are also secret marks and combinations of letters and figures known only to the proper authorities. A peculiar ink and paper are used. Pamphlets called "detectors" are printed with lists and descriptions of counterfeit notes and coins. (See FORGERY, by PROF. T. W. DWIGHT, LL.D.)

Coun'terfort [Fr. *contrefort*], in architecture, a buttress or pier built against or at right angles to a wall, to strengthen it and enable it to resist a particular thrust. In fortification, a mass of stone or brickwork added to the revetment of a rampart in such a way as to form a buttress.

Coun'ter-Guard is an outwork designed to defend the two faces of a bastion or ravelin from a direct fire, so as to retard a breach being made. The counter-guard consists of two lines of rampart parallel to the faces of the bastion or ravelin, and separated from them by a narrow ditch.

Coun'ter-Mark, in numismatics, a stamp often seen on ancient coins or medals, is generally a figure or inscription. Some antiquaries suppose this mark was struck on money taken from an enemy.

Coun'terpart, a correspondent part, a copy, a duplicate. In law, when the parts of an indenture are interchangeably executed by the several parties, that part which is executed by the grantor is termed the *original*, and the others are *counterparts*.

Coun'terpoint [Fr. *contrepoint;* It. *contrapunto*], the art of writing music in several distinct parts. The name is derived from the circumstance of the notes being placed one against or over the other on the score. (See MUSIC, by REV. WILLIAM STAUNTON, D. D.)

Coun'terpoise [Fr. *contrepoids* (*i. e.* that which "weighs against" something else)], a weight sufficient to balance another in the opposite scale; equal force or weight acting in opposition to something. In mechanics, a mass of metal connected with an instrument or machine, either for the purpose of giving steadiness or diminishing the pressure on some particular point.

Counter-Proof, an impression obtained from a freshly-printed proof of an engraving, by laying it, before the ink is dry, on paper and passing it through the press. In this mode a reversed impression is obtained, which is useful in enabling the engraver to judge of the success of his work.

Coun'terscarp, in fortification, is the side of the ditch opposite the scarp. A *revetted* counterscarp is constituted usually by a wall of masonry called a counterscarp-wall; an *unrevetted* counterscarp is of earth at its natural slope.

Coun'tersign, a watchword given daily by the commander of an army, in order that friends may be distinguished from enemies by their knowledge of it. Sentinels require every person who approaches their posts by night to give the countersign.

COUNTERSIGN is also the signature of a public officer or secretary to the charter of a king, or to any writing signed by the principal or superior, as a certificate that the charter or instrument is authentic.

Coun'ter-Ten'or, in music, the highest adult male voice and the lowest female voice.

Coun'ty [Fr. *comté*], originally the territory of a count or earl. In modern usage it denotes a division of a state or kingdom. In England and Scotland the term is equivalent to a shire. The term shire in England is not applied to those counties which were originally distinct sovereignties, such as Kent, Essex, Norfolk, Cumberland, and Sussex. Lancaster, Chester, and Durham are called counties palatine. (See PALATINE.) The primary divisions of the provinces of Ireland are called counties. Each State of the U. S., except Louisiana, is divided into counties, each of which contains a capital or county-town, in which the court-house is located.

County Court, in several of the U. S., is the title of a tribunal higher in rank than the municipal or local courts, and inferior to the supreme court of the State. In some of the States, courts of this grade are called courts of common pleas, and in others superior courts. (See COURTS, by GEORGE CHASE, LL.B.)

Coup, koo, a French word signifying a "stroke," a "blow," is a part of many phrases which are often used by the English and other nations; as *coup d'état*, a "stroke of state," a sudden, forcible political act, usually designed to subvert the constitution, or to increase the power of a ruler by encroachments on the constitution. *Coup de main*, in the language of war, means a "sudden, unexpected attack," a surprise. *Coup d'œil*, a "glance of the eye," is used in the fine arts to express the general effect of a picture or group at first sight. The term sometimes signifies a view, prospect, survey.

Coup'le of For'ces or **Pres'sures,** in statics, denotes two equal pressures having precisely opposite directions, but applied at different points of a body. According to the ordinary method of the composition of parallel forces, the resultant of such a system would be a parallel force having the intensity zero, and applied at an infinite distance. In reality, two such forces have no single resultant, their tendency being to produce rotation about an axis perpendicular to their plane. The theory of couples, their composition, resolution, etc., was first given by Poinsot, and now constitutes an essential branch of statics. The distance between the parallel forces is called the arm of the couple, and the product of either force into the arm the moment of the couple. The statical effect of a couple is unaltered by transportation to a parallel plane, or by any variation in the magnitude and direction of its forces and arm, provided the moment remains the same. On this account a couple, like a simple force, may be conveniently and perfectly represented by a line OA drawn from any origin O perpendicular to its plane, having a length OA proportional to its moment, and a direction such that to an observer at A, looking towards O, the rotation which it is the tendency of the couple to produce shall appear to be direct, like the hands of a clock. Such a line, limited in length and definite in direction, is called the moment-axis of the couple, to distinguish it from the rotation-axis, which is unlimited in length, and simply indicates the direction of the plane of the couple. This mode of representation being adopted, the composition and resolution of couples follow the same laws as those of concurrent simple pressures. Thus, if we regard the moment of a couple as positive or negative, according as the rotation would be direct or retrograde, we may say, The resultant of two or more coaxal couples is another coaxal couple, whose moment is the algebraical sum of the moments of the components. Again: the moment-axis of the resultant of any two couples is the diagonal of the parallelogram whose sides are the moment-axes of the components. The above two properties of couples being established, the general problem of the composition of any number of pressures acting on a body in different directions becomes greatly simplified.

Coup'le of Rota'tions, or **An'gular Veloc'ities,** two equal and opposite rotations around parallel axes. The term was introduced by Poinsot, who first fully investigated the composition and resolution of rotations. A couple of rotations is shown to be equivalent to a translation of the whole body in a direction perpendicular to the plane of the rotation-axis, with a velocity equal to that which either axis possesses in virtue of its rotation about the other. The common velocity of all points of the body is expressed by the product of either of the equal angular velocities into the distance between the axes. This distance is called the arm of the couple, and the product its moment. A couple of rotations therefore may be represented perfectly by a single line, exactly as in the case of a couple of pressures, and the composition and resolution of both kinds of couples follow precisely the same laws. Velocities of rotation and translation are, as it were, reciprocal—a *couple* of either is equivalent to one of the other.

Coupon [from the Fr. *couper*, to "cut"], a cheque or slip of paper cut off from a bond. The term is applied mostly to a dividend or interest certificate, which is attached to the bottom of a bond or debenture, and is cut off when the interest is due, and is then presented for payment.

Courbet (GUSTAVE), a French painter of landscape, animals, and figures, born at Ornans (Doubs) June 10, 1819. His parents were people of moderate estate, who gave him the best education in their power. His father would have had him a lawyer, and in 1839 he went to Paris to study for that profession, but he hesitated between the law

and painting, and finally decided for the latter. On his first visit to the Louvre he was filled with enthusiasm for the works of the Flemish, Dutch, and Venetian painters, and repeated the legend of Correggio, by saying, when he saw Delacroix's "Massacre of Scio," "I could do as well as that if I wished." Although he studied at different times in the painting-rooms of three artists, Flageoulot, Steuben, and Hesse, he says truly of himself that he never had a master. He exhibited for the first time in the Salon of 1844. Characteristically enough, the picture was his own portrait. In the Salon of 1850–51, Courbet exhibited, among others, three pictures, "An Interment at Ornans," "Peasants of Flagey returning from the Fair," and "The Stone-Breaker," which made an uproar in the artistic and cultivated world of Paris, and divided it into two fiercely hostile camps. Courbet's party was strong, but so was that of his enemies; and, disgusted by the rejection of some of his most important pictures from the Salon of 1855, Courbet determined to appeal to the general public, and, erecting a building at his own expense on a piece of ground as near as he could hire to the Salon, he opened an exhibition of forty pictures, charging a fee for admission. The catalogue was prefaced by his declaration of principles. It was long before the war thus begun ceased, and when it ended Courbet's rank as a great but very unequal painter may be said to have been definitely fixed. Courbet has made himself notorious all his life by his extreme opinions in politics and religion, and of late by the part he played in the Commune. It was by his influence that the column of the Place Vendôme was destroyed. For this act of vandalism Courbet was tried, but, after a long imprisonment, was released. One of the first acts of the reactionary government that succeeded the rule of M. Thiers was to confiscate all Courbet's property, to help to pay for the new column which it was voted to set up on the Place Vendôme. Since 1870, Courbet has not been allowed to exhibit in the Salon, and his pictures, thus made a mark of, have gone up greatly in price. CLARENCE COOK.

Courbevoie, a town of France, department of Seine, on the left bank of the river Seine, 5 miles N. W. of Paris. It has large barracks, and manufactures of white lead and brandy. Pop. 9862.

Courcelle, a town of Belgium, on a railroad, 16 miles E. of Mons. It has linen and nail manufactures, and exports coal. Pop. 7463.

Courier [from the Fr. *courir*, to "run"], literally, a runner, a messenger or bearer of despatches, usually on public business. According to Xenophon, couriers were first employed by Cyrus the Great. Herodotus speaks of the Persian *cassids* or foot-messengers, who travelled with great rapidity. They were stationed, one man and one horse, for each day's journey; and by these messengers Xerxes sent the news of his defeat to Persia (480 B. C.). Gibbon bears testimony to the rapidity with which communication was carried on in the Roman empire by the regular institution of posts. The Mexican couriers, according to Prescott, travelled with incredible swiftness. The Peruvian chasquis or runners carried despatches at the rate of 150 miles a day.

Courier, or **Courier de Méré** (PAUL LOUIS), a French scholar and writer, born in Paris Jan. 4, 1772. He entered the army in 1792, and served with distinction. In 1809 he resigned his commission. He translated several Greek classics into French, and produced a good edition and version of Longus (1810). He was liberal in politics, and acquired a high reputation as a political writer. Among his writings, which display wit, eloquence, masculine sense, and genial satire, is the "Pamphlet des Pamphlets" (1824). He was assassinated on his estate in Touraine April 10, 1825. The most complete collection of his writings is "Mémoires, correspondance et opuscules" (1828).

Cour'land, or **Kurland,** a Baltic province, incorporated with Russia by the third partition of Poland, in 1795. It is bounded on the N. by the Gulf of Riga and on the W. by the Baltic, and lies between lat. 56° and 58° N. and lon. 21° and 27° E. Area, 10,556 square miles. The chief river is the Duna, which flows along the north-eastern border. The soil is in some parts very fertile, but there are many forests, lakes, and swamps. The greater part is occupied by Germans. Courland was originally an independent duchy, but from 1561 to 1795 was in feudal subjection to Poland. Capital, Mitau. Pop. 597,288.

Court [Fr. *cour;* It. *corte*, perhaps from the Gr. χόρτος, an "enclosed place;" Lat. *aula* or *regia*], originally an enclosure or yard; the residence of a sovereign; a royal or princely household. In England and some other countries the term usually denotes the family and attendants of the sovereign, regarded in a public capacity. Also a judicial tribunal, whether composed of one or more judges; sometimes the hall or room in which judges sit and try causes. The term "court circle" in England is applied to the nobles, bishops, ministers of state, and other persons who are in the habit of approaching the sovereign and of associating with the other members of the royal family.

Courtais, a township of Crawford co., Mo. Pop. 962.

Court de Gébelin (ANTOINE), a French scholar and author, born at Nîmes in 1725, was the son of Antoine Court, celebrated as the reviver of French Protestantism. He devoted much attention to mythology and the affinity of languages. Among his works is "The Primitive World Analyzed and Compared with the Modern" (9 vols., 1773–84). He assisted Benjamin Franklin in editing a periodical entitled "The Affairs of England and America" (15 vols., Paris, 1776 *et seq.*). Died May 10, 1784.

Courtenay (EDWARD H.), LL.D., an American officer and educator, born in 1803 in Maryland, graduated at West Point in 1821. He served, while lieutenant of engineers, as assistant professor at the Military Academy 1821–24; in construction of Fort Adams, R. I., 1824–26; as assistant to chief engineer 1826–28; and as acting professor of natural and experimental philosophy at the Military Academy 1828–29; appointed full professor Feb. 16, 1829, on the resignation of his lieutenancy, and with great credit to the Military Academy and profit to his pupils held the chair of philosophy till Dec. 31, 1834, when he accepted the professorship of mathematics in the University of Pennsylvania, continuing in it till 1836; civil engineer New York and Erie R. R. 1836–37; at Fort Independence, Mass., 1837–41; and construction of dry-dock, Brooklyn navy-yard, 1841–42. He resumed his former vocation, for which he was admirably fitted, as professor of mathematics in the University of Virginia 1842–53; translator and editor of Boucharlat's "Mechanics" 1833, and was author of a "Treatise on Differential and Integral Calculus, and Calculus of Variations." Died Dec. 21, 1853, at Charlottesville, Va., aged fifty.

GEORGE W. CULLUM, *U. S. Army.*

Court-house, a township of Montgomery co., Ala., includes part of the city of Montgomery. Pop. 9194.

Court-house, a township of Camden co., N. C. P. 1759.

Court-house, a township of Chesterfield co., S. C. P. 1708.

Court-house, a twp. of Spartanburg co., S. C. P. 1229.

Court-house, a twp. of Taylor co., West Va. Pop. 753.

Court'land, a township and post-village of Lawrence co., Ala. The village is on the Memphis and Charleston R. R., 45 miles W. of Huntsville. It has a court-house, male and female academies, two steam-mills, four churches, and a weekly newspaper. Pop. 2553.

D. R. HUNDLEY, ED. "NORTH ALABAMA REPORTER."

Courtland, a township and village of De Kalb co., Ill., about 50 miles W. of Chicago. Pop. 1293.

Courtland, a township of Jo Daviess co., Ill. P. 1786.

Courtland, a township of Kent co., Mich. Pop. 1338.

Courtland, a post-township of Nicollet co., Minn. Pop. 640.

Courtland, a township of Columbia co., Wis. P. 1449.

Court-Mar'tial, in the army, navy, and marines, a tribunal for the examination and punishment of offenders against martial law or against good order and military or naval discipline. The subjects of courts-martial are usually officers or men in actual service, but when martial law prevails courts-martial sometimes punish offences committed by persons not in the service.

Courts-martial are called "general," "garrison," and "regimental." Summary and informal courts held in the field are sometimes called "drumhead courts-martial." The officers of military and naval courts are a president, a JUDGE-ADVOCATE (which see), and a clerk, all commissioned officers. The sentences passed by these courts are usually subject to the approval of department commanders or other high officers, or even to that of the President of the U. S. (See S. V. BENÉT on "United States Military Law," 1862.)

Cour'town, EARLS OF, and Viscounts Stopford (1762), barons of Courtown (Ireland, 1796), Barons Saltersford (Great Britain, 1796).—JAMES GEORGE HENRY STOPFORD, fifth earl, born April 24, 1823, succeeded his father in 1858.

Courtray [anc. *Cortoriacum;* Flem. *Kortryk*], a fortified town of Belgium, on the river Lys, 26 miles S. W. of Ghent. It is well built and clean, has a castle, a fine old bridge, a noble town-hall, and a beautiful Gothic church founded in 1238. Here are manufactures of damasks and other linen fabrics, hosiery, lace, paper, cotton goods, soap, etc. This place was taken in 880 A. D. by the Normans, who fortified it. In July, 1302, the Flemings here defeated the French in the famous "Battle of the Spurs," so called from the great number of spurs taken from the fallen knights. Pop. in 1864, 23,497.

Courts (in law), public tribunals established for the administration of justice and the interpretation and enforcement of the law. The protection of private rights, the punishment of criminal offences, the regulation of conflicting interests of individuals and states, the exposition and application of legislative enactments, and, in some nations, even of constitutional provisions, are the various important functions which are generally deputed to such judicial organizations. It cannot be said, however, that all tribunals which have been designated courts in various countries and at different epochs have enjoyed all these prerogatives, or have exercised them so exclusively as is understood to be the appropriate province of courts at the present day among civilized communities. In a primitive form of society the powers of the judiciary are usually much restricted, and subjected, to a greater or less degree, to executive and legislative interference. This remark applies also to despotic governments, even though a high degree of civilization be attained, as the history of France and Germany bears ample witness. In modern times, however, it has been recognized as a necessity to confer upon the courts the powers above enumerated, and to render their independence of the other departments of government as complete as possible. They are generally composed of distinct bodies of officials holding their positions during stated terms, and are under no supervisory control for decisions rendered or other legal acts performed but that of superior or appellate organizations of a similar nature. In the exercise of their powers courts do not attempt to ferret out and redress every evil and form of injustice that may exist within society, and determine the law of their own motion by the direct establishment of legal principles, but are confined to the decision of controverted questions presented to them by injured parties, and thus evolve the law indirectly and mediately. Criminal cases are presented by the government, while those of a civil nature are brought either by states or individuals affected therein, at their own option.

But while there is a general agreement among civilized nations at the present day in regard to the objects to be attained by the creation of courts, the modes by which the same results are sought are notably and strikingly diverse. The courts upon the continent of Europe and in Scotland administer a system of jurisprudence derived from the civil or Roman law, while in England and the U. S. they apply a system which they themselves have originated, called, by way of distinction, the "common law." In the latter the rule of precedent holds sway, in accordance with which principles determined in previous decisions are, in general, to be deemed authoritative in subsequent causes involving similar circumstances. In this system, moreover, the mode of trial by jury was developed as a safeguard against oppressive action by the courts, and has been sedulously maintained as far as its application is reasonably practicable. The judge does not examine witnesses nor decide any questions but points of law, so that every inducement may be removed which would lead him to act as advocate instead of arbiter, and awaken his personal interest in the cause. A broad distinction is also drawn between actions which are termed legal and suits which are called equitable, the latter dispensing with a jury, administering a more adequate relief in many instances, and in various ways supplementing the deficiencies of the proceedings applicable to the former. In the European courts, on the other hand, which proceed upon the doctrines of the civil law, the force of precedent is not recognized as a controlling principle. Jury trials have only been introduced as a foreign system, are employed in a comparatively small class of instances, and are looked upon with so little favor that any extension of their application is generally thought undesirable. The judges, moreover, may engage directly in the examination of witnesses and prisoners, and not infrequently, particularly in criminal trials, appear to become so strongly biassed in consequence as seriously to impair one's belief in the impartial administration of justice. And lastly, no distinction of causes and remedies as legal or equitable is attempted. In fact, the English practice in this respect has even excited the derision of continental lawyers, who charge that it presumes two different kinds of justice.

Besides these fundamental points of difference between the two systems, there are great diversities between the several countries in the number, the character, and the functions of the various courts which have been established, and their relations with each other, which will require an investigation into the judicial system of each of the more important modern nations specifically. England, Scotland, France, and the U. S. will be selected for this purpose, and reference made to their most important tribunals in detail.

I. The Courts of England.—By the English and American common-law system courts are distinguished as those *of record* and those *not of record*. A court of the former class is provided with a clerk and a seal, and receives its name from the fact that its proceedings are required to be preserved in accurate *records;* courts of the latter class are inferior tribunals without clerk or seal, and their acts are not formally enrolled. Courts are said to have *original* jurisdiction before which causes are brought in the first instance; *appellate* jurisdiction when decisions rendered in inferior tribunals are transferred to them for review. Civil causes heard before a single judge, with a jury, are said to be heard at *nisi prius* or at circuit; when several judges sit to review causes on appeal they are said to sit *in banc*. Courts are also distinguished as civil or criminal, superior or inferior, as courts of law, of equity, of admiralty, etc.—distinctions which require no explanation. In the following synopsis of the English courts at the present time (Jan., 1874) an account will be given (1) of the superior common-law courts of record; (2) of the superior courts of equity; (3) of the courts of probate, divorce, and admiralty; (4) of the criminal courts; (5) of the appellate courts.

(1) *The Superior Common-Law Courts of Record.*—These are the Court of Common Pleas, the King's or Queen's Bench, and the Court of Exchequer. These several tribunals, which now enjoy very much the same jurisdiction, are considered to have been derived originally from a single organization, the *Aula Regis* (or King's Council), which was the only superior court in the realm during the early history of the Roman kings. This had both civil and criminal jurisdiction, and was ambulatory, or attendant upon the person of the king, holding its sessions in such different parts of the kingdom as he entered in the course of his journeyings. The present courts were, when first created, nothing more than subordinate branches or committees of the council, established for the more speedy transaction of business. The exchequer branch entertained questions relating to the royal revenue; that of the common pleas, civil suits between individuals except for forcible injuries; while there was left to the *Aula Regis* proper, jurisdiction in criminal causes and in civil actions for injury by violence, and a general controlling power over inferior tribunals.

In the reign of Edward I. (1272) the three bodies were constituted separate courts, were all fixed at Westminster, and their powers, as distinct tribunals, determined. Each retained, however, its previous particular jurisdiction. But in the course of time, by a gradual process of encroachment, justified by ingenious legal fictions, each court trenched upon the appropriate province of the others, assuming thereby similar powers, so that at the present day they all entertain co-ordinate jurisdiction in nearly all civil causes. The Court of Queen's Bench, however, still retains exclusive cognizance of criminal matters and the sole superintendence over inferior courts and civil corporations; the Court of Common Pleas has alone the right to entertain real actions—*i. e.* actions for the specific recovery of real property (actions now rarely brought); while the Court of Exchequer still exercises entire control over strict questions of revenue. In other cases the parties to the action may select any one of the courts they may prefer. As regards the organization of these common-law courts, the Queen's Bench and Common Pleas consist each of a chief-justice and five puisne justices; the Exchequer, of a chief baron and five puisne barons. These judges hold office during good behavior, but may be retired on a pension after fifteen years' service. An appeal lies from any one of these courts to the Exchequer Chamber, which, when hearing a cause sent from one of them, is composed of the judges of the other two. A second appeal may also be taken to the House of Lords.

To remedy the inconvenience to suitors arising from the fixed establishment of these courts at Westminster, provision was made at an early period for the hearing of jury trials in every county one or more times during each year. The tribunals for this purpose are called *courts of assize and nisi prius*, are composed of two or more commissioners, of whom a superior court judge, a sergeant-at-law, or a barrister must be one, and in most counties they sit twice each year. Appeals from them, however, can only be heard at Westminster.

(2) *The Superior Courts of Equity.*—It was found at an early period that the common-law tribunals, determining causes as they did only through the instrumentality of juries in the first instance, and in all cases, where no demand was made for specific property, giving only pecuniary damages as relief, were totally inadequate to administer exact justice in a large variety of cases, and the separate system of equity jurisprudence was established to repair the deficiencies of the strict legal methods. These courts are likewise governed by the rule of precedent, but their modes of procedure are less technical, their forms of rem-

edy more diverse, and they employ no juries, though a practice exists of referring special questions to courts of law to be tried by a jury, whose verdict is reported to the equity judge to aid his future action. The equity judges consist, at present, of three vice-chancellors, a master of the rolls, two lords justices, and the lord chancellor. The vice-chancellors and the master of the rolls hold each separate courts at which causes are heard in the first instance; so that there are four equity tribunals of original jurisdiction. Appeals may be taken from either of them to the Court of Appeal in Chancery or to the lord chancellor.

The Court of Appeal in Chancery is composed nominally of the two lords justices and the lord chancellor, but almost invariably it is held by the lords justices alone. Any two of these three judges, however, are sufficient for holding the court, or even the lord chancellor alone. Moreover, each of the justices may, under certain restrictions, sit alone. The chancellor may, in addition, exercise an independent jurisdiction, without acting as a member of the court of appeals. This jurisdiction is ordinary when according to common-law methods; extraordinary, when equitable in its nature. An appeal may be taken to the House of Lords. The term of office of these judges is the same as that of the common-law judiciary, except in the case of the chancellor, who may be deprived of his position at the pleasure of the Crown.

(3) *The Courts of Probate, Divorce, and Admiralty.*—The Court of Probate and that of Divorce were established in 1857 to supersede the former ecclesiastical courts, and received more extended powers. Their names sufficiently define the nature of their jurisdiction. The judges of either of these tribunals may try questions of fact with a jury, or may order an issue to be tried by a court of law. Appeals may be taken to the House of Lords. The Court of Probate has only a single judge, who may, however, associate with himself a common-law judge or judges. The appropriate labor of this tribunal is facilitated by the establishment of district registries throughout the realm. These are forty in number, besides the principal registry in London, all having power to grant probate and administration.

The Court of Divorce consists of the judge of probate, the lord chancellor, and the judges of the superior common-law courts. The probate judge is made judge ordinary, and may act alone or with the other judges. The power to grant divorce, which has been conferred upon this court, was exercised till 1857 only by Parliament. Actions for criminal conversation may also be maintained in this court.

The High Court of Admiralty has cognizance of causes of action arising from the navigation of the seas, as, *e. g.*, claims for repairs of foreign vessels and for supplies furnished them, actions for pilotage fees, for seamen's wages, for personal injuries inflicted at sea or injuries by collision, seizure, and the like; also to determine matters of prize in time of war, and decree the forfeiture of vessels of the enemy or of neutrals in proper cases. This court is held by a single judge, who is appointed by the Crown. He may be the same person as the judge of probate.

(4) *The Criminal Courts.*—These are divided into the inferior and the superior, the former including the general and quarter sessions of the peace, while the latter embrace the assizes, the admiralty sessions, the Court of King's Bench, and the Central Criminal Court. The assizes are held before commissioners twice a year in nearly all the counties. These officials act by virtue of various commissions, the most important of which are those of "oyer and terminer" and "general jail delivery." At oyer and terminer the judges can only act upon indictments found before themselves, and they have jurisdiction whether the offender is or is not in custody. The commission of jail delivery authorizes the delivery of the jail of a specified town. Indictments may be tried found before other justices, but the persons charged must always be in custody to give the court jurisdiction.

The King's or Queen's Bench is the highest court of criminal jurisdiction. This prerogative, as has been seen, it enjoys to the exclusion of the other superior common-law courts.

The other criminal courts require no particular mention.

(5) *Appellate Courts.*—(*a*) The Exchequer Chamber, to which appeals are first taken from the King's Bench, the Common Pleas, and the Exchequer, is composed, as already explained, of the judges of the two courts in which the action was not heard originally.

(*b*) The Judicial Committee of the Privy Council has exclusive jurisdiction of appeals in admiralty and ecclesiastical cases, and in those coming from the colonies. It is a court of record, and is composed of a lord president, all the equity judges, the three chief judges of the common-law courts, and certain other officials to the number of twenty or more. Only four, however, are required to constitute a quorum. Four of the whole number of members receive a salary, are required to attend the sittings, and retain their positions during good behavior. But the members of the Council generally hold office during the pleasure of the Crown. There is no appeal to the House of Lords, and there is, consequently, danger of a conflict of authority between these tribunals of last resort.

(*c*) The House of Lords. Though, in theory, this entire body constitutes the appellate tribunal, and any of the lords might, if so disposed, assume to act as judges, yet the judicial functions are, in reality, entirely delegated to a few members of the legal profession, known as the "law lords." The services of the others are only available when they are needed to make up a quorum, for which three members are required. The organization of this court has several objectionable features, since the sittings are only held while Parliament is in session; there is no regularity of attendance required on the part of members; and a judge may sometimes sit in review of his own decisions. The decisions rendered, however, enjoy generally a great reputation from the eminence of those who usually act as judges.

There is a large number of other courts in England's present judicial system, but they are all of minor importance and need no specific mention.

The inconveniences arising from this complexity of court organization in England are so manifold that a reform has long been felt necessary. Accordingly, an act of Parliament has been recently passed, entitled "The Supreme Court of Judicature Act" (36 and 37 Vict., chap. 66), to come into effect in November of the present year (1874), by which a reorganization is to be effected. The chief tribunals now existing are to constitute in combination a single court, called the "Supreme Court of Judicature." This is, however, to be separated into two divisions—one to be known as "Her Majesty's High Court of Justice," exercising mainly original jurisdiction, while the other will be named "Her Majesty's Court of Appeal," with exclusive appellate powers except in some few classes of instances. There is to be no appeal to the House of Lords. The High Court is to consist of twenty-one judges—viz. all the present equity judges, with the exception of the lords justices, all the common-law judges (whose number, however, will be reduced in future to fifteen), the judge of the Court of Probate and Divorce, and the admiralty judge. Though the present lord chancellor will form a member of this court, his successor will not. The Court of Appeal will be composed of fourteen judges, of whom five will be judges *ex officio*, and nine *ordinary* judges. Additional members may also be appointed if desired. The *ex-officio* judges will be the lord chancellor, the master of the rolls, and the three chief-justices of the common-law courts. All these, as has been seen, are also members of the High Court. The ordinary judges will be the two lords justices in Chancery, the four salaried judges of the Privy Council, and three others to be hereafter appointed. These nine, and any additional judges who may be appointed, will be known as lords justices of appeal. All the judges of both tribunals will hold office for life, though they may be removed by the Crown on the address of Parliament.

For the more convenient despatch of business, the High Court of Justice is to be divided into five divisions, corresponding to the present tribunals, whose jurisdiction it has received. Thus, one division is to consist of the equity judges, who will be members of the High Court, and is to be known as the Chancery Division. In like manner, there will be the Queen's Bench Division, the Common Pleas Division, the Exchequer Division, and the Probate, Divorce, and Admiralty Division; the first three of which will consist of the judges of the present courts from which they derive their names, while the last will be composed of the two judges of the Courts of Probate and Divorce and the Court of Admiralty. Provision is made for a reduction or increase in the number of these divisions, or in the number of judges who may be attached to any particular division, by order in council of the queen. Judges may also be transferred from one division to another by Her Majesty when it shall be thought desirable. Each of these divisions is to possess very much the same jurisdiction as the present court of the same name, and will be in fact the same tribunal, though with some important differences of authority. For instance, the courts which now proceed entirely upon common-law principles will then be enabled to apply the doctrines of equity jurisprudence, for it is provided that in every civil cause or matter entertained in the Supreme Court of Judicature law and equity shall be concurrently administered, and that equitable rules shall supersede those of the law when any conflict arises. It is still true, however, that causes of action which in them-

selves have been hitherto considered distinctively equitable are to be brought before the Chancery Division, which takes the place of the four present chancery courts of original jurisdiction.

In a large number of questions several divisions, it is evident, will have co-ordinate jurisdiction. It is accordingly provided that any person commencing a cause may assign it to any proper division he may think fit by marking his documents with its name. If a wrong assignment be made, a transfer may be had, on proper application, by direction of the court or by a judge of the division in which the matter is brought, or the cause may even be retained if a transfer would be inexpedient. Such causes as may at present be heard by a single judge are to be heard in the same manner when this act goes into effect. Other matters are referred to divisional courts of the High Court, which are to be constituted of two or three judges. These divisional courts are not the same as the divisions already mentioned. Any number of them may sit at the same time, and they may consist of any of the twenty-one judges of the High Court. The divisional courts hear appeals from the decisions of single judges of the High Court and from inferior courts, decide various motions, etc. Appeals from inferior courts, such as the petty and quarter sessions, county courts, etc., here receive final determination. Other appeals may go on to the Court of Appeal.

Every appeal to the Court of Appeal shall be heard either by the whole court or by a divisional court consisting of any number, not less than three, of the judges thereof. Appeals may also be reargued before decision, or be reheard before final judgment, before a greater number of judges, if the Court of Appeal so direct. But no judge shall hear a case on appeal which he himself decided, or helped to decide, originally.

Provision is also made for the appointment of commissioners to hold circuit courts throughout the kingdom, as at present. Referees may also be appointed for the hearing of causes or the determination of much of the incidental business arising in the courts. The rules of practice and pleading are also to be considerably altered and simplified; but for all these minor details reference must be made to the Judicature Act itself. This synopsis of the general organization of the courts shows how fundamental a revolution is to be effected in the judicial system as at present constituted.

II. The Courts of Scotland.—Although both England and Scotland belong to one united kingdom and have but a single legislative body, the Houses of Parliament, their judicial organization is almost entirely diverse. There is one tribunal of supreme appellate jurisdiction, the House of Lords, which is common to both countries, but this is the only element of correspondence in the two systems. Scotland administers the civil law instead of the common. The courts of chief importance are the Court of the Sheriff, or sheriff-substitute, and the Court of Session. The Scottish sheriff differs from the English in not being confined to the performance of merely ministerial duties. He acts also as the chief local judge of the county to which he belongs. The jurisdiction he exercises is both civil and criminal, and is quite extensive in its scope. In civil causes it extends to all actions on contract and for damages, no matter how large the amount involved. In matters, however, relating to landed property his authority is much restricted. He has also a summary jurisdiction, conferred by statute, in small-debt cases, where the sum involved is not above £12. In most cases of this kind there is no appeal from his decisions. The sheriff also takes cognizance of bankruptcy, insolvency, and admiralty questions. His criminal jurisdiction extends to all cases which do not infer death or banishment. No jury is employed in the trial of civil causes, but only in those of a criminal nature. Though, however, these various powers are described as appertaining to the sheriff himself, yet in practice, so far as the capacity of hearing causes originally is concerned, they are delegated to a subordinate officer, appointed by the sheriff, and styled a sheriff-substitute. If it is desired to secure the review of a decision rendered by the substitute in the first instance, then the sheriff himself acts in the capacity of an appellate judge. From him also, in proper cases, an appeal may be taken to the Court of Session, and thence to the House of Lords.

The Court of Session is the highest civil tribunal in Scotland. It takes cognizance of all questions of a civil nature, whether legal, equitable, admiralty, or probate, and exercises both original and appellate jurisdiction. It was established in 1532, and, as originally constituted, consisted of fifteen judges, all of whom sat in a body to hear appeals. This arrangement occasioned great dilatoriness of procedure, but continued nevertheless for nearly three centuries, despite this and other commonly recognized inconveniences. The present organization is much different. The number of members has been reduced to thirteen. Five of these are called "lords ordinary," exercise severally original jurisdiction, and constitute collectively what is known as the "Outer House." The eight remaining judges form the "Inner House," and have, as a general rule, only appellate jurisdiction. They are divided into two divisions of four each, either of which possesses the same authority, and may be selected by any party appealing, at his own option. One division is presided over by the lord justice clerk, the other by the lord president. In some few instances the Inner House may exercise original jurisdiction, and in cases of exceptional difficulty the whole body of thirteen judges may consider a question upon appeal; but such cases are very rare. In the trial of civil causes in the first instance before a lord ordinary juries have been employed since 1815, but by no means to so great an extent as in the English practice. The jury system was introduced as an exotic, and does not thrive very vigorously under the unfavorable conditions of a common prejudice against it on the part of clients and hostile criticism by able members of the bar. Juries may be dispensed with, in general, in the discretion of the court or by consent of parties; and, as might be supposed, a resort to these expedients is not infrequent. The constitution of the appellate branches of the Inner House in this system is evidently faulty. There may be an equal division of the judges in either body, so as to render the determination of any question impossible, or the decisions of one branch may directly contradict those of the other, so as to make the law fluctuating and uncertain. The first evil is remedied by calling in a lord ordinary or three judges of the other house to attend a rehearing of the cause, by which means the whole number of judges is made uneven and a majority rendered certain. In the second case the opinions of the whole court may be taken, but this mode of reference is discretionary, and therefore inadequate to meet the difficulty. The final appeal, which may be taken from the Court of Session to the House of Lords, has this peculiar consequence—that it refers questions arising under the civil-law procedure to jurists trained only in common-law methods as a general rule. It cannot be said, however, that any practical evils have resulted from this co-operation of systems.

There are several other courts in Scotland composed of members of the Court of Session. Only one, however, deserves mention—viz. the High Court of Justiciary, a tribunal exercising an important criminal jurisdiction. The other courts are of inferior importance.

III. The Courts of France.—The most important courts are the Tribunals of the First Instance, the Courts of Appeal, the Courts of Assize, and the Court of Cassation. The Tribunals of the First Instance, as their name implies, entertain causes originally, and they exercise both civil and criminal jurisdiction. One of them is established in each of the arrondissements into which the whole country is divided. Each of these courts consists of from three to twelve judges, the number varying with the population of the districts. When their number is seven or more, they are formed into two chambers—one for the hearing of civil, and the other of criminal, causes. When there are twelve judges, three chambers are formed, two civil and one criminal. The tribunal at Paris is so large as to be divided into ten chambers. In civil cases three judges must concur in order to pronounce a decision, while in criminal actions the agreement of five is necessary. Appeals may be taken to the Courts of Appeal.

The Courts of Appeal are twenty-seven in number, and each of them is named from the city or place in which it is situated. They consist severally of at least twenty-four judges, who are generally divided into three chambers—one of civil jurisdiction, another of criminal, while the third hears appeals in police matters. Seven judges must concur in the determination of civil causes, five in criminal accusations. The Court of Appeal in Paris has six chambers and fifty-nine judges. Each chamber in all these courts has its own president. When momentous state questions are to be decided or causes of exceptional complexity two chambers may be united. This is called "the solemn hearing," and the concurrence of fourteen judges is required in order that a decision may be given. Appeals lie from these courts to the Court of Cassation.

The Courts of Assize are composed of judges of the Courts of Appeal, and exercise only criminal jurisdiction. One of these tribunals is established in each of the departments into which France is divided (about eighty in number), and their institution is peculiar, as compared with French courts in general, in that it exhibits the employment of the English jury system. The jurors, however, are not required to be unanimous in their verdict, a majority sufficing. The number of judges in each court is three, and sessions are held every three months. The large

amount of business in Paris, however, requires two sessions a month. Appeals may be taken to the Court of Cassation.

The Court of Cassation is the highest permanent court of appeal in France. It is composed of a first president, three presidents of chambers, and forty-five other judges called counsellors. It is divided into three chambers—one for the hearing of appeals in civil causes, another in those of a criminal character, while the third is termed the Chamber of Requests, and takes cognizance of petitions, determines whether appeals are admissible, etc. Appeals must be brought within three months after the previous decision was rendered. The judges, as in all the higher courts of France, hold office for life. The constitution and functions of the Court of Cassation differ quite essentially from those which are conferred upon appellate tribunals in England and generally in other countries, and even upon the subordinate French courts of appeal; for it possesses no power to affirm the judgment of the court below, but only, as its name indicates, to reverse a decision, and transfer the cause for another hearing to some tribunal having co-ordinate jurisdiction with the one in which judgment was first rendered. Moreover, notwithstanding the pre-eminent position of this court, its determination of the law is not considered authoritative upon inferior tribunals, but only as presumably correct and open to contradiction. Instances in which its views are disregarded, however, are of course very rare.

Other French courts of limited jurisdiction but great usefulness are the Tribunals of Commerce, established in all the commercial cities and towns, and the Courts of Prudhommes, existing in Paris and a few of the larger cities. The former consist largely of men experienced in mercantile pursuits, and take cognizance of questions arising in commercial transactions. The latter are mechanics' courts, consisting of manufacturers and artisans, and take charge of matters arising from the relations of employer and employed. They relieve the ordinary courts of much labor.

IV. The Courts of the United States.—In accordance with the provision of the Constitution establishing a Supreme Court and conferring upon Congress the power to create inferior tribunals, a regular system of courts has been formed throughout the Union. The most important are the District Courts, the Circuit Courts, and the Court of Claims. Final appeals are taken to the Supreme Court at Washington. All these tribunals exercise both law and equity jurisdiction, and the judicial authority given by the Constitution is variously apportioned among them.

The District Courts are at present (1874) sixty in number. Each State generally constitutes a single district, though some of the larger ones, as New York, Pennsylvania, and a few others, are divided into two or three. New districts are formed by Congress as the population increases or new States are admitted, so that the number is subject to constant variation. Each court consists of a single judge, who must reside in the district for which he is appointed. Original jurisdiction is exercised in civil, criminal, and admiralty causes. The classes of questions of which these courts take cognizance are determined entirely by Congressional enactment, and are variously modified at different times. They entertain exclusively questions of admiralty or maritime jurisdiction in the first instance, including all seizures upon navigable waters under laws of imposts, navigation, or trade of the U. S., actions for injuries committed upon the high seas, suits to recover upon maritime contracts, actions for salvage, for injuries by collision, and matters of prize. They also have sole original cognizance of questions arising from seizures upon land, and of all suits for penalties and forfeitures under the U. S. laws, and also of actions against consuls or vice-consuls. In addition, they have original jurisdiction in all causes under the bankrupt laws. They exercise concurrent jurisdiction with the Circuit Courts of all crimes and offences against the U. S. the punishment of which is not capital, of patent and copyright cases, and of all causes, civil or criminal, affecting persons who are denied in the State courts their rights of citizenship under the U. S. laws. They also have concurrent jurisdiction with the Circuit Courts or with the State Courts of all causes where an alien sues for a tort in violation of the law of nations or a treaty of the U. S., and of all suits at common law where the U. S. or any officer thereof sue. The trial of issues of fact in the District Courts, except in civil causes of a maritime character, is by jury. No person can be arrested in one district for trial in another. Appeals are generally taken to the Circuit Courts, though sometimes to the Supreme Court.

The Circuit Courts are nine in number, and each circuit in which one of these courts is established consists of several States. The nine justices of the Supreme Court are allotted, by their own selection, each to a particular circuit, and each is required to attend at least one term of such court to which he is appointed in each district of his circuit during every period of two years. There is also appointed a special circuit judge in each circuit, within whose limits he must reside. A circuit court is held by the Supreme Court justice thereto allotted, or by the regular circuit judge, or by the district judge of the district sitting alone, or by the Supreme Court justice and circuit judge sitting together and the former presiding, or, in the absence of either of these, by the other (who then presides) and the district judge. Such courts may be held at the same time in the different districts of the same circuit. Two sessions of each court are held annually within each district of the circuit. The circuit courts have both original and appellate jurisdiction. Their original jurisdiction extends, concurrently with that of the State courts, to civil suits in law or equity for more than $500 when the U. S. are plaintiffs, or an alien is a party, or the suit is between a citizen of the State where the suit is brought and a citizen of another State. They also entertain causes arising under the revenue laws and some questions of a particular nature in bankruptcy procedure. Their important concurrent jurisdiction with the District Courts has already been mentioned. Provision is made, moreover, for the removal of certain causes—such as, *e. g.*, actions against revenue officers, suits on titles to land derived from other States, etc.—from the State courts to the Circuit Courts, on proper petition by the defendant and the entering of security. The appellate jurisdiction of Circuit Courts extends to admiralty and maritime causes, and to civil actions referred from the District Courts, where the matter in dispute exceeds the value of $50; also to patent and some other questions. Appeals from the Circuit Courts are taken to the Supreme Court.

The Court of Claims is a tribunal established at Washington, consisting of five judges, of whom one is appointed chief-justice. It has jurisdiction to determine all claims founded upon any law of Congress, or upon any regulation of an executive department, or upon any contract with the government of the U. S., which are presented to it by petition. All petitions in regard to such claims introduced into Congress are required, unless that body otherwise orders, to be transmitted to this court. So the cabinet officers may refer certain claims made upon their departments. Demands which are adjudged valid are payable from the national treasury. The Court of Claims has a single annual session. Appeals are taken to the Supreme Court.

The Supreme Court is the highest tribunal of the U. S. It consists of a chief-justice and eight associate justices, and holds one term annually at Washington. Six justices are required to constitute a quorum. The jurisdiction exercised is both original and appellate, but chiefly, in practice, the latter. The original jurisdiction extends to all cases affecting ambassadors, other public ministers, and consuls, and those in which a State is a party, except that in the latter case no suit can be prosecuted against any State by the citizens of another State. In actions *against* ambassadors or other public ministers, and in many controversies where a State is a party, its jurisdiction is not only original, but exclusive. Its other original authority is shared with the inferior tribunals. In the exercise of its appellate powers the Supreme Court reviews the judgments or decrees of the Circuit Courts, of certain District Courts with Circuit Court powers, of the Court of Claims, and of some tribunals established in the Territories. Moreover, the decisions of the highest State tribunals which are repugnant to the Constitution, treaties, or laws of the U. S. may be re-examined by the Supreme Court, and reversed or modified as may be necessary. Questions also which fail of determination in the Circuit Courts by reason of an equal division among the judges may be transferred to this court for final decision. It has power to review both the law and the fact in any cause of which it takes cognizance on appeal.

The Federal tribunals in this way possess exclusive jurisdiction over subjects of such manifest national importance as patents, copyrights, admiralty causes, and questions of revenue, and have power to determine controversies between States, and to declare void all laws, whether of Congress or of a State legislature, which are in contravention of the provisions of the U. S. Constitution.

V. The judicial systems of the various States of the Union are so diverse that to give any account of them would be impracticable. They all agree in having a number of tribunals, some of original and others of appellate jurisdiction, and the determination of the law by the courts of each State, subject to the review of the Supreme Court of the U. S. in constitutional matters, is conclusive within its own boundaries. Reference must be made to the constitutions and statutes of the States severally for further details.

George Chase, revised by T. W. Dwight.

Cous'cous, called also **Spotted Phalan'ger** or **Sham'sham,** the *Phalangista maculata*, is a white marsupial with black and brown spots. It is about the size of a common cat, and has a prehensile tail and opposable thumbs on the hind feet. It is found in the Spice Islands, and is caught for its fur as well as its flesh, which is eaten. The animal has a disagreeable odor from a secretion of its anal glands.

Couscous, or Spotted Phalanger.

Coushat'ta Chute, a post-village, capital of Red River parish, La. It is on the Red River, and has one weekly newspaper.

Cousin (Victor), a French philosopher, born Nov. 28, 1792, was the son of a watchmaker of Paris. After brilliant academic studies, though he had a strong inclination to music, his mind was directed towards philosophy under Laromiguière, Royer-Collard, and Maine de Biran. In 1815 he succeeded Royer-Collard as professor at the Sorbonne, and continued the teaching of the Scotch philosophy initiated by him, and promoted the reaction against the sensualism of Condillac and the thinkers of the eighteenth century. In a journey to Germany he became indoctrinated with the idealistic philosophy. In 1820 he was suspended on political grounds. He published editions of Proclus (6 vols. 8vo, 1820–27) and Descartes (11 vols. 8vo, 1827), and his celebrated translation of Plato (13 vols. 8vo, 1825–40). In 1827 he was replaced in his chair at the Sorbonne, and shared with Guizot and Villemain a popularity and power in the community unexampled in university annals. He was under Thiers (1840) minister of public instruction for eight months, and delivered in the Chamber of Peers his "Défense de l'Université et de la philosophie" (8vo, 1844). The revolution of 1848 called forth, in refutation of socialism, "Justice et Charité." "Du Vrai, du Beau, et du Bien" appeared in 1853. He taught a philosophy called *eclectic*, which he said was not a method, but a manifestation of the modern spirit of liberty and tolerance in philosophy. Of his numerous works have appeared in this country his "Course of Modern Philosophy" (1855) and "Lectures on the True, the Beautiful, and the Good" (1857), translated by O. B. Wight. Died Jan. 15, 1867.

Coutances (anc. *Constantia*), a town of France, department of Manche, is on a conical hill 8 miles from the English Channel and about 44 miles S. of Cherbourg. It was formerly fortified. It is the seat of a bishop, and has a handsome old cathedral, a public library, a theatre, and manufactures of druggets, worsted stuffs, hardware, etc. Pop. in 1866, 8139.

Couture (Thomas), a French painter, pupil of Delaroche, exhibited first in 1840 "Jeune Venetien après une orgie." His works have brilliant color-effects; among them are "Trouvère," "Fauconnier," "L'Amour d'or," and the famous "Romains de la décadence."

Cove, a post-township of Polk co., Ark. Pop. 456.

Cove, a township of Barbour co., West Va. Pop. 1657.

Cove Creek, a township of Washington co., Ark. Pop. 514.

Cove Creek, a township of Watauga co., N. C. P. 887.

Coveland, a post-village, capital of Island co., Wash. Ter., near the Strait of Juan de Fuca, and about 112 miles N. of Olympia.

Cov'enant [Fr. *convenant* (from *convenir*, to "agree"), literally, an "agreeing" or "agreement;" Gr. διαθήκη; Lat. *foedus*; Ger. *Bund*], in theology, the promises recorded in the Scriptures, made by God on certain conditions of obedience, faith, etc. on the part of man. The old dispensation (or Old Testament) is called in Greek ἡ παλαιὰ διαθήκη, *i. e.* "the old covenant;" and the new dispensation (or Testament), ἡ καινὴ διαθήκη, "the new covenant."

The so-called "Theology of the Covenants" or "Federal System" began with Cocceius (1603–69), who taught: (1) the covenant of works before the fall; (2) the covenant of grace after the fall. And under this second covenant three economies: (1) prior to the law; (2) under the law; (3) under the gospel.

Covenant [remotely from the Lat. *convenio*, to "come together"], in law, is a promise under seal. There are several words appropriated to sealed instruments or promises contained in them, such as bond, covenant, deed, and obligation. The first, third, and fourth words are used to express the entire instrument, while "covenant" is commonly employed to designate a particular clause in a sealed instrument. Thus, there may be many covenants in a deed. The subject is fruitful in distinctions, covenants being treated in the law-books as to their form, their nature, their relation to other covenants, their assignability, and the like. One of the most important of these is that which classifies covenants into those which "run with the land" and those which do not. To explain this subject it is necessary to state that in ordinary conveyances of land there are found certain clauses which affirm in substance that the grantor is owner in possession, actual or constructive (or seized), and has a good right to convey; that there are no encumbrances on the land; that the purchaser shall quietly enjoy the land without being evicted by any person having a superior title; that the grantor will warrant and defend the title; and that he will make such further deeds or conveyances as he may be called on to make to perfect the title. In brief terms and in technical language these are covenants of seisin, good right to convey, against encumbrances, of quiet enjoyment, of warranty, and of further assurance. The first three of these, it will be observed, affirm an existing fact; the last three concern the future, and are promissory in their nature. The first three do not run with the land; the last three do. The reason of the distinction is technical. The first three, if untrue at all, are so at the very moment when the deed was delivered, and accordingly then conferred a right of action. This immediate right to sue is in the nature of personal property, and closely resembles ordinary rights of action, such as a claim on a promissory note already due. Accordingly, if the grantee in the deed should convey the land, he would not by that act alone transfer these rights of action; they would not, in technical language, "run with the land." On the other hand, as to the three covenants in the future tense, it is clear that no action can be brought upon them until the event against which they are designed to guard happens, or, in other words, until the covenant is broken—that is, until the quiet enjoyment ceases or the grantee is evicted. Until that occurs the covenant will "run with the land," by which expression is meant that the mere conveyance to the second grantee transfers these covenants, as it would the houses, trees, and other additions to land. The distinction thus pointed out also applies to the case of landlord and tenant, and there are abstruse distinctions here to be noted which cannot properly be stated within the brief compass of this article. Some of the common covenants in a lease which run with the land are the agreement of the tenant to pay rent, or to make repairs, or to keep houses insured. It should be added that the rule respecting the assignability of covenants in leases applies to covenants binding either on the tenant or the landlord. There is a growing practice in conveyances of land in towns and cities to insert clauses binding the purchaser to use the land in a particular manner, as to build dwelling-houses upon it, and even such as are of a particular description. Although these clauses do not strictly fall within the technical doctrines of covenants running with the land, yet they are binding in equity law on a subsequent purchaser with notice. The record of the deed containing them will in general be sufficient notice to such subsequent purchaser. The covenant may be enforced through the medium of an injunction or other appropriate equitable remedy. T. W. Dwight.

Cov'enant (National, of Scotland), an agreement to protect the Reformed religion in the Church of Scotland from the attempt of the English government to enforce the episcopal form of worship, was drawn up and published by the Four Tables in Edinburgh, Mar. 1, 1638. It professed to be based upon a document which James VI. had signed in 1580. The Four Tables, as they were called, consisted of—1, nobility; 2, gentry; 3, ministers; and 4, burgesses; and in their hands the whole authority of the kingdom was vested. They elected a general assembly which met at Glasgow in Nov., 1638, and abolished episcopacy; ordering that every person should sign the Covenant on pain of excommunication. The Covenanters prepared for war, and though a treaty of peace was concluded in June, 1639, they entered England in Aug., 1640. An agreement was signed at Ripon, Oct., 1640, by which commissioners were to be appointed, to whom the settlement of the points in dispute was referred. This covenant, under the name of the Solemn League and Covenant, was received by the Parliament of the Assembly of Divines, Sept., 1643. It differed essentially from the covenant of 1638, and according to Hallam "consisted in an oath to be subscribed by all sorts of persons in both kingdoms, whereby they bound themselves to preserve the Reformed religion in the Church of Scotland, in doctrine, worship, discipline, and government, according to the word of God and practice of the best Reformed churches; and to endeavor to bring the churches of God in the three kingdoms to the nearest conjunction and uniformity in religion, confession of faith, form of church government, directory for worship, and catechising; to endeavor, without respect of persons, the extirpation of popery, prelacy (that is, church government by archbishops and other ecclesiastical officers), and whatsoever should be found contrary to sound doctrine and the power of godliness; to preserve the rights and privileges of the Parliaments, the liberties of the kingdoms, and the king's person and authority in the preservation and defence of the true religion and liberties of the kingdoms; to endeavor the discovery of incendiaries and malignants who hinder the reformation of religion and divide the king from his people, that they may be brought to punishment; finally, to assist and defend all such as should enter into this covenant and not suffer themselves to be withdrawn from it, whether to revolt to the opposite party or to give in to a detestable indifference or neutrality." This document was signed by members of both houses and by civil and military officers. A large number of the beneficed clergy who refused to subscribe were ejected. Charles II. signed it very reluctantly at Spey in June, 1650, in the hope of recovering the English throne. After the Restoration a majority in the House of Commons ordered it to be burned by the common hangman in May, 1661. In the same year the Scottish Parliament renounced the Covenant and declared the king supreme. Under the reign of Charles II. the Covenanters were subjected to a fierce and cruel persecution, in which neither age nor sex was spared. It is in the standards of the Covenanters that we have to look for a true embodiment of the tenets held by the great body of English and Scottish Presbyterians of 1643. Others gave in to the Revolution settlement, and afterwards found cause to secede. The Covenanters never gave in, and of course never seceded. Although in point of fact an elder sister of the existing Church of Scotland and all its secessions, the Cameronian body did not assume a regular form till after the Revolution; and it was with some difficulty that it organized a communion with ordained ministers. The stedfastness of members was put to a severe trial by the defection of their ministers, and for a time the people were as sheep without a shepherd. After sixteen years they were joined by the Rev. John McMillan from the Established Church, in 1706. In 1743 they constituted a presbytery at Braehead, under the name of the Reformed Presbytery. Holding strictly to the covenants, the political position of the Covenanters is very peculiar, as they refuse to recognize any laws or institutions which they conceive to be inimical to those of the kingdom of Christ. The Reformed Presbyterians regard themselves as the modern representatives of the Covenanters.

Cov'enanters, a name given to the signers of the Covenant in Scotland. (See COVENANT.) The Covenanters were also called Cameronians, from Richard Cameron, the founder of the sect. (See REFORMED PRESBYTERIANS.)

Cov'ent Garden [a corruption of "convent garden," so called because it was once the garden of Westminster Abbey] is a square in London famous for its market of fruits and flowers. It was formerly a fashionable quarter of the town. Frequent allusions are made to this place in the old English comedies. The market originated about 1656. Covent Garden is one of the most interesting of London sights; it is seen to the best advantage about three o'clock on a summer morning, Tuesday, Thursday, and Saturday being the principal days. The Covent Garden Theatre was opened in 1732, and has been several times burned. The present edifice was opened in 1858.

Cov'entry [Lat. *Coventria*], a city of England, in the county of Warwick, on the Sherbourne, 10 miles N. N. E. of Warwick, on the London and North-western Railway. The modern part of it is well built. Among the remarkable buildings are St. Michael's church, founded in 1313, which is a masterpiece of the lighter Gothic style, has a spire 303 feet high, and is said to be the largest parish church in England; Trinity church; Christ church, with a handsome ancient spire, belonging to the old Grayfriars' convent from which the town has its name; and St. Mary's Hall, built about 1450, an admirable specimen of ornamental architecture. The ancient cathedral was destroyed by Henry VIII. Coventry returns two members to Parliament. It has manufactures of ribbons, fringes, and watches, and is the greatest emporium for ribbons in England. It was formerly famous for the manufacture of broadcloth, caps, and blue thread. In 1044, Earl Leofric and his wife, the celebrated Lady Godiva, founded here a magnificent Benedictine abbey. In the fifteenth century religious mysteries were often acted here before the king. Pop. in 1871, 39,470.

Coventry, a township and post-village of Tolland co., Conn. The village is near the Hartford and Providence R. R., 20 miles E. of Hartford. Total pop. 2057.

Coventry, a post-township of Chenango co., N. Y. Pop. 1490.

Coventry, a township of Summit co., O. Pop. 1817.

Coventry, a township and post-village of Kent co., R. I. The village is on the Hartford Providence and Fishkill R. R., about 10 miles S. W. of Providence. The township contains several manufacturing villages, and has a national bank at Anthony. Total pop. 4349.

Coventry, a post-township of Orleans co., Vt. It has an academy, and manufactures of lumber, leather, and starch. Pop. 914.

Coventry, EARLS OF, Viscounts Deershurst (England, 1689).—GEORGE WILLIAM COVENTRY, ninth earl, born May 9, 1838, succeeded his grandfather in 1843.

Cov'erdale (MILES), an English bishop and Reformer, born in Yorkshire in 1487. An Augustine monk in his youth, he was one of the first Englishmen who adopted Protestant doctrines. In 1535 he published an English translation of the Bible, which was reissued in 1537 with the royal sanction. The version of the Psalms is that of the present Prayer-Book. This was the first entire Bible ever published in English. He edited the "Great Bible," or Cranmer's Bible (1540). In 1551 he was appointed bishop of Exeter. On the accession of Mary, in 1553, he was deprived of his office and imprisoned for two years. He was then permitted to take refuge on the Continent, whence he returned in 1558, and died in London in Feb., 1568.

Cov'ert, a township and post-village of Seneca co., N. Y. The village is 1 mile S. W. of Cayuga Lake and 12 miles N. W. of Ithaca. The township has five churches and some manufactures. Total pop. 2238.

Cov'ert Way, or **Covered Way,** is a path outside the fosse or moat of a fortified place, between the counterscarp and the banquette of the glacis. It is about thirty feet wide, and is sunk so far below the crest of the glacis that soldiers standing upon it cannot be seen by besiegers; hence the name. Sentinels placed in the covert way prevent all access of the enemy's spies, and musketeers mounted on the side next the glacis can pour fire on the enemy over the crest. The covert way is broad enough to allow troops to form on it, either to act defensively or make sorties; and to increase this accommodation enlarged portions, called places of arms, are made.

Covilhã', a town of Portugal, in the province of Beira, is situated among the mountains, 48 miles E. of Coimbra. It has thermal springs, and manufactures of a woollen cloth called saragoca. Pop. 9022.

Cov'ington, a county in the S. of Alabama. Area, 1000 square miles. It is intersected by the Conecuh River. The surface is nearly level; the soil sandy. Cotton, wool, and rice are raised. Capital, Andalusia. Pop. 4868.

Covington, a county in the S. of Mississippi. Area, 600 square miles. It is drained by Leaf River and several of its affluents. The soil is sandy, and partly covered with pine forests. Cotton, wool, and corn are raised. Capital, Williamsburg. Pop. 4753.

Covington, a post-village, capital of Newton co., Ga., on the Georgia R. R., 41 miles E. by S. from Atlanta, is

the seat of the Southern Masonic Female College, and has one weekly newspaper. Pop. 1121.

Covington, a post-village, capital of Fountain co., Ind., on the Wabash River, the Wabash and Erie Canal, the Indianapolis Bloomington and Western, and a branch of the Chicago Danville and Covington R. Rs., 71 miles W. N. W. of Indianapolis, has two newspapers, a high school, a foundry, and four coal companies. Pop. 1888.

J. H. SPENCE, PUB. COVINGTON "PEOPLE'S FRIEND."

Covington, a city of Kentucky, Kenton co., is on the Ohio River opposite Cincinnati, and just below the mouth of the Licking River, which separates it from Newport. It occupies a nearly level site, and is pleasantly situated. A noble suspension bridge across the Ohio connects it with Cincinnati. It has also a suspension bridge connecting it with Newport. Covington is the northern terminus of the Kentucky Central R. R., which extends to Nicholasville, Ky., and is connected with Louisville by another railroad. It is the seat of a Roman Catholic bishop, has twenty-six churches, six public schools, nine Roman Catholic schools, three English and one German weekly newspaper, three national and one State bank, waterworks, gasworks, paid fire department, and fire-alarm telegraph, two horse-car lines, one orphan asylum, one hospital, two rolling-mills, and one railroad-iron mill; also manufactures of stoves, wood-work, tobacco, etc. It has 40 miles of paved streets. Pop. 24,505. J. W. DAVIS, "JOURNAL."

Covington, a post-village, capital of St. Tammany parish, La., 45 miles N. of New Orleans. Pop. 585.

Covington, a post-township of Dakota co., Neb., has one weekly newspaper. Pop. 225.

Covington, a township and post-village of Wyoming co., N. Y. Pop. 1189.

Covington, a post-village of Miami co., O., on the railroad which connects Columbus with Chicago, 79 miles W. of Columbus, has one weekly newspaper. Pop. 1010.

Covington, a township of Clearfield co., Pa. P. 701.

Covington, a township of Luzerne co., Pa. P. 1182.

Covington, a township and post-borough of Tioga co., Pa., on the Blossburg and Corning and Tioga R. Rs. Pop. of township, 811.

Covington, a post-village, capital of Tipton co., Tenn., on Big Hatchie River, 200 miles W. by S. from Nashville. It has one weekly newspaper. Pop. 447.

Covington, a post-village, capital of Alleghany co., Va., on Jackson's River and on the Chesapeake and Ohio R. R., 205 miles W. of Richmond. Pop. of township, 1268.

Covode (JOHN), born in Westmoreland co., Pa., Mar. 17, 1808, was brought up as a farmer and blacksmith, but in the early days of the Pennsylvania coal trade he went into that business with success, and afterwards was also a woollen manufacturer and railroad stockholder and director. He was a member of Congress from Pennsylvania, 1854–70, and was distinguished for his energy and political influence. His freedom and impetuosity of speech made him many friends and enemies, and won him the title of "Honest John Covode." Died Jan. 11, 1871.

Cow. See CATTLE.

Cow'an, a township of Wayne co., Mo. Pop. 492.

Cowanshan'nock, a township and village of Armstrong co., Pa. The village is on the Alleghany Valley R. R., 48 miles N. E. of Pittsburg. Total pop. 2246.

Cow'ansville, a post-village of Dunham township, Missisquoi co., Quebec (Canada), on the South-eastern Counties Junction Railway, 14 miles from West Farnham Junction. It has a weekly paper. Pop. about 600.

Cow Bay, a port and post-village of Cape Breton co. and island, 22 miles from Sydney, has mines of bituminous coal, and a breakwater for the protection of shipping. Pop. about 2500.

Cow-bird, or **Cow-bunting,** the *Molothrus pecoris*, a bird of the U. S. belonging to the blackbird family. It takes its name from the fact that it associates with cattle in pastures, probably for the purpose of catching the insects which are aroused by the cattle. Like the European cuckoo, it lays its eggs in the nests of other birds, never hatching its own young.

Cow Castle, a twp. of Orangeburg co., S. C. P. 720.

Cow'ee, a township of Macon co., N. C. Pop. 760.

Cowes, West, a seaport and watering-place of England, on the Isle of Wight, at the mouth of the river Medina, 10½ miles S. S. E. of Southampton. It is built on a steep slope, and presents a fine appearance from the sea. Here are many elegant villas and good hotels. Cowes has an active coasting-trade. Pop. 5482.

Cowe'ta, a county in the W. N. W. of Georgia. Area, 378 square miles. It is bounded on the N. W. by the Chattahoochee River. The surface is uneven; the soil is mostly fertile. Cotton, wool, and corn are raised. It is intersected by the Atlanta and West Point R. R. Capital, Newnan. Pop. 15,875.

Cow'hage, Cowitch, or **Mu'cuna,** a drug which consists of short, slender, brittle hairs, which grow on the pods of twining plants of the genus *Mucuna* or *Stizolobium*, natives of the tropical parts of America and Asia. This genus belongs to the order Leguminosæ, and has a knotted, 2-valved pod, divided by transverse partitions. Most of the cowhage brought to market is from the *Stizolobium pruriens* and *Stizolobium urens*, natives of the West Indies. *Stizolobium pruritum* of the East Indies yields cowhage of similar quality. The hairs readily stick in the skin and cause intolerable itching. Cowhage is used in medicine, acting mechanically in killing and expelling worms, particularly the species of *Ascaris*. That it does not act on the inner surface of the intestinal canal is supposed to be owing to the mucous secretion. It is generally administered in syrup or honey. Before the pods of the cowhage plants are ripe they are used as a vegetable, like those of beans, and are very palatable.

Cow Island, a township of Lincoln co., Me. P. 19.

Cow Lake, a township of Jackson co., Ark. Pop. 189.

Cow'ley, a county in the S. of Kansas. Area, 804 square miles. It is intersected by the Arkansas River and Grouse Creek. There is considerable timber, and the soil is fertile. Coal and building-stone are found. Cattle, grain, and wool are raised. Capital, Winfield. Pop. 1175.

Cow'ley (ABRAHAM), M. D., an English poet, the son of a grocer, born in London in 1618, entered Trinity College, Cambridge, in 1636. He said that he became a poet from reading a volume of Spenser that lay in his mother's parlor. He made verses at the age of ten, and his first volume, "Poetic Blossoms," he published at fifteen. He was ejected from college as a royalist in 1643. In 1646 he went to Paris with the queen, and remained ten years. He published in 1647 "The Mistress," a series of poems which abound in frigid conceits. He was imprisoned as a royalist, but was released through interest, and obtained the usufruct of one of the queen's estates, £300 yearly. He studied natural history, and issued "Liber Plantarum" (1662–78). The epic "Davideis," commenced in college, was never finished. His essays, as well as his anacreontics, evidence sensibility and refinement of thought, a facile imagination, a brilliant wit, and cultured mind, but are marred with the prevailing trivial love for glittering ingenuity of style. The most admired poet of his day, he is called on his tombstone "Anglorum Pindarus, Flaccus et Maro." His works were published in 1680 by Sprat, and by Aikin in 1802, 3 vols. Died July 28, 1667.

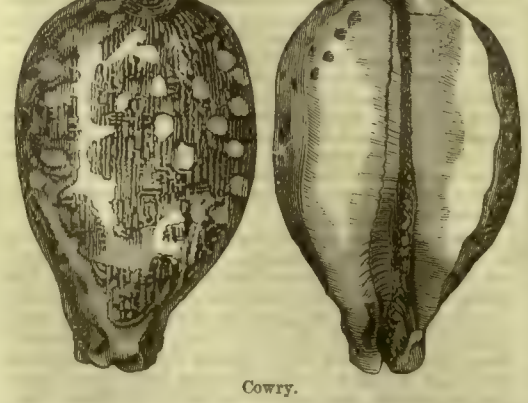
Cowley (HENRY RICHARD WELLESLEY), FIRST EARL, a British diplomatist, a son of Sir Henry Wellesley and a nephew of the duke of Wellington, was born June 17, 1804. He became minister to Switzerland in 1848, and was ambassador to Paris from 1852 to 1867.

Cow'litz, a county in the S. W. of Washington Territory. Area, 400 square miles. It is bounded on the S. by the Columbia River, and intersected by the Cowlitz. It is finely timbered and contains coal. It is intersected by the Northern Pacific R. R. Capital, Monticello. Pop. 730.

Cow-Pars'nip, the popular name of certain plants of the genus *Heracleum*, of the order Umbelliferæ, having petals bent in at the middle, and flat fruit. The *Heracleum lanatum* grows in the U. S., from North Carolina northward and westward. It is a coarse weed, from three to eight feet high, strong scented, and is said to be poisonous. One species is a native of Europe (*Heracleum Sphondium*), the common cow-parsnip, a rank weed, with coarse, hairy leaves, and stem about three to five feet high. It is gathered in some parts of England for fattening pigs, and is said to afford wholesome food for cattle. Some Siberian species are much larger, and are valued for the abundant herbage which they yield very early in the season, particularly *Heracleum Panacea*, which sometimes attains a height of ten feet, and the root-leaves are three to five feet long. The species are mostly Asiatic.

Cow'pens, a village of Spartanburg co., S. C., about 100 miles N. N. W. of Columbia. Here the American general Morgan defeated Colonel Tarleton Jan. 17, 1781. The British lost about 300 killed and wounded, and 500 prisoners.

Cow'per, EARLS, Viscounts Fordwich (Great Britain, 1718), Barons Cowper (England, 1706), Barons Butler of Moore Park (England, 1679), Barons Dingwall (Scotland, 1607), and baronets (1642).—FRANCIS THOMAS DE GREY COWPER, seventh earl, a prince of the Holy Roman Empire, captain of the corps of gentlemen-at-arms, born June 11, 1834, succeeded his father April 15, 1856.



Cowper (William), Earl, an eminent English judge and orator, born in 1664. He was called to the bar in 1688, and elected to Parliament in 1695. He became an excellent debater and the leader of the Whig party in the House of Commons. In 1705 he was appointed lord chancellor. He resigned the great seal when the Tories obtained power in 1710, but was reappointed in 1714. Having resigned office in 1718, he was then created an earl. Died Oct. 10, 1723.

Cowper (William), an English poet, born at Great Berkhamstead, in Hertfordshire, Nov. 26, 1731, was the son of the rector, John Cowper, chaplain of George II., and nephew of Earl Cowper, noticed above. Deprived of his mother at the age of six, he was a tender, shrinking child, and a sensitive, melancholy boy at Dr. Pitman's school, made more so by the rough fagging at Westminster School, where he advanced in classical studies. First articled to an attorney, living in the Temple in 1752, and called to the bar in 1754, he never practised. Appointed clerk of the journals in the House of Lords, he could not bring himself to appear for nervousness. He determined on suicide, but wanted courage. Morbidly dejected, he was taken in 1763 to Dr. Colton's at St. Alban's. In 1767 he went to Huntingdon, and came to know Mrs. Unwin, "Mary" in his poems. The acquaintance grew into a tender friendship. Residing with the Unwins amid gentle and religious influences, where his spirit found repose and ease, he visited their friend, Rev. Mr. Newton, in 1773, whose gloomy religious views had the effect to bring back his mental malady. Tended by Mrs. Unwin through a long illness, in his convalescence he translated the hymns of Madame Guyon, and diverted himself with taming hares. Mrs. Unwin suggested a poem on the "Progress of Error" in Dec., 1780, and in three months he wrote "Truth," "Table-Talk," "Progress of Error," and "Expostulation," published in 1781. Lady Austen, whom he met in 1781, inspired him to write "The Task" (1785), and to translate Homer (1791), and first told him the story of John Gilpin. "The Task" met with great success. In his later life Cowper became more and more the prey of dejection and remorse, which sometimes deepened into insanity. His "Private Correspondence" (2 vols., 1824) is gentle, thoughtful, and pervaded with playful humor. Cowper gave to English taste a simpler and more earnest cast. Editions of his works are Gilfillan's (Edinburgh, 1854, 2 vols.) and Southey's (15 vols., 1837–38). (See the Lives in Southey's edition, and in that of Hailey.) Died April 25, 1800.

Cowper's Glands, two small and rather lobulated yellowish glands which in the male of the human species are found between the layers of the deep perinæal fascia, under the anterior part of the membranous portion of the urethra. They secrete a mucus which flows into the bulbous portion of the urethra by a duct an inch long. The vulvo-vaginal glands (glands of Bartholine) are the analogues in the female.

Cow-Pox Inoculation. This species of inoculation, as a security against the smallpox, was introduced by Dr. Jenner, and it became general in 1799. The genuine cow-pox appears in the form of vesicles on the teats of the cow. It was first brought into use by Jenner, who first vaccinated from arm to arm in 1796. He had been studying and experimenting about it for a number of years before. (See Inoculation and Vaccination, by Frank P. Foster, M. D.)

Cow'ry [Hindostanee], the shell of *Cypræa*, a genus of

Cowry.

prosobranchiate gasteropodous mollusks, of the family Cypræidæ, to all the members of which the name cowry is often extended. They belong to the Siphonostomata, have spiral, convoluted shells, the spire visible in the young, but entirely concealed in the adult, and the outer lip thickened and bent in. The aperture extends the whole length of the shell. The shells, often called "porcelain shells," are sometimes beautifully enamelled. They are most abundant and attain the largest size in warm seas. Many species occur as fossils. A few very small living species are found on the British coasts. Several species occur on the eastern and western shores of America. The name cowry is chiefly applied to the shells of *Cypræa moneta*, which have commercial value from their use as a substitute for coin in many parts of Asia and Africa. They are said to have been used by the ancient Assyrians, and specimens were found by Layard at Nimrood. They are not of great beauty, are yellow and white, often with a yellow ring; they are about an inch long, and nearly as broad as long. They are found in the Indian and Pacific oceans, and are one of the most important exports of the Maldive Islands. In Bengal, 3200 cowries are counted equal to one rupee (fifty cents). Yet cowries to the value of $100,000 are said to have been at one time imported annually into Bengal. Many tons of cowries are used in trade with the west of Africa. In 1849, 300 tons were brought to Liverpool for the African trade.

Cow'slip (*Primula veris*), an herbaceous plant of the order Primulaceæ, is a native of England and other parts of Europe. It bears a beautiful and fragrant flower, which is a general favorite. The flowers, which are small and grow in an umbel at the top of a scape, have sedative properties, and are sometimes used as an anodyne and antispasmodic. American cowslip is a common name of the *Dodecatheon Meadia*, a plant of the same natural order, and a native of the U. S. It is cultivated in gardens for the beauty of its flowers. (See also Caltha.)

Cow Tree, a name given to several trees of different natural orders, the bland juice (*latex*) of which is used instead of milk. They are natives of tropical climates. Some of them belong to the order Moraceæ, and are allied to the fig; others to the closely-related order Artocarpaceæ, one of which is the famous *palo de vaca*, or cow tree, of the Cordilleras (*Brosimum utile*). It grows in rocky situations, at an elevation in equatorial regions of about 3000 feet. It is a lofty tree, with leaves ten to sixteen inches long, and very small flowers. For several months in the year its branches appear dead, but as soon as the trunk is pierced there flows a full stream of sweet and nourishing milk. This juice flows most freely at sunrise. The natives then hasten from all directions with bowls to receive it. The milk has a pleasant odor, and a viscidity which does not belong to the milk of animals. It becomes yellow in a short time, and a cream rises to the surface, which gradually thickens into a cheesy consistency. This milk is much used by the negroes and Indians, but differs very much from the milk of animals, more than one-half being wax and a nitrogenous compound; a little sugar, a salt of magnesia, and water chiefly making up the rest. The hyahya (*Tabernæmontana utilis*, of the order Apocynaceæ) also yields an abundant thick juice, which is used in Guiana and elsewhere as a substitute for milk, and is harmless, agreeable, and nutritious. The *Gymnema lactiferum*, an asclepiadaceous plant of Ceylon, yields a milk which is used as food.

Cox (Abraham S.), M. D., born in New York in 1800, studied medicine, and attained great eminence in the practice of his profession. Resigning his large and lucrative practice, he accepted, at the commencement of the civil war, the appointment of surgeon in the army, was promoted to be surgeon-in-chief of a division, and at the time of his death was attached to the Army of the Cumberland. The labor and exposure incident to the active campaigns of that army undermined his health, and he died July 28, 1864, at Lookout Mountain, Tenn.

G. C. Simmons, *Clerk, Board of Engineers.*

Cox (David), an English aquarelle painter, born in Birmingham in 1793. "His foliage," says Ruskin, "is altogether exquisite in color, in its impressions of coolness, shade, and mass." He published a "Treatise on Painting in Water-Colors" (1814). Died June 7, 1859.

Cox (Jacob D.), an American general and lawyer, born at Montreal Oct. 27, 1828. He became a major-general of Union volunteers in the autumn of 1862, and served under Gen. Sherman in Georgia in 1864. In December of that year he commanded a division at the battle of Nashville. He was elected governor of Ohio by the Republicans in Oct., 1865, and was appointed secretary of the interior in Mar., 1869. He resigned in Nov., 1870.

Cox (Melville Beveridge), the first Methodist Episcopal foreign missionary, born at Hallowell, Me., in 1799, entered the ministry in 1822, and sailed as missionary to

Liberia Nov. 3, 1852. Here he labored with great zeal and success for some months. He died of the "African fever" July 21, 1833. (See STEVENS, "History of the Methodist Episcopal Church," vol. iv., pp. 43, 451.)

Cox (RICHARD), bishop of Ely, born in 1499, was the tutor of King Edward VI. He translated for "the Bishops' Bible" the four Gospels, the Acts, and the Epistle to the Romans. Died July 22, 1581.

Cox (SAMUEL HANSON), D. D., LL.D., a Presbyterian author and divine of Quaker parentage, born at Leesville, N. J., Aug. 25, 1793, was ordained July 1, 1817. He was pastor of the Spring street church, N. Y. (1820–33), professor of sacred rhetoric at Auburn Theological Seminary (1834–37), and pastor of the First Presbyterian church, Brooklyn, N. Y. (1837–54). He was an early and eminent advocate of temperance, anti-slavery, and other reforms, and was distinguished for his brilliancy and effectiveness as a platform speaker. He wrote "Quakerism not Christianity," 1833, and "Interviews, Memorable and Useful," 1853.

Cox (SAMUEL SULLIVAN), a Democratic politician, born at Zanesville, O., graduated at Brown University in 1846, was a member of Congress from Ohio (1857–65) and from New York City (1869–75). He is a well-known editor and lecturer, and has published "The Buckeye Abroad" (1852), "Eight Years in Congress," etc.

Coxal'gia, or **Coxi'tis** (*Morbus coxarius*, "hip-joint disease"), a chronic inflammation of the hip joint, which may begin either in the head of the thigh-bone or the socket of the hip-bone, or else in the membrane (*synovial*) that lines its cavity, but which finally extends to all its tissues, cartilages, ligaments, and surrounding soft parts. Inflammation of the bones (*osteitis*), by far the most common origin of the disease in children, is chronic and insidious in its development, and is favored by the incomplete ossification and active nutrition of the bones in childhood. Inflammation of the lining membrane (*synovitis*) is the most frequent form of hip disease in adolescence, and then is often of rheumatic origin. Chronic infantile coxitis principally affects children between one and five years of age, and is often awakened by a fall or blow, especially when such accident occurs to children of a lymphatic or scrofulous constitution. The very first symptom is lameness, followed by pain, first felt in the knee, afterwards excited in the joint itself by direct pressure, by motion of the limb, or by the weight of the body resting upon it. To lessen this weight the patient rests on the ball of his toes, and drags the leg in walking, stiffly extending it. At this stage it is turned a little outward by spasmodic contraction of the muscles on the outer side of the joint. But very soon, in order to still further lessen the weight, the body bends over on the thigh, and the arm and lame part of the back, with the abdomen, are carried forward. When the patient lies down, therefore, a space is left between the body and the bed, and if the spinal column be forcibly straightened out and the curve flattened, the thigh in turn is bent on the body by dragging of the muscle that runs from the spinal column to the head of the thigh-bone (*psoas*). Still, for the purpose of lessening weight, the hips are tilted towards the painful side, and appear oblique, while the leg is thus apparently lengthened. Behind, the nates are flattened. It soon becomes impossible to glide the head of the thigh-bone in its socket; the whole hip moves with every motion communicated to the leg. This sign is most characteristic of the confirmed disease; it is due at first to the spasmodic rigidity of muscles—later to inflammatory adhesions.

In the second stage liquid is poured out into the cavity of the joint to increase the space of this cavity, the thigh is more strongly bent on the body (flexed), and drawn inward (adducted), so that the foot crosses the opposite leg. The affected limb is therefore apparently shortened. A swelling appears in the groin and at the outer aspect of the thigh; the pain becomes intolerably severe; standing and walking are impossible.

In the third stage the cavity fills with matter, the ligaments of the joint are relaxed, abscesses form in the neighborhood, and all the soft parts are swollen by inflammatory exudations. Dislocation occasionally though rarely occurs. More often the head of the thigh-bone separates from its shaft, and adheres to the socket of the joint, while the socket itself is enlarged. The patient's strength is severely undermined, hectic fever sets in, the emaciation is extreme, and death may occur gradually from exhaustion, or more rapidly from acute absorption of pus.

The diagnosis of *morbus coxarius* is only difficult in the first stage. The lameness may simulate that of muscular paralysis, from which it is distinguished by the freedom with which the head of the thigh-bone may be moved; or the pain in the knee may fix suspicion on the wrong joint; or the thigh may exactly imitate hysterical muscular contraction; but in this affection the limb relaxes completely under chloroform.

The prognosis for spontaneous cure is always very unfavorable. After suppuration death may be caused by pyæmia, by exhaustion, by general tuberculosis, or by amyloid disease. Appropriate treatment of the first and second stages offers about 50 per cent. of recoveries; operative treatment of the third stage has so far cured about one-third of the cases submitted to it. In a large number of cases, although the inflammation is arrested, and hence life is saved, the joint becomes permanently immobilized (ankylosis) by fibrous bands within and around its cavity, that hold the articular surfaces firmly together (false ankylosis). This result is to a certain extent favored by the treatment adopted for the cure of inflammations; it is important therefore that the stiffened limb be left in the most favorable position for use—namely, extension.

The treatment varies according to the stage of the disease. During the primary osteitis that so often precedes inflammation of the joint, and is indicated by the one symptom of lameness, constitutional treatment is to be adopted—cod-liver oil, iron, cinchona, nourishing food, fresh air, and salt-water bathing. As soon as the movements of the joint are compromised, local treatment becomes of primary importance. It aims—1st, to immobilize the joint, so as to prevent friction of the inflamed parts; 2d, to extend the limb, so as to separate as much as possible the folds of the lining membrane, to reduce to a minimum size the cavity of the joint, and thus favor the reabsorption of fluids; finally, to leave the limb in the best position for use should it become permanently stiffened. The limb can only be maintained in extension by a force sufficient to overcome the spasmodic muscular contractions. Many apparatuses are devised for this purpose, in which the limb is straightened out and fastened to an inflexible plane, and forcibly retained in this position by means either of a weight attached to the foot or a sliding screw at the knee. The simplest form of apparatus is made by swathing the limb in bandages stiffened by plaster of Paris or dextrine. These are only adapted to the earliest stage, or when cure is already progressing. It enables the patient to walk about. This facility is also afforded by steel apparatus that supports the limb at the waist and foot, and gradually extends it by continued traction at the knee. In other cases the patient is kept in bed, the leg fastened to a simple long splint, with a cross-piece under the foot, to which is attached the weight. A large double gutter, in which were laid the entire pelvis and both lower extremities of the patient, was formerly famous, but is now seldom used. During the employment of such apparatus, ice may be applied to the joint to subdue acute inflammation, occasionally blisters, where fluid has been rapidly effused, more often pressure by means of elastic bands, a powerful means of promoting reabsorption. Leeching is useless, as also are applications of iodine; while cauterization, formerly much in vogue, is now generally condemned.

When suppuration has occurred within the joint, and especially when pus has discharged externally by one or more fistulæ, it is necessary to amputate (resect) the head of the thigh-bone. Very extensive destruction of the hip-bone and certain general diseases, amyloid disease or general tuberculosis, with incoercible diarrhœa, contra-indicate the operation. After it, death may result from such complications or from surgical fever (pyæmia, septicemia). When successful, however, the patient is rescued from an otherwise certain death, and the joint recovers its integrity, ankylosis being much less frequent than after treatment by immobilizing apparatus.

MARY C. PUTNAM JACOBI.

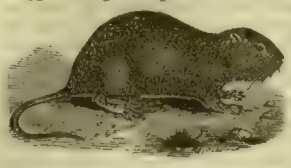
Cox Creek, a post-township of Clayton co., Ia. Pop. 989.

Coxe (ARTHUR CLEVELAND), D. D., a son of Dr. S. H. Cox, noticed above, an American Episcopalian bishop, born at Mendham, N. J., May 10, 1818, graduated at the University of New York in 1838, and took holy orders in 1841. He wrote, besides other works, "Christian Ballads" (1840) and "Impressions of England" (1856). He became rector of Calvary church in the city of New York in 1859, and bishop of Western New York in 1865.

Coxe (JOHN REDMAN), M. D., born at Trenton, N. J., in 1773, received his medical education in Europe, settled in Philadelphia in 1796, was a professor in the University of Pennsylvania (1809–35), and was the author of several medical, scientific, and literary works. Died Mar. 22, 1864.

Coxe (WILLIAM), an English historian, born in London Mar. 7, 1747. He was appointed curate of Denham in 1771. He published, besides other works, "Travels in Russia, Poland, Sweden, and Denmark" (1784), a "History of the House of Austria" (1792), "Memoirs of Sir Robert

Walpole" (3 vols., 1798), and "Memoirs of the Kings of Spain of the House of Bourbon, 1700–88" (1813). He became archdeacon of Wilts in 1805. Died July 8, 1828.



Coxe's, a township and village of Etowah co., Ala., on the Selma Rome and Dalton R. R. Pop. 274.

Coxsack'ie, a post-village of Greene co., N. Y., near the Hudson River, 22 miles S. of Albany. It has six churches, an academy, important manufactures of brick, a national bank, and one weekly newspaper. Pop. of Coxsackie township, 3829.

Coyo'te [a Spanish American name, probably derived from the Mexican *cayotl*, "wolf"], a popular name for the small barking or prairie wolf, of which several varieties occur in the U. S. and Mexico. (See WOLF.)

Coyote, a township and village of Trego co., Kan., on the Kansas Pacific R. R., 273 miles W. of Topeka. P. 17.

Coy'pu, the South American name of the *Myopotamus Coypus*, a quadruped allied to the beaver, with which it agrees in its teeth, limbs, feet, and in some of its habits; but it differs from the beaver in the form of the skull, having a more elongated muzzle and a contracted palate; and in the tail, which resembles that of a rat. It is the only known species of its genus, and inhabits South America on both sides of the Andes, burrowing in river-banks, and sometimes near the sea-beaches. It is nearly as large as the beaver, has small ears, very long and stiff whiskers, long hair mixed with dense, soft, short hair, the upper parts beautifully pencilled with shades of yellow, the sides and under parts lighter and more uniform in color. The fur has become an important article of commerce under the names of ragondin and nutria, the latter name (signifying in Spanish an "otter") being that chiefly in use in the U. S.

Coypu.

Coz'zens (FREDERICK SWARTWOUT), an American writer, born in New York Mar. 5, 1818, was a wine-merchant. He contributed to the "Knickerbocker Magazine" and "Putnam's Magazine." Among his works are "Prismatics" (1853) and "Sparrowgrass Papers" (1856). Died Dec. 23, 1869.

Cozzens' Landing, a village of Cornwall township, Orange co., N. Y., near the West Point Military Academy, and on the Hudson River.

Crab [Lat. *cancer;* Gr. *κάραβος;* Ger. *Krabbe;* Fr. *crabe*], a name popularly applied to many decapod crustaceans, arranged in the sub-orders Anomura (irregularly-tailed crabs) and Brachyura (short-tailed crabs). Among the very numerous species the following are important:

Hermit Crab (with shell).

1. *Sub-order Anomura.*—The *Pagurus Bernhardus*, the European hermit crab, has a hard shell, while the abdominal portion is soft, forming a fleshy mass behind the cephalothorax. The comfort of the animal requires some shelter for this appendage, and for this purpose he selects the empty shell of some mollusk. He coils himself in this shell, and secures his position by a sucker at the extremity of the tail, and by several feet on the abdominal sac. He adheres so firmly to this home that he will be destroyed rather than loosen his hold. By protruding his body with his three pairs of legs, he is able to walk in search of prey, but if danger approaches he hastens into the shell, the orifice being filled by one of his claws. He changes his residence as often as he needs a larger one, and may be seen crawling in and out of shells cast upon the beach, in search of a suitable home. He returns to his old home after each trial until he finds one fitted for his comfort. There are many species of the hermit crab, one or more of which

Hermit Crab (without shell).

Purse Crab: *Birgus latro.*

are found on the American coasts. The purse crab (*Birgus latro*) is a hermit crab of Amboyna and some other islands.

Spinous Spider Crab: *Maia spinado.*

It inhabits the fissures of rocks, and seeks its food along the beach at night. When observed, it snaps its claws

Eriphia spinifrons.

fiercely and retreats. It is said to climb the cocoanut tree for the fruit, but this is probably untrue.

2. *Sub-order Brachyura.*—This sub-order includes, among others, the following families: the Maiadæ, or spider crabs, which live in deep water, and are seldom seen on the shore. One species, the *Libinia canaliculata*, found along the American coast north of the Chesapeake, is said to feed upon oysters. The family Canceridæ includes those of which the common crab of Europe (*Cancer pagurus*) is the type. In these the shell is narrow behind and round in front, the claws of unequal size. These inhabit deep water, and are caught in nets or baskets. Many edible species are

Parthenope horrida.

known in various parts of the world. The Portunidæ resemble the Canceridæ, and are called paddling crabs. The common edible crab of the U. S. (*Lupea dicantha*) is found along the whole coast. These, like other crabs, moult once a year, and are several days casting the shell, but a new one is soon formed. While the new shell is tender, or before it is formed, they are called soft-shell crabs, and are much esteemed as food. The common small edible crab (*Carcinus mœnas*) is a small species found in England and

The Red Sea Crab: *Lupea pelagica.*

France, and one similar to it frequents our coast. These are found at low tide under stones and sand. Some crabs of the genus *Lupea* live in the ocean, floating on the seaweed or resting on the surface of the water. They are called swimming crabs. The *Eriphia spinifrons* is found in nearly all seas. The *Parthenope horrida* lives in the Indian and Atlantic oceans. The *Lupea pelagica* is from the Red Sea. The Ocypodidæ include the little pea crab (*Pinnotheres pisum*). The carapace is quadrilateral or oval, the front transverse and knotted. They inhabit the muscle shell. The ancients were acquainted with one species of this crab, and believed that it found food for the mollusk and warned him of danger. There are several American species of this genus, one of which is a well-known parasite upon the oyster. The land crabs of the tropics are among the most curious members of this family. They live upon mountains at a distance from the sea, and have a kind of leaflet for retaining moisture in the branchial cavities. Once a year they visit the coast to deposit their eggs. It is said that in these journeys they have been observed to form a procession one hundred and fifty feet wide and three miles long. In Jamaica they are much valued as food. They live in moist regions, and make excavations which they inhabit during the day, seeking their food at night. Some species are said to live in dry woods. The violet crab (*Cardisoma carnifex*) inhabits the West Indian Islands, chiefly in the mangrove swamps. Its food is the fruit of a species of *Anona*, but it is said also to frequent cemeteries and devour the bodies. It is highly regarded as food, but only those are eaten which live at a distance from the cemeteries. Another kind of land crab (the *Gelasimus*) is named the calling crab, from the beckoning gesture of the claw which it makes when alarmed. This claw is larger than the other, and is used in digging its burrows. A common American species, the *Gelasimus vocans*, is called the fiddler, because one of its claws is thought to resemble a fiddle. It lives on the land, but is at home also in the water. It remains in its hole in the winter. The Thelphusæ are land crabs, but some of them inhabit fresh water. Many of the so-called land crabs are properly crayfish. (For the king-crab (usually regarded as an entomostracan) see KING-CRAB.)

Crab-Apple (*Pyrus Coronaria*), a small tree growing wild in the U. S., bears rose-colored fragrant blossoms and fragrant greenish fruit, which is prized for preserves. Another wild crab-apple, the *Pyrus angustifolia*, also grows in the Southern States. The cultivated crab-apple is the *Pyrus baccata*, a native of Siberia. (See APPLE.)

Crabb (GEORGE W.) was born in Tennessee, but removed to Alabama. He distinguished himself in the Indian war in Florida, where he was made a major-general. He was elected a member of Congress in 1838, but defeated in 1841. Died in 1847.

Crabbe (GEORGE), an English poet, born at Aldborough, Suffolk, Dec. 24, 1754. He learned the profession of surgeon, which he soon renounced. He went to London in 1780, and soon produced "The Candidate," an unsuccessful poem, and was reduced to extreme poverty, from which he was relieved by the generosity of Edmund Burke, who received him as an inmate in his own house, and secured the publication of "The Library" by Dodsley (1781). Having taken holy orders in 1782, he became chaplain to the duke of Rutland at Belvoir Castle, and married Miss Sarah Elmy. His reputation was increased by the "The Village," a poem (1783). He became curate of Strathern in 1785, and obtained the living of Trowbridge, in Wiltshire, in 1813. Among his works are "The Parish Register" (1807), "The Borough" (1810), and "Tales in the Hall" (1819). He was distinguished for his vigor and the "Chinese accuracy" of his observation. "Mr. Crabbe," says Lord Jeffrey, "is the greatest *mannerist*, perhaps, of all our living poets. The homely, quaint, prosaic style, the eternal full-lengths of low and worthless characters, with their accustomed garnishing of sly jokes and familiar moralizing, are all on the surface of his writings." Died Feb. 3, 1832. (See "Life of George Crabbe," by his son, 1838.)

Crabbe (THOMAS), rear-admiral U. S. N., was born in Maryland in 1788, entered the navy when young, became a captain in 1841, a commodore in 1862, and rear-admiral in 1866. Died at Princeton, N. J., June 29, 1872.

Crab Creek, a township of Henderson co., N. C. P. 607.

Crab Orchard, a post-village of Lincoln co., Ky., on the Knoxville branch of the Louisville and Nashville R. R., 40 miles S. by E. from Lexington. Here are important saline mineral springs, much resorted to from the Southern States. Pop. 631.

Crab Orchard, a township of Mecklenburg co., N. C. Pop. 1522.

Cra'bro [Lat. for *hornet*], a genus of hymenopterous insects belonging to the section Aculeata, or sting-bearers, and to the sub-section Fossores (burrowers). The hornet (*Crabro vulgaris*) is the type of this genus, which is now raised to the rank of a family named Crabronidæ. Some insects

of this family excavate their nests or retreats in wood. In the U. S. they build in fences, trees, etc.

Crab'tree, a township and post-village of Haywood co., N. C. Pop. 1048.

Crack'lins, a township of Montgomery co., Md. Pop. 3477.

Cra'cow, or **Kra'kow,** a city in Austrian Poland, on the left bank of the Vistula, 158 miles S. S. W. of Warsaw. It is connected by a railway with Vienna, Berlin, and Warsaw. It is the seat of a Catholic bishop, and has a castle founded about 700 A. D., a magnificent cathedral, and once had seventy-six churches, but only thirty-six are preserved, besides seven Jewish synagogues, a university (begun in 1343, chartered in 1364, finished in 1401, and reorganized in 1817), a library of 30,000 volumes, a botanic garden, and many monasteries. Cracow was founded about 700 A. D., and was the capital of Poland from 1320 to 1609, when the court was removed to Warsaw. In the sixteenth century it contained thrice its present population. On the third partition of Poland, in 1795, it was annexed to the dominions of Austria. It formed a part of the duchy of Warsaw from 1809 to 1815. By the Congress of Vienna (1815) Cracow, with a small territory, was organized as a republic, under the protectorate of Russia, Austria, and Prussia. After an insurrection in 1846 it was again annexed to Austria. Pop. in 1869, 49,835, about one-fourth of whom are Jews.

Crafts (Samuel Chandler), born at Woodstock, Conn., Oct. 6, 1768, graduated at Harvard in 1790, settled in Craftsbury, Vt., in 1790; held many important offices in Vermont, and was long one of the judges of the State courts; was a member of Congress 1817–23, governor of the State 1829–32, and became U. S. Senator in 1842. In 1802 he explored the Lower Mississippi in company with F. A. Michaux. Died at Craftsbury, Vt., Nov. 19, 1853.

Crafts'bury, a post-township of Orleans co., Vt. It has an academy, and manufactures of woollen goods, doors, sash and blinds, etc. Pop. 1330.

Crag, the name given to a part of the pliocene formation in the east of England, in France, Italy, etc. It consists of a shelly sand and gravel used to fertilize soils which are deficient in calcareous matter. The "coralline crag," etc. of the older pliocene is extensively found in Europe and Asia.

Cra'gin (Aaron H.), born in Weston, Vt., Feb. 3, 1821, was a member of Congress from New Hampshire (1857–61), U. S. Senator (1865–71), and was re-elected in 1870 for six years.

Craig, a county in the S. W. of Virginia, is drained by Craig's Creek. The surface is partly mountainous; the soil is fertile. Tobacco, grain, wool, and fruit are raised. Capital, Newcastle. Pop. 2942.

Craig, a township of Van Buren co., Ark. Pop. 282.

Craig, a post-township of Switzerland co., Ind. Pop. 1843.

Craig (John), a Scottish Reformer, born in 1512. He entered the Dominican order, and had charge of the novices at Bologna. Converted to the doctrines of Calvin, he was tried and condemned to be burned by the Inquisition, but was saved by a mob, who, on the death of the pope, broke open the prison. He returned to Scotland, and became a colleague of John Knox in the church of Edinburgh. He was appointed chaplain to James VI. in 1579, and wrote the National Covenant in 1580. Died in Dec., 1600.

Craig (Lewis S.), an American officer, born in Virginia, entered the U. S. army as second lieutenant of dragoons in 1837; transferred to the infantry 1838; promoted to be first lieutenant in 1840, and captain in 1846. He served with distinction during the war with Mexico at Monterey (brevet major), Cerro Gordo (brevet lieutenant-colonel), Contreras, and Churubusco, severely wounded in the latter. He was killed by deserters, while in discharge of his duty, June 6, 1852, near New River, Cal.

Craig (Sir Thomas), a Scottish lawyer, born about 1540. He was appointed a judge (justice-depute) in 1564. He wrote, besides Latin poems, a celebrated "Treatise on Feudal Law" ("Jus Feudale," 1655). Died Feb. 26, 1608.

Craig'head, a county in the N. E. of Arkansas. Area, 950 square miles. It is intersected by the St. Francis River and the Cache River. The surface is nearly level; the soil fertile. Corn, tobacco, cotton, wool, and live-stock are raised. Capital, Jonesborough. Pop. 4577.

Craigs'ville, a post-village of Blooming Grove township, Orange co., N. Y., has manufactures of cotton goods.

Craik (Dinah Maria), better known as **Miss Muloch,** an English novelist, born at Stoke-upon-Trent in 1826. Her first novel, "The Ogilvies," was published in 1849, and "John Halifax, Gentleman," in 1857. In 1865 she married G. L. Craik, a nephew of the literary historian. Besides novels and other works, she has published a volume of poems.

Craik (George Lillie), one of the most useful writers of his time in the field of literary history and biography, was born in Fifeshire, Scotland, in 1799. In 1830 he published an interesting compilation of biographical anecdote, "The Pursuit of Knowledge under Difficulties," in one volume. This was originally issued by the Society for the Diffusion of Useful Knowledge, but has since been many times reprinted. He wrote several of the books published by the above-named society in their well-known series, and he also rendered much valuable help in the preparation of Knight's "Pictorial History of England," and wrote many of the historical and biographical articles in the "Penny Cyclopædia." In 1836 appeared in the Useful Knowledge series "Paris and its Historical Scenes," 2 vols.; in 1844–45, "Sketches of the History of Literature and Learning in England," six small volumes in three. This excellent work of permanent value was rewritten from chapters on the subject in the "Pictorial History of England." A new and enlarged edition, "Manual of English Literature and the English Language," was published in 1862. In 1845, Craik published "Spenser and his Poetry," 3 vols., and in 1846–47, "Bacon, his Philosophy and Writings," 3 vols. Each of these books was reprinted in 1859–60 in one small volume. The "Bacon" is a remarkable piece of condensation, completeness, and accuracy. In 1848 appeared another book of anecdote, which has had a wide popularity, "The Romance of the Peerage." In 1849, Craik was made professor of history and of English literature in Queen's College, Belfast, and in 1851 he published "Outlines of the History of the English Language," and in 1857 a well-known book, the parent of many others of its kind, "The English of Shakspeare illustrated by a Philological Commentary on his 'Julius Cæsar.'" Besides much valuable information and suggestion, this edition of Julius Cæsar contains two or three original emendations, one of which is of real importance. Prof. Craik died June 25, 1866. A nephew of the professor, of the same name, married Miss Muloch (Dinah Maria).

Clarence Cook.

Craik (James), M. D., derives interest from his long and intimate association with Washington. Their commissions in the army were dated the same day, and their friendship was cemented by fifty years' intercourse. He was born in Scotland in 1731, was surgeon to the expedition against the Indians in 1754, was at Braddock's defeat (9th July, 1755), and subsequently served throughout the American Revolution. Washington said of him, "He was my compatriot in arms, my old and intimate friend." After the Revolution he practised at Mount Vernon, and was the family physician of Washington. Died Feb. 6, 1814.

Paul F. Eve.

Cramp (John Mockett), D. D., born July 25, 1796, at St. Peter's, Isle of Thanet, Kent, England, educated at Stepney College, was ordained May 7, 1818, and became pastor of the Baptist church in Dean street, Southwark, London. In 1827 he returned to his native place, and was associated in the ministry there with his father. In 1842 he became pastor of the Baptist church at Hastings, Sussex. In 1844 he became president of the Baptist college, Montreal, Canada, and president of Acadia College, Nova Scotia, in 1851; the principal of the theological department 1853–60; was reappointed president in 1860, and retired in 1869. In 1831 he published "A Text-Book of Popery;" in 1833, "The Reformation in Europe" (issued by the Religious Tract Society); in 1844, "Lectures for these Times;" in 1868, "Baptist History;" and in 1871, "The Lamb of God." He has published about twenty sermons, lectures, or essays in pamphlet form. He has written also "Paul and Christ: a Portraiture and an Argument," and a memoir of the late Madame Feller of the Grande Ligne Mission, Canada.

Cramp'ton's Gap, a pass in the South Mountains, near Burkittsville, Frederick co., Md. The left wing of Gen. McClellan's army, under command of Gen. W. B. Franklin, approached this pass about noon of the 14th of Sept., 1862, to find it defended by a portion of the Confederate general McLaw's division of Lee's army, under command of Gen. Howell Cobb. After a stubborn fight of four or five hours, the Confederates were forced out of the gap, having suffered severe loss in killed and wounded, besides 400 prisoners and many small-arms.

Cra'nach, or **Kranach** (Lucas), called the Elder, an eminent German painter and engraver, born at Cranach, a town near Bamberg, in 1472. His family name was Sunder. He became court-painter to Frederick, the elector of Saxony, in 1504, and worked for many years at Wittenberg, where

he was much respected and was made burgomaster. He continued to hold the office of court-painter under the two successors of Frederick, John the Constant and John Frederick the Magnanimous, and when, after the battle of Muhlberg in 1547, John Frederick was taken prisoner, Cranach shared his five years' captivity. They were both released in 1552. He was also an intimate friend of Luther and Melanchthon, whose portraits he both painted and engraved. His works consist of oil paintings, engravings on copper, and woodcuts. His most important picture is at Weimar. It is an altar-piece. He was so rapid and prolific a worker that he was called *pictor celeberrimus*, and it is not surprising that his pictures are found in every considerable collection in Europe. There are two good specimens of his work in the Bryan Gallery, New York Historical Society, a "Venus and Cupid" and a "Portrait," and one in the New York Metropolitan Museum, a portrait of John Frederick the Magnanimous. He died Oct. 16, 1553. (See HELLER, "Das Leben und die Werke Lucas Cranach's," 2d ed., Bamberg, 1844. But the latest and best authority is SCHUCHARDT, "Lucas Cranach des Älteren Leben und Werke," Leipsic, 3 vols., 1851–71.)

CLARENCE COOK.

Cranach, von (LUCAS), a painter, a son of the preceding, was born in 1515. He painted portraits with success. He was burgomaster of Wittenberg. A good specimen of his work is in the Metropolitan Museum, New York—"Portrait of a German Lady." Died in 1586.

Cran'berry (*i. e.* "crane-berry," so called because its slender stalks were fancied to resemble the legs of a crane), the fruit of several species of a sub-genus, *Oxycoccus*, of small, mostly prostrate evergreen shrubs of the natural order Ericaceæ, belonging to the genus *Vaccinium*, but differing from the rest of the genus in having a wheel-shaped corolla, with its four petals decidedly revolute. The species are few, natives of the colder regions of the northern hemisphere. The fruit is acid, and is in great request for making sauces, jellies, etc. The only British species is the *Vaccinium Oxycoccus*, a native also of the northern parts of Europe, Asia, and America. It grows in marshy grounds in the Northern States, and is a wiry shrub with creeping branches, and small oval leaves strongly revolute at the margin. The blossoms are small, but beautiful, and of a deep rose-color. Large quantities of the fruit are collected in the north of England and in other countries, but it is seldom gathered in the U. S. They are often kept for a long time in water. They are an excellent antiscorbutic, and valuable in sea-stores. A sort of wine is made from them in Siberia and Russia. The American cranberry (*Vaccinium Macrocarpon*) is a larger and more erect plant, with larger leaves, less revolute at the edges. The berries are larger and of a brighter red. It is a native of Canada, but is found as far S. as Virginia, growing in sandy bogs and also elevated situations. The berries are largely cultivated near the sea-coast in the Northern States, and large quantities of them exported to Europe. Cranberries are imported into Great Britain from Russia. The berries of the cowberry (*Vaccinium Vitis Idæa*) are sold under the name of cranberries in Scotland, and used in the same way. They also grow in New England, but are there scarcely edible. A third species of cranberry (*Vaccinium Erythrocarpon*), a native of the Alleghanies in Virginia and Carolina, is a shrub four feet high, and with a habit more like that of the whortleberry than the other cranberries; it has an insipid fruit. The "high-bush cranberry" is the *Viburnum Opulus* of the U. S. and Europe. Its fruit has little value. The name mountain cranberry is often given to the *Arctostaphylos Uva Ursi* of the U. S. and Europe, a plant whose leaves are of value as a diuretic.

Cranberry, a township of Alleghany co., N. C. Pop. 458.

Cranberry, a township of Mitchell co., N. C. P. 158.

Cranberry, a township of Crawford co., O. P. 1281.

Cranberry, a township of Butler co., Pa. Pop. 945.

Cranberry, a township and post-village of Venango co., Pa., 60 miles N. N. E. of Pittsburg. Pop. of township, 2337.

Cranberry Isles, a post-township of Hancock co., Me., consisting of small islands just outside of Mount Desert Island. The inhabitants are engaged in the fisheries. Pop. 350.

Cran'bury, a post-village and township of Middlesex co., N. J., on the Camden and Amboy R. R.

Cranch (CHRISTOPHER PEARSE), a son of the following, an American artist and poet, born at Alexandria, Va., Mar. 8, 1813, graduated at Columbian College, Washington, in 1831, studied divinity, but became a landscape-painter and author. He published a volume of poems (1854), and two stories for children, "The Last of the Huggermuggers" (1856) and "Kobboltozo" (1857); also a translation of Virgil's "Æneid" (1872). Many of his finest poems appeared in the "Dial."

REVISED BY CLARENCE COOK.

Cranch (WILLIAM), LL.D., an eminent American jurist, born at Weymouth, Mass., July 17, 1769, graduated at Harvard in 1787. He was appointed chief-justice of the U. S. circuit court for the District of Columbia in 1805. He held this position for fifty years, during which, it is said, only two of his decisions were overruled by the Supreme Court of the U. S. As reporter of the decisions of the Supreme Court he prepared nine volumes of reports (1801–15). His legal learning was very profound. Judge Cranch was first cousin to President John Quincy Adams. Died Sept. 1, 1855.

Crane [from the Anglo-Sax. *cran*; Ger. *Kranich*; Gr. γέρανος; Lat. *grus* (gen. *gruis*); Fr. *grue*], a popular name of various birds of the order Grallatores, and belonging to the family Gruidæ, of which the genus *Grus* alone occurs in the U. S. This family differs from herons, storks, etc. in having the short hind toe placed much higher on the leg than the front ones. They are nearly all large birds, with long necks, long legs, and powerful wings. Their wings are not elongated, but rounded. One of these is the common European crane (*Grus cinerea*), which breeds in the northern parts of Europe and Asia; it retires in winter to sub-tropical regions. Flocks of cranes periodically pass over the southern and central countries of Europe, uttering harsh cries, and often alighting for food. This crane, when standing, is about four feet high, its color ashen-gray, with face and neck nearly black. The visits of the crane to Great Britain are now rare; formerly they were more frequent. It feeds on seeds and roots, insects, reptiles, and small quadrupeds. It is highly valued for the table. The whooping crane (*Grus Americana*) is larger than the common crane, which it resembles, except that its plumage is pure white, the wings tipped with black. It frequents the southern parts of the U. S. in winter; in summer it migrates northward. The U. S. have also the sand-hill crane (*Grus Canadensis*) and the *Grus fraterculus*, the little crane. To this family belongs also the demoiselle (*Anthropoides virgo*) or Numidian crane, with which, rather than with the true crane, the Balearic cranes (*Balearica*) are ranked. Cranes use their bills as a weapon of defence, attacking the eyes of an assailant. The blue heron (*Ardea Herodias*) is sometimes called the blue crane.

Crane, a machine employed to raise heavy weights and to deposit them at some distance from their former position. The most common crane consists of an upright revolving shaft, with a projecting arm or transverse jib, at the upper end of which is a fixed pulley. At the other end is a cylinder, which is put in motion by a wheel and pinion or cog-wheel. The weight is fastened to a rope which passes over the pulley and is wound round the cylinder, by means of which the weight is raised to the required height.

Crane, a township of Paulding co., O. Pop. 1686.

Crane, a township of Wyandot co., O. Pop. 3876.

Crane (WILLIAM CAREY), D. D., born in Richmond, Va., Mar. 17, 1816, graduated at Columbian College and Hamilton Theological Seminary, pastor of a Baptist church in Montgomery, Ala., 1839–42. Since then he has occupied many positions of influence and responsibility in the South, and has been president of Baylor University (Independence, Tex.) since 1863. He has contributed largely to the periodical literature of both sections of our country.

Crane (WILLIAM MONTGOMERY), an American naval officer, born at Elizabethtown, N. J., Feb. 1, 1776. He served with distinction in the war against Great Britain (1812–15). He became chief of the bureau of ordnance in 1842. Died by suicide Mar. 18, 1846.

Crane Creek, a township of Mason co., Ill. Pop. 1068.

Crane Creek, a township of Barry co., Mo. Pop. 527.

Cra'ney Island, at the mouth of Elizabeth River in Norfolk co., Va., has a lighthouse fifty feet high, standing in shallow water on iron screw-piles; lat. 36° 53′ 28″ N., lon. 76° 20′ W. On this island the Confederates erected batteries during the civil war.

Cran'ford, a thriving post-village of Union co., N. J., on the Rahway River and on the Central R. R. of New Jersey, 16½ miles from New York. It is finely laid out, and the surrounding region is fertile and picturesque.

Cranganore, a maritime town of Southern India, is on the Malabar coast, about 18 miles N. of Cochin. A Christian church has existed here at least since the fifth century. This place was taken from the Portuguese by the Dutch in 1663, and now belongs to the British.

Craniology. See PHRENOLOGY, by F. G. FAIRFIELD.

Cranium. See SKULL.

Crank [allied to the Icelandic *kringr*, a "circle"], an important contrivance which is a part of the machinery of steam-engines, and is the most usual mode of converting alternating circular or rectilinear motion into continuous circular motion, or *vice versâ;* and for this purpose the crank must be connected by a rigid rod with the prime mover. The crank consists usually of a double winch, but is sometimes only single. The part between the two elbow-joints is termed the arm of the crank. The connecting rod which transmits the alternate motion is attached to the crank by a joint, and consequently is made to traverse the circumference of a circle of which the arm is the radius, and so to produce the rotation of the axis. When the connecting rod is in a straight line with the crank (which occurs twice in every revolution), it has no tendency to turn the crank. A fly-wheel is attached to the shaft to equalize the motion, and prevent it from being much retarded at the "dead points"—*i. e.* the positions where the rod exerts no power.

Cran'mer (Thomas), English reformer, born at Aslacton, in Nottinghamshire, July 2, 1489, of an ancient Norman family. He studied at Jesus College, Cambridge, of which he became a fellow in 1510, and was well versed in Greek, Hebrew, and theology. He lost his fellowship by marriage, but it was soon after restored on the death of his wife. In 1523 he was appointed lecturer on theology. He gained the favor of Henry VIII. in 1529 by advising that the question of the king's divorce should be tried by the word of God and referred to the universities. He was appointed a chaplain to the king, who sent him to Rome on a special mission. He married a niece of Osiander in 1532. He was appointed archbishop of Canterbury in 1533 by the king, of whom he soon became the favorite minister and adviser. He co-operated with Henry in the suppression of monasteries, but in 1538 he opposed the law of the "Six Articles" or "Bloody Statutes." He promoted the translation and circulation of the Bible. On the death of Henry VIII., Cranmer, in accordance with the royal will, was appointed one of the regents of the kingdom. He was the head of a commission which composed the Liturgy of the Anglican Church in 1548, and efficiently supported the Protestant cause during the reign of Edward VI. On the accession of Queen Mary, in 1553, he was placed in the Tower on a charge of treason. He was also accused of heresy, and was induced by the hope of saving his life to recant six times, and to subscribe to the doctrines of the papal supremacy and the real presence; but his enemies were determined not to spare his life. He was burned at the stake Mar. 21, 1556, and met his death with great fortitude, thrusting his right hand into the flames before his body began to burn. According to Hume, "He was a man of merit, possessed of learning and capacity, and adorned with candor and sincerity, and all those virtues which were fitted to render him useful and amiable in society." Macaulay and some other writers consider him an unscrupulous time-server. (See Archdeacon Todd, "Life of Cranmer," 1831.)

Crannoge, a term applied to a fortified island, such as are found in the lakes of Ireland and Scotland, and which were used as dwellings and places of refuge by the ancient Celtic inhabitants. The area of a small isle in some cases was enlarged by wooden piles or heaps of stones. Crannoges are mentioned in Irish annals as early as the ninth century. (See Lake Dwellings.)

Crans'ton, a township and village of Providence co., R. I. The village is on the Hartford Providence and Fishkill R. R., 4 miles S. of Providence. It has extensive manufactures of prints, cotton goods, thread, and machinery. Total pop. 4822.

Cranston (Henry Y.), born at Newport, R. I., in 1790, was a prominent official of his native State and city, and was in Congress 1843–47. Died Feb. 12, 1864.

Cran'tor [Κράντωρ], a Greek Academic philosopher, born at Soli, in Cilicia, lived about 300 B. C. He was a pupil of Xenocrates at Athens, and wrote, besides other works, a "Treatise on Affliction," which was highly esteemed. He is mentioned by Horace as an eminent moralist.

Cran'worth (Robert Monsey **Rolfe**), Baron, an English judge, born at Cranworth, in Norfolk, Dec. 18, 1790. He was elected to Parliament as a liberal in 1832, became solicitor-general in 1834, and a baron of the exchequer in 1839. In 1852 he was appointed lord chancellor by Lord Aberdeen. Having resigned in 1858, he was again lord chancellor from July, 1865, to June, 1866. Died July 26, 1868.

Crape [Fr. *crêpe*, from the Lat. *crispus*, "crisped" or "curled"], a light, transparent fabric, made of raw silk deprived of its gloss. Crapes are crisped or smooth, according to the degree of twist in weaving. They are manufactured in Italy, England, and France, and are extensively used for mourning-dresses.

Crapo (Henry H.). See Appendix.

Cra'shaw (Richard), an English poet, was the son of a clergyman. He was educated at the Charter-house and at Cambridge. In 1644 he was ejected from his fellowship for refusing to sign the Covenant. Going to France, he became a Catholic, and, through the influence of Queen Henrietta Maria, obtained a secretaryship to a cardinal, and afterwards became a canon at Loretto, where he died in 1640. His works, marked with fertility of imagination and devout fervor, are "Steps to the Temple," "Delights of the Muses," and "Carmen Deo Nostro" (1646).

Crassula'ceæ [from *Crassula*, one of the genera], also called **Sempervi'væ,** a natural order of exogenous plants (herbaceous or shrubby), all remarkable for the succulence of their stems and leaves. It comprises about 300 species, widely distributed over the world, and abounding in South Africa. They grow in dry situations, and derive nourishment from the air rather than from the soil. Many of them are cultivated in green-houses on account of their grotesque forms. The *Sedum* (stone-crop), houseleek, and other plants of the U. S. belong to this order.

Cras'sus (Marcus Licinius), a Roman triumvir, born about 108 B. C., was in his youth a partisan of Sulla. He was elected prætor in 71 B. C., and defeated Spartacus, the leader of a servile revolt. In the year 70 he was chosen consul as the colleague of Pompey. He amassed an immense fortune by speculation, mining, dealing in slaves, and other methods. Avarice is said to have been his ruling passion, but for the sake of political success he gave large gifts to the people. About 60 B. C. he united with Cæsar and Pompey in a coalition called the first triumvirate. Crassus and Pompey having been chosen consuls in 56 B. C., the former obtained command of Syria for five years. He invaded Parthia in the year 54, in order to enrich himself by plunder. In 53 B. C. he was defeated with great loss by the Parthian general Surena, near Carrhæ (the Haran of the Bible). He was treacherously killed at a conference with Surena soon after that battle (53 B. C.). (See Plutarch, "Life of Crassus.")

Cratæ'gus [Gr. κραταιγός, a "thorn-bush"], a genus of thorny shrubs of the natural order Rosaceæ, sub-order Pomeæ, which contains the pear, apple, etc., but distinguished from the rest of the sub-order by its bony carpels. The species are numerous, natives of the temperate parts of the northern hemisphere, and often have flowers in beautiful corymbs. They are nearly all more or less spiny, hence the name thorn or thorn-bush is popularly applied to them. The only native of Great Britain is the hawthorn (*Cratægus Oxyacantha*), which is now naturalized in the Atlantic States of the Union. A number of other species are now found in plantations and hedges in Great Britain, of which the most common is the cockspur thorn (*Cratægus Crus Galli*), a native of North America from Canada to Carolina. Its leaves are not lobed; its fruit rather larger than that of the hawthorn. The azarole (*Cratægus Azarolus*), a native of the south of Europe, and the aronia (*Cratægus Aronia*), a native of the Levant, are occasionally cultivated for their fruit, which is about as large as the Siberian crab, and is used for dessert or pies, as are the fruits of some American species in Canada. *Cratægus orientalis* and *Cratægus tanacetifolia* have also fruit of considerable size. The latter is much used in Armenia. *Cratægus Pyracantha* differs in appearance from most of the genus. It is an evergreen shrub, with lanceolate, crenate leaves and clusters of rich red berries. It is a native of the south of Europe and the Caucasus. In Great Britain it is cultivated as an ornament, and known as the pyracantha. The American species are at least eleven in number. Apples, pears, and quinces are sometimes grafted upon thorn stocks. The thorn-bushes are used as hedge plants, but are apt to be infested by borers.

Cra'ter [from the Gr. κρατήρ, a "bowl" or "cup"], the mouth or cup-shaped cavity at the summit of a volcanic mountain. Through this aperture the lava, scoriæ, etc. are usually ejected, but these materials sometimes issue by immense rents in the sides of the mountain. (See Volcano, by Prof. Arnold Guyot, Ph. D., LL.D.)

Crater (the "Cup"), one of Ptolemy's northern constellations, situated near Cervus, the "Deer."

Crater, a township of Calhoun co., Ill. Pop. 564.

Crat'erus [Gr. Κρατερός], an eminent Macedonian general, and one of the successors of Alexander the Great. He served under that prince in Asia, and was one of his favorite generals. After the death of Alexander (323 B. C.) he was associated with Antipater in the government of Macedonia. He was defeated by Eumenes, and killed in battle in Cappadocia in 321 B. C.

Cra'tes [Κράτης] **of Athens,** a Greek comic poet who

flourished about 450 B. C. He was also an actor, and performed parts in the plays of Cratinus. His works were greatly admired, and were praised by Aristotle. Only small fragments of them are extant.

Crates of Thebes, a famous Cynic philosopher, lived about 320 B. C., and was a disciple of Diogenes at Athens. He had a high reputation for probity, wisdom, and self-control. He was rich in his youth, but set an example of voluntary poverty. He wrote poems and other works which are all lost.

Crati'nus [Κρατῖνος], an eminent Athenian comic poet of the old comedy, was born in 519 B. C. He was a contemporary and rival of Aristophanes. He was the first comic poet who introduced personal satire into the drama, and undertook to castigate the vices of his prominent contemporaries. Pericles was among the objects of his satire and invective. Cratinus gained a prize for his "Wine-Flask" in 423 B. C., when Aristophanes was his competitor. Died in 422 B. C.

Cratip'pus [Gr. Κράτιππος], a Greek Peripatetic philosopher, a native of Mitylene. He was the most eminent philosopher of that age in the estimation of Cicero, who was his pupil and friend. Pompey, after his defeat at Pharsalia, had an interview with Cratippus, who conversed with him on Providence. Brutus attended his lectures at Athens in 44 B. C. Cratippus wrote a work "On Divination by Dreams."

Cra'ven, a county in the E. S. E. of North Carolina, bordering on Pamlico Sound. Area, 1000 square miles. It is intersected by the Neuse River. The surface is nearly level, and partly occupied by swamps. Cotton, rice, and corn are raised. It is traversed by the Atlantic and North Carolina R. R. Capital, Newbern. Pop. 20,516.

Craven, Earls of, Viscounts Uffington, Barons Craven (England, 1665).—George Grimston Craven, third earl, born Mar. 16, 1841, succeeded his father in 1866.

Craven (Charles H.), U. S. N., born Nov. 30, 1843, in Maine, graduated at the Naval Academy as ensign in 1863, became a lieutenant in 1866, and a lieutenant-commander in 1868. He served in the steam-sloop Housatonic off Charleston from early in 1863 to Feb. 14, 1864, when that vessel was blown up by a torpedo-boat. He was in the combined army and navy expedition which resulted in the capture of the greater part of Morris Island July 10, 1863, and commanded a division of boats in the night assault upon Fort Sumter of Sept. 11, 1863.

Foxhall A. Parker, U. S. N.

Craven (Peyton), M. D. See Appendix.

Craven (Thomas T.), U. S. N., born Dec. 30, 1808, in Portsmouth, N. H., entered the navy as a midshipman May 1, 1822, became a passed midshipman in 1828, a lieutenant in 1830, a commander in 1852, a captain in 1861, a commodore in 1862, and a rear-admiral in 1866. During the summer of 1861 he commanded the Potomac flotilla. During the year 1862, while in command of the steam-sloop Brooklyn, he took part in the engagement with Forts St. Philip and Jackson and capture of New Orleans, and "excited the admiration of his officers and crew by his coolness and the masterly handling of his vessel." He was engaged on the 28th of June, 1862, for two hours and forty minutes with the batteries at Vicksburg. In his report of the passage of the forts on his way to New Orleans, Admiral Farragut writes: "It was not long before we were enabled to bear away and give the forts a broadside of shells, shrapnell, and grape, the Pensacola, at the same time, passing up and giving a tremendous broadside of the same kind to the starboard fort; and by the time we could reload, the Brooklyn, Captain Craven, passed handsomely between us and the battery, and delivered her broadside, and shut us out." Foxhall A. Parker, U. S. N.

Craven (Tunis Augustus), U. S. N., born Jan. 11, 1813, in the State of New York, entered the navy as a midshipman Feb. 2, 1829, became a passed midshipman in 1835, a lieutenant in 1840, and a commander in 1861. He commanded the iron-clad Tecumseh in the engagement with Howlett's battery, James River, June 21, 1864, and on the morning of Aug. 5, 1864, was blown up by a torpedo while gallantly leading the iron-clads into the bay of Mobile.

Foxhall A. Parker, U. S. N.

Craw'fish, or **Cray'fish** [etymologically related to the word *crab*], a name given to several long-tailed decapodous crustaceans, those of Europe and the Pacific States of our country belonging to the genus *Astacus*, while those of the Eastern States and the Mississippi Valley belong to the genus *Cambarus*. They inhabit fresh water, and dig long burrows in the earth. They feed upon insects, mollusks, dead animals, etc. By some they are esteemed for the table. Crawfishes do immense damage by opening passages for water through the levees of the Mississippi, which in some cases have caused extensive crevasses. In New England they are quite rare, but are occasionally seen. Certain salt-water crustaceans are popularly called crawfishes, especially the spiny lobsters, of the genus *Palinurus*.

Craw'ford, a county in the W. of Arkansas. Area, 585 square miles. It is bounded on the S. by the Arkansas River. The surface is partly mountainous. The soil is fertile. Timber, lead, coal, and iron abound. Corn, tobacco, cotton, and wool are raised. Boston Mountain in this county is nearly 2000 feet high. Capital, Van Buren. Pop. 8957.

Crawford, a county in W. Central Georgia. Area, 289 square miles. It is bounded on the S. W. by the Flint River. The surface is uneven; the soil of the southern part is sterile. Cotton, corn, and wool are raised. Capital, Knoxville. Pop. 7557.

Crawford, a county in the E. S. E. of Illinois. Area, 420 square miles. It is bounded on the E. by the Wabash River, and drained by the Embarras River. It contains a large portion of prairie; the soil is fertile. Cattle, grain, tobacco, and wool are raised. Capital, Robinson. P. 13,889.

Crawford, a county in the S. of Indiana. Area, 280 square miles. It is bounded on the S. by the Ohio River, and also drained by Blue River. The surface is uneven. The soil is fertile. Coal and iron abound here. Cattle, grain, tobacco, wool, and lumber are produced. Capital, Leavenworth. Pop. 9851.

Crawford, a county in the W. of Iowa. Area, 700 square miles. It is intersected by Boyer River and by the Chicago and North-western R. R. The soil is productive. Grain and wool are staple products. Cap. Denison. P. 2530.

Crawford, a county in the S. E. of Kansas. Area, 504 square miles. It is drained by small affluents of the Neosho River. It is a part of what was once known as the Cherokee Neutral Lands. The Missouri River Fort Scott and Gulf R. R. runs through the centre, and the Missouri Kansas and Texas R. R. through the N. W. portion of the county. The eastern portion is underlaid with fine beds of bituminous coal. The soil is fertile. Stock-raising and farming are the principal pursuits. The products are corn, wheat, root-crops, flax, castor beans, wool, tobacco, cotton, etc. Capital, Girard. Pop. 8160.

*Wasser & Riddle, Eds. "Girard Press."

Crawford, a county in the N. of the southern peninsula of Michigan. Area, 576 square miles. It is drained by the Au Sable River.

Crawford, a county in S. E. Central Missouri. Area, 600 square miles. It is intersected by the Maramec River. The surface is partly hilly. Productive mines of copper, iron, and lead have been opened here. Coal is also found in this county, which is traversed by the Atlantic and Pacific R. R. The soil is fertile. Cattle, grain, and wool are raised. Capital, Steelville. Pop. 7982.

Crawford, a county in N. Central Ohio. Area, 412 square miles. It is drained by the head-streams of the Sandusky and Olentangy rivers. The surface is nearly level; the soil is fertile. Cattle, grain, and wool are largely raised. Lumber, furniture, brick, clothing, metallic wares, etc. are manufactured. It is intersected by the Pittsburg Fort Wayne and Chicago R. R. Capital, Bucyrus. Pop. 25,556.

Crawford, a county in the N. W. of Pennsylvania. Area, 975 square miles. It is intersected by French Creek, and also drained by Oil and Shenango creeks. The surface is undulating; the soil is generally fertile. Cattle, grain, and wool are raised. Furniture, leather, lumber, barrels, carriages, etc. are manufactured. Large quantities of petroleum are procured in this county, which is traversed by the Atlantic and Great Western, the Pittsburg and Erie, and other railroads. Capital, Meadville. Pop. 63,832.

Crawford, a county of Wisconsin, bordering on Iowa. Area, 612 square miles. It is bounded on the W. by the Mississippi and on the S. E. by the Wisconsin River, and intersected by the Kickapoo. The surface is hilly; the soil fertile. Grain and wool are staple products. The Milwaukee and St. Paul R. R. connects Milwaukee with Prairie du Chien, the capital of the county. Pop. 13,075.

Crawford, a township of Yell co., Ark. Pop. 211.

Crawford, a township of Madison co., Ia. Pop. 739.

Crawford, a twp. of Washington co., Ia. Pop. 1317.

Crawford, a township of Cherokee co., Kan. Pop. 593.

Crawford, a twp. of Crawford co., Kan. Pop. 1535.

Crawford, a post-twp of Washington co., Me. P. 209.

Crawford, a township of Buchanan co., Mo. P. 1516.

Crawford, a township of Osage co., Mo. Pop. 2438.

Crawford, a township of Orange co., N. Y., on the Middletown and Crawford R. R. It has five churches, and

a scythe-factory and other manufacturing interests. Pop. 2024.

Crawford, a township of Currituck co., N. C. P. 1867.

Crawford, a township of Coshocton co., O. Pop. 1245.

Crawford, a township of Wyandot co., O. Pop. 1860.

Crawford, a township of Clinton co., Pa. Pop. 400.

Crawford, EARLS OF (1398), earls of Balcarres (1650), Barons Lindsay (previous to 1443), Barons Lindsay of Balcarres (1633), Lords Lindsay and Barneil (Scotland, 1650), Barons Wigan (United Kingdom, 1826).—ALEXANDER WILLIAM CRAWFORD LINDSAY, twenty-fifth earl, M. A., author of "Letters on Christian Art," "Lives of the Lindsays," "Progression by Antagonism," etc., born Nov. 16, 1812, succeeded his father in 1869.

Crawford (GEORGE W.), born in Columbia co., Ga., Dec. 22, 1798, graduated at Princeton in 1820, was admitted to practise law in Georgia in 1822, was a member of Congress in 1843, governor of Georgia (1843–47), and secretary of war under President Taylor (1849–50).

Crawford (MARTIN J.), an eminent citizen of Georgia, born Mar. 17, 1820, educated at Mercer University, rose to distinction at the bar, was elected to the State legislature in 1845, and elevated to the bench in 1853. In 1856 he was returned to Congress, and continued in the House of Representatives till Jan., 1861, when he withdrew on the secession of Georgia, and became a member of the Congress of the Southern States which met at Montgomery Feb. 4, 1861. He was one of the three commissioners appointed by that body to treat with the authorities at Washington for a peaceful separation of the States. Since the war he has been actively engaged in the practice of his profession.

Crawford (NATHANIEL MACON), D. D., an American Baptist minister and eminent pulpit-orator, a son of William H. Crawford, was born near Lexington, Ga., Mar. 22, 1811. He became in 1854 president of Mercer University in Georgia. He was a prominent advocate of liberal education. Died Oct. 27, 1871.

Crawford (S. WYLIE), an American officer, born in Franklin co., Pa., Nov. 8, 1829, graduated at the University of Pennsylvania in 1847, appointed assistant surgeon U. S. A. in 1851. He served principally in Texas and New Mexico. In 1861 he was appointed major Thirteenth Infantry U. S. A., promoted to be lieutenant-colonel Feb. 17, 1864, and colonel Sixteenth Infantry Feb. 22, 1869; transferred to Second Infantry Mar. 15, 1869. On the outbreak of the civil war, April, 1861, Gen. Crawford was among the garrison of Fort Sumter. He was commissioned brigadier-general of volunteers April, 1862, and served in the Shenandoah campaign and with the Army of the Potomac up to the closing scenes at Appomattox Court-house, 1865. At Antietam, in 1862, he took command of Mansfield's division after the latter's death, and was severely wounded. Brevet-colonel, brigadier-general, and major-general U. S. A. Retired from active service, on account of wounds received, Feb. 19, 1873.

Crawford (THOMAS), an American sculptor, born in New York Mar. 22, 1814. He was a pupil of Thorwaldsen at Rome, where he worked for many years. He was employed in 1849 by the State of Virginia to execute a colossal equestrian statue of Washington, which is at Richmond. Among his works are a statue of "Orpheus," and a colossal statue of the Genius of America, which is on the dome of the Capitol at Washington. Died in London Oct. 10, 1857.

Crawford (WILLIAM HARRIS), an American statesman, born in Amherst co., Va., Feb. 24, 1772, removed to Georgia in his early youth. Having studied law, he was admitted to the bar in 1798, and settled at Lexington, Ga. He was elected a Senator of the U. S. in 1807 by the Democrats, and was sent as minister to France in 1813. He became secretary of war in 1815, and was secretary of the treasury from 1816 to Mar., 1825. In 1824 he was nominated for the presidency of the U. S. by a Congressional caucus. In the election of that year he had three competitors—Gen. Jackson, John Quincy Adams, and Henry Clay. Crawford received only forty-one electoral votes. Died Sept. 15, 1834.

Crawford County System. See CAUCUS, by HON. HORACE GREELEY, LL.D.

Craw'fordsville, a post-village of Crawford township, Washington co., Ia. Pop. 249.

Crawfordsville, a post-village, capital of Montgomery co., Ind., on the Indianapolis Bloomington and Western R. R. where it crosses the Louisville New Albany and Chicago R. R., 44 miles W. N. W. of Indianapolis. It is the seat of Wabash College, founded in 1835, and has a national bank and three weekly papers. Pop. 3701.

Craw'fordville, a post-village, capital of Wakulla co., Fla., 20 miles from Tallahassee. It has good soil and climate, and there are several mills and valuable mineral springs in the vicinity.

Crawfordville, a post-village, capital of Taliaferro co., Ga., on the Georgia R. R., 65 miles W. of Augusta.

Crayfish. See CRAWFISH.

Cra'yon [from the Fr. *craie*, "chalk"], a word of French origin, signifying something to mark with, hence a pencil; a cylinder of charcoal, pipeclay, or chalk colored with various pigments and used for drawing on paper. Cohesiveness is given to the paste of which the cylinder is formed by gum, wax, or soap. Crayons containing plumbago are styled lead pencils.

Crea'gerstown, a township and post-village of Frederick co., Md., 2 miles from the Western Maryland R. R., and about 40 miles N. W. of Baltimore. Pop. 2006.

Cream [Lat. *cremor*; Fr. *crême*; Ger. *Rham*], the oily or butyraceous part of milk, which being lighter rises to the surface. The term cream is applied in different ways to various preparations, indicative of superior quality or of cream-like consistence, as cold cream, shaving cream, etc. The French expression "La crême de la crême" ("The cream of the cream") signifies the most fashionable or aristocratic class of society.

Cream of Tartar, Acid Tartrate of Potassa, Bitartrate of Potassa, Supertartrate of Potassa, or **Potassæ Bitartras** [pharm.]; chemical constitution, $KHC_4H_4O_6$; old system, $KO,HO,(C_8H_4O_{10})$, a compound existing already formed in the juice of the grape and in other vegetable juices. In the juice of the grape it is held in solution by the saccharine matters present, but as it is less soluble in solutions containing alcohol and less sugar, as the sugar is transformed into alcohol in the process of fermentation, it is deposited in the casks, forming the crude tartar or argol of commerce. The amount varies with the variety of the grape, its ripeness, and with the process pursued in making the wine. The well-known "crust" of port wine is simply a deposit of this crude tartar or argol. Cream of tartar was known to the ancients, the Greek name for it being τρυξ, while the Latin term was *fæx vini*. Up to 1764 it was considered to be an acid, and even in 1781 it was denominated in the Prussian Pharmacopœia as *acidum tartari*. Marggraf, however, showed in 1764 that the alkali existed in it already, and was not formed by incinerating it, as had been previously supposed. Argol is an article of export from wine-producing countries, the best qualities coming from Italy and the south of France. It is used as the source of tartaric acid and the various tartrates employed in medicine and the arts.

Argol, as met with in commerce, is of two kinds—red and white, according as it has been deposited in the manufacture of red or white wines, some of the coloring-matter of the wine always existing in it. It contains from 5 to 45 per cent. of tartrate of lime, besides other impurities derived from the wine. It is refined by treatment with boiling water, in which the cream of tartar is quite soluble. The water being then cooled or evaporated, the salt crystallizes out; it is then redissolved in water, 4 or 5 per cent. of pipeclay added to the solution to precipitate the impurities, the liquid drawn off and evaporated. Thus prepared, it consists of colorless rhombic crystals, which usually contain 2 to 5 per cent. of tartrate of lime, besides, in some cases, traces of iron and copper. In damp situations the tartrate of lime is apt to change to the carbonate, and hence is objectionable, both in the crude and the refined article.

Cream of tartar has a pleasant acid taste, and is soluble in about 15 parts of boiling and 240 parts of cold water. It is much more soluble in water containing borax in solution. It is frequently adulterated with sawdust, clay, gypsum, flour, chalk, alum, and sulphate of potash. Samples purchased from several grocers in New York in 1872 were found to contain considerable proportions of gypsum or sulphate of lime, in one case 70 per cent. Cream of tartar is extensively used, in connection with bicarbonate of soda, as a substitute for yeast and leaven for raising bread. (See BREAD.) Cream of tartar is often used as a mordant in dyeing wool. In medicine it is used for its cathartic, diuretic, and refrigerant properties. It is frequently prescribed in combination with senna, sulphur, or jalap. It is also used for the preparation of soluble tartar (neutral tartrate of potash), Rochelle or Seignette salts (tartrate of potash and soda), tartar emetic (tartrate of potash and antimony), tartarized iron (tartrate of potash and iron), white and black flux, etc. Salt of tartar is the carbonate of potassa, prepared by the incineration of cream of tartar.

C. F. CHANDLER.

Cream Ridge, a post-township of Livingston co., Mo. Pop. 956.

Crea'sy (Sir Edward Shepherd), an English historian and lawyer, born at Bixley, in Kent, in 1812. He became professor of history in University College, London, in 1850, and was appointed chief-justice of Ceylon in 1860. Among his works are "Fifteen Decisive Battles of the World" (1851) and a "History of England" (5 vols., 1869–70).

Cre'atine [from the Gr. *κρεας*, "flesh"], a neutral principle discovered in 1835 by Chevreul in raw muscular flesh, and afterwards carefully studied by Liebig and others. Anhydrous creatine has the formula $C_4H_9N_3O_2$. Creatine is found in the flesh of many if not all vertebrate animals, but is now generally considered to be one of the products of the normal destruction of the tissues. It occurs in the urine. Combined with two equivalents of water, it readily forms brilliant, colorless, transparent crystals, soluble in water.

Creat'inine, a powerful organic base or alkaloid ($C_4H_7N_3O$) which exists in small quantities in the juice of animal flesh and in urine, as one of the products of the physiological destruction of tissues. When creatine is subjected to the action of strong acids, it is changed to creatinine, which is crystallized in colorless rhombic prisms.

Crea'tionism, as distinguished from Traducianism and the doctrine of Pre-existence (which see), is the belief that the human soul is directly created by God, and that it joins the embryo soon after conception. Many passages of Scripture, of the Fathers, and of Aristotle were quoted to sustain this view.

Crébillon, de (Prosper Jolyot), a French dramatic poet, was born at Dijon Jan. 13, 1674. He produced in 1705 "Idoménée," in 1707 "Atrée," "Rhadamiste" in 1711, and "Pyrrhus" in 1726, after which he wrote nothing for twenty years. He was admitted into the French Academy in 1731. His genius was hampered by poverty. Among his later works is "Catilina" (1749). Died June 17, 1762. He is ranked among French dramatists of the first order. (See D'Alembert, "Éloge de Crébillon.")—His son, Claude Prosper Jolyot de Crébillon, *fils*, romancist, is known as one of the most libertine writers of a most dissolute age.

Crécy, a small town of France, department of Somme, about 12 miles N. of Abbeville. It was the scene of a signal victory gained by Edward III. with 40,000 English soldiers over a French army of 100,000 on the 26th of Aug., 1346. It is stated that nearly 30,000 of the French were killed in this action.

Creden'tials [from the Late Lat. *credentia*, "evidence," "trust" (from *credo*, to "believe"); Fr. *lettres de créance*], papers or letters given to an ambassador or other diplomatic agent, in order to enable him to claim the confidence of the court to which he is sent. There are two sorts of credentials—the one sealed, drawn up and countersigned by the minister of foreign affairs; the other open, and signed only by the king.

Cre'di, di (Lorenzo Sciarpelloni), an Italian painter, born at Florence in 1452. He was a fellow-pupil of Leonardo da Vinci. Grace and depth of feeling mark his pictures. Died Jan. 12, 1537.

Cred'it [Lat. *creditum*, a "trust," from *credo*, *creditum*, to "trust," to "believe," to "lend;" Fr. *crédit*], belief, reliance, reputation for solvency and probity; honor or esteem; influence of a good character. In bookkeeping, *credit*, abbreviated as *Cr.*, is the reverse of *debit*, and denotes in personal accounts those items or values received from the party named at the head of the account. The term credit or creditor is also applied to the side of an account-book on which are entered all moneys, goods, etc. received by the party that keeps the book. In political economy, credit is used to express the lending of money or other property. The party who lends money or sells goods to be paid for at some future time is said to give credit, which is sometimes defined to be the acquisition by one party of the wealth of another in loan. In a majority of cases loans are made by persons who wish to retire from business, or who have more capital than they can advantageously employ, to parties entering into business or who wish to increase their business. "Public credit" is a phrase used to express the general confidence placed in the solvency of a state, and in its fidelity as well as its ability to pay its debts, or at least the interest on the same. (See Political Economy.)

Crédit Foncier [*i. e.* "landed credit," from *fond*, "bottom" or "ground"], in France, a plan of borrowing money by mortgaging land (for a sum not exceeding half its value), and repaying the borrowed money and interest in small and regular instalments. The Crédit Foncier was established Feb. 28, 1852.

Credit, Letters of. See Letters of Credit.

Crédit Mobilier (*i. e.* "credit on movable or personal property"*), a name given to a gigantic scheme or joint-stock company which originated in France in 1852, and was sanctioned by the government, with a capital of 60,000,000 francs. The objects of it are—1. To initiate trading enterprises of all kinds on the principle of limited liability; 2. To supersede or buy up trading companies—*e. g.* railway companies—and to substitute scrip and shares of its own for the shares and bonds of the company; and 3. To carry on the business of a bank or bankers on the principle of limited liability. (See Aycard, "Histoire de Crédit Mobilier," 1867.)

"The Credit Mobilier of America" is the title of an organization chartered in Pennsylvania in 1859 as a corporation for a general loan and contract business, and reorganized in 1864 with the intention, it would appear, of enabling the shareholders of the Union Pacific R. R. to construct their road without incurring any pecuniary liability in case of the failure of the enterprise. To this end the Credit Mobilier was to contract for the construction of the road at the risk of its own stockholders. The honesty of its management having been impeached, the affairs of the Credit Mobilier received (1872–73) an investigation from Congress, certain members of which were charged with having unlawfully profited by the enterprise.

Credit River, a township of Scott co., Minn. P. 448.

Creed [from the Lat. *credo*, to "believe;" Fr. *croyance*; Ger. *Glaube*], a term originally signifying "belief," but commonly applied to a statement or profession of fundamental points of belief [Lat. *symbolum*; Fr. *symbole* or *profession de foi*; Ger. *Glaubensbekenntniss*], especially applied to summaries of Christian doctrine. The Protestant churches agree in considering creeds mere standards of belief, the Bible alone affording authoritative rules of faith and practice, but they differ in their estimate of the importance of symbols. Among the more important creeds are the following:

The Apostles' Creed, a summary of the Christian faith which most Christian churches accept. Many ancient writers assert that this was composed by the apostles themselves, before they separated after our Lord's ascension; but this tradition is now almost universally rejected. The substance of it is no doubt very ancient, but in its present form it dates from the fourth century.

The Athanasian Creed, once supposed to be the work of Athanasius, was certainly composed by some other hand. It probably originated in Gaul, not far from the middle of the fifth century, but its author is not known. It is now omitted from the services of the Protestant Episcopal Church in America, but it is still read in the Church of England.

The Niceno-Constantinopolitan (or Nicene) Creed was first adopted at the Council of Nice, 325 A. D. This creed sets forth the faith of the Church in respect to the errors of Arianism. It is admitted by many Protestant churches, and is held as authority in the Roman and Greek churches. The form in which the Nicene Creed now appears in the Anglican prayer-books is essentially identical with the modified form of this creed adopted by the second œcumenical council of Constantinople, 381 A. D., with the addition of "and of the Son," made at Toledo in 589. The above formulas are known as the three catholic or general creeds, because they are received by the Greek and Roman churches, as well as by several Protestant bodies.

The Creed of Chalcedon was an exposition of faith declared by the fourth œcumenical council, held A. D. 451 at Chalcedon. It embraced the Niceno-Constantinopolitan Creed, followed by a statement of the doctrine of Christ's Person.

The so-called Creed of Pope Pius IV. is a statement of the doctrines of the Roman Catholic Church, as established by the Council of Trent. It was issued in 1564 by Pius IV. as a bull. It is slightly altered from the Nicene Creed in the first part, but is much more complicated, and especially enforces the doctrine of transubstantiation. It is sometimes called the "Tridentine Profession."

The Greek Church has no symbolical books, strictly speaking, but approves the "Answers of the Patriarch Jeremiah to the Lutherans" (1574–81), the "Orthodox Confession of Peter Mogila" (1643), and the "Eighteen Articles of the Synod of Bethlehem" (1672).

The Russian Church, in addition to its use of the above-mentioned documents, has of its own: (1) the "Primer for Children" (1720); (2, 3) the "Shorter" and "Longer Catechisms" (1839); (4) the "Treatise on the Duty of Parish Priests" (1776).

The Lutheran Church has had many creeds and confessions. Besides the Apostles', Nicene, and Athanasian Creeds, may be mentioned the Augsburg Confession (1530), the Articles of Schmalcald (1537), the Catechisms of Luther

* The term "mobilier" is especially applied to stocks, government securities, and the like.

(1529), the Confession of Lower Saxony (1571), the Suabian-Saxon Formula (1575), the Torgau Formula (1576), and the Formula Concordiæ (1580).

The Calvinistic Confessions of Bâle (1530), the Tetrapolitan Confession (1531), that of the Helvetic churches (1536), the Palatine Catechism (1563), the "Expositio Simplex" (1566), the "Formula Consensus" (1675), the Gallican Confession (1559), the Belgic Confession (1559–61), the Scottish Confession of 1560, and the great Westminster Confession (1646), and Catechisms (Shorter, 1647; Larger, 1648), are among the most important Protestant symbols. The articles held by the Congregationalists and Baptists are based upon the Westminster Confession.

The Church of England receives the three catholic creeds and the "Thirty-nine Articles." The Anglican Creed at first (1552) consisted of forty-two Articles; in 1562 it was reduced to thirty-eight; and finally in 1571 it was put forth in its present form. A modification of these articles is received by the Protestant Episcopal Church in the U. S. The "Articles" of the Methodist Episcopal Church are also based upon the "Thirty-nine Articles."

Creed'moor, a station on the Central R. R. of Long Island, 11 miles E. of New York City, in Queens co., N. Y., has the largest and most complete rifle-range in the U. S., and is much frequented for target-practice. The range is under the control of an incorporated association, and was established in 1871, chiefly at the expense of the State and the cities of New York and Brooklyn.

Creek, a township of Dewitt co., Ill. Pop. 1022.

Creek Indians, a tribe of American savages formerly living in Alabama and Georgia, were sometimes called Muscogees. They were numerous and warlike. In 1814 they waged war against the U. S., and were subdued by Gen. Jackson. In 1832 they ceded their lands to the U. S., and subsequently removed to the Indian Territory beyond the Mississippi. They are now in a condition of advancing civilization, and numbered in 1872, 12,295.

Creep'er [named from the movements of the bird], a

Creeper.

popular name for several passerine birds of the genus *Certhia* and other allied genera. The best-known North American species are the brown creeper (*Certhia Americana*) and the *Certhia albifrons* of the South-western States. They belong to the family Certhiadæ.

Creery (William R.), born in Baltimore, Md., in 1824, graduated at Dickinson College in 1842, taught in the Baltimore schools (1842–48 and 1862–68), was professor of belles-lettres in Baltimore City College (1854–59), president of Lutherville Female Seminary (1859–62), and in 1868 became superintendent of public instruction in Baltimore. In conjunction with Prof. M. A. Newell, he prepared the Maryland series of school-books. Died May 1, 1875.

Cre'feld, a manufacturing town of Rhenish Prussia, is 13 miles N. W. of Düsseldorf, on the railway to Cologne. It is well built, and has more extensive manufactures of silk than any other town in Prussia. Here are also manufactures of cotton, linen, and woollen fabrics, lace, earthenware, etc. Pop. in 1871, 57,128.

Creigh'ton (J. Blakeley), U. S. N., born Nov. 12, 1822, in Rhode Island, entered the navy as a midshipman Feb. 10, 1838, became a passed midshipman in 1844, a lieutenant in 1853, a commander in 1862, and a captain in 1868. In 1862 he commanded the steamer Ottawa, South Atlantic blockading squadron. In 1863, while commanding the steamer Mahaska, he participated in several engagements with the forts and batteries of Charleston harbor.

Foxhall A. Parker, U. S. N.

Cre'ma, a town of Italy, province of Cremona, on the river Serio, 24 miles E. of Milan. It was founded by the Longobards in the sixth century. It is well built, is enclosed by a wall, and has an old castle and a cathedral; also manufactures of silk and lace. Pop. 8075.

Cremation. See Funeral Rites.

Cre'mer (Jacob John), a Dutch novelist, born Sept. 1, 1827, studied painting, but devoted himself to literature. His "Betuwsche Novellen" (sketches of Dutch life) have been followed by "Anna Roose," "Dr. Helmond," and others.

Crémieux (Isaac Adolphe), a French advocate and republican, born of Jewish parents at Nîmes April 30, 1796. He practised as an advocate in the court of cassation in Paris. In 1842 he was elected a member of the Chamber of Deputies, in which he acted with the radical party. He was minister of justice in the provisional government (1848), and retired from office in June. He was a member of the National Assembly in 1849–50. In Sept., 1870, he became minister of justice after the deposition of Napoleon III. As president of the Universal Israelite Alliance of Paris he has displayed a remarkable activity in behalf of the Jews all over the world.

Crem'nitz, a Hungarian town, in Bars, in a gold and silver mining region. It has a mint and paper and vitriol works. Pop. 8442.

Cremo'na, a province of Italy, bounded on the N. by the provinces of Bérgamo and Brescia, W. by Milan, S. by Piacenza, Parma, and Reggio, and E. by Venetia. Area, 670 square miles. The soil is fruitful, producing grain, maize, rice, flax, wine, olives, etc. Capital, Cremona. Pop. in 1871, 300,595.

Cremona, a city of Italy, capital of the above province, in Lombardy, on the Po, here crossed by a bridge, 47 miles S. E. of Milan. It is surrounded by walls, is well built, with wide streets, and has handsome palaces and a cathedral. Connected with the cathedral is a belfry called Torazzo, 372 feet high, completed in 1284, and one of the most beautiful towers in Italy. Cremona is a bishop's see, and has a city hall, two theatres, a lyceum, a public library, and several hospitals. Here are manufactures of silk and cotton fabrics, porcelain, and chemical products. It was formerly celebrated for the violins of Amati (1590–1620), of Guarneri, and of Stradivari (1670–1728). Cremona was a populous town during the ancient Roman empire. Pop. 30,919.

Crenelle, or **Crenel,** a term used sometimes to denote a battlement, but more frequently an embrasure in a battlement. The word *crenellated* is employed to signify that a building is supplied with crenelles.

Cren'shaw, a county in the S. of Alabama. Area, 550 square miles. It is intersected by the Patsaliga River. The surface is nearly level. Corn, cotton, rice, and wool are raised. Capital, Rutledge. Pop. 11,156.

Crenshaw (Anderson) was born in South Carolina, but removed early to Alabama, where he held positions respectively as a judge of the circuit court, as a judge of the supreme court, and as chancellor of the southern division. He died in 1847.—Walter H. Crenshaw, son of Anderson Crenshaw, came to the House in 1838, and served from that time to 1867 in one or the other branch of the legislature of Alabama, and was never defeated.

Cre'ole [Sp. *criollo*, from *criar*, to "create," to "beget;" also to "nurse;" originally, a "child" or "nursling," a "descendant"], a native of the West Indies or South America who is descended from Europeans. The term is sometimes incorrectly applied to those whose ancestors were partly white, and have in their veins some blood of the Indians or negroes.

Cre'osote [Lat. *creasotum*, from the Gr. κρέας, "flesh,"

and σώζω, to "save," referring to its antiseptic qualities], a colorless, syrupy liquid obtained for commercial purposes chiefly from the tar of beech-wood. It has a great refractive power, and a density of 1.037. It boils at 397° F. Its taste is peculiar, and almost insupportable when placed even in a minute quantity upon the tongue. It has an odor resembling that of smoked meats, which doubtless owe their preservation to its presence in the smoke they absorb. Creosote is sparingly soluble in water, but readily so in ether and alcohol. It is generally adulterated in commerce with a large percentage of phenol (see CARBOLIC ACID), which can with difficulty be detected. The medical properties of true wood-creosote are doubtless important, but have not been sufficiently studied. It is employed in toothache, in obstinate vomiting, and as an outward application in cancer. In an over-dose it is an irritant poison, for which no antidote is known. Distilled with dilute sulphuric acid it yields creosol, $C_8H_{10}O_2$.

Crer'ton, a township of Sumpter co., Ala. Pop. 1562.

Crescen'do [from the It. *cresco*, to "grow," to "increase"], in music, signifies a gradual increasing of sound, or changing from piano to forte and fortissimo. It is marked thus  , or with the abbreviation *cresc.* The swell of a good organ produces a most perfect crescendo.

Cres'cent [from the Lat. *cresco*, to "grow" or "increase"], the figure of the new moon. The term is often used as an emblem of progress. It is generally supposed to be the "arms" of the Turkish empire, but it is more properly the "emblem" of that empire. It was used by the Greeks, and was the symbol of the Byzantine people before it was adopted by the Turks.

Crescent, a township of Del Norte co., Cal. Pop. 977.

Crescent, a township of Pottawattamie co., Ia. Pop. 1117.

Crescent, a township of Alleghany co., Pa. Pop. 364.

Crescent City, the capital of Del Norte co., Cal., is on the Pacific Ocean, about 260 miles N. N. W. of Sacramento. It has a small but safe harbor, and a lighthouse in lat. 41° 44′ 34″ N., lon. 124° 11′ 22″ W., with a flashing white light. It has one weekly newspaper. Pop. 458.

Crescen'zi, de' (PIETRO), an Italian senator, born at Bologna in 1230. He wrote in Latin a treatise on rural economy ("Opus Ruralium Commodorum"), the fruit of long travel and observation and the origin of agricultural science. Died in 1307.

Cres'co, a post-village, capital of Howard co., Ia., on the Milwaukee and St. Paul R. R., 19 miles N. W. of Calmar. It has five churches, a union school, two newspapers, two foundries, and other manufactories, and shipped in 1872, 378,000 bushels of wheat. Pop. 912.

W. R. MEAD, ED. "IOWA PLAIN DEALER."

Cresco, a township and village of Kossuth co., Ia. The village is on the Des Moines Valley R. R., 20 miles N. of Dakota. Pop. 309.

Cres'kill, a post-village of Bergen co., N. J., on the Northern R. R. of New Jersey, 17 miles N. of Jersey City and 2½ miles W. of the Palisades of the Hudson. It is finely situated, and has two parks and a fine railroad station.

Cre'sol [a term which appears to be derived from the first syllable of "creosote" and the first syllable of the Lat. *oleum*, "oil"], called also **Cresyl'ic Ac'id** and **Cres'yl Al'cohol,** a compound (C_7H_8O) derived from coal-tar or from wood-tar by fractional distillation. Most of the CARBOLIC ACID (which see) of commerce contains a large percentage of cresol. It combines with alkalies, like its analogue phenol, and hence is by some called an acid: it is isomeric with benzyl alcohol, and is itself properly one of the alcohols. It refracts light strongly, and boils at 397° F. It is sold in large quantities as "carbolic acid," and used as a disinfectant.

Cress, a name popularly applied to many cruciferous plants having a pungent taste and used in salads. The garden cress (*Lepidium sativum*) is an annual, a native of Asia. It is easily raised by a little artificial heat in winter. It is antiscorbutic. The bitter cress or cuckoo flower (*Cardamine pratensis*) is common in moist meadows in Great Britain. The flowers are white or light purple, and have stimulant and diaphoretic properties. They had once a reputation for the cure of epilepsy, particularly in children. This plant is also a native of America, like many of the other cresses. The young leaves of this species, as well as of *Cardamine amara* and *Cardamine hirsuta*, both British, and the latter American, are used as salads in Europe. The juice of *Cardamine pratensis* is much used as an antiscorbutic in the north of Europe. Water-cress (*Nasturtium officinale*) is a perennial, aquatic, cruciferous plant, used as a spring salad, and is a native of almost all parts of the world. It grows best in shallow running water, with a bottom of sand. Mud is injurious to its growth and flavor. It is often cultivated and brought to market in America and Europe.

Cres'son, a post-village of Cambria co., Pa., on the Pennsylvania R. R., 252 miles W. by N. from Philadelphia, and 102 miles E. of Pittsburg, at the junction of the Ebensburg branch. It is beautifully situated on the top of the Alleghany Mountain, about 3000 feet above the level of the sea. It is a fashionable place of summer resort, and is commended for the purity of its air.

Cresso'na, a post-borough of Schuylkill co., Pa., on the Mine Hill and Schuylkill Haven R. R., about 5 miles S. of Pottsville. Pop. 1507.

Cressy, in France. See CRÉCY.

Crest, in heraldry, the ornament affixed to the helmet, being a personal or hereditary device. Warriors bore insignia peculiar to themselves in this manner among the ancients. The earliest instance of the heraldic crest in England is said to have been that of Edmund Crouchback, earl of Lancaster, about 1280. The crest is in modern blazonry a figure placed upon a wreath, coronet, or cap of maintenance, which surmounts the coat-of-arms.

Crest, a town of France, department of Drôme, on the river Drôme, 14 miles S. S. E. of Valence. It has manufactures of silk fabrics and cotton prints. Pop. 5351.

Crest'line, a post-village of Crawford co., O., on the Pittsburg Fort Wayne and Chicago R. R. where it crosses the Cleveland Columbus and Cincinnati R. R., 63 miles N. by E. from Columbus. It is the terminus of the B. and I. R. R. Here are extensive shops of the railroads; also lock-works and other manufactories, a fine park, a splendid public-school building, six churches, waterworks, and two weekly newspapers. Pop. 2279.

A. BILLOW, PROP. "CRESTLINE ADVOCATE."

Creston, a post-village of Ogle co., Ill. It is a station on the Chicago and North-western R. R., 70 miles W. of Chicago, and has one weekly newspaper.

Cres'ton, a post-village of Union co., Ia., on the Burlington and Missouri River R. R., 190 miles W. of Burlington. Here are the engine-houses and repair-shops of the railroad company. It has three weekly newspapers. P. 411.

Cres'well, a township of Cowley co., Kan. Pop. 214.

Creswell (JOHN A. J.), an American lawyer, born at Port Deposit, Md., Nov. 18, 1828. He was chosen a Republican member of Congress in 1862, and a Senator of the U. S. for a short term in 1865. In Mar., 1869, he was appointed postmaster-general of the U. S. He resigned in Mar., 1873, and was then reappointed.

Cres'wick (THOMAS), an English landscape-painter, born at Sheffield in 1811. He became an associate of the Royal Academy in 1842. He painted British scenery with success. Among his works are "The Weald of Kent," a "Shady Glen," and "Wind on Shore." Died Dec. 28, 1869.

Cresylic Alcohol, or **Cresylic Acid.** See CRESOL.

Cre'ta [the Latin for "chalk," originally signifying "Cretan earth"], a pharmaceutical name for chalk (native carbonate of lime) and for the precipitated carbonate of lime. The former is more generally used. The chalk is powdered, washed, and dried, and is then known as *creta præparata* ("prepared chalk"), an excellent antacid remedy. *Creta præcipitata* (the chemically-prepared chalk) is more finely divided. (See CHALK.)

Creta'ceous [from the Lat. *creta*, "chalk"] **Sys'tem,** in geology, a name applied to the last-formed or uppermost rocks of the secondary or mesozoic period. It takes its name from the chalk, which in Europe is one of the characteristic rocks of the lower strata of this system. Next below the cretaceous lie the Jurassic rocks, and next above come those of the eocene period, which are the oldest of tertiary rocks. Cretaceous beds abound in the U. S.; and on the great plains and on both sides of the Rocky Mountains they are immensely developed, and contain great beds of valuable lignitic coal, which, however, is by some referred to the tertiary, or to a transition group between the cretaceous and the eocene.

Crete, or **Can'dia** [Gr. Κρήτη; Turk. *Kirídi*], a large and famous island of the Mediterranean, is between lat. 34° 57′ and 35° 41′ N., and lon. 23° 29′ and 26° 20′ E. It is 150 miles long, and from 6 to 35 miles wide. The surface is mountainous. Mount Ida rises near the middle of the island to the height of 7674 feet. Numerous caverns occur here, and an extensive one near Mount Ida is fabled to have been that which was anciently the retreat of the Minotaur. Among the minerals are limestone and slate. The chief productions of Crete are cotton, tobacco, olive oil, grapes, oranges, lemons, wine, silk, and wool. The population in ancient times is believed to have amounted

to 1,200,000, and at the time when it was acquired by the Venetians, to 500,000; it is now estimated at 210,000, of whom about 50,000 are Mohammedans, nearly all the others being Christians belonging to the Greek Church, which has eight bishops in the island.

History.—Crete is by some historians considered the cradle of the civilization brought to Europe by the Phœnicians and Egyptians. According to tradition, Minos, a celebrated legislator, reigned over this island before the beginning of the historical period. In the time of Homer, Crete had a dense population of the Hellenic race, and contained a great number of flourishing cities. Crete was visited by the apostle Paul, who planted a church in it. The Venetians became masters of this island in 1204. The Turks conquered it from the Venetians in 1669. In 1866 the Christian inhabitants revolted against the Turks, and demanded annexation to the kingdom of Greece. This war excited much sympathy among Christian nations, but the Cretans were subdued in 1869.

Crete, a township and post-village of Will co., Ill., about 34 miles S. of Chicago. Pop. 1468.

Crete, a city, capital of Saline co., Neb., on the Burlington and Missouri River R. R., at the junction of the Beatrice branch, 20 miles from Lincoln. It has four churches, several manufactories, and one weekly paper, and is the seat of Doane College.

Cre'tin [Fr. *crétin*], a person affected with CRETINISM (which see).

Crétineau-Joly (JACQUES), a French author, born Sept. 23, 1803, at Fontenay, studied theology in Paris, and wrote a number of works in defence of the interests of royalty and the Catholic Church. He is best known by his "History of the Jesuits" (6 vols., 1844–46), an elaborate work in defence of that order. Among his other works are "Histoire de la Vendée Militaire" (4 vols., 5th ed. 1864), "Histoire de Louis Philippe" (2 vols., 1861–63), "Le Pape Clément XIV." (1853), "Le Cardinal Consalvi" (1864).

Cret'inism [Fr. *crétinisme;* etymology uncertain], a name applied to epidemic idiocy or defective mentality, usually associated with physical deformity and moral debasement. It is frequently hereditary, and is almost always found in connection with goitre. It prevails especially in deep alpine valleys, not only in Switzerland and Italy, but in the Pyrenees and Himalayas. It is also found in China, and in Bengal is frequent on calcareous plains. In Europe it is seldom found at a higher elevation than 3000 feet. Cretins are often very repulsive, dirty, and shameless, their appetite voracious, the mouth large and open, the eyes small and usually crossed, the nose flat and broad, the skull wide at the top, with a narrow base, and the forehead retreating. The complexion is cadaverous, the limbs rachitic, the whole body dwarfish except the hands and feet, which are large. Cretinism is a physical degeneration, caused by defective nutrition, bad ventilation, lack of sunlight, and especially by calcareous matter taken into the system in drinking-water. Like goitre, it is said to prevail especially where magnesian limestone abounds. Cretinism is often incomplete. The institution founded by Guggenbühl on the Abendberg in Switzerland has been the model for many others for the improvement of cretins and other idiots. (See IDIOCY, by HERVEY B. WILBUR, M. D.)

Cre'tius (KONSTANTIN), a German artist, born Jan. 6, 1814, studied with König. He has treated South European peasant-life and later history, especially the Cromwellian period. A seriousness of composition in his works and excellent coloring are to be remarked.

Creuse, a department near the centre of France, has an area of 2151 square miles. The surface is mostly mountainous; the soil in some parts is thin and poor. The principal mineral productions are coal and salt. The rearing of cattle is one of the chief branches of industry. This is one of the poorest departments of France. Capital, Guéret. Pop. 274,057.

Creu'zer (GEORGE FRIEDRICH), a learned German philologist and antiquary, born at Marburg Mar. 10, 1771. He became professor of philology and ancient history at Heidelberg in 1804, and retained that position for forty-four years. His principal work is his "Symbolism and Mythology of Ancient Peoples, especially the Greeks" (4 vols. 8vo, 1810–12). He ascribed to the pagan myths a mystical significance and a supernatural origin. The old poet Voss, in "Antisymbolik," contested the theory, and a lively controversy ensued. He edited the Oxford Plotinus (3 vols., 1835). Died Feb. 16, 1858. (See CREUZER'S autobiography, "Aus dem Leben eines alten Professors," 1847.)

Creuzot, Le, a town of France, department of Saône-et-Loire, 12 miles S. S. E. of Autun. It is situated in the midst of rich mines of coal and iron, and has extensive blast-furnaces, iron-foundries, machine-shops, and glass-works. Cannon, anchors, steam-engines, etc. are made here. This town has increased rapidly in recent times. P. 23,872.

Crevasse [a French word signifying a "crevice" or "crack," from *crever*, to "burst," to "break," to "split"], a breach in the dike or embankment of a river, as in the levees of the Mississippi. Crevasses are sometimes caused by the burrowing of crawfishes and other animals, and are frequently very destructive. The name is also given to the fissures in glaciers. (See LEVEES.)

Crew, in nautical language, is the company of persons employed in a ship, but the name is mostly limited to seamen and non-commissioned officers. There are upwards of eighty different grades or offices among the crew of the largest war-steamers. Besides the regular crew there are minor groups of workmen, such as the cooper's, carpenter's, sailmaker's crew, etc. In England the master of a merchant-ship, before starting on a voyage, is obliged to send a list of his crew to the customs comptroller at the port of departure, and a similar list within forty-eight hours after his return. This, however, is required of the masters of coasting vessels only twice a year. The number of hands in large sea-going steamers is relatively great, owing to the duties relating to the machinery, a steamer of a thousand tons sometimes requiring sixty or seventy hands. American ships carry smaller crews for their tonnage than those of other nations. This is regarded as a cause of many shipwrecks.

Crewe, a town of England, in Cheshire, 34 miles S. E. of Liverpool. It is a central station of five important railways, and has shops for the manufacture and repair of railway-carriages. Pop. 8159.

Crib'bage [from *crib*, as used in the game], a popular game at cards, usually played by two persons. The game is sixty-one points, which are scored with pegs on a board called a cribbage-board having sixty-one holes on each side. In the U. S. the game, when two or four play, is decided by the winning of two out of three *legs*. Where three play, the first out in a double circuit of the board is the winner. When cribbage is played by three persons a three-cornered board is used. In this case each player receives five cards, and an extra card is dealt, which is added to the crib. When four persons play each has a partner, and each receives five cards, of which he discards one to form the crib. When only two persons play, six cards are dealt to each player, and each discards two, to form what is called the *crib*, which belongs to the dealer. The pack is then cut, and the dealer turns up a card, called the *turn-up*, which is reckoned in scoring as belonging to all the hands and the crib. The cards held in the hands are then played alternately, counting the pips (for every court card ten) up to thirty-one, for which two is scored to the person playing the card that makes it, and scoring in the same way for every combination made according to any of the following rules: Any combination of cards the united pips of which make up fifteen scores two points. A sequence in rank (without regard to suit) of three or more cards scores one for each card. Two similar cards of different suits (as two fives or two knaves) form a *pair*, and score two; three form a *pair-royal*, and four a *double pair-royal*, scoring respectively six and twelve. When the cards are all played each hand is counted by itself, according to the same rules. For example, a hand containing two sevens, an eight, and a nine, with an eight turned up, would score twenty-four: four fifteens (produced by the different combinations of eight and seven) = 8; four sequences of three each = 12; two pairs = 4. If the cards in either hand, or the cards in the crib and turn-up, are all of the same suit, it is called a *flush*, and one is scored for each card. If a knave of the same suit as the turn-up be in either hand or in the crib, the holder scores one; when the turn-up is a knave the dealer scores two. During the play, when it is found impossible to count to thirty-one without passing that limit, it is called a *go*, and the last player scores one.

Crich'ton (JAMES), called THE ADMIRABLE CRICHTON, born in Perthshire in 1551 or 1560, was a son of Robert Crichton, lord advocate of Scotland. Educated at St. Andrew's, before he was twenty he had run through the entire circle of the sciences. He could speak in ten languages, and was adroit in all manly accomplishments. He journeyed through Europe about 1580, challenging all scholars to a learned disputation in any of twelve tongues. He vanquished all the doctors of all the universities; moreover, he disarmed the most famous swordsman of the time in fencing, and by his grace and manly beauty his amorous triumphs were not less distinguished. He found his death in 1583, at the hands of his pupil Vincentio, son of Gonzago, the

duke of Mantua, a dissolute youth whom he had roughly jostled in a carnival encounter. Unmasking on discovering his young opponent, he presented his sword and bared his breast, and the brutal stripling stabbed him. "He was," says Scaliger, "a man of very wonderful genius, more worthy of admiration than esteem." The stories of his accomplishments are no doubt exaggerated. (See P. F. Tytler, "Life of the Admirable Crichton," 1823.)

Crick'et [probably so called from the sound they produce], the popular name of certain orthopterous insects, nearly allied to locusts and grasshoppers, the type of the family Achetidæ. The wings, being horizontally folded, form a slender point beyond the wing-covers. In virtue of

Field Cricket.

a peculiar formation of the wing-covers, and by their friction, the males produce that stridulous sound by which these insects are so well known. Of the typical genus *Acheta* the U. S. have several species, including the common black cricket (*Acheta abbreviata*). The common American mole-cricket (*Gryllotalpa brevipennis*) has wings shorter than the mole-crickets of Europe. The mole-crickets construct chambers for their eggs beneath the surface of the earth, and the passages leading to these cells are long and tortuous, like those of the mole. The climbing crickets (*Œcanthus*) are represented in the U. S. by several species. They are often found upon weeds and shrubs.

Cricket [etymologically related to the word *crook*, it having been formerly played with a crooked stick for a bat], a sport well known as one of the national games of England, is of unknown though ancient date. It has become popular in England within the present century. It is played upon a tract of level, grassy ground, and requires players sufficient to form two sides of eleven, or twenty-two each. The variety of the game known as "double wicket" is that which is generally played, requiring two sets of wickets and bails, two bats and a ball. "Single wicket" may be played by a less number of persons. When a match is to be played, they first "pitch" the wickets, which are wooden frames of three upright sticks or "stumps" twenty-seven inches high. Two horizontal pieces of wood called "bails" are placed on the top of each wicket. The wickets are twenty-two yards apart. The players first toss for first innings, and the director of one side places a batter at each wicket; a wicket-keeper, a bowler, a "long-stop," and fielders are placed in position by the director of the other side. The object of the bowler is so to direct his ball towards the opposite wickets as to knock off the bails or strike down the stumps or upright rods, while the batter's object is to protect his wicket by stopping the ball or driving it out of the field. At a given signal the bowler delivers the first ball. If the batsman misses the ball and it passes the wicket, the wicket-keeper stops it and returns it to the bowler, who delivers another. When the batsman strikes the ball away, he runs to the opposite wicket, his companion crosses to his, and so on till the ball is returned by a fielder to the bowler or wicket-keeper. The batter may possibly have time to make two or three "runs" before the ball is returned. The scorers credit him with these runs. If the wicket-keeper or bowler touches the wicket with the ball before the batsman touches it with his bat or has reached his ground, the striker is out and another takes his place. If one of the opposite party catch a ball before it reaches the ground, or if the striker knocks down his own wicket, or if he prevent a ball from being caught, or strikes it twice, or if a ball which would have hit his wicket is stopped by any part of his person, the striker is out. The duty of the wicket-keeper is to stop with his hands the balls which the batsman misses. The long-stop stands behind him, and stops balls that escape the wicket-keeper. The fielders are posted in different parts of the ground. They must possess quickness of eye and foot, and much depends on their judgment of distance. Fielders throw the ball to the wicket-keeper, who returns it to the bowler. All change places at the end of every four bowls; every four balls are thus delivered from alternate wickets. Four balls are called an "over," and credited to the side which is in. The laws of the Marylebone Club of England are generally taken as the standard rules for this game.

Crick'lade, a town of England, in Wiltshire, on the river Isis, 7 miles S. E. of Cirencester. It consists mainly of a single street of poorly built houses. It has two antique churches. It was formerly a borough-town, but was disfranchised in 1782. Pop. in 1871, 43,552.

Crillon, de (Louis des Balbes de Berton), a famous French warrior, born in Provence in 1541. He served at the siege of Calais in 1558, and fought against the Huguenots in the civil wars. He distinguished himself at Jarnac and Moncontour, and at the naval battle of Lepanto (1571). During the reign of Henry III. he fought for that king against the Catholic League. In 1589 he entered the service of Henry IV., who styled him "the bravest of the brave." He contributed to the victory at Ivry (1590). Died 1615. (See Servien, "Histoire du brave Crillon," 1844; Abbé de Crillon, "Vie de L. des Balbes de Berton de Crillon," 3 vols., 1826.)—A descendant of "the brave" Crillon, Louis (1718–96), was a distinguished general of the Thirty Years' war, and in the service of Spain became duke of Mahon, and commanded at the futile investment of Gibraltar in 1782.—His grandson, Duc de Mahon (1775–1832), a Spanish general, was viceregent of Navarre under Joseph Bonaparte.

Crime, any act done in violation of those duties which an individual owes to the community, and for a breach of which the law has provided that the offender shall make satisfaction to the public. The ascertainment of these duties, which society imposes upon its members for the general welfare, is derived either from the common concurrence of the moral sentiments of any community or from the enactment of specific laws defining and enforcing particular obligations. Offences against the one variety of duties are said to be *mala in se* (wrongful in themselves), while those against the other are designated *mala prohibita* (wrongful because prohibited by statute). As a general practice, however, legislative prohibition is also extended to the case of crimes which are strictly *mala in se*, both to provide against uncertainty and fluctuation of opinion and to create additional sanctions; so that the precise original distinction between the two classes is no longer preserved. The laws of England recognize a larger variety of crimes not depending upon statute than is generally the case in the American States. But even here, as a rule, there are still some offences for which the common law alone makes provision.

By the common law crimes are divided into two great classes—felonies and misdemeanors. The distinction is based upon the relative enormity of various offences. Thus, the term "felony" includes those which are of greatest magnitude, while "misdemeanor" is reserved for the residue. But nevertheless an understanding of the exact extent of meaning of these two designations can only be attained by an indirect mode of definition—viz. by showing the diversity of punishment in the respective cases. A felony was originally any crime for which the penalty might be a forfeiture of lands or goods; a misdemeanor was one which entailed a milder punishment. In some of the American States the punishments distinguishing felonies have been changed, and are now either death or imprisonment in a State prison. In others, while the common-law distinction has been discarded, no different one has been adopted to supply its place, so that the two terms are used without precision or definiteness of meaning.

In order that a person may be guilty of a crime there must be a concurrence of capacity, intent, and wrongful act. The questions of capacity and intent are, in fact, closely related, since the law adjudges a person incapable of a criminal offence only because it presumes him incompetent to form a criminal purpose. The principal causes

of incapacity are infancy and the want of mental soundness. Infancy exempts from responsibility only when children are so young as to have no acquaintance with the nature of a criminal offence. At the common law a child under seven years of age is conclusively presumed to be unable to commit a crime; between seven and fourteen, his liability depends upon his actual discretion, which must be determined in each particular instance by special proof; after fourteen, he is considered presumptively capable. The want of proper mental capacity to form a criminal intention exists in the case of idiots, lunatics, and all persons who are either permanently of unsound mind, or so deranged at the time of the commission of any wrongful act as not to be aware of its guilty character. Exactly what degree of mental alienation should be sufficient to exempt from responsibility is a matter difficult to determine. The only criterion that can generally be adopted is the wrong-doer's power of appreciation of the wrongful nature of the particular act which he committed. (See INSANITY.) Voluntary drunkenness, however, though it may confuse and disorder the moral perceptions, and produce a kind of temporary insanity as pernicious in its effects as natural aberration, affords, in general, no defence for the criminal offender. Only where a specific intent is an essential element to constitute a crime can a person intoxicated be excused for that particular offence. As a rule, the intent to drink is sufficiently culpable to make the resulting act punishable. If, however, true insanity or delirium tremens should be produced as a consequence of intoxication, and the victim of it should commit an act which if he were sane would be a crime, he will be excused. The law in that case only regards the fact of insanity, without reference to the means by which it has been occasioned. Besides these natural incapacities, which exempt from penalty, there exist certain other causes for exoneration, such as duress and coverture. Whenever an offence is not perpetrated voluntarily, but under the compulsion of force or fear, there is wanting that willing pursuit of crime which is alone a just reason for condemnation. In like manner, the stress of overwhelming necessity relieves from guilt the involuntary wrong-doer. Coverture also, or the condition of a married woman, exempts from liability in some instances, because her action is considered to have been occasioned by constraint exerted by her husband. Thus, all crimes committed by a wife in the presence of her husband, except some of a graver class, as treason, murder, robbery, and the like, are presumed to be done by coercion. This presumption is not a conclusive one, but relieves a married woman from any consequence of her action until rebutted by direct evidence that the crime was exclusively of her own commission. This mode of justification by alleging constraint only applies to married women. Servants and children are not excused, though acting under the command of masters or parents.

The necessity for the existence of a criminal intent in order to make a person responsible for his wrongful acts forms an important distinction between criminal and civil liability, for in civil cases intent need not generally be proved. It has always been a well-recognized maxim in criminal jurisprudence that "the act does not make a man guilty unless his purpose also be guilty." But the intention need not necessarily contemplate the commission of the particular consequence which results. In most instances, of course, the act done will be the specific act intended. But yet, if there be a purpose to perpetrate one crime, and the means used for its accomplishment unexpectedly result in a different offence or affect a person against whom they were not directed, there is still a sufficient connection of intent and act to warrant a holding to accountability. Thus, if a man intends to shoot A and his act results in the death of B, whom he did not intend to injure, he is nevertheless responsible, as though he had actually intended to kill B. This principle, however, is not in all its rigor applicable when the crime committed is strictly in the class of *mala prohibita*, for the original purpose is not then deemed sufficiently reprehensible. A still different case arises where the preconceived intention had reference to the specific act performed, but did not include knowledge of its criminality, as where a person shoots game at a certain season when it is prohibited, without being aware that he is violating the law. In this class of instances it is likewise true that all the necessary elements of a crime are sufficiently present to justify punishment. The principle is, that ignorance of the law must afford no excuse. If such were not the rule, all laws would be ineffective, for would-be offenders would be likely to abstain from examining their provisions, and thereby secure impunity. The accompaniment of intent and act, therefore, which will constitute criminal transgression, may occur in three different forms: First, the intent may be wrongful, and contemplate the very offence committed; second, the intent may be wrongful, but contemplate another offence than the one committed; third, the intent may be really innocent, but contemplate an offence which happens to be prohibited by law, and so criminal.

There are some cases in which, though no actual criminal intent is conceived, yet the law presumes its existence. When acts are characterized by such a degree of negligence or carelessness as to evince a culpable indifference whether wrong is done or not, the wanton disregard of commonly recognized duties is essentially criminal of itself. But if an unlawful act is committed, through mere accident or misfortune, in the prosecution of some legitimate undertaking, the unwitting offender is excused. In like manner, though ignorance of law affords no justification, ignorance of fact, where no reasonable opportunity is granted for acquiring correct information, is a valid excuse. The law may always be known when the facts cannot be ascertained. "The guilt of the accused," it has been said as to these matters of fact, "must depend on the circumstances as they appear to him."

The necessity that an act must concur with the intent depends upon the principle that no mere mental conception or fancy, no matter how reprehensible morally, can ever be taken cognizance of at law without some overt expression of it in an objective result.

The parties engaged in the commission of crimes are distinguished either as principals or accessories. A principal in the first degree is one who is the actual, direct perpetrator of the offence. A principal in the second degree is one who is present, aiding and abetting the act to be done. An accessory is a participant in the wrong-doing in some more remote manner, either by procuration or assistance before the act, or after its occurrence by sharing in the profits acquired or shielding the immediate offenders from justice. In the one case he is called an accessory before the fact; in the other, an accessory after the fact. This distinction between principals and accessories is maintained only with reference to felonies, and even among these an exception is made of the crime of treason. There is no accessory before the fact in the common-law crime of manslaughter, for in it there is no preconceived intent to kill. In treason and in misdemeanors all the participants are deemed principals; in the one case, from the enormity, and in the other from the comparative triviality, of the offence. Where the distinction is preserved there is no reason for diversity of punishment as between principals and accessories before the fact. Accessories after the fact are not so severely punished, as their offence consists in an attack on the administration of justice. A wife is excused for thus shielding her husband. It was formerly the rule that the accessory could not be brought to trial before the principal, but this doctrine has been quite generally changed by statute.

The various crimes which may be committed are classified by legal writers in different ways. Blackstone in his Commentaries treats them as either offences against morals and religion or the law of nations, or as against the existence of the government or state, such as treason, or against public order under the respective titles of public justice, public peace, public trade, public health or economy, and finally, against individuals. These last are subdivided into those which are committed against the person, against habitations, and against property. This classification is incomplete, and no place can be found in it for certain well-established crimes, particularly those which have been created by statute. The most satisfactory treatment of the subject is that adopted by Mr. Bishop, who discusses the general principles of law governing crimes, and then considers specifically each crime known to the law under an alphabetical arrangement. It should be noticed that the criminal law of the Federal government is wholly created by statute, Congress having enacted so-called "Crime Acts." Under the State governments the common law of crimes exists unless changed by statute. It will be impossible in this brief notice to do more than to refer to some of the leading crimes, which are considered under their respective titles: ARSON, BRIBERY, BURGLARY, CHAMPERTY, CHEATING, EMBEZZLEMENT, FALSE PRETENCES, FORGERY, GAMING, LARCENY, LIBEL, MAYHEM, PERJURY, PIRACY, POLYGAMY, RAPE, RIOT, ROBBERY, TREASON, USURY. For punishment of crimes, see PUNISHMENT.

In this brief account only the common-law doctrine of crimes could be considered. Upon this may be further consulted BLACKSTONE'S "Commentaries," book iv.; BISHOP "On Criminal Law;" BISHOP "On Criminal Procedure;" WHARTON'S "American Criminal Law;" RUSSELL "On Crimes;" HALE, "Pleas of the Crown;" HAWKINS, "Pleas of the Crown;" EAST, "Pleas of the Crown;" and FOSTER'S "Crown Law." The statutes of the States severally should also be referred to. T. W. DWIGHT.

Crime'a, The [Russ. *Krim*; anc. *Taurica Chersonesus*], a peninsula of Southern Russia, forms part of the government of Taurida, and is nearly surrounded by the Black Sea and the Sea of Azof. It is connected with the main land by the isthmus of Perekop, 5 miles broad. Its length E. and W. is nearly 200 miles, and its area 7654 square miles. Pop. about 200,000. The north-western part of the Crimea is a treeless plain, the soil of which is impregnated with salt and fit only for pasturage. The south-eastern part is occupied by wooded mountains and fertile valleys, but they are ill cultivated. The highest peak of these mountains is 5180 feet above the level of the sea. Among the productions are grain, grapes, olives, silk, honey, and wine. Many horses and cattle are reared here, and salt is exported. The chief towns are Simferopol, Sevastopol, and Baktshi-Serai. The majority of the population are Tartars. It was conquered in the thirteenth century by the Tartars, who converted it into the khanat of Krim Tartary. It was annexed to Russia in 1783.

Crimean War, so called because it was chiefly waged in the Russian peninsula of the Crimea. It was carried on by France, Great Britain, Turkey, and Sardinia, against Russia. The motive of the allies was partly to check the growing power and encroachments of Russia, and to prop up the tottering throne of the Turkish sultan. One cause of the war was the claim of Russia to be the protector of the Greek Church in Turkey. After ineffectual negotiations between Russia and the Ottoman Porte, the Russian army entered the principalities in July, 1853, and war was declared by the sultan in October of that year. Early in Jan., 1854, the French and English fleets entered the Black Sea, and these allied powers announced to the czar Nicholas that their combined fleets must have command of that sea. A treaty of alliance between France, England, and the Porte having been signed Mar. 12, the former two powers declared war Mar. 27 and 28. The French and English fleets bombarded Odessa April 22. Lord Raglan took command of the British army, and Marshal Saint-Arnaud of the French. The allied armies landed at Varna May 29, and there suffered severely from cholera. The allies moved their armies to the Crimea early in September, and defeated the Russians at the river Alma on the 20th of that month. Prince Mentchikof commanded the Russian army. The allies commenced the bombardment of Sevastopol Oct. 17, fought a battle at Balaklava Oct. 25, and gained a victory at Inkerman Nov. 5. The British troops, being ill supplied with food and clothing, suffered great privations and hardships in the ensuing winter, and large numbers of them perished. The king of Sardinia joined the allies in Jan., 1855. In May, General Pélissier became commander-in-chief of the French army. On June 18 the allies attacked the important fortresses known as the Malakoff and the Redan, but were repulsed. The French took the Malakoff by storm Sept. 8, and the Russians evacuated Sevastopol about the 9th of that month. An armistice was concluded Feb. 26, 1856, and after the belligerents had met in conference at Paris, a treaty of peace was signed in that city Mar. 30, 1856.

Criminal Law. See LAW, by PROF. T. W. DWIGHT.

Crim'mitschau, a town of Saxony, on the Pleisse and on the railway from Altenburg to Zwickau, 10 miles N. W. of the latter. It has manufactures of woollens and a number of machine-works and breweries. Pop. 15,280.

Crinoid'ea, or **Crinoideæ** [from the Gr. κρίνον, a "lily," and εἶδος, "appearance"], an order or family of radiated animals of the class Echinodermata. As fossils they are sometimes called stone-lilies, having a radiated, lily-shaped disk supported on a jointed stem. When this stem is cylindrical, the species are termed encrinites; when it is pentagonal, they are called pentacrinites. The recent species of Crinoidea are few, but the extinct species are so numerous that their fossils constitute the greater part of extensive strata of limestone. The Burlington limestone contains a great variety of beautiful crinoids.

Apiocrinites trigintidactylus (a fossil encrinite).

Crin'oline [from the Lat. *crinis*, "hair"], a name first given by the French to a fabric of horse-hair used in ladies' dress. It is now applied generally to structures of steel wire called "hoops," and used for the same purpose—that of distending the skirts. This was called *fardingale* in the time of Elizabeth. In 1744 hoops were so large that a woman occupied the space of six men. In 1796 they had been discarded in private life, but were worn at court until the time of George IV., who abolished them. Hoops have reappeared since 1850; they are made of steel wires covered with cotton thread, and form a skirt which varies in size and shape according to the changes of fashion.

Cri'osphinx [from the Gr. κριός, a "ram"], a term applied to images, found in Egypt, of sphinxes having a ram's head instead of a human head. The latter are termed *androsphinxes*.

Cris'field, a post-village of Somerset co., Md., on the Little Annemessex River, and at the southern terminus of the Eastern Shore R. R., 19 miles S. by W. of Princess Anne. It has a tri-weekly steamboat connection with Norfolk, Va. It has two weekly newspapers.

Cri'sis [Gr. κρίσις, a "determination," from κρίνω, a "judge," to "decide"], a term which is used by physicians to denote the sudden determination of disease towards recovery or towards death. The doctrine of crises is connected with that of a *materies morbi*, or material of disease, in the blood. A doctrine associated with that of crises is the belief in certain days as showing characteristic symptoms, sometimes prognostic of recovery or death. This old belief seems to have had a certain foundation in the facts observable in clinical medicine. The doctrine of crises and of a *materies morbi* is still sometimes taught. A sudden discharge of any suppressed secretion is called a critical discharge when occurring about the turning-point of the disease.

Cris'pi (FRANCESCO), an Italian statesman, born Oct. 4, 1819, at Ribera, became a lawyer in Naples, was in 1848 one of the heads of the insurrection in Palermo, and for two years one of the leaders of the Sicilians in their resistance to Ferdinand I. In 1859 and 1860 he was again at the head of the new revolution of Sicily, and co-operated with Garibaldi in the expulsion of the Bourbons, which caused the annexation of Naples and Sicily to the kingdom of Italy. He led in 1861 the constitutional opposition.

Cris'pin, SAINT, a native of Rome, is supposed to have worked at the trade of a shoemaker in Gaul. According to the legend, he was so benevolent that he stole leather to make shoes for the poor. In 287 A. D. he and his brother Crispinian suffered martyrdom. He is the patron saint of shoemakers. St. Crispin's Day is October 25.

Crispin, Knights of Saint, a secret society among shoemakers, founded in 1866 in Milwaukee, Wis., numbered in 1870 about 100,000 members in 300 lodges. They have an organization similar to that of the Free Masons and other secret orders. All the lodges of one State are under the jurisdiction of a State grand lodge, while the latter is subordinate to the U. S. grand lodge. The object of the order is to protect the interests of the workingmen against employers, to regulate the wages, and to establish special funds in support of the members of the order and their families in case of sickness and death. There is also an order of the "Daughters of Saint Crispin," embracing women employed in the manufacture of shoes and boots.

Crit'ias [Κριτίας], an Athenian orator and one of the Thirty Tyrants, was a pupil of Socrates. He was banished from Athens about 406 B. C., but he returned with Lysander the Spartan in 404, and then became one of the ruling body called Thirty Tyrants. He caused the death of Theramenes. He was killed in a battle by the army of Thrasybulus in 404 B. C.

Crit'ic [Gr. κριτικός (from κρίνω, to "judge"); Lat. *criticus*; Fr. *critique*; Ger. *Kritiker*], literally and strictly, "[one] fit or competent to judge;" but the term is applied in common parlance to any one who takes upon himself to judge of works of literature, art, etc.—in short, of anything which requires the exercise of the judging, and particularly of the æsthetic, faculty. To *judge* and *condemn* appear to be considered by many as the principal part of the office of a critic. But he who is really "fit to judge"

will be no less able nor less willing to discover beauties, if they exist, than point out defects. It may indeed be the more frequent duty of a true critic to blame than to praise, because works of genuine merit are exceptions to the general rule; nevertheless, it is unquestionably a rarer, as it is a higher and nobler, office to appreciate and do justice to the various kinds and shades of excellence, than simply to condemn what merits condemnation.

Of all the critics of antiquity, the greatest beyond comparison was undoubtedly Aristotle. Aristarchus, who is often styled "the prince of critics," was more properly a grammarian and commentator than a critic, in the wider modern acceptation of this term. Among the Romans, Quintilian was especially distinguished as a critic, but the poet Horace was a critic of a higher and rarer order.

In modern times the greatest names in general criticism among the English are those of Dryden, Pope, Doctor Johnson, S. T. Coleridge, Hazlitt, Mackintosh, and Hallam; to which may be added those of Lords Jeffrey, Brougham, and Macaulay; and lastly that of Carlyle, who, if too often extravagant and wayward, is perhaps, when not biassed by pique or prejudice, not surpassed by any in breadth of comprehension or truth of insight. Among the French the most celebrated names are those of Boileau, Voltaire, Villemain, Sainte-Beuve, and Taine. The literature of Germany is rich in illustrious critics; among the greatest of these, in the department of general criticism, are Lessing, Goethe, and the two Schlegels. It is proper to observe that the Germans have studied the great principles which lie at the base of all sound criticism (*i. e.* the art or science of judging) more philosophically and more thoroughly than the critics of other nations. But it is perhaps in particular criticism that the Germans are most distinguished. Among the most remarkable examples of this kind we may cite Kant in the department of philosophy, Winckelmann in art, and Niebuhr in history, besides a host of other less distinguished names.

Crit'icism [for etymology, see CRITIC] signifies both the act and the art of criticising. In its latter signification it has been defined as "the art of judging with propriety concerning any object or combination of objects." In a more limited meaning its province is confined to literature, philology, and the fine arts, and to subjects of antiquarian, scientific, and historical investigation. The elements of criticism depend on the two principles of beauty and truth, one of which is the final end or object of study in every one of its pursuits—beauty in letters and the arts, truth in history and the sciences. Thus, historical criticism teaches us to distinguish the true from the false or the probable from the improbable in historical works; scientific criticism has the same object with respect to the different branches of science; while literary criticism, in a general sense, has for its principal employment the investigation of the merits and demerits of design, style, or diction, according to the general principles of composition and to the received standard of excellence in every language. In poetry and the arts, criticism develops the principles of that more refined and exquisite sense of beauty which forms the ideal model of perfection in each.

Cri'to, or **Cri'ton** [Κρίτων], a Greek philosopher, was a citizen of Athens, and a friend and disciple of Socrates, whom he attended in his last hours. He wrote seventeen dialogues on philosophy, which are not extant. Plato gave the name of "Crito" to one of his books.

Critola'us [Κριτόλαος], a Greek philosopher, born at Phaselis, in Lycia. He was the head of the Peripatetic school in Athens, and was eminent as an orator as well as a philosopher. He was sent to Rome on an important embassy with Carneades about 155 B. C.

Crit'tenden, a county in the E. of Arkansas. Area, 750 square miles. It is bounded on the E. by the Mississippi River, and on the S. W. by the St. Francis. The surface is mostly level; the soil is alluvial and fertile, except the swamps. Cotton, grain, and hay are raised extensively. It is intersected by the Memphis and Little Rock R. R. Capital, Marion. Pop. 3831.

Crittenden, a county in the W. of Kentucky. Area, 420 square miles. It is bounded on the N. W. by the Ohio River, and on the N. E. by the Tradewater. The surface is undulating or nearly level; the soil is fertile. Cattle, wool, grain, and tobacco are produced. Here are mines of coal, iron, and lead. Capital, Marion. Pop. 9381.

Crittenden, a township of Champaign co., Ill. Pop. 870.

Crittenden, a post-village of Grant co., Ky. P. 295.

Crittenden (GEORGE B.), GENERAL, a son of the following, was educated at West Point, began to practise law in Kentucky in 1835, served with distinction in the Mexican war, resigned his commission of lieutenant-colonel in the U. S. army in 1861, and joined the Southern Confederacy. He became a major-general, was defeated at Mill Spring, Ky., Jan. 19, 1862, was kept in arrest by the Confederates till Nov., 1863, and soon after resigned.

Crittenden (JOHN JORDON), an American statesman, born in Woodford co., Ky., Sept. 10, 1786. He studied law, which he practised with distinction, and was elected to the Senate of the U. S. for a short term in 1817. Having passed about sixteen years in private life, he was re-elected to the national Senate by the Whigs in 1835 for a term of six years. He was a personal and political friend of Henry Clay. In Mar., 1841, he was appointed attorney-general of the U. S., but he resigned in September of that year. He was again elected a Senator of the U. S. in 1843, and was chosen governor of Kentucky in 1848. He was attorney-general in the cabinet of President Fillmore from July, 1850, to Mar., 1853, soon after which he joined the Native American party. In 1855 he again became a U. S. Senator. He opposed the secession movement in 1860–61, and, performing the part of a mediator, offered in the Senate a series of resolutions called the "Crittenden Compromise," which were not adopted. Died July 26, 1863.

Crittenden (THOMAS LEONIDAS), an American general, a son of the preceding, was born at Russellville, Ky., in 1819. He served with honor in the Mexican war. He commanded a division of the Union army at Shiloh, April, 1862, and obtained the rank of major-general of volunteers in the summer of that year. He commanded a corps at the battle of Stone River, which ended Jan. 2, 1863.

Croatan', a township and post-village of Craven co., N. C. Pop. 656.

Croa'tia, a province of the Austro-Hungarian monarchy, is bounded on the N. W. by Carniola and Styria, on the W. by the Adriatic Sea, on the N. E. by Hungary, and on the S. by Turkey and Slavonia. On the seaboard the olive grows, but in the mountainous regions the snow lies eight months. The Julian Alps, which occupy the entire midland, are of limestone formation, are mostly covered with forests, and contain many caverns. The principal rivers are the Save, the Drave, and the Kulpa. Among the chief articles of export are grain, wine, and chestnuts. Capital, Agram. Of the inhabitants, 94.55 per cent. are Croats and Servians, 2.76 per cent. Germans, 1.38 per cent. Magyars; the remainder are Israelites, Italians, and Albanians. Croats and Servians are two Slavic tribes which speak the same language, though the former use the Latin and the latter the Cyrillic alphabet. About 60 per cent. of the population are Roman Catholics, 33 per cent. belong to the Oriental Greek Church; the remainder are Protestants and Jews. This region was anciently inhabited by the Pannonians, who were conquered by the Romans in the reign of Augustus. In 640 A. D. the Croatians or Horvats migrated from the Carpathian Mountains to this country, and gave it the name of Croatia. For several centuries Croatia was an independent kingdom, until in 1097 it was conquered by the king of Hungary. This province, with Slavonia, now forms a division of the Hungarian kingdom (*Transleithania*). Their united area is 8873 square miles. Pop. in 1869, 1,168,037, inclusive of the city of Fiume, which is placed under the immediate control of the Hungarian ministry.

Crochet, kro'shā [a diminutive of the Fr. *croche*, a "hook"], a kind of thread or worsted work consisting of a system of loops made with a small hook designed for the purpose. Various light and elegant patterns of crochet-work are made. Open work is made by omitting one or more loops. Wool and cotton of a great variety of shades and colors are used for crochet.

Crock'er, a county of Iowa, bordering on Minnesota. Area, 432 square miles. It was organized since the U. S. census of 1870. The soil is fertile. Capital, Greenwood Centre.

Crock'ery [from the Anglo-Saxon *croc;* Old English, *crock*, an "earthen vessel," a "pot or jar"], a collective term including all kinds of earthenware used for household purposes. The principal kinds are common or coarse earthenware, stoneware, queensware, and porcelain.

Crockery, a township of Ottawa co., Mich. P. 1125.

Crock'et [allied to the word *crook*], in Gothic architecture, an ornament resembling curved and bent foliage running up on the edge of a gable, pinnacle, or spire. The varieties of crockets are numerous, many kinds of leaf and flower being imitated for the purpose. Crockets only appear in pyramidal or curved lines, never in horizontal lines.

Crock'ett, a county of the W. of Tennessee, formed since the census of 1870. It is in a good cotton region, and is intersected by the Memphis and Ohio R. R. Capital, Alamo.

Crockett, a township of Arkansas co., Ark. Pop. 637.

Crockett, a city, capital of Houston co., Tex., on the line of the International and Great Northern R. R., at the centre of the county. It has an active trade and is very thriving. Here are four churches, a male and female seminary, and a weekly newspaper. Pop. 538.

Rainey & Frymier, Props. "East Texas Herald."

Crockett (David), a famous American hunter and humorist, born in Tennessee Aug. 17, 1786. He was elected a member of Congress in 1827, 1829, and 1831, and was a political friend of General Jackson. His habits were eccentric. He enlisted in the Texan army in revolt against Mexico, was taken prisoner at Fort Alamo, and massacred Mar. 6, 1836.

Croc'odile [Gr. κροκόδειλος, a "lizard" or "crocodile;" Lat. *crocodilus*], a genus (*Crocodilus*) of saurian or rather

Nilotic Crocodile.

loricate reptiles, which gives its name to the family Crocodilidæ, other genera of which are also called crocodiles. Like most reptiles, the crocodiles are carnivorous, and owing to their great size, strength, and voracious habits, they are the dread of the countries which they inhabit. They have bony plates embedded in the skin, which form a strong armor. They are called Emydosauri, or tortoise-lizards. Some authors term them Loricata, or mailed reptiles (from the Latin *lorica*, a "coat of mail"). They are capable of walking on land, but are much better fitted for the water. They are furnished with elevated nostrils at the extremity of the skull, so that they can almost wholly conceal themselves in water while breathing the air. The water does not enter the throat, which closes like the valves of the heart. The ears are also guarded by tightly-closing valves. The young crocodiles are hatched from eggs strangely small in proportion to the size of the adult animal, being less in size than the eggs of the goose.

These great reptiles are divided into two families—the true crocodiles and the alligators. They are easily distinguished by the shape of the head, the muzzle of the crocodiles being narrow behind the nostrils, while that of the alligator forms a straight line; and there are other anatomical distinctions. The gavial, or Gangetic crocodile (*Gavialis Gangeticus*), is one of the largest of its order, sometimes being thirty feet long. It has an extraordinary length of muzzle, which gives it a grotesque aspect. It has one hundred and twenty teeth, of similar appearance and equal length. Its color is a dark olive-brown, with black spots. The crocodile of the Nile (*Crocodilus vulgaris*), now seldom seen below the first cataract, is a most formidable animal. Living exclusively on animal food, and preferring tainted meat, it is useful in purifying the waters. It also feeds on fish, and is a dangerous foe to cattle and other animals. It is nearly as large as the former species. The Indian crocodile (*Crocodilus porosus*) is an Asiatic species; it is sometimes called the double-crested crocodile, because the head has two long ridges extending from the front of the eye over the upper jaw. This is never found except in low lands with still water. It is very common in Ceylon. The marsh crocodile (*Crocodilus palustris*), frequently called mugger or goa, has a large range of locality, and sometimes grows to a great length; in the British Museum is a skull twenty-six inches long, denoting a total length of thirty-three feet. It is found in Asia, and is said to occur in Australia. Another species is the American crocodile (*Crocodilus acutus*), often confounded with the alligator. This is found in the hotter portions of America, and occurs in the U. S. It makes a hideous noise at night, so that one unaccustomed to it has no chance of sleep. The margined crocodile (*Crocodilus marginatus*) inhabits the rivers of Southern Africa. It is distinguished from the Egyptian crocodile by the great concavity of the forehead and stronger dorsal plates. Several other living species are known. Many fossil species have been found, especially in the U. S. (See Alligator, Cayman, Gavial.)

Cro'cus [Gr. κρόκος, "saffron"], a large genus of iridaceous plants (herbs) native of Asia and Europe. The *Crocus vernus* and other species are well known as affording many varieties of very early spring flowers which are common in cultivation. *Crocus sativus* and other species blossom in autumn. The autumn crocuses are rarely cultivated in the U. S. Their orange-red stigmas, when dried, constitute the drug known as "true" Saffron (which see).

Crocus of Mars, a name given to the finely-divided red oxide of iron, used in medicine and in the arts. The "crocus of antimony" of the old chemists was a mixture of the tersulphide and teroxide of antimony. The "crocuses" received their name from their saffron color.

Cræ'sus [Gr. Κροῖσος], a king of Lydia proverbial for his riches, was born about 590 B. C. He succeeded his father Alyattes in 560, and soon extended his dominions by the conquest of the Æolians, Ionians, and other peoples of Asia Minor. Sardis was the capital of his kingdom. He is said to have enriched himself by the golden sand of Pactolus. In 546 B. C. he was defeated in battle and taken prisoner by Cyrus of Persia, who treated him with generosity.

Croetan', a township of Dare co., N. C. Pop. 255.

Croft (William), an English composer of cathedral music, was born in Warwickshire in 1677. He was appointed composer to the chapel-royal and organist of Westminster Abbey in 1708. He composed "Divine Harmony" (1712) and "Musica Sacra" (1724). Died Aug. 14, 1727.

Cro'ghan, a township and post-village of Lewis co., N. Y. The village is about 50 miles S. of Ogdensburg. The township has manufactures of lumber, leather, etc. Total pop. 2433.

Croghan (George), an inspector-general of the U. S. army, born in Kentucky Nov. 15, 1791. He served as volunteer aide in the battle of Tippecanoe 1811; was appointed captain in the Nineteenth Infantry 1812, major 1813, lieutenant-colonel 1814, and inspector-general, with the rank of colonel, 1825. He distinguished himself at the defence of Fort Meigs and sortie May 15, 1813, and for his gallant conduct in the defence of Fort Stephenson, against a greatly superior force of British and Indians, he was presented by Congress with a gold medal with suitable emblems and devices. Died Jan. 8, 1849, at New Orleans.

Cro'ker (John Wilson), a writer and politician, born at Galway, in Ireland, Dec. 20, 1780. He was elected a Tory member of Parliament in 1807. He co-operated with Scott and others in founding the "Quarterly Review," to which he contributed many roughly satirical reviews. In Parliament he obstinately opposed the Reform Bill. Among his works are "Songs of Trafalgar" and an edition of Boswell's "Life of Johnson" (5 vols., 1831). Died Aug. 10, 1857.

Croker (Thomas Crofton), a popular Irish writer, born at Cork Jan. 15, 1798. He obtained a clerkship in the admiralty at the age of twenty-one, and retained that position until 1850. He published, besides other works, "Researches in the South of Ireland" (1824), "Fairy Legends and Traditions" (1825), "Legends of the Lakes" (1828), and "My Village" (1832). Died Aug. 8, 1854.

Cro'ly (George), LL.D., a poet, prose-writer, and pulpit-orator, born in Dublin, Ireland, in Aug., 1780. He took orders in the Anglican Church, and became in 1835 rector of St. Stephen's, Wallbrook, London. Among his works are "Salathiel, a Story of the Past, Present, and Future" (1827); "History of George IV." (1830); "Poetical Works" (2 vols., 1830); "Catiline, a Tragedy," which was praised in "Blackwood's Magazine:" a "Life of Edmund Burke" (1840); and "Marston," a novel (1846). Died Nov. 24, 1860.

Crom'arty, a county of Scotland politically connected with Ross (which see), and comprising nine detached districts inside that county. Area, 344 square miles.

Crom'arty, a town and seaport of Scotland, in the united counties of Ross and Cromarty, is finely situated at the entrance of Cromarty Frith, 18 miles N. N. E. of Inverness. It has a good harbor, which will admit vessels of 400 tons; also manufactures of ropes, sailcloth, and sacking. Hugh Miller was born here. Pop. in 1871, 1476.

Cromarty Frith, a landlocked inlet of the North Sea, in the N. E. part of Scotland. It communicates with Moray Frith, and is adjacent to the counties of Ross and Cromarty. It is 18 miles long, varies in width from 3 to 5 miles, and forms a noble harbor, in which the largest fleet could ride safely. The entrance to this frith is a strait 1½ miles wide.

Cro'mer, a small seaport and watering-place of England, in Norfolk, and on the North Sea, 21 miles N. of Norwich. It stands on the top of a high cliff. It has a fine church in the Tudor style and a public library. All attempts to form a harbor here have been baffled by the heavy sea, which is continually encroaching on the land. Cromer Bay is dangerous to navigators, and is called by sailors "The Devil's Throat."

Cro'mers, a township of Newberry co., S. C. P. 2224.

Crom'lech [a Welsh term signifying a "bent or concave stone"], or **Dolmen,** a rude structure of two or more unhewn stones fixed vertically in the ground, and supporting a large flat stone placed in a horizontal position. Cromlechs are found in England, Wales, Ireland, France, Germany, Denmark, Hindostan, and other countries. The theory of the older antiquaries was that the cromlech was a Druidical altar, but the skeletons and other remains which have been found in many of them tend to confirm the opinion that cromlechs were originally the sepulchral monuments of some now forgotten race. In many instances cromlechs have been discovered in the interior of earthen mounds or barrows. Among the remarkable cromlechs in England are Kit's Coty House in Kent and Chun Quoit in Cornwall. The weight of the flat stone in the latter is estimated at twenty tons.

Cromp'ton (SAMUEL), inventor of the spinning-mule, was born near Bolton, in Lancashire, England, Dec. 3, 1753. Farming and weaving were the employments of his boyhood. For his invention, which was perfected in 1779, he received, in subscriptions from the manufacturers, only £67 6*s.* 6*d.* Parliament in 1812 voted him £5000. He was a shy, sensitive, studious man, fond of mathematics and of music. Died at Bolton June 26, 1827. (See FRENCH, "Life of Crompton," 1859.)

Crom'well, a township and post-village of Middlesex co., Conn. The village is on the Connecticut Valley R. R., 12½ miles S. of Hartford. The town has quarries of brownstone. Total pop. 1856.

Cromwell, a post-village of Douglas township, Union co., Ia. Pop. 166.

Cromwell, a township of Huntingdon co., Pa. Pop. 1380.

Cromwell (HENRY), a younger son of Oliver, was born at Huntingdon Jan., 1628. He served as colonel under his father in Ireland in 1649, became a member of Parliament in 1653, and lord deputy of Ireland in 1657. His administration was moderate and popular. After 1659 he lived as a private citizen. Died in 1674.

Cromwell (OLIVER), lord protector of England, was born at Huntingdon April 25, 1599. He was a son of Robert Cromwell and a grandson of Sir Henry Cromwell. In 1616 he entered Sidney Sussex College, Cambridge, which he quitted on the death of his father, in June, 1617. He married Elizabeth Bourchier in 1620, and settled on his estate at Huntingdon. In the short Parliament of 1628 he made but one speech, and during the eleven years prorogation he devoted his time to the cultivation of his farms. He represented Cambridge in the Short Parliament, which met in April, 1640, and in the Long Parliament, which met the same year. He was then a zealous member of the Country party, and took an active part in the business of the House, but was not a fluent speaker. Once, when he rose to address the house, Lord Digby inquired of Hampden (who was Cromwell's first cousin), "Who is that sloven?" Hampden replied that it was Oliver Cromwell, and added, "That sloven whom you see before you has no ornament in his speech; but if we should ever come to a breach with the king, that sloven, I say, will be the greatest man in England." Having raised two companies of volunteers, he entered the army of the Parliament in 1642 as a captain of cavalry, and distinguished himself by his strict discipline. He soon became a colonel, and formed a body of fanatical soldiers, the redoubted "Ironsides." On the 2d of July, 1644, he commanded the victorious left wing at Marston Moor. The Parliamentarians were divided into two parties, Presbyterian and Independent, of which latter Cromwell was the master-spirit. He was excepted from the "Self-Denying Ordinance," which excluded from military command members of Parliament. When the army was reorganized, and Fairfax appointed general-in-chief, Cromwell was promoted to the rank of lieutenant-general. In command of the right wing at Naseby, June, 1645, he greatly contributed to that decisive victory. In May, 1646, the king surrendered himself to the Scottish army, which transferred him to the custody of the English Parliament, in which the Presbyterians had a majority. In June, 1647, the king was seized by one of Cromwell's officers, and removed from the custody of Parliament into that of the army, which the Independents controlled. Charles hoped to profit by the dissensions between the Presbyterians and the Independents, and intrigued with both. Cromwell defeated the duke of Hamilton, who commanded an army of Scottish royalists, at the battle of Preston Aug., 1648. In December of that year forty-one Presbyterian royalists were ejected from Parliament by Colonel Pride, acting under the orders of Cromwell. This was called "Pride's Purge." Cromwell was a member of the court which tried the king and condemned him to death in Jan., 1649. Cromwell was now the most powerful man in the country, and became a member of the new council of state. In 1649 he went to Ireland as lord lieutenant with an army, and subdued the rebellious Irish royalists with extreme severity. The Scotch proclaimed Charles II. as their king, and raised an army for the invasion of England and the promotion of the royal cause. Cromwell, who had returned to England in May, 1650, was then appointed commander-in-chief. He signally defeated the Scottish army at Dunbar on the 3d of Sept., 1650, and took about 10,000 prisoners. Charles II., having been reinforced, marched into England, and was pursued by Cromwell, who gained a decisive victory at Worcester Sept. 3, 1651. In this great crisis he displayed eminent vigor and sagacity. Clarendon observes that "his parts seemed to be raised, as if he had concealed his faculties until he had occasion to use them." In April, 1653, he dissolved the remnant of the Long Parliament, which was called the Rump, and he soon summoned a new Parliament. He assumed the title of Lord Protector of the Commonwealth in 1653. His domestic policy was favorable to religious liberty and conducive to the prosperity of the country. His foreign policy was dignified and enlightened, and secured for England a more commanding position than she had previously occupied. The title of king was offered to him by Parliament, but he declined it. He was stigmatized as an usurper by the royalists, and also by the republicans. He died on the 3d of Sept., 1658, and was succeeded by his son Richard.

It was long the fashion for historians to represent Cromwell as a fanatic, a hypocrite, and a man of cruel temper and mediocre talents. His character has been vindicated from these calumnies by Carlyle and other recent writers, and it is now generally admitted that as a statesman and commander he displayed abilities of the highest order. "Never," says Macaulay, "was any ruler so conspicuously born for sovereignty. The cup which has intoxicated almost all others sobered him. His spirit, restless from its buoyancy in a lower sphere, reposed in majestic placidity as soon as it had reached the level congenial to it. Rapidly as his fortunes grew, his mind expanded more rapidly still. Insignificant as a private citizen, he was a great general; he was a still greater prince." (See CARLYLE, "Letters and Speeches of Cromwell;" JOHN FORSTER, "Life of Cromwell" in his "Statesmen of the Commonwealth of England," 7 vols., 1840; R. SOUTHEY, "Life of O. Cromwell," 1844; VILLEMAIN, "Histoire de Cromwell," 1819.)

Cromwell (RICHARD), a son of the preceding, was born at Huntingdon Oct. 4, 1626. He entered Lincoln's Inn as a student of law in 1647, and married Dorothy Major in 1649. He was a man of moderate capacity, virtuous and unambitious. After Oliver became Protector, Richard was elected to Parliament, and was a member of the privy council. He succeeded his father as Protector in Sept., 1658, but the army was disaffected, and he was not earnestly supported by the people. He resigned his power in April, 1659, and passed the rest of his life in obscurity and peace. Died in 1712.

Cromwell (THOMAS), earl of Essex, an English courtier and minister of state, was born at Putney about 1490. He became an agent of Cardinal Wolsey, who employed him in important business. Soon after the fall of Wolsey he entered the civil service of Henry VIII., whose favor he gained. He promoted the Reformation by his strenuous efforts to destroy the supremacy of the pope, and co-operated with his friend Cranmer in establishing a new ecclesiastical polity. In 1534 he was appointed principal secretary of state, and about a year later vicar-general with power to suppress monasteries. He was for several years the most powerful subject in England, and was created earl of Essex in 1539. He was a man of superior talents, but is said to have been unscrupulous and rapacious. Froude, however, defends him against these imputations, and gives him a high character. He promoted the marriage of Henry VIII. with Anne of Cleves, because she favored the Lutheran doctrines. His agency in this affair was conducive to his own ruin, for the capricious king regarded her with disgust. Cromwell was tried for treason, and was beheaded July 28, 1540. (See MICHAEL DRAYTON, "Historie of the Life and Death of Lord Cromwell," 1609; FROUDE, "History of England," chaps. vi.–xvii.)

Cro'nos [Κρόνος], a god of the Greek mythology, was

said to be a son of Uranus, and the father of Jupiter, Neptune, Juno, and Ceres. He is commonly identified with the Roman Saturn.

Cron'stadt [Ger. "crown city"], a fortified seaport-town of Russia, is on the flat and arid island of Kotlin, in the Gulf of Finland, about 20 miles W. of St. Petersburg, and opposite the mouth of the river Neva; lat. 59° 59′ 42″ N., lon. 29° 46′ 30″ E. It is an important commercial town, and the greatest naval station of Russia. It is stated that two-thirds of the foreign commerce of Russia passes through Cronstadt, which has three harbors. The outer harbor, which is intended for ships of war, is capable of containing thirty-five ships of the line. The inner harbor is used for merchant-vessels, and has a capacity for 1000 vessels. The place is very strongly fortified. Pop. in 1867, 45,155. Ice renders this port inaccessible for nearly five months in the year.

Cronstadt, in Transylvania. See KRONSTADT.

Crook, a post-township of Boone co., West Va. P. 702.

Crook (GEORGE), an American officer, born Sept. 8, 1828, near Dayton, O., graduated at West Point in 1852, and July 28, 1866, lieutenant-colonel Twenty-third Infantry. He served on frontier duty 1852–61, in Rogue River expedition 1856, and in command of Pitt River expedition 1857; engaged in several actions, in one of which was wounded with an arrow. In the civil war he became colonel Thirty-sixth Ohio Volunteers, and was promoted Oct. 21, 1864, to be major-general U. S. volunteers, serving in West Virginia operations 1861–62, engaged at Lewisburg (wounded and brevet major); in Northern Virginia campaign 1862; in Maryland campaign 1862, engaged at South Mountain and Antietam (brevet lieutenant-colonel); in operations in West Virginia 1862–63; in Tennessee campaign 1863, engaged at Tullahoma, Hoover's Gap, Chickamauga, and pursuit of Wheeler, with constant skirmishes (brevet colonel); in Northern Virginia 1864, making constant raids and in numerous actions (brevet brigadier-general U. S. A. and brevet major-general U. S. volunteers); in Sheridan's Shenandoah campaign 1864, engaged at Berryville, Fisher's Hill (brevet major-general U. S. A.), Strasburg, Opequan, and Cedar Creek; in command of cavalry of Army of the Potomac 1865, engaged at Dinwiddie Court-house, Jettersville, Sailor's Creek, Farmville, and Appomattox Court-house; and in command of the district of Wilmington, N. C., 1865–66. Since the war he has been on rifle tactics board 1866, in command of the district of Idaho 1866–72, and actively engaged against hostile Indians; and is (1873) in command of the district of Arizona, having quelled all Indian disturbances and compelled them to sue for peace. Promoted to be brigadier-general U. S. A. Oct. 29, 1873. GEORGE W. CULLUM, *U. S. Army.*

Crook'ed Creek, a township of Boone co., Ark. P. 646.

Crooked Creek, a twp. of Cumberland co., Ill. P. 981.

Crooked Creek, a township of Jasper co., Ill. P. 1568.

Crooked Creek, a township of Houston co., Minn. Pop. 465.

Crooked Creek, a township of McDowell co., N. C. Pop. 389.

Crooked Island, one of the Bahama Islands, has an area of 160 square miles. Salt is exported from it.

Crooked Lake, in the western part of New York, extends from Penn Yan south-westward into Steuben co., and is about 18 miles long. The greatest width is one and a half miles. The surface is 718 feet above the level of the ocean. It is now generally called Keuka Lake, and is celebrated for the fine vineyards in the vicinity. It lies in a deep valley.

Crooked River, a township of Ray co., Mo. P. 1622.

Crooks (GEORGE R.), D. D., a Methodist divine and journalist, was born in Philadelphia Feb. 3, 1822, graduated in 1840 at Dickinson College, joined the Methodist ministry in 1841, travelled and preached extensively in Illinois, was appointed classical and mathematical tutor in Dickinson College in 1842, principal of the Collegiate Grammar School in 1843, and adjunct professor of ancient languages in 1846. In 1848 he resumed the ministry, occupying important pulpits in Philadelphia, Wilmington, New York, and Brooklyn. In conjunction with Professor McClintock, he prepared "A First Book in Latin," and "A First Book in Greek," which have been successful text-books. He has also published Butler's "Analogy," with an elaborate analysis of the work, notes, index, and life of Butler. His most important production is a "Latin-English Lexicon" for schools and colleges, the preparation of which was shared by Professor Schem. His eminent journalistic career began in 1860, when he was elected first editor of the "Methodist," a weekly newspaper established in New York City by a company of Methodist laymen who were favorable to independent or unofficial journalism in their Church. Under his control the "Methodist" has been an effective power in the denomination, visibly elevating the character of its journalism, successfully advocating lay representation in its councils, and freely discussing all questions relating to its welfare.

Crop, the first stomach of a fowl; also applied to grain and other plants or fruits cultivated on a farm. In geology, crop or outcrop signifies the edge of a stratum where it comes to the surface of the earth. Strata which are not horizontal, and which expose one edge at the surface, are said to *crop out.*

Crop'sey, a township of McLean co., Ill. Pop. 859.

Cropsey (JASPER FRANK), an American landscape-painter, born at Westfield, Richmond co., N. Y., Feb. 18, 1823. He became a resident of England in 1856. Among his works are "The Sibyl's Temple" and "Niagara Falls."

Crop'well, a post-tp. of St. Clair co., Ala. Pop. 1080.

Croquet, kro'kā' [etymology uncertain], the French name of a game recently revived from obscurity, and introduced into this country. It is played with wooden balls and mallets, the object of the game being to propel a ball through a number of hoops or arches fastened into the ground to a fixed goal (turning-post), and thence back to the starting-point (winning-post). The laws of the game have been explained in various treatises. The game is a modification of the ancient sport called "pell-mell." The best place to play croquet on is a level grass-plot or lawn. It can be played by from two to eight persons.

Cros'by, a township of Hamilton co., O. Pop. 2514.

Crosby (ALPHEUS), an American educator, born at Sandwich, N. H., Oct. 13, 1810, graduated at Dartmouth in 1827, was tutor and professor of ancient languages in his *alma mater* (1829–57), and principal of the normal school at Salem, Mass. (1857–65). He edited Xenophon's "Anabasis," and published a Greek grammar and other works, which have been extensively used. Died Apr. 17, 1874.

Crosby (Rev. HOWARD), D. D., LL.D., was born in New York City Feb. 27, 1826, graduated at the New York University in 1844, became professor of Greek in the same in 1851, professor of Greek in Rutgers College, N. J., in 1859, pastor of First Presbyterian church in New Brunswick in 1861, resigned his pastorate in 1862, and his professorship in 1863, when he became pastor of the Fourth Avenue Presbyterian church in New York City. In 1870 he was elected chancellor of the University of New York. Of bold, ardent, and energetic temper, his scholarship has always been put to popular use. Besides other works, he has published "Lands of the Moslem" (1850), "Œdipus Tyrannus" (1851), "Notes on the New Testament" (1861), "Bible Manual" (1870), "Life of Jesus" (1871).

Crosby (PIERCE), U. S. N., born Jan. 16, 1824, in Pennsylvania, entered the navy as a midshipman in 1838, became a passed midshipman in 1844, a lieutenant in 1853, a commander in 1862, and a captain in 1868. He served on the E. coast of Mexico during the Mexican war, and in 1861 was employed with the army, and rendered most important service in Chesapeake Bay and in the sounds of North Carolina, particularly at the capture of Forts Hatteras and Clarke, where he was highly complimented for "his efficient services" by Major-General Butler, who commanded the land forces in the attack. He commanded the Pinola at the passage of Forts St. Philip and Jackson and capture of New Orleans, April 24, 1862, and at the passages up and down the Mississippi past the Vicksburg batteries, June 30 and July 15, 1862. He did good service during the years 1863–64 in command of the Florida and Keystone State, North Atlantic blockading squadron, and in 1865 commanded the steamer Metacomet during the operations which led to the fall of Mobile. His services are thus highly spoken of by Rear-Admiral Thatcher in his official despatch to the navy department of April 12, 1865: "I am also much indebted to Commander Crosby, who has been untiring in freeing the Blakely River of torpedoes, having succeeded in removing over 150—a service demanding coolness, judgment, and perseverance."

FOXHALL A. PARKER, U. S. N.

Cro'sier, or **Crozier** [Late Lat. *cruciarium,* from *crux* (gen. *crucis*), a "cross:" Fr. *crosse*], a staff surmounted by a cross, which is carried before an archbishop on solemn occasions. It is about five feet long and is hollow. The term is also somewhat incorrectly applied to the pastoral staff of Roman Catholic bishops, which is curved at the top in imitation of a shepherd's crook.

Cros'land's, a township of Tuscarora co., Ala. P. 316.

Cros'man (ALEXANDER F.), U. S. N., born June 11, 1838, at St. Louis, Mo., graduated at the Naval Academy in 1855, became a master in 1858, a lieutenant in 1861, a lieutenant-

commander in 1862, and a commander in 1870. He was attached to the steam-frigate Wabash during 1863 and 1864, during which period he was constantly in action on shore in co-operation with the army. He was with the naval brigade at the severe engagements of Boyd's Neck and Tulifinny Cross-Roads Nov. 30 and Dec. 6, 1864, and honorably mentioned in the official report of Commander George H. Preble of Jan. 10, 1865. Drowned at Greytown, Nicaragua, April 12, 1872.

FOXHALL A. PARKER, U. S. N.

Cross [Gr. σταυρός; Lat. *crux* (gen. *crucis*); Fr. *croix;* Sp. *cruz;* Ger. *Kreuz;* It. *croce*], an instrument anciently used for inflicting the punishment of death, for ever memorable as the means of our Saviour's passion. As its Greek name indicates, it was often a simple stake, upon which the victim was either impaled or tied. There were also other forms, as the *crux decussata*, or Saint Andrew's cross (X); the *crux commissa*, or Saint Anthony's cross (T); and the *crux immissa* (†), upon which, according to uniform tradition, our Lord suffered. (See CRUCIFIXION.)

Cross, in heraldry, an ordinary formed by lines drawn palewise and fesswise, enclosing (if bounded by the escutcheon) one-fifth of the shield, or one-third if charged. It is one of the honorable ordinaries, and occurs with many varieties of forms.

Cross, a county in the N. E. of Arkansas. Area, 600 square miles. The soil is very fertile, partly level and partly hilly; cotton, grain, and fruit are raised. Timber is abundant. It is intersected by the St. Francis River. Capital, Wiltsburg. Pop. 3915.

Cross, a township of Howard co., Md. Pop. 1734.

Cross, a township of Buffalo co., Wis. Pop. 564.

Cross (CHARLES E.), an American officer, born in Massachusetts in 1837, graduated at West Point in the engineer corps in 1861, and at the time of his death was a captain of engineers, U. S. A. He served in constructing the defences of Washington, and on engineer duty in Manassas campaign of 1861; in Peninsula campaign of 1862 (brevet major July 1, 1862); and at the battle of Antietam, Sept. 17, 1862 (brevet lieutenant-colonel); at the battle of Fredericksburg Dec., 1862, at the battle of Chancellorsville May, 1863; and while in charge of bridge details at the third crossing of the Rappahannock this gallant and accomplished officer was shot through the brain, and instantly killed, June 5, 1863. Brevet-colonel June 5, 1863.

G. C. SIMMONS, *Clerk Board of Eng'rs.*

Cross (GEORGE D.), born at Westerly, R. I., Jan. 24, 1799, was for many years a prominent and public-spirited citizen of his native town and State, and was for a long time chief-justice of the common pleas court of Washington co. Died Oct. 1, 1872.

Cross (JOSEPH), D. D., a clergyman, first of the Methodist Episcopal Church, afterwards of the Protestant Episcopal Church, born in Somersetshire, England, in 1813. He removed to the U. S. about 1825, and published various works, among which are "Life and Sermons of Christmas Evans," "Headlands of Faith," and contributions to periodical literature.

Cross (TRUEMAN), an American officer, born in Maryland, appointed an ensign in the Forty-second Infantry, U. S. A., April 27, 1814, second lieutenant Oct., 1814, first lieutenant Jan. 18, captain and assistant deputy quartermaster-general June 18, assistant inspector-general (rank of major) Oct., 1820. He served in the infantry 1821–26, when he was transferred to quartermaster department; colonel and assistant quartermaster-general July, 1838. Killed April 21, 1846, by Mexican banditti near the camp opposite Matamoras, Tex., while serving as chief quartermaster Army of Occupation.

Cross Anchor, a township and post-village of Spartanburg co., S. C. Pop. 1833.

Cross-Bill, the name of several birds of the genus *Loxia*. The *Loxia curvirostra* inhabits the north of Europe, and feeds on pine-cones, seeds, and nuts, its strong bill enabling it to break the shells with ease. The mandibles of the bill cross each other, and are crescent-shaped. The bird is about seven inches long, and subject to great changes of color. The older birds are of a greenish-yellow, spotted with white, and have a gray tinge. The males of a year old are red. The cross-bills migrate southward in winter, and are sometimes seen in England. The American cross-bill (*Loxia Americana*) is distinct from the European, but much resembles it. It is a northern bird, but is sometimes found in Pennsylvania. It feeds on seeds and buds

Parrot Cross-Bill.

of trees. The male is red, but of a whitish color beneath. The parrot cross-bill (*Loxia pityopsittacus*) is seven inches and a half long, of a tile-red color, with dark streaks below. It is similar to the common cross-bill in its habits. It is sometimes seen in England and France. The European white-winged cross-bill (*Loxia bifasciata*) is six and a quarter inches long. It is of a brick-red orange or grayish-brown above, reddish-orange beneath; it is a rare species. The American white-winged cross-bill (*Loxia leucoptera*) is of a crimson color, with black wings and tail; the wings have two white bands. It is about six inches in length. This bird is rarely seen farther S. than New York.

Cross-Bow. See ARBALEST.

Cross Creek, a township of Cumberland co., N. C. Pop. 147.

Cross Creek, a township of Jefferson co., O. P. 1800.

Cross Creek, a post-township of Washington co., Pa. Pop. 1034.

Cross Creek, a township of Brook co., W. Va. Pop. 1907.

Crosse (ANDREW), an English gentleman who gained distinction by his experiments in electricity, was born in Somersetshire June 17, 1784, and was educated at Oxford. He commenced in 1807 experiments with a view to form artificial crystals by a voltaic battery, in which he was successful. In the course of many years spent in this pursuit he obtained not less than twenty-four mineral crystals similar in form to those produced by nature. These discoveries were not published until he explained them before the British Association for the Advancement of Science in 1836. Some excitement was produced in the same year by the apparent generation of insects of the genus *Acarus* during his experiments with a voltaic battery. (See SPONTANEOUS GENERATION.) Died July 6, 1855.

Cros'sen, a town of Prussia, in the province of Brandenburg, at the confluence of the Bober with the Oder, 32 miles S. E. of Frankfort. It has manufactures of woollen cloth and hosiery. Pop. in 1871, 6977.

Cross-Examination, in the law of evidence, is the examination of a witness by a party against whom he is called to testify, and is thus distinguished from a direct examination, which is had by the party calling the witness. The range of a cross-examination is much wider than that of a direct examination, the party examining being allowed to impeach the credit of the witness, and to show the inconsistency of his statements, his bias, his want of memory, and other matters tending to reduce the value of his testimony. The course of the examination, depending on the circumstances of the case, must be largely left to the discretion of the presiding judge. For these reasons leading questions are regularly allowed, though they are in general excluded on the direct examination, as tending to make the answers of the witness mere echoes of the questions asked. It is, however, a rule that if a merely collateral question be asked and answered, the cross-examining counsel will not be allowed to call witnesses to disprove the

truth of the answer. This rule would not extend to a question as to the point whether the witness had not previously given a different version of the facts from that to which he testifies. If such a question is properly put to him as to time, place, and circumstances, and he answers in the negative, he can be contradicted by other witnesses. The same remark may be made as to a question put to him as to expressions used by him showing hostility towards the party against whom he is called. A witness on cross-examination cannot be required to answer whether he has committed a crime the commission of which would subject him to punishment, or has done any act which would subject him to a forfeiture of his estate; though this rule does not extend to an answer which would merely expose him to a civil liability. So he may, to a certain extent, be compelled to answer questions tending to discredit and degrade him. Thus, according to the better opinion, he may be asked whether he has not been confined in the State prison, as the object of the question is not to exclude him from testifying, but to affect the credit due to his statements. He could be shown to be *incompetent* to testify only by the production of the record of his conviction. The true theory of a cross-examination is to qualify the direct testimony, and accordingly the witness should not at this stage of the case be called on by the cross-examining counsel to give independent testimony sustaining his part of the issue, though this rule is not always adhered to in practice. (See EVIDENCE.) T. W. DWIGHT.

Cross Hill, a township and village of Laurens co., S. C. The village is 45 miles S. of Spartanburg. Total pop. 2393.

Cross Keys, a township of Macon co., Ala. Pop. 2560.

Cross Keys, a township and post-village of Union co., S. C. Total pop. 1349.

Cross Keys, a post-office of Rockingham co., Va. An indecisive action took place here on June 8, 1862, between the armies under command of Gens. Fremont and Jackson. Gen. Fremont's forces attacked "Stonewall's" army at 9 A. M. The battle continued with great violence till 4 P. M., and skirmishing and artillery fire till dark. During the night Jackson's army retreated.

Cross Plains, a township and post-village of Dane co., Wis., on the Milwaukee and St. Paul R. R. Total pop. 1506.

Cross River, a post-village of Lewisboro' township, Westchester co., N. Y., contains a number of manufactories.

Cross Roads, a township of Blount co., Ala. P. 770.

Cross Roads, a township of Etowah co., Ala. P. 345.

Cross Roads, a township of Madison co., Ala. P. 336.

Cross Roads, a township of Pike co., Ala. P. 1120.

Cross Roads, a township of Wilson co., N. C. P. 694.

Cross, The Order of the, originally a spiritual order of knighthood, which was founded in Palestine in the time of the Crusades, and was then called the "Bethlehemite Order." In 1211 the knights of this order adopted the monastic life, and settled in Austria, Bohemia, and other parts of Europe. They still have two establishments in Austria, and one in the Netherlands. They are called "Canons Regular of the Holy Cross." The "Regular Clerks of the Holy Cross" were founded in 1834, in France, by Abbé Moreau. They had in the U. S. in 1868 about 170 members. A congregation of "Daughters of the Holy Cross" was founded in the seventeenth century in France, and numbered in 1870 about 500 members. A second congregation of the same name was founded in 1835 in Belgium.

Cross, The Southern, the most conspicuous constellation of the southern hemisphere, is not visible in the northern hemisphere, except in regions near the equator. It consists of four bright stars arranged in the form of a cross. The two stars which mark the summit and foot of the cross have nearly the same right ascension, and serve as pointers to the South Pole.

Cross'ville, a post-village, capital of Cumberland co., Tenn., about 110 miles E. of Nashville. Pop. 95.

Cros'well (EDWIN), an American politician and journalist, born at Catskill, N. Y., in May, 1797, was a member of the Albany Regency. He became about 1824 editor of the "Albany Argus," a Democratic journal of great influence, which he continued to direct until 1854. Died June 13, 1871.

Crotala'ria [from the Gr. *κρόταλον*, a "rattle"], a genus of plants of the natural order Leguminosæ, sub-order Papilionaceæ, deriving its name from the inflated pods in which the ripe seeds rattle. It comprises numerous species, partly annual herbaceous plants and partly shrubs. The most important of them is the *Crotalaria juncea*, the sunn hemp of India, an annual plant extensively cultivated for its fibre, which is considered equal to Russian hemp. The *Crotalaria sagittalis*, or "rattle-box," is a small annual growing in most of the U. S. Several other species grow in the Southern States and the West.

Crotalus. See RATTLESNAKE.

Crotch (WILLIAM), an English composer of music, born at Norwich July 5, 1775. He became professor of music at Oxford University in 1797. He published "Styles of Music of All Ages." Died Dec. 29, 1847.

Crotch'et [Fr. *crochet*, diminutive of *croche*, a "hook"], in music, one of the notes or characters of time, equal to half a minim.

Cro'ton [Gr. *κρότων*], a genus of trees, shrubs, and herbs of the order Euphorbiaceæ; the species are numerous and mostly tropical. Some of them possess the acrid properties of their order in excess. One of the most important is the *Croton Tiglium*, which yields croton oil. It is a native of the tropical parts of Asia. The seeds were formerly used as a purgative, but their use is disapproved on account of their uncertain and violent action; they are now chiefly valuable for the oil which they yield. Some species of croton are fragrant and aromatic, and are employed in medicine. One of these is the CASCARILLA (which see). Eight species are native to the Southern States.

Croton, a post-township of Newaygo co., Mich. P. 923.

Croton, a village of Cortlandt township, Westchester co., N. Y., on the E. bank of the Hudson River and on the Hudson River R. R., 35 miles from New York and 4 miles above Sing Sing. It has four churches, five brickyards, a foundry, and a fine brick railroad station. Here are many fine country residences. Croton is justly celebrated for the beauty of its scenery. Croton Point, in the vicinity, is a peninsula which contains numerous thriving vineyards.

Croto'na, or **Cro'ton,** an ancient Greek city of Italy, was in the peninsula of the Bruttii, and on the Mediterranean Sea. It was founded 710 B. C., and became a populous and important city. The people of Crotona waged war with success against the Sybarites in 510 B. C. This city was the residence of Pythagoras, and the native place of Milo, a famous athlete. The site is now occupied by the town of COTRONE (which see).

Croton Aqueduct. See AQUEDUCT, by GEN. M. C. MEIGS, *U. S. Army*.

Croton Falls, a post-village of Westchester co., N. Y., in North Salem and Somers townships, on the Harlem R. R., 48 miles from New York. It has good water-power.

Croton Oil (*Oleum Tiglii*) is the expressed oil of the seeds of *Croton Tiglium*, a small tree which grows in Hindostan, Ceylon, and other parts of India. In taste it is hot and acrid, varies from a pale yellow to a reddish-brown color, has a faint, peculiar smell, and is miscible with alcohol, ether, and oil of turpentine. It is a powerful purgative, valuable because it can be employed with good effect in very minute portions. Great care must be used in its administration. It is applied externally as a counter-irritant in neuralgia, epilepsy, and pulmonary diseases. The pale oil comes directly from India; that of a darker color is expressed after importation.

Croton River rises in Dutchess co., N. Y., flows south and south-westward through Putnam and Westchester counties. It enters the Hudson River about 35 miles above New York City, which derives from this river its supply of water. Its length is estimated at 50 miles.

Croup. All the forms of croup have one thing in common—viz. an obstruction (catarrhal or inflammatory) in the interior of the larynx, particularly on the vocal chords. The milder form is called "false croup" or "pseudo-croup." The larynx is reddened, its mucous membrane swelled, and its secretion of mucus usually increased. Thereby the passage of air through the larynx is impeded, and spasmodic action of its muscular apparatus effected. It is frequently found in children who have before suffered from "colds," especially from catarrh of the throat and enlarged tonsils, and who have been too carefully kept from the contact with cold air and cold water. The attack of "pseudo-croup" is sudden or preceded by nasal or bronchial catarrh. It takes place after the child has been asleep for some hours. It wakes up about midnight with a barking cough, loud and laborious respiration, small and frequent pulse, and more or less fever. In bad cases the veins of the neck and face swell, the face is bloated and bluish, and suffocation appears imminent. This attack may last from half an hour to six hours. It terminates in perspiration, the cough becoming moister, the voice being hoarse, but may return in the next night. Some children are apt to have many attacks in the course of many years. There are no membranes in the throat, no glands swollen round the neck. A very severe

attack requires an emetic (powdered ipecac, sulphate of zinc, sulphate of copper, turpeth mineral): milder attacks require very little or no treatment. Let the child drink a little hot milk at short intervals. It must not sleep longer than an hour at a time, and should take a drink on waking up. Put a mustard-plaster round the neck, or apply cold water at short intervals. Where the throat is sore, ice-pills every five or ten minutes; where inhalation is very spasmodic, half a teaspoonful of paregoric (one dose) or one grain of Dover's powder. Treat the consecutive general catarrh for four or five days with uniform warm (not hot) temperature of the room, warm water inhalations (kettle on the stove), small doses (hourly) of ipecac, or an antimonial preparation or muriate of ammonia. Where there is a chronic catarrh of the throat (dryness, redness, swelled tonsils, hacking cough, snoring), a teaspoonful of glycerine as a preventive at bed-time.

While this "pseudo-croup," commonly called "croup," is a very mild disease—we have never seen a case terminating fatally—the other form, or "true croup," "membranous croup," is very dangerous. Under ordinary circumstances, and with a treatment exclusively medicinal, ninety out of a hundred die. It consists sometimes in simple inflammatory swelling ("laryngitis"), but usually in the obstruction of the larynx by a deposit of a whitish, grayish, or (through admixture with a little blood) darker "croupous" or "diphtheritic" membrane. The deposit may take place upon or into the normal tissue of the organ. It seldom originates in the larynx; sometimes ascends from the trachea; mostly descends from the throat, where it is discovered in one or more small spots or over a larger surface. In exceptional cases it extends over the interior surface of the nose and the mouth. Such deposits may be known to exist for days; they will then descend, result in hoarseness, increasing to complete absence of voice (aphonia), and in great difficulty of respiration, with final suffocation. When the deposits cover the whole interior of the larynx, both inspiration and expiration are impeded, and aphonia is complete. When they result in serous (watery) swelling of the larynx (especially the posterior insertion of the vocal chords) only, expiration is easier and the voice not entirely suppressed. The first stage is either that of throat diphtheria or of a simple catarrh only, which is attended with but little fever, and therefore little thought of. It may last a few days. In the second stage (twelve hours to fourteen days) the symptoms of obstruction show themselves; the voice is hoarse, and at last absent; respiration is slow, labored, and loud; the muscles of the neck and chest exerted to their utmost; the insertion of the diaphragm drawn in with every inspiration, deep grooves forming with every inspiration above and below the clavicle, the child tossing about, supporting itself on its knees, and throwing the head backward. The lips begin to exhibit a bluish hue. This symptom (cyanosis) increases in the third stage, where the influence of the insufficient oxygenization of the blood is more visible in general paleness, bluishness, in sleepiness, in the frequent and irregular pulse, in the cool surface, convulsive twitchings, and loss of consciousness. Unfortunately, the latter symptom is not constant, many children dying with undisturbed intellect. Death is the result of direct suffocation, or the result of a complication of the disease with bronchitis or pneumonia. Medicinal treatment is very unsatisfactory. We seldom succeed in dissolving and removing the membranes. Nitrate-of-silver applications to the larynx have justly been discarded. Inhalation of diluted lime-water through an atomizer or of lactic acid in glycerine and water (1 : 8–10) has proved successful in a few instances. Emetics are of use in such cases *only* where the membranes are known to be partially loosened (peculiar flapping sound in respiration), or when the presence of mucus, in addition to a membrane, proves dangerous. Ice-pills frequently, ice applications to the throat, moist air, 1–2 grains of chlorate of potassa in a teaspoonful of water every ½–1 hour; inhalations of carbolic acid, either through an atomizer or sprinkled through the room; muriate of ammonia evaporated on a stove or hot coal,—all such means may be tried, but not to such an extent as to interfere with a copious supply of pure air, the effect of which may still be improved by inhalation of oxygen gas. Where the disease runs its course with fever, quinia, seldom aconite or veratrum. Most cases will resist treatment. Twenty or twenty-five per cent. will be saved by tracheotomy, an operation consisting in the artificial opening of the windpipe below the obstructed larynx. This opening in the trachea is kept patent by means of a silver or hard-rubber tube inserted in it until the disease has disappeared from the larynx. The relief given by this operation is surprising, and although the mortality after its performance is still very great, death is almost always easier, resulting more from exhaustion than from suffocation.

ABRAHAM JACOBI.

Crow [Ang.-Sax. *crawe*, so called from the sound produced by the bird], a name popularly applied to several birds of the genus *Corvus*, which includes also the ravens, the rooks, the daws, and some other birds. The carrion crow of Europe is called in England by various names—flesh crow, black crow, etc. Its feathers are very black and glossy, with reflections of green and purple. It is a cautious and intelligent bird, and feeds on flesh.

The common American crow (*Corvus Americanus*) is not so large as the preceding. Its voice is less harsh, and it is somewhat gregarious in its habits. Its color is a glossy blue-black. It inhabits the civilized parts of North America. It is hated and persecuted by farmers for its destruction of Indian corn and the eggs and young of other birds, but has great cunning and tenacity of life. These crows are found more especially in the Northern than the Southern States, as they are unable to contend with the vultures which abound in the latter. Many devices have been employed to exterminate them, without much success. They accomplish some good by devouring the grubs of injurious insects.

The fish crow of the U. S. (*Corvus ossifragus*) is sixteen inches long, black, and resembles the common crow, but is somewhat smaller, and may be distinguished by the naked chin. Other American species are the white-necked crow of Arizona (*Corvus cryptoleucus*) and the fish crow of Puget Sound (*Corvus caurinus*).

The hooded crow of Europe (*Corvus cornix*) resembles the

Hooded Crow of Europe.

others in habits, but is more mischievous. It is of a shiny black, but its neck, back, and under parts are of a smoky gray. It is extremely sagacious; it is found in all parts of Europe.

Crow'der's Mountain, a post-township of Gaston co., N. C. Pop. 1931.

Crown [Lat. *corona*; Fr. *couronne*; Ger. *Krone*], originally a fillet of leaves, and used by the ancients in the observance of religious rites and festive occasions. The Greeks used the crown as a symbol of office and a token of victory. It was not only bestowed on victors in the games, but also on citizens who had rendered great services to the country. The Romans used it as the reward of courage. The *corona obsidionalis* was most highly prized; this was bestowed by a besieged army or town on the general who came to their rescue. The civic crown, made of oak leaves and acorns, was given to any soldier who had saved the life of a citizen. This gave him a place next the senators on public occasions, and he, his father, and grandfather were released from all public burdens. The person whose life he had saved owed to him filial duty ever after. The *corona muralis* was bestowed on the first who entered a beleaguered city. It was a circlet of gold surmounted by turrets. The *corona triumphalis* was of three kinds, and the reward of a victorious general.

The modern crown was introduced by Constantine I. ("the Great"), whose reign began in 306. Crowns were first used by Spanish kings about 580, by the kings of Lombardy about 590, and in France in 768. The papal triple crown was at first a plain pointed cap. Pope Hormisdas added the first crown (523), Boniface VIII. the second (1294–1303), and John XXII. the third (1316–34).

Crown and **Half Crown** were originally English gold coins issued by Henry VIII. in 1527. The first commission for coining them of silver was signed by Edward VI. Oct. 1, 1551. The crown at present is a silver coin worth five shillings sterling—about $1.25 U. S. in silver.

Crown Creek, a township of Stearns co., Minn. Pop. 197.

Crown Glass, the glass usually employed for windows. It is made of a mixture of 100 parts of sand, 35 of soda-ash or potash, and 35 of chalk. It is essentially a silicate of soda (or potash) and lime.

Crown Imperial. See Fritillary.

Crown'ingshield (A. S.), U. S. N., born Mar. 14, 1843, in the State of New York, graduated as ensign at the Naval Academy in 1863, became a lieutenant in 1866, and a lieutenant-commander in 1868. He served in the steam-sloop Ticonderoga in both the Fort Fisher fights, and was commended for efficiency by his commanding officer, Capt. Charles Steedman. Foxhall A. Parker, U. S. N.

Crown Point, a post-village, capital of Lake co., Ind., on the Pittsburg Cincinnati and St. Louis R. R., 41 miles S. S. E. of Chicago. It has six churches, four graded schools, two banks, and a public library. Two weekly newspapers are published here.

Frank S. Bedell, Ed. Crown Point "Register."

Crown Point, a post-village and township of Essex co., N. Y. The township was first settled by the French, who in 1731 built Fort St. Frederick (the "Crown Point" of history) on a long cape projecting into Lake Champlain, which became the seat of thriving settlements, which were destroyed in 1759, and again in 1777, by the British troops. In 1775 it was surprised and taken by the provincial forces. The British fort at Crown Point, which cost $10,000,000, is now in a ruinous condition. Crown Point has extensive beds of rich iron ore and mineral phosphate of lime. Iron, lumber, and wooden wares are manufactured on an extensive scale. It has a lighthouse. Pop. of township, 2449.

Crown Prince [Ger. *Kron Prinz*], in Prussia, Sweden, and some other European countries, is the title of the heir-apparent to the throne.

Crown, Treaty of the, a treaty made at Vienna Nov. 16, 1700, in which the emperor Leopold recognized the elector Frederick III. as king of Prussia. Frederick engaged to furnish 10,000 men to support Austria in the Diet, and to vote as elector for the descendants of the emperor's son, Joseph, king of the Romans.

Crows, or **Absoro'kas,** a tribe of American Indians inhabiting the northern part of Wyoming Territory and the southern part of Montana. They are divided into "Mountain" and "River Crows," and belong to the great Dakota family.

Crow Wing, a county in N. Central Minnesota. Area, 540 square miles. It is bounded on the N. W. and W. by the Mississippi River, and partly on the E. by Lake Mille Lacs. Capital, Crow Wing. It is intersected by the Northern Pacific R. R. Pop. 200.

Crow Wing, a post-village, capital of the above county, is on the Mississippi River opposite the mouth of a small stream called the Crow Wing, and 120 miles N. W. of St. Paul.

Croy'don, a market-town of England, in the county of Surrey, on the London and Brighton Railway, 10½ miles S. of London Bridge. It has a fine Gothic church. The archbishops of Canterbury had a palace here until 1750. About a mile from Croydon is Addiscombe House, which became a military academy, and is now called the Royal India Military College. Pop. 20,325.

Croy'don, a post-township of Sullivan co., N. H. Pop. 652.

Croyle, a township of Cambria co., Pa. Pop. 886.

Cro'zer Theolog'ical Sem'inary (Baptist) is located at Upland, Pa., 14 miles from Philadelphia, on the Philadelphia Wilmington and Baltimore R. R. It was founded and endowed through the liberality of the members of the Crozer family, residents of Upland and Philadelphia, in 1868. It has (1873) 4 professors, 50 students, an endowment of $230,000, and a seminary building, library building, gymnasium, and three professors' houses, delightfully situated on grounds twenty acres in extent.

Crozet (Claude), an eminent educator, born in France, educated at the Polytechnic School of Paris, became an officer of artillery under Napoleon I. He emigrated to this country in 1816, and was appointed professor of engineering at the U. S. Military Academy at West Point; resigned in 1823, and became a civil engineer. Died in 1863.

Cru'cible [Late Lat. *crucibulum*; see below], a vessel employed by chemists in heating and fusing metallic ores, glass, and other substances. Crucibles are generally made of materials capable of resisting high temperatures, such as fireclay, plumbago, porcelain, platinum, and silver. Crucibles are said to have been so called because they were formerly marked with a cross (Lat. *crux*, gen. *crucis*), which was thought by the alchemists to protect them from evil spirits.

Cruci'feræ [Lat. from *crux* (gen. *crucis*), a "cross," and *fero*, to "bear," alluding to the cross-shaped flowers], a large and well-marked order of exogenous herbs, characterized by flowers with four petals arranged in the form of a cross, and by four long and two short stamens. The seed-vessels are *siliques*, *silicles*, *loments*, or nut-like fruits. The juice is usually acrid, but none of the order are poisonous. Among the cultivated Cruciferæ are the cabbage, turnip, rape, and mustard. The wallflower, stock-gillyflower, etc. are valued in ornamental horticulture. The number of genera is about 175, and the known species are over 1600.

Cru'cifix, a cross with an image of Christ upon it, either carved or painted. At first only the naked cross was used; then (in the time of Paulinus of Nola, 353–431 A. D.) the cross with a lamb at its foot to represent Christ. Justin II. (565–578) gave the bishop of Rome a cross with a bust of Christ at the top and bottom, and a lamb in the middle. From about 692 to the twelfth century, Christ was represented as alive and clothed, with his hands extended in prayer. In the twelfth century four nails were used, the feet side by side. From the thirteenth century only three nails were used, and Christ was represented as dead or dying, with only a girdle about his loins.

Crucifix'ion [Lat. *crucifixio*, from *crucifigo*, *crucifixum*, to "crucify," from *crux*, *crucis*, a "cross," and *figo*, *fixum*, to "fix" or "fasten"], literally, "fastening on the cross," a form of capital punishment common among almost all ancient nations, except the Jews, who in their later history probably borrowed it from the Romans. The hanging on a tree spoken of in Deuteronomy xxi. 22 apparently has reference to crucifixion *after death*. Tradition ascribes its invention to Semiramis. It consisted in nailing or binding the criminal to a Cross (which see), where he was left until dead from hunger or exhaustion. The legs were frequently broken to hasten death; sometimes, however, a fire was lighted under the cross for the same purpose, or wild beasts were let loose upon those crucified. The body was usually left on the cross till destroyed by the action of the elements. Crucifixion was abolished by Constantine the Great, probably in the year 315.

This inhuman form of punishment was visited upon Christ by the Jews, in accordance with the unwilling sentence of Pontius Pilate. In addition to the scourging, which seems to have been a legal part of the punishment, he was forced to wear the crown of thorns, and subjected to other indignities by the brutality of the soldiers and populace. (See the accounts given in the four Gospels.)

Cru'den (Alexander), author of the "Concordance," was born at Aberdeen, in Scotland, May 31, 1700. He was educated for the ministry of the Kirk, but never preached, having had his reason unsettled by disappointment in love. In 1722 he removed to London, and taught the classics, and shortly after to the Isle of Man. In 1732 he returned to London and opened a bookstore. In 1735 he became librarian to Queen Caroline, wife of George II. In 1737 he published his "Complete Concordance of the Old and New Testaments," which is still the best in our language. He was several times an inmate of lunatic asylums, and during all the latter part of his life was flighty and extravagant. He set up as a reformer, calling himself "Alexander the Corrector." He died suddenly at Islington, Nov. 1, 1770.

Cru'ger (**Boscobel Post-office**), a village of Cortland township, Westchester co., N. Y., on the Hudson River and on the Hudson River R. R., 4 miles S. of Peekskill. It has extensive manufactories of brick.

Cruik'shank (George), an English caricaturist, son of an engraver originally from Scotland, was born in London Sept. 28, 1792. He illustrated William Hone's satirical works. His comic humor and fertile imagination were displayed in illustrations for "The Comic Almanac," "Peter Schlemihl," "Oliver Twist," and "My Sketch-

Book." With his brother ROBERT (1790–1856) he produced "Life in London." In 1848 appeared "The Bottle," eight plates depicting the drunkard's career. He subsequently devoted himself to oil painting.

Cruikshank (WILLIAM), F. R. S. L., a Scottish anatomist, born in Edinburgh in 1746. He became a resident of London, and a partner of Dr. William Hunter. He published, besides other works, "Anatomy of the Absorbent Vessels" (1786). Died June 27, 1800.

Crusade [from the Sp. *cruzada* (from *cruz*, a "cross"); Catalan, *crusada*; Fr. *croisade*; It. *crociata*; Ger. *Kreuzzug*], *i. e.* a war waged for the defence or advancement of the cross, but applied especially to the religious wars carried on by the Christians of the Middle Ages for the recovery of Palestine from the Mohammedans. From a very early period the Christians were in the habit of making pilgrimages to Jerusalem and other parts of Palestine rendered sacred by events connected with the Saviour's life and death. These pilgrimages continued with but little opposition till the year 1065, when Palestine, then governed by the Egyptian caliphs, was overrun and conquered by hordes of Seljook Turks. The accounts (doubtless often exaggerated) of the indignities inflicted on the Christian residents and pilgrims by these barbarians produced a deep and powerful impression in all parts of Christendom. At length, Peter the Hermit, a monk and native of Amiens in France, having visited Palestine and witnessed the cruelty of the Turks, reported what he had seen to Urban II., by whom encouraged, he travelled through Italy and France, and by his zeal and eloquence excited an extraordinary religious enthusiasm among all classes. In 1095, at a council held at Clermont, a crusade was resolved on. On this occasion the pope himself addressed the multitude. Previous to the setting out of the true crusade, four armies, consisting of disorderly multitudes of the very dregs of Christendom, had departed for Palestine. The first consisted of 20,000 foot, commanded by Walter the Penniless. It marched through Hungary, but was almost entirely destroyed by the natives of Bulgaria, a few only escaping to Constantinople. It was followed by a second, consisting of 40,000 men, women, and children, under Peter the Hermit. The two united at Constantinople, crossed the Bosphorus, and encountered the Turks at Nice. They were utterly routed. Another unorganized band of 15,000 Germans was cut to pieces in Hungary, and its fate was shortly shared by an immense mob of 200,000 persons from England, France, Flanders, and Lorraine. It was only now that the true crusaders entered upon the scene. Six armies, embracing all the chivalry of Europe, and led respectively by Godfrey of Bouillon, Hugh the Great (count of Vermandois), Robert Curthose, Count Robert of Flanders, Prince Bohemond of Tarentum (under whom was Tancred), and Count Raymond of Toulouse, set forth for Constantinople. Having united their forces and spent some time at this place, they crossed into Asia Minor Here their first step was the capture of Nice in June, 1097. They also defeated the sultan Soliman at Dorylæum, and took the principality of Edessa. They then marched into Syria, and laid siege to Antioch. After a seven months' siege, during which the crusaders suffered terribly from famine and disease, the city surrendered. The inhabitants were massacred by their captors, who were besieged in their turn by an army of 200,000 Mussulmans. On the 28th of June, 1098, the Mohammedans were put to rout, and the way opened to Jerusalem. In the summer of 1099, 40,000 crusaders, the remnant of a vast host which had comprised not less than 600,000 warriors, laid siege to Jerusalem. The city was taken on the 15th of July, after a siege of somewhat more than five weeks. Eight days later Godfrey of Bouillon was elected king of Jerusalem.

The three Latin principalities of the East (Edessa, Antioch, and Jerusalem) maintained themselves against the attacks of the Mohammedans till the year 1144, when the emir of Mosul conquered Edessa and massacred its Christian inhabitants. His son, Noor-ed-Deen, marched upon Syria and Palestine. A second crusade was preached by Saint Bernard, abbot of Clairvaux, and in 1147 two armies, numbering together 1,200,000 men, set out for Jerusalem. They were commanded by Louis VII., king of France, and Conrad III., emperor of Germany. This expedition utterly failed through the treachery of the Greek emperor, Manuel Comnenus, and neither army ever saw the Holy Land.

In 1187, Salah-ed-Deen (or Saladin), sultan of Egypt, invaded Palestine, and in October of that year took Jerusalem. This event gave rise to a third crusade, under the leadership of Frederick Barbarossa, emperor of Germany, Philippe Auguste, king of France, and Richard Cœur-de-Lion, king of England. Barbarossa was drowned on the way. The crusaders gained some important victories, but they were not united among themselves, and the crusade was closed by a treaty in which Saladin agreed to impose no taxes on Christian pilgrims to Jerusalem. In 1195, Henry VI. of Germany undertook a crusade (sometimes called the fourth), but the death of the emperor caused the project to be abandoned. A fourth crusade, instituted by Pope Innocent III. in 1203, turned from its course to take possession of the Byzantine empire, and never reached Palestine at all.

The Children's Crusade in 1212 (of which an excellent account has been written by the Rev. George Zabriskie Gray, New York, 1870) is one of the strangest episodes in history. An army of unarmed French children, 30,000 strong, headed by a boy named Stephen, set out for the Holy Land by way of Marseilles. A similar army of German children, 20,000 strong, led by a boy named Nicholas, crossed the Alps at Mont Cenis. A second army of German children, numbering nearly 20,000, the name of whose leader is not known, crossed the Alps by a more westerly route, touching the sea at Brindisi. Their idea was, that the Mediterranean would open a path for them to Palestine, and that the Holy Land would be recovered and the Moslems converted by miracles. Some of the children got discouraged and returned to their homes; many stopped by the way; but most of them either perished on the march, were lost at sea, or were sold into slavery.

In 1228, Frederick II. of Germany commanded a fifth crusade, by which he became master of Palestine and was crowned king of Jerusalem.

In 1239, the Turks having again seized upon Jerusalem, a sixth crusade was undertaken, under Thibaud, count of Champagne. A nominal surrender of the Holy Land was the result.

In 1244, Jerusalem was burned and pillaged by a new race of Turks. A seventh crusade, headed by Louis IX. (Saint Louis) of France, set out in 1249. It was badly defeated by the sultan of Egypt, who also made a prisoner of the king. Louis obtained his freedom by the payment of a large ransom.

The eighth and last crusade was also undertaken by Saint Louis in 1270. The king died at Carthage of the plague, and Prince Edward, afterwards Edward I. of England, assumed the command of the army. The expedition accomplished nothing of importance, and in July, 1272, Edward returned to England with the last of the crusaders. The chief result of the Crusades was a better acquaintance of the people of Western Europe with two civilizations more advanced than their own—the Greek and the Saracenic. Thus a powerful impulse was given both to the literature and the commerce of Europe. (See MICHAUD'S "Histoire des Croisades;" HALLAM'S "Middle Ages;" MILMAN'S "Latin Christianity," and WILKEN'S "Geschichte der Kreuzzüge.") REVISED BY R. D. HITCHCOCK.

Cru'senstolpe (MAGNUS JAKOB), a Swedish author, born Mar. 11, 1795. He wrote, besides historical novels, satirical political tracts. His "Positions and Relations" brought upon him a three years' imprisonment. Many of his works are translated into German. Died Jan. 18, 1865.

Crushing Machinery. See GRINDING and CRUSHING MACHINERY, by PROF. R. H. THURSTON, C. E.

Crusta'cea [neut. plu. of *crustaceus*, a Latin adjective signifying "shelly," or "having shells" like those of a lobster, from *crusta*, the "shell of a lobster"], a class of articulate animals considered by Linnæus as insects, but now universally regarded as distinct, though having interesting resemblances to that class. They are usually divided into DECAPODS, TETRADECAPODS, ENTOMOSTRACANS (including CIRRIPEDS), and ROTIFERS (which see).

The decapods (crabs, lobsters, etc.) are at the head of this class, but many of the others are of very different forms and habits. In the most important members of this class the body is somewhat spindle-shaped, and composed of a number of articulated rings, allowing of considerable movement. These divisions are sometimes of almost equal size, having similar appendages. In some cases a few of the segments attain a higher development than the others, and the organs of motion are confined to them, while the appendages of the other segments approach a rudimentary condition; and in the higher forms the anterior segments coalesce into a single mass, called the *cephalothorax*, which bears the mouth and organs of motion. By means of a calcareous secretion the skin is hardened into a skeleton; this protects the soft parts of the body; a thin membrane joins the segments. The animal casts off its shell at certain periods, and a new calcareous secretion is made. The form of the articulated appendages (legs and feet) is various. The nervous system of the Crustacea is formed by a series of ganglia running along the surface of the body, united to each other and to a cephalic ganglion or brain by a pair of nervous filaments, from which nerves proceed to the different organs of the senses, and is situated above the œsophagus. The digestive organs show a high degree

of development. The respiration takes place through branchiæ of different forms. The species are mostly unisexual, and reproduction takes place by ova.

Cruveilhier (JEAN), a French anatomist, born at Limoges Feb. 9, 1791. He obtained in 1835 the chair of pathological anatomy created in Paris by Dupuytren. He published an important work on "The Pathological Anatomy of the Human Body" (2 vols., gr. fol., with 233 plates, 1829–40), and other works. Died Mar. 11, 1874.

Cry'olite [from the Gr. κρύος, "ice," and λίθος, a "stone"] is so named because it melts in the flame of a candle. It is a double fluoride of aluminium and sodium, and is important as a source of the metal aluminium. It is a rather rare mineral, found in Greenland, from which large quantities are imported into Europe and the U. S. for the manufacture of soda. When fused it may be made into table-ware much resembling porcelain, and known as "hot-cast porcelain."

Cryoph'orus [from the Gr. κρύος, "ice," and φέρω, to "bear"], an instrument invented by Wollaston to freeze water by its own evaporation. It consists of a glass tube with a bulb at each end. One bulb contains water. A complete vacuum is produced in the tube and opposite bulb, and the empty bulb being placed in a freezing mixture, the vapor arising from the water is condensed, so that the water soon congeals in the other bulb, though the intervening tube be two or three feet long.

Crypt [from the Gr. κρυπτός, "hidden"], the under or hidden part of a building; a vault under a church, either entirely or partly under ground. Crypts generally do not extend beyond the limits of the choir or chancel, and some are of smaller dimensions. They were sometimes used as places of sepulture, and seem indeed to have been designed at first for the reception of the bodies of saints, martyrs, and the higher dignitaries of the Church. The later Romanesque and the more recent styles of church architecture generally have no crypt. One of the largest crypts in England is that under Canterbury Cathedral.

Crypto-Calvinists, a name applied in the last half of the sixteenth century to the followers of Melanchthon (called also Philippists), who earnestly desired the union of the Lutherans and Calvinists, and were charged with leaning too strongly towards the Calvinistic doctrine of the Lord's Supper.

Cryptog'amous Plants, or **Cryp'togams** [from the Gr. κρυπτός, "hidden," and γάμος, "marriage"], a term applied to flowerless plants, the lower series of plants in the natural system, which have no true flowers, but have, instead of seeds, spores that consist of a single cell and contain no embryo. They have no obvious stamens or pistils. The name "cryptogamous" was first used by Linnæus, and implied that in his opinion they had organs analogous in functions to stamens and pistils, but concealed from view; and the correctness of his surmise is now confirmed. He gave the name Cryptogamia to a distinct class in his artificial system. Many cryptogamous plants have no leaves, some have no root, and those which are lowest in organization consist only of a single cell. Many of them are parasitic. Cryptogamous plants are divided into two principal groups—namely, thallogens, in which the stem and leaf are not distinguishable; and acrogens, in which the stem and leaf are distinguishable. The former group comprises the Fungi, Lichens, Algæ (sea-weeds), and Characeæ, etc.; the latter, Filices (ferns), Musci (mosses), Equisetaceæ, Hepaticæ, club-mosses, etc. The Protophytes, etc. are all cryptogamous, though hardly belonging to either of the above divisions.

Cryptog'raphy [from the Gr. κρυπτός, "hidden," and γράφω, to "write"], the art of writing or telegraphing in cipher, or in such a way that the matter written cannot be read by any one not in possession of the necessary key. Many plans have been devised for this purpose, but almost any person who has taste for the solution of puzzles or enigmas can readily understand most writing of this kind; and it is probable that no kind of cipher could be invented which would be proof against systematic and ingenious decipherers. Military and naval signals resemble cryptographic writing in this respect. Among the learned authors who have discussed this comparatively unimportant subject may be mentioned Lord Bacon, Doctor William Blair, Bishop Wilkins, the marquis of Worcester, and many others.

Crystalline Lens. See EYE.

Crys'talline Rocks, a term applied in geology to such rocks as granite, quartz, and marble, which show by their crystalline structure that they have been brought into their present state by the action of chemical forces. In the early history of geology such rocks were called *primitive*, but they are not limited to any geological age, and it is not improbable that crystalline rocks may be in course of formation at the present time. The greater number of intruded igneous rocks (such as basalt) possess the crystalline structure.

Crystallog'raphy is the science of crystals. It is derived from the Gr. κρύσταλλος, a "crystal," and γράφω, to "describe." A crystal is a natural inorganic solid, bounded by plane surfaces, which are symmetrically arranged around certain imaginary lines called *axes*. Κρύσταλλος originally meant "ice;" it was afterwards applied to the transparent variety of quartz, because it was thought that rock-crystal was water turned into stone; it was subsequently applied indifferently to any solid which assumed a geometrical shape by natural laws.

All crystals may be referred to seven systems, six of which are referred to three axes, and one of them to four. These systems are divided into two classes, according as the axes are or not at right angles. Those which are at right angles are called the *orthometric*, and those which are not are called *clinometric* systems. In each one of them there are three varieties. When all the axes are equal and at right angles, the system is called *isometric*. When only two are equal, but all at right angles, it is called the *tetragonal*. When none of the axes are equal, but all are at right angles, it is called the *orthorhombic*. The *clinometric* systems are called, respectively, the *monoclinic*, the *diclinic*, and the *triclinic*, according as the axes have different inclinations. The single system of four axes is called the *hexagonal*.

In all of these systems one axis is placed upright, and is called the vertical axis. In the isometric, tetragonal, and hexagonal systems the other axes are simply called the basal axes, while in each of the other systems each axis has its own name. The axes always terminate in homologous parts, whether these parts are edges or angles.

The axes form a system of co-ordinates by which the position of any face may be determined. Taking the most general case of three unequal axes, the vertical axis is usually designated by *c*; the one from left to right, *b*; and the one from front to behind, *a*. Starting from the origin, the half-axes are determined as + or − (Figs. 43, 44). The distances on these half-axes, cut off by any crystal face, are called parameters. One of them can always be made equal to unity, so that $ma : nb : c$, with their signs, will always give the position of any crystal face with reference to a given variety of axes. When a face is parallel to an axis, it is said to cut it at a distance equal to infinity, and its coefficient for that axis will be so written, as $\infty a : \infty b : c$. Every face of a crystal which does not cut all the axes must either cut two or be parallel to two of them. According to Weiss, the symbol of *any* face will be $ma : nb : c$. Naumann simplifies it by using two letters, or their numerical values, and writing between them the capital letter which represents the type of the system—O for octahedron, P for pyramid, and R for rhombohedron. The two letters are always written in the same order: *m* is always equal to, greater or less than unity, and always greater than *n*, $m \gtreqless 1$, $m > n$. The coefficient 1 is never written.

Dana's symbols are simply a contraction of Naumann's, in which the letters for the primitive form of the system are left out, and ∞ is written *i*. Thus, mOn becomes *mn*, and $\infty O\infty$ becomes *ii*.

In every crystalline system a single form is taken as the base of the system. Any form belonging to the system *may* be taken for this base, but it is generally conceded to adopt pyramids. From this form all the others are derived by three very simple laws: (1) All the similar parts of a crystal may be similarly and simultaneously modified. This gives rise to *holohedral* forms. (2) Half the similar parts may be similarly and simultaneously modified. This gives rise to *hemihedral* forms, which in some of the systems are known as *inclined*, *parallel*, or *gyroidal* forms.

(3) One quarter of the similar parts may be similarly and simultaneously modified, giving rise to *tetartohedral* forms.

In the isometric system the modifications may be composed of one, two, three or six planes; in the tetragonal and hexagonal, of one and two; in the orthorhombic, monoclinic, diclinic, and triclinic, of only one plane at a time.

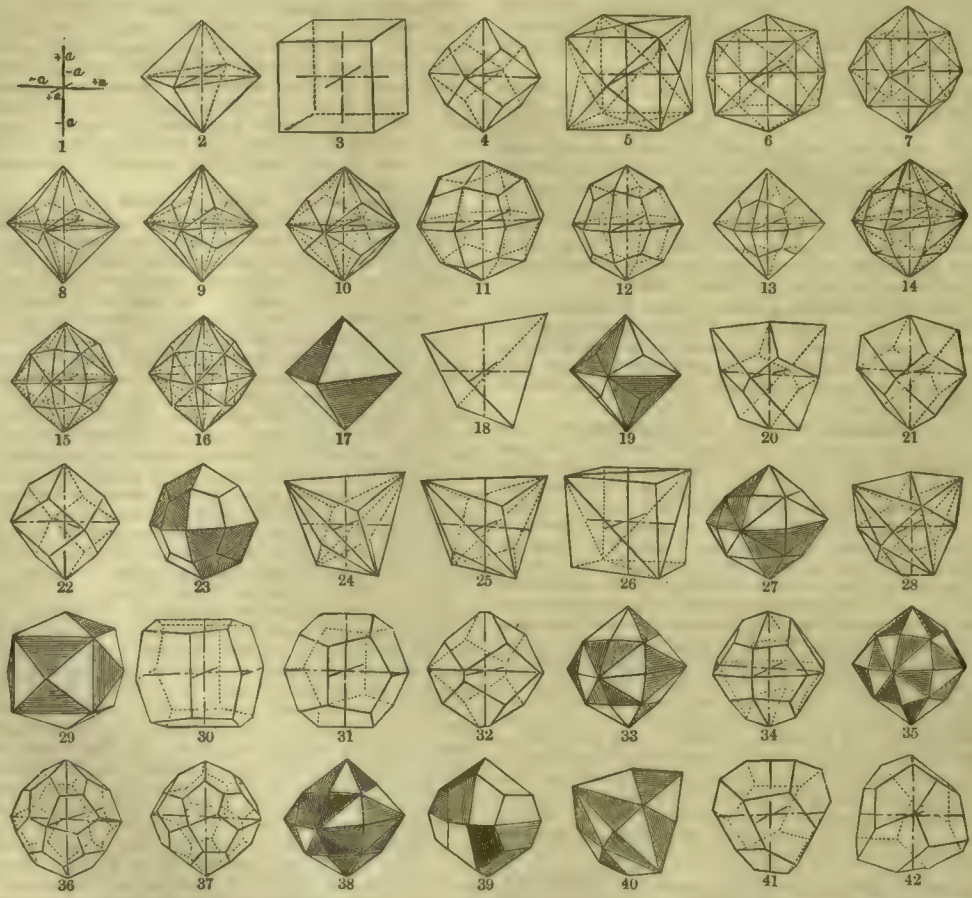
ORTHOMETRIC SYSTEMS.

Isometric System.—1. *Holohedral Forms.*

Three axes, a, a, a (Fig. 1), all equal and at right angles. The base of the system is the octahedron.

Octahedron, O.—When the axes a cut in the relation $a:a:a$, the solid is made up of eight faces, which are equilateral triangles (Fig. 2). There can be but one octahedron.

Hexahedron, $\infty O\infty$.—When the solid angles of the octahedron are modified by planes which are parallel to two of the axes, and cut one at a distance equal to unity, the resulting solid will be a cube, and will have the formula $a:\infty a:\infty a$ (Fig. 3).



Rhombic Dodecahedron, ∞O.—When the edges of the octahedron are modified in such a way that two of the axes are cut at a distance equal to unity, while the plane is parallel to the third, the formula will be $a:a:\infty a$ (Fig. 4). There can be but one rhombic dodecahedron.

Tetrahexahedron, ∞On.—When the edges of the octahedron are modified, so that one of the axes is cut at unity, one at infinity, and one at n, the formula will be $\infty a:a:na$ (Fig. 5). As there is nothing to limit the inclination of the planes, there may be an infinite variety of tetrahexahedra (Figs. 5, 6, 7), the limit being ∞O on the one hand when $n=1$, and $\infty O\infty$ on the other when $n=\infty$.

Trigonal Trisoctahedron, mO.—When the edges of the octahedron are replaced, so that two of the axes are cut at unity and the third at m, the formula is $ma:a:a$. Each plane of the octahedron becomes replaced by three triangular planes; hence the name trisoctahedron. As there is nothing to limit the inclination of the planes, there may be an infinite variety of trigonal trisoctahedra (Figs. 8, 9, 10). Their limit will be O on the one hand when $m=1$, and ∞O on the other when $m=\infty$.

Tetragonal Trisoctahedron, mOm.—When the solid angles of the octahedron are modified so that two of the axes are cut at a distance m and the third at unity, the formula will

ISOMETRIC SYSTEM.

be $ma:a:ma$. The faces of the octahedron will be replaced by three tetragonal planes. As there is nothing to limit the inclination, there may be an infinite number of tetragonal trisoctahedra (Figs. 11, 12, 13). Their limit will be O on the one hand when $m=1$, and $\infty O\infty$ on the other when $m=\infty$.

Hexoctahedron, mOn.—When the angles of the octahedron are modified so that each axis is cut at a different distance, the formula will be $ma:na:a$. Each plane of the octahedron will be replaced by six triangular planes. As there is nothing to limit the inclination of the planes, there may be an infinite number of hexoctahedra (Figs. 14, 15, 16). This solid is the most interesting of all the solids of the system, for by successively changing the values of m and n all the other forms of the system may be derived from it. They can all be seen upon it in outline.

2. *Hemihedral Forms.*

In the isometric system there are three kinds of hemihedry: (1) *inclined*, (2) *parallel*, and (3) *gyroidal*. (1) The forms are said to be *tetrahedral* or *inclined* when the faces are not parallel. This is produced when all of the modifications are carried out on alternate homologous parts. (2) They are *dodecahedral* or *parallel* when alternate modifications are carried out in the same order on all the homologous parts. (3) *Gyroidal* forms are produced when alternate modifications are carried out alternately on all the homologous parts. The hexoctahedron is the only solid which allows of hemihedral forms according to the three laws.

(1) *Inclined or Tetrahedral Forms.*

Tetrahedron, $\pm\frac{O}{2}$.—When alternate faces of the octahedron are produced to the exclusion of the others (Fig. 17), a tetrahedron (Fig. 18) is formed. There can be but two tetrahedra, which are distinguished as + and −.

Hemi-Trigonal Trisoctahedron, $\pm\frac{mO}{2}$.—When mO is modified by this law, a tetrahedron is produced, each of whose faces is replaced by three tetragonal planes (Figs. 19, 20, 21, 22).

Hemi-Tetragonal Trioctahedron, $\pm \frac{mOm}{2}$.—When mOm is modified by the same law, a tetrahedron is produced, each one of whose planes is replaced by three triangular planes (Figs. 23, 24, 25, 26).

Hemi-Hexoctahedron Inclined, $\pm \frac{mOn}{2}$.—When mOn is modified by the same law, a tetrahedron is produced, each one of whose faces is replaced by six triangular planes (Figs. 27, 28). The other forms, $\infty O\infty$, ∞O, and ∞On, do not admit of inclined hemihedry.

(2) *Parallel or Dodecahedral Forms.*

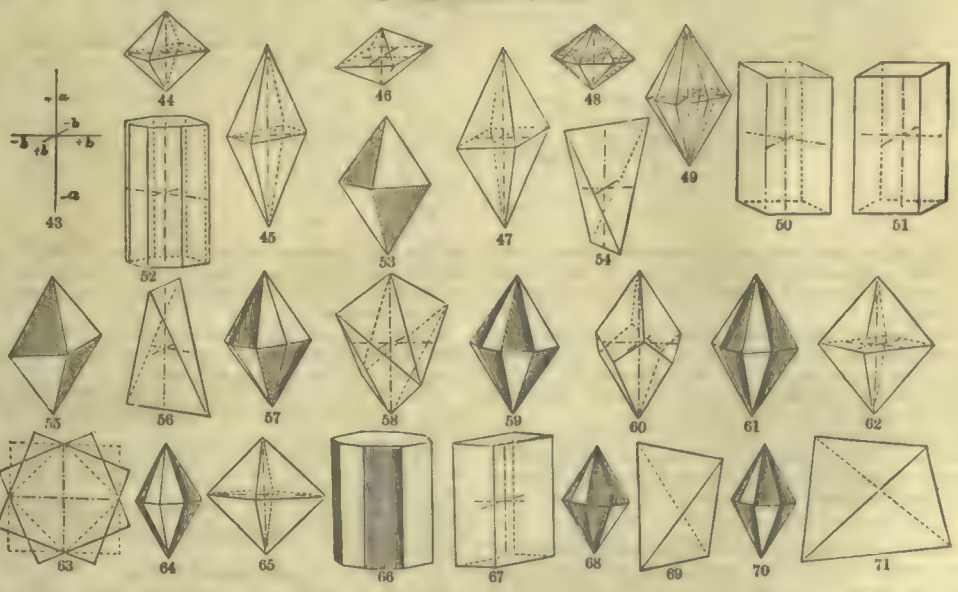
Hemi-Tetrahexahedron, ∞On.—When ∞On (Fig. 29) is modified, so that every alternate face is produced, a solid is formed (Figs. 30, 31, 32), which is often called the *pentagonal dodecahedron.*

Hemi-Hexoctahedron Parallel, $\pm \left[\frac{mOn}{2}\right]$.—When mOn is modified so that every other plane is taken in the same order on each face (Fig. 33), a solid (Fig. 34) is produced, which is often called the *diploid.*

3. *Gyroidal Form.*

Gyroid, $\pm \left(\frac{mOn}{2}\right)$.—When mOn is modified in such a way that the faces are taken alternately above and below (Fig. 35), a solid having twenty-four pentagonal faces is produced (Figs. 36, 37). This solid has not been found in nature.

(3) *Tetartohedral Form.*



Tetartoid, $\pm rl \frac{mOn}{4}$.—mOn is the only form which allows of the carrying out of this law. When the hexoctahedron, the diploid, or the hemi-hexoctahedron inclined, is modified as shown in (Figs. 38, 39, and 40, Figs. 41 and 42) are produced, and as there are two pairs of these, which are right and left forms, they are distinguished as + and − r and l.

TETRAGONAL SYSTEM.

The axes of this system (Fig. 43) are of two kinds: a, the vertical, being longer or shorter than b, b, which are both equal.

Holohedral Forms.—Closed Forms.

Tetragonal Pyramid of the First Order, P.—When the axes are cut in the relation $a : b : b$, the pyramid of the first order or protopyramid (Figs. 44, 45) is produced. The plane which includes the axes b is a square, and is called the basal plane, and its angles and edges are called basal angles and edges. The planes which include the axes a, b are rhombs, and are called the terminal planes, and their angles and edges terminal angles and planes. The general formula for these pyramids is $ma : b : b$, for which the symbol is mP, in which $m \gtreqless 1$; but in that protopyramid P which is selected for the base of the system the value of m is taken for unity. As m may have any value, there may

be any number of pyramids. They are called acute or obtuse according as the terminal angle is acute or obtuse.

Pyramid of the Second Order, mP∞.—When the terminal edges of the protopyramid are modified by one plane in the relation $ma : \infty b : b$, a solid exactly similar in all respects to the protopyramid is produced, but turned 90°, so that the basal axes terminate in the centre of the basal edges (Figs. 46, 47). As m may be $\gtreqless 1$, there may be an infinite number of deuteropyramids. The two forms, P∞ and 2P∞, occur where $m = 1$ in the first case, and $m = 2$ in the second.

Ditetragonal Pyramid, mPn.—When the terminal edges of the protopyramid are modified in the relation $ma : nb : b$, a solid is produced in which each plane of the protopyramid is replaced by two planes (Figs. 48, 49). This solid $n \gtreqless 1, n > 1 < \infty$; hence there may be any number of ditetragonal pyramids. This solid bears the same relation to this system that the hexoctahedron does to the isometric system.

Open Forms.

Tetragonal Prism of the First Order, ∞P.—When the basal edges of P are modified by one plane, the axes will be cut in the relation $\infty a : b : b$, which produces simply four vertical planes (Fig. 50), which, as they are not closed, produce an open form and is the protoprism.

Tetragonal Prism of the Second Order, ∞P∞.—When the basal angles of the protopyramid are modified by one plane in the relation $\infty a : \infty b : b$, a prism (Fig. 51) is produced similar to the protoprism, but turned 90°.

Ditetragonal Prism, ∞Pn.—When the basal angles of the protopyramid are modified by two planes in the relation $\infty a : nb : b$, a prism (Fig. 52), made up of eight faces, which are parallelograms, is produced.

Basal Pinacoid, oP.—When the axes are cut by planes in the relation $a : \infty b : \infty b$, we have simply a pair of planes parallel to the basal axes.

Pyramidal Hemihedral Forms.

The pyramidal hemihedral forms of the tetragonal system are called (1) *scalenohedral* or *sphenoidal*, (2) *trapezoidal*, (3) *pyramidal.*

(1) *Scalenohedral.*

Sphenoid of the First Order, $\pm \frac{P}{2}$.—When alternate planes of P are produced, a solid resembling a tetrahedron is formed, in which the faces are isosceles triangles (Figs. 53, 54). There will be two of these sphenoids. This solid is named after the mineral *sphene*, in which it frequently occurs.

Sphenoid of the Second Order, $\pm \frac{m\text{P}\infty}{2}$.—When mP∞ is treated by this law, another sphenoid is produced, similar in every respect to the sphenoid of the first order, but turned 90° (Figs. 55 and 56).

Tetragonal Scalenohedron, $\pm \frac{m\text{P}n}{2}$.—When two faces together, taken alternately above and below, of mPn are taken (Fig. 57), the solid resulting is a sphenoid, each of whose faces is replaced by two planes (Fig. 58).

(2) *Trapezoidal.*

Tetragonal Trapezohedron, r or $l\frac{mPn}{2}$.—When mPn is modified by taking one plane alternately above and below (Fig. 59), a solid (Fig. 60) is produced; to distinguish them from the other hemihedral forms of mPn, they are called right, r, and left, l.

(3) *Pyramidal.*

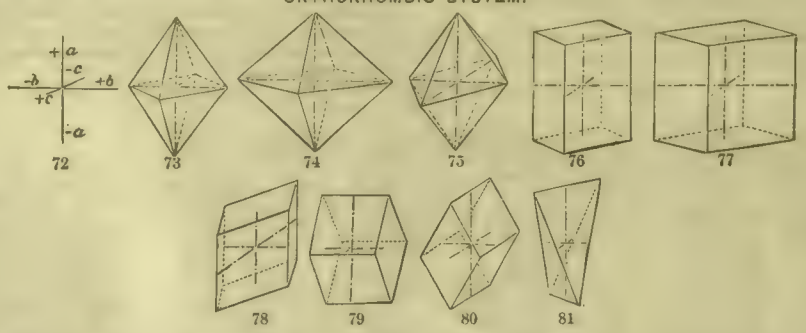
Tetragonal Pyramid of the Third Order, $\frac{r}{l}$ and $\frac{l}{r}\frac{mPn}{2}$.—When mPn is modified, by taking one alternate plane, but the same plane above and below (Fig. 61), a pyramid is formed which resembles the other pyramids of this system (Fig. 62). It is, however, turned to one side more or less, depending on the angle of mPn. The relations of the pyramids and prisms of the three orders is illustrated by (Fig. 63). Another pyramid which is purely theoretical is formed as shown in (Figs. 64 and 65).

Prismatic Hemihedral Forms.

Tetragonal Prism of the Third Order, $\frac{r}{l}$ or $\frac{l}{r}\frac{\infty Pn}{2}$.—When ∞Pn is modified so that only every other plane is taken (Fig. 66), a prism is produced resembling the prism of the second order, except that the basal axes terminate to one side of the centre of the faces of the prism (Fig. 67).

Tetartohedral Forms.—Sphenoidal.

Tetarto-Sphenoid, $\pm\frac{r}{l}\frac{mPn}{4}$.—When mPn is modified as shown in Fig. 68, it produces a sphenoid (Fig. 69), called the sphenoid of the third order.



Plagio-Sphenoid.—When mPn is modified as in (Fig. 70), it produces a sphenoid (Fig. 71), called the sphenoid of the fourth order. It has not been found in nature.

ORTHORHOMBIC SYSTEM.

The axes of this system (Fig. 72), a, b, c, all unequal, but all at right angles.

Holohedral Forms.—Closed Forms.

Rhombic or Protopyramid, P.—When the axes are cut in the relation $a:b:c$, the solid produced is a pyramid, whose faces are scalene triangles (Fig. 73). The planes ab, ac, and bc are rhombs of different values. As the basal axes form the diagonals of the rhombs bc, they are called, b the *macro* or *longer,* and c the *brachy* or *shorter* axis or diagonal. In each species a value of a is selected for unity, and this value is represented in P, the base of the system. The general formula will, however, be $ma:b:c$, or mP, in which $m \gtrless 1$.

72 73 74 75 76 77

78 79 80 81

Macropyramid, $mP\breve{n}$.—This solid (Fig. 74) resembles the protopyramid, but the symbol is $ma:nb:c$, in which $m \gtrless 1$. The macro axis has for its coefficient $n>1$. The planes, therefore, cut the macro axis extended. The long mark ¯ through the P symbolizes this fact.

Brachypyramid, $mP\breve{n}$.—In this form (Fig. 75) the symbol is $ma:b:nc$, in which $m \gtrless 1$ and $n>1$. The planes, therefore, cut the brachy axis extended, which is expressed by the curve ⌣ drawn through the P.

Open Forms.

Rhombic or Protoprism, ∞P.—When the basal edges of P are modified by one plane, which is parallel to the vertical axis a, according to the law $\infty a:b:c$, the resulting form is composed of vertical parallelograms (Fig. 76).

Macroprism, $\infty P\breve{n}$.—When the basal edges of mPn are modified by planes passed according to the law $\infty a:nb:c$, in which $n>1$, the macro axis extended will be cut. The form consists of four vertical parallelograms (Fig. 77).

Brachyprism, $\infty P\breve{n}$.—When the basal of mPn edges are modified according to the law $\infty a:b:nc$, in which $n>1$ (Fig. 78), the resulting form is a prism, in which the brachy axis extended is cut.

Basal Pinacoid, oP.—When the axes are cut in the relation $a:\infty b:\infty c$, we have simply two pairs of planes.

Macrodome, $mP\breve{\infty}$.—When the terminal edges of P are modified according to the law $ma:\infty b:c$, in which $m \gtrless 1$, the form is roof-shaped, and is called a *dome,* from *domus,* a "house." The dome is always over the axis from which it takes its name.

Brachydome, $mP\breve{\infty}$.—When the terminal edges are modified according to the law $ma:b:\infty c$, in which $m \gtrless 1$, a dome over the brachy axis is formed.

Basal Pinacoid, oP.—When the axes are cut in the relation $a:\infty b:\infty c$, planes parallel to the basal axes are produced.

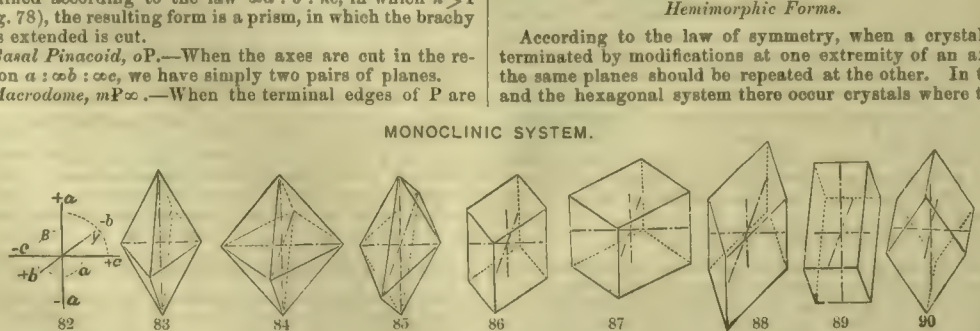
Macro Pinacoid, $\infty P\breve{\infty}$.—When the axes are cut according to the law $\infty a:\infty b:c$, planes parallel to the axis b are produced.

Brachy Pinacoid, $\infty P\breve{\infty}$.—When the axes are cut according to the law $\infty a:b:\infty c$, planes parallel to the axis c are produced.

Hemihedral Forms.

The hemihedral forms of this system consist of one solid, the rhombic sphenoid, and pairs of planes or single planes.

Rhombic-Sphenoid, $\pm\frac{mP}{2}$.—When alternate planes of the protopyramid are taken, a sphenoid is formed whose faces are scalene triangles (Fig. 81).



Hemimorphic Forms.

According to the law of symmetry, when a crystal is terminated by modifications at one extremity of an axis, the same planes should be repeated at the other. In this and the hexagonal system there occur crystals where this law does not hold good, and these exceptions are called *hemimorphic* forms.

Limit Forms.

When the protoprism is accompanied by the macro and brachy pinacoids, the prism has a hexagonal section. When the angle of the prism is near 120°, forms are produced which are so similar to hexagonal combinations that it is frequently difficult, without careful measurement or a determination of the optical properties of the mineral, to make the distinction.

MONOCLINIC SYSTEM.

82 83 84 85 86 87 88 89 90

CLINOMETRIC SYSTEMS.

Monoclinic System.

The axes of this system (Fig. 82) are of three kinds, and have only a single inclination. The angle γ of the plane $ac = 90°$, the angle α of the plane $bc = 90°$, the angle β of the plane $ab \gtrless 90°$. a is called the *vertical*, b the *clino*, and c the *ortho* axis or diagonal. The plane of the basal axes is thus inclined to the vertical axis, while the ortho and clino axes are at right angles to each other.

Holohedral Forms.—Open Forms.

Monoclinic Pyramid, $\pm$ P.—As the axes b and c are of unequal length, and the plane which contains them makes two angles with the vertical axis, the one in front being an obtuse and the one behind making an acute angle, the relation $a : b : c$ will produce only a hemipyramid or a pair of planes, above in front or behind below. The pyramid will be formed by these and the other pair of planes behind above and in front below. The pyramid itself will be $\pm$ P (Fig. 83). The two planes, above in front and below behind, are by convention called $-$ P, and the others $+$ P. When m is not equal to 1, the symbol becomes $\pm m$P.

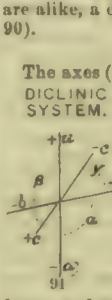
Orthopyramid, $\pm m\breve{P}n$.—When the axes are cut in the relation $ma : b : nc$, the two forms produce the orthopyramid (Fig. 84).

Clinopyramid, $\pm m\breve{P}n$.—When the axes are cut in the relation $ma : nb : c$, the two forms produce the clinopyramid (Fig. 85).

Protoprism, ∞P.—When the basal edges of the protopyramid are modified, the axes are cut in the relation $\infty a : b : c$. A monoclinic prism (Fig. 86) results.

Orthoprism, $\infty\breve{P}n$.—When the basal edges of the protopyramid are modified by one plane in such a way that the ortho axis extended is cut at a distance n, the relation is $\infty a : b : nc$ (Fig. 87).

Clinoprism, $\infty\breve{P}n$.—When the orthopyramid is modified so that the clino axis extended is cut at a distance n, the relation is $\infty a : nb : c$ (Fig. 88).



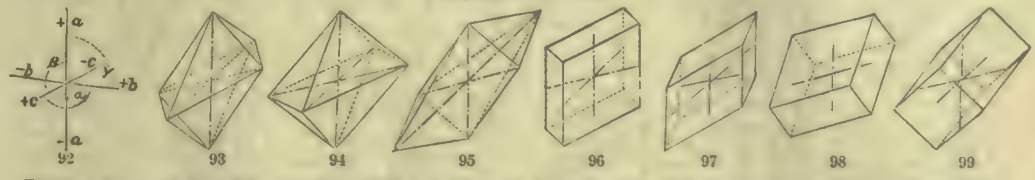
Orthodome, $\pm m\breve{P}\infty$.—As the edges which join the axes a, b are of two kinds, only parallel planes will be produced by a single modification, $ma : b : \infty c$. The orthodome (Fig. 89) will therefore be made up of two hemi-orthodomes. The same convention for the signs $+$ and $-$ is made as for the pyramid.

Clinodome, $m\breve{P}\infty$.—As the edges which join the axes a, c are alike, a dome results from the relation $ma : \infty b : c$ (Fig. 90).

Diclinic System.

The axes (Fig. 91) of this system are of three kinds, and have two inclinations. The angle γ of the planes $ab \gtrless 90°$, the angle α of the planes $bc = 90°$, the angle β of the planes $ac \gtrless 90°$. The basal axes are thus at right angles to each other, but the plane which contains them has two inclinations to the vertical axis.

DICLINIC SYSTEM.



91

Diclinic Pyramid, $\breve{P}$.—As the faces of the pyramid are equal only in pairs, the pyramid is made up of four tetarto pyramids. This system admits of only hemi forms and tetarto forms. a is called the vertical, b the macro, and c the brachy axis. It admits of tetarto, macro, and brachy pyramids and prisms, and tetarto, macro, and brachy domes and the pinacoids. Mitscherlich announced that he had discovered this system in a crystal of hyposulphite of lime, but subsequent crystallographic and optical researches proved that this salt was triclinic; in consequence of which the system was abandoned by most crystallographers. It has, however, the same theoretical basis as any of the other systems, and there does not seem to be any good reason why it should not be preserved.

Triclinic System.

The axes of this system (Fig. 92) are of three kinds and have three inclinations, the angles α, γ, β, are $\gtrless 90°$. The axis a is called the vertical, b the macro, and c the brachy axis.

TRICLINIC SYSTEM.

92 93 94 95 96 97 98 99

Triclinic Pyramid, $\breve{P}$.—When the axes (Fig. 92) are cut in the relation $a : b : c$, a pair of planes are produced. The pyramid is made up of four tetarto-pyramids, which are distinguished by accents. P′ signifies the planes right above, P the planes left above, P, the planes right below, and ,P the planes left below, with their diagonally opposite planes. The pyramid is $\breve{P}$. The protopyramid (Fig. 93) will always be $m\breve{P}$, except when m equals one, the macropyramid (Fig. 94) is $m\breve{P}n$, and the brachy pyramid (Fig. 95) $m\breve{P}n$.

Triclinic Prism, ∞P. — When the relation $\infty a : b : c$ is carried out, it produces a single pair of planes, whose symbol is ∞P′ or ∞P, according as the planes are to the right or the left. Each prism is made up of two hemiprisms. The whole form (Fig. 96) is $\infty\breve{P}$. The brachy prism (Fig. 97) is $\infty\breve{P}$, and the macro prism $\infty\breve{P}n$.

Triclinic Domes.—The domes are single pairs of planes, and each dome is made up of two hemidomes. The macrodomes are made up of $m\breve{P}\infty$ and $m\breve{P},\infty$ (Fig. 98), and the brachydomes of $m\breve{P}\infty$ and $m\breve{P},\infty$ (Fig. 99).

The only other planes are the basal pinacoid, oP, the macro pinacoid, ∞P∞, and the brachy pinacoid, ∞P∞.

SYSTEM WITH FOUR AXES.

Hexagonal System.

The hexagonal system is referred to four axes. One of these a (Fig. 100) is vertical. It is at right angles to the plane of the basal axes b, which are inclined to each other at an angle of 60°. The vertical is the optical axis, and is consequently the line of greatest physical as well as mathematical importance.

Holohedral Forms.—Closed Forms.

Hexagonal Pyramid, P.—When the axes (Fig. 100) are cut in the relation $a : \infty b : b : c$, the pyramid of the first order (Fig. 101), or protopyramid, is produced. In the form chosen for the base of the system the vertical axis is cut at a distance equal to unity, but it may be cut at other distances, $m \gtrless 1$, so that the general symbol is mP. The pyramids are said to be acute or obtuse according as the terminal angle is acute or obtuse.

Hexagonal Pyramid of the Second Order, mP2.—When the terminal edges of the protoprism are replaced by one plane, so that the axes are cut in the relation $ma : 2b : b : 2b$, another pyramid called the deuteropyramid (Fig. 102), which is similar in all respects to the protopyramid, except that it is turned 30° from it, is produced.

Dihexagonal Pyramid, $m\breve{P}n$.—When the terminal edges of the protopyramid are replaced by two planes, all three of the axes b will be cut at unequal distances. If the shortest parameter is called unity or b, and the longest μb, the third parameter will have a value of $\frac{\mu}{\mu - 1} b$, and its length will be between 1 and 2. The axes will be in the relation $ma : \mu b : b : \frac{\mu}{\mu - 1} b$, or $ma : \mu b : b : nb$, in which $m \gtrless 1$, $\mu \geqq 2$, and $n = \frac{\mu}{\mu - 1}$ (Fig. 103).

Open Forms.

Hexagonal Prism, ∞P.—When the basal edges of the protopyramid are modified by one plane which is parallel to the vertical axes, they are cut in the relation $\infty a : \infty b : b : b$, and the protoprism (Fig. 104) is produced.

Hexagonal Prism of the Second Order, ∞P2.—When the basal edges of the deuteropyramid are modified by one plane parallel to the vertical axis, a deuteroprism is produced (Fig. 105). The axes are cut in the relation $\infty a : 2b : b : 2b$. This prism is in every respect similar to the protoprism, but it is turned 30°.

Dihexagonal Prism, $\infty\breve{P}n$.—When the basal edges of the dihexagonal pyramid are modified by one plane, so that the axes are cut in the relation $\infty a : \mu b : b : \frac{\mu}{\mu - 1} b$, a dihexagonal prism (Fig. 106) is produced.

Basal Pinacoid, oP.—When the axes are cut in the relation $a : \infty b : \infty b : \infty b$, the basal pinacoid is produced.

Pyramidal Hemihedral Forms.

This system admits of four different kinds of hemihedral forms, derived from its pyramids, which are called (1) *scalenohedral*, (2) *trapezoidal*, (3) *pyramidal*, and (4) *trigonal hemihedry*.

(1) *Scalenohedral.*

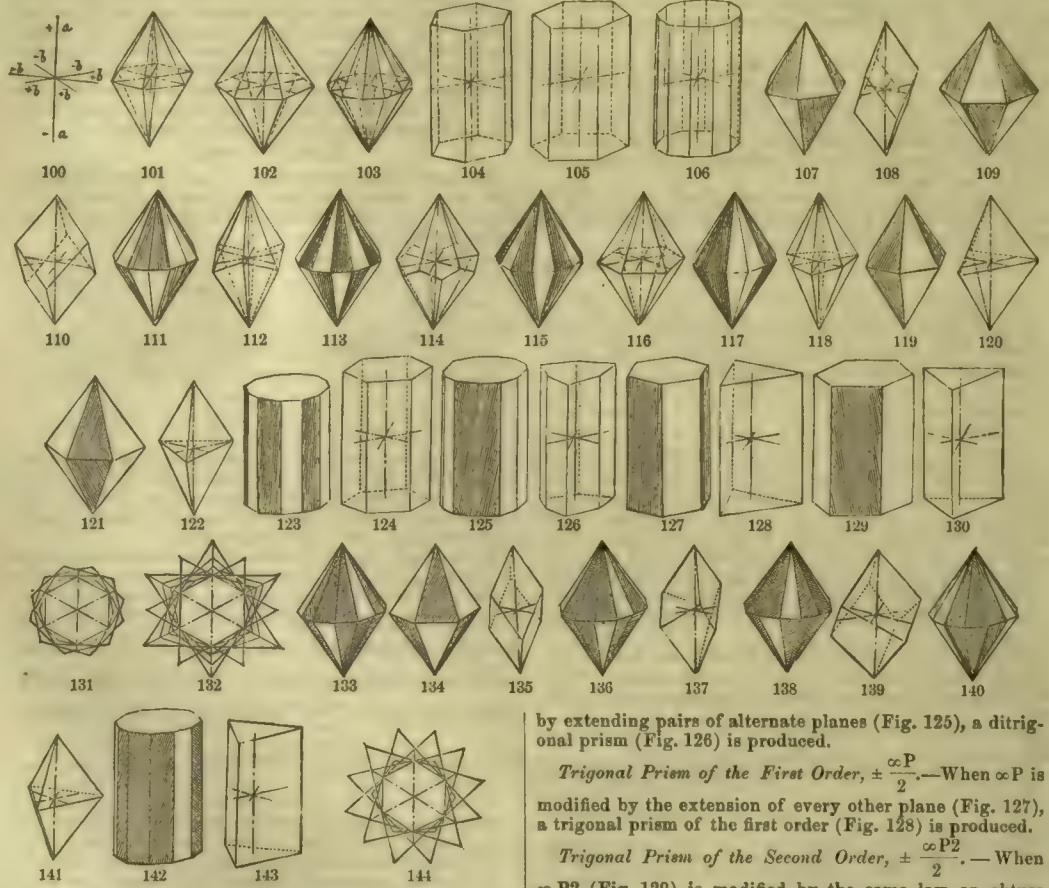
Rhombohedron of the First Order, $\pm \frac{m\mathrm{P}}{2}$.—When mP is modified by producing every alternate plane (Fig. 107), the rhombohedron (Fig. 108) is produced. As there are two of them, they are designated by the signs + and −.

Rhombohedron of the Second Order, $\pm \frac{\infty \mathrm{P2}}{2}$.—When ∞ P2 is modified by the same law (Fig. 109), other rhombohedra (Fig. 110) are produced, similar to those of the first order, but turned 30°. As there is no limit to the angles of the pyramids from which they are produced, there are an infinite variety of rhombohedra. They are called acute or obtuse according as the terminal angle is acute or obtuse.

Hexagonal Scalenohedron, $\pm \frac{m\mathrm{P}n}{2}$.—When the dihexagonal pyramid is modified, so that every two alternate faces above and below are taken (Fig. 111), the scalenohedron (Fig. 112) is produced. There are four of these scalenohedra. In order to get a clear idea of them, we have only to suppose that the terminal or basal edges of the rhombohedra were modified by two or the terminal angles by six planes.

(2) *Trapezoidal Hemihedry.*

Hexagonal Trapezohedron, r or l $\frac{m\mathrm{P}n}{2}$.—When the dihexagonal pyramid is modified by the extension of every alternate plane above and below (Fig. 113), the hexagonal trapezohedron (Fig. 114) is produced. They are distinguished as right and left.



(3) *Pyramidal Hemihedry.*

Hexagonal Pyramid of the Third Order, $\frac{r}{l}$ or $\frac{l}{r}$ $\frac{m\mathrm{P}n}{2}$.—When mPn is modified as in Fig. 115, a hexagonal pyramid, in which the basal axes terminate to one side of the centre of the basal edges, is produced (Fig. 116), which, to distinguish it, is called the pyramid of the third order.

(4) *Trigonal Hemihedry.*

Ditrigonal Pyramid, r or l $\left[\frac{m\mathrm{P}n}{2}\right]$.—When mPn is modified so that every alternate pair of planes, but the same planes above and below, are taken (Fig. 117), a ditrigonal pyramid (Fig. 118) is produced; to distinguish the symbol it is written in brackets.

HEXAGONAL SYSTEM.

Trigonal Pyramid of the First Order, r or l $\frac{m\mathrm{P}}{2}$.—When mP (Fig. 119) is modified by extending every other plane, but the same plane above and below, a trigonal pyramid of the first order (Fig. 120) is produced.

Trigonal Pyramid of the Second Order, r or l $\frac{m\mathrm{P2}}{2}$.—When mP2 (Fig. 121) is modified by the same law, a trigonal pyramid is produced.

Prismatic Hemihedral Forms.

Hexagonal Prism of the Third Order, $\frac{r}{l}$ or $\frac{l}{r}$ $\frac{\infty \mathrm{P}n}{2}$.—When ∞P$n$ is modified by the extension of every alternate plane (Fig. 123), a hexagonal prism of the third order is produced.

Ditrigonal Prism, r or l $\left(\frac{\infty \mathrm{P}n}{2}\right)$.—When ∞P$n$ is modified by extending pairs of alternate planes (Fig. 125), a ditrigonal prism (Fig. 126) is produced.

Trigonal Prism of the First Order, $\pm \frac{\infty \mathrm{P}}{2}$.—When ∞P is modified by the extension of every other plane (Fig. 127), a trigonal prism of the first order (Fig. 128) is produced.

Trigonal Prism of the Second Order, $\pm \frac{\infty \mathrm{P2}}{2}$.—When ∞ P2 (Fig. 129) is modified by the same law, an obtuse trigonal prism is produced (Fig. 130).

The relation of all these forms to each other is made plain by Figs. 131 and 132. Fig. 131 shows the relative positions of the hexagonal pyramids and prisms of the first, second, and third orders, and the dihexagonal pyramid and prism (Fig. 132) shows the relations of the first, second, and third orders, the scalenohedron, the trigonal and ditrigonal pyramids and prisms.

Pyramidal Tetartohedral Forms.

There are two kinds of pyramidal tetartohedry in the hexagonal system, *rhombohedral* and *trapezoidal.*

Rhombohedral Hemihedry.

Rhombohedron of the Third Order, $\pm \frac{r}{l}$ or $\frac{l}{r}$ $\frac{m\mathrm{P}n}{4}$.—When the dihexagonal pyramid or the hexagonal pyramid of the third order is modified as shown in Figs. 133 and 134, a rhombohedron of the third order (Fig. 135) is produced.

Trapezoidal Hemihedry.

Trigonal Trapezohedron, $\pm r$ or $l \frac{mPn}{4}$.—When mPn is modified as shown in Figs. 136 and 138, the solids (Figs. 137 and 139) are produced. These solids were formerly called plagihedra. They vary in form according as the terminal angle is acute or obtuse.

Trigonal Pyramid of the Third Order, $\pm r$ or $l \left[\frac{mPn}{4}\right]$.—When mPn is modified as shown in Fig. 140, a trigonal pyramid (Fig. 141) is produced.

Prismatic Tetartohedral Form.

Trigonal Prism of the Third Order, $\pm r$ or $l \frac{\infty Pn}{4}$.—When ∞Pn is modified as shown in (Fig. 142), a trigonal prism is produced (Fig. 143). The position of these tetartohedral forms is illustrated in the diagram Fig. 144, which shows the relative position of the hexagonal pyramids of the first and second orders, the dihexagonal pyramid and prism, and the trigonal pyramids and prisms of the third order.

THOMAS EGLESTON.

Crys'tal Pal'ace, a building erected in London in 1851, in which the great World's Fair of that year was held. It was designed by Sir Joseph Paxton, and was composed of glass and iron, excepting the floors, which were of wood. It was 1851 feet in length, and covered an area of twenty-one acres. During the exhibition it was visited by over 6,000,000 persons. The whole structure was removed soon afterwards. A permanent crystal palace was erected in 1854 at Sydenham, eight miles from London. It cost £1,450,000, and contains an extensive museum, in which almost every department of art and science is represented. In 1853 a crystal palace for another universal exhibition was erected in New York, after a design by Messrs. Carstenson and Gildemeister. It was burned in 1858. Others have since been erected for similar purposes in different cities of Europe.

Crystal Peak, a township of Washoe co., Nev. Pop. 120.

Crystal Springs, a post-village of Copiah co., Miss., on the New Orleans Jackson and Great Northern R. R., 25 miles S. W. of Jackson. Pop. 864.

Csa'ba, a market-town of Hungary, 7 miles S. S. W. of Bekes, is well built. It has an extensive trade in grain, wine, and cattle. Previous to 1840 it was but a village. Pop. in 1870, 30,022.

Csa'nád, a county of Hungary, is bounded on the N. by Bekes, on the E. by Arad, on the S. by Torontal, and on the W. by Csongrad. Area, 640 square miles. It consists of a plain, which is very fertile, but the climate and water are unhealthy. The chief products are wheat, wine, tobacco, and fruit. Chief town, Mako. Pop. in 1869, 95,847.

Csanád, a decayed market-town of Hungary, in the county of Csanád, on the Máros, 44 miles N. of Temesvár. Pop. in 1870, 5250.

Cserven'ka, a town of Hungary, in the county of Upper Bács, on the Franzens Canal, 130 miles S. of Pesth. Pop. in 1870, 6877.

Cson'grad, a county of Hungary, is bounded on the N. by Szolnok, on the E. by Bekes and Csanad, on the S. by Torontal, and on the W. by Pesth. Area, 1280 square miles. The soil and products are similar to those of Csanad. It is traversed by the Theiss. Chief town, Szegedin. Pop. in 1869, 207,585.

Csongrad, a market-town of Hungary, in a county of its own name, is at the confluence of the Theiss with the Körös, 70 miles S. E. of Pesth. Pop. in 1870, 17,356.

Cte'noid Fishes [from the Gr. κτείς (gen. κτενός), a "comb," from the comb-like teeth of the scales], an order of fishes (in Agassiz's former classification) characterized by having the skin covered with scales whose margins have notches or spines resembling the teeth of a comb. There are sometimes many rows of teeth or little spines, sometimes but one, the rows wearing off successively as new ones are formed. Living fishes of this order are numerous; among them are the turbot, perch, and flounder. Fossil fishes of this class are comparatively few. The word *ctenoid* is retained, as expressing an important character, but no such order as the above is now recognized.

Cte'sias [Κτησίας], a Greek historian, a native of Cnidos, in Caria, lived about 400 B. C. He passed many years in Persia as physician to King Artaxerxes Mnemon, and afterwards returned to his native place. He wrote a "History of Persia" (Περσικά) and a "Description of India." His reputation for veracity is not high.

Ctesib'ius [Κτησίβιος], a famous Greek mechanician who flourished at Alexandria about 130 B. C. He invented the clepsydra, a pump, and other machines. He is said to have been the first who applied the elastic force of air as a motive-power.

Ctes'iphon, an ancient city of Assyria, on the E. bank of the Tigris, 20 miles S. E. of Bagdad, was the capital of the kings of Parthia. Its ruins still attest its former magnificence. The site is now occupied by a village called Modain.

Ctesiphon [Κτησιφῶν], an Athenian who proposed that a crown of gold should be given to Demosthenes for his public services. For this act he was prosecuted by Æschines, and defended with success by Demosthenes in his famous oration "On the Crown," 330 B. C.

Cu'ba, the largest of the Antilles or West Indian Islands, and the most important of all the Spanish colonial possessions, is in the Caribbean Sea, about 130 miles S. of Florida, from which it is separated by the Bahama Channel. It is about 45 miles W. of Hayti, and extends from lon. 74° to 84° 58′ W. It is about 800 miles long E. and W., has a width varying from 130 to 25 miles, and an area of 45,883 square miles. Good harbors occur on the coasts at Havana, Matanzas, and other places. Cuba is traversed lengthwise by a mountain-chain. The highest peak, the Pico Turquinos, rises about 7750 feet above the level of the sea. From the base of the range the country expands into savannas or meadows, sprinkled with lagoons and swampy flats. The rivers are all small, and not navigable except for small boats. Granite, gneiss, and limestone are abundant here. Among the mineral resources of Cuba are copper, coal, silver, iron, and marble. Several productive mines of copper have been opened in the mountains.

The climate is hot and dry nearly all the year, the mean temperature near the sea-coast being about 78° F. In summer the mercury seldom rises above 88°. Earthquakes frequently occur. The vegetation is very luxuriant, and the highlands are covered with forests of mahogany, ebony, cedar, and fustic. The pineapple, orange, banana, lemon, and melon flourish here. The cultivated lands produce abundantly sugar, cotton, coffee, rice, maize, tobacco, and indigo. Sugar is the chief article of export. In 1871 the sugar exported amounted to 1,126,141 boxes (551,896 to the U. S.) of 400 pounds each, and 416,153 casks (376,628 to the U. S.). The export of tobacco from Havana amounted in 1869 to 22,000,000 pounds, exclusive of 179,000,000 cigars. The commerce of Havana embraces about 50 per cent. of the aggregate exports, and 75 per cent. of the imports of the island. The aggregate production is valued at $126,000,000. Of manufactures, the most important are the making of sugar, molasses, and rum, the preparation of coffee, the making of cigars, the bleaching of wax, and the manipulation of the minor staples of the island. Cattle-breeding is increasing, the number being estimated at about 1,300,000 head. The number of vessels entering the port of Havana amounted in 1869 to 1669, of which 721 were from the U. S. The aggregate length of railroads in operation amounted in 1871 to 397 miles. The supreme political and military command is in the hands of a governor captain-general. The island is divided into two departamentos—the western and the eastern. The former is subdivided into two gobiernos (Havana and Matanzas) and twenty tenencias de gobierno; the latter into two gobiernos (Santiago de Cuba and Puerto Principe) and eight tenencias de gobierno. There is a university at Havana with about 400 students. The entire population (except foreign residents) belongs to the Roman Catholic Church, which has an archbishop at Santiago de Cuba and a bishop at Havana. Pop. in 1867, 1,414,508, of whom 370,553 were slaves, 760,612 were white, and 283,343 free colored. Capital, Havana.

History.—This island was discovered in Oct., 1492, by Columbus, who named it Juana; Cuba is the aboriginal name. He found it occupied by a mild and indolent race of aborigines. In 1511 this island was colonized by the Spaniards, who with a few short intervals have retained possession of it ever since that date. The cruel treatment of the Indians under the administration of Hernando greatly injured the prosperity of the island, as in 1553 the entire Indian population had become extinct. In 1534, and again in 1554, Havana was destroyed by the French, but each time it was speedily rebuilt, and in 1584 it was strongly fortified. In 1624 it was taken by the Dutch, but soon restored. In the second half of the seventeenth century the island greatly suffered from the invasion of filibusters, who in 1688 plundered and destroyed the city of Puerto Principe. After the suppression of these bands of robbers the prosperity of the island rapidly increased, and in 1717 the Spanish government monopolized the tobacco trade. In 1762, Havana was taken by the English, who in 1763 restored it in exchange for Florida. The Spanish government now found it necessary to allow the free com-

mercial intercourse of Cuba with Spain. The commercial importance of the island rapidly increased, but it became at the same time the centre of the slave-trade for all Spanish South America. From 1789, in which year the slave-trade was freed from all former restrictions, to 1820, the average number of slaves imported was 7500; from 1820 to 1841, about 13,000. In 1845 the importation of slaves was forbidden, and from 1845 to 1847 the vigilance of Captain-General Concha suppressed the slave-trade almost entirely; after that date it was again revived through the indulgence of the Spanish authorities. The commercial prosperity of the island had, in the mean while, been considerably increased by the decay of Hayti, the abolition of the tobacco monopoly (1816), and the establishment of general freedom of trade (1818). Several insurrections of the negroes, the most important of which were those of 1844 and 1848, were suppressed; in the latter more than 10,000 negroes perished. Since the annexation of Florida to the U. S. the government of Washington has shown a considerable interest in the destiny of Cuba. In 1848, President Polk authorized the American ambassador in Madrid to offer the Spanish government $100,000,000 for the sale of Cuba, but the proposition was promptly rejected. In 1849, Colonel Narciso Lopez and other Cubans unsuccessfully attempted to revolutionize Cuba. In May, 1850, Lopez, who had fled to the U. S., sailed with 600 filibusters from the U. S., and landed at Cardenas, but had immediately to return. In Aug., 1851, another expedition of 500 armed men under Lopez and the American colonel Crittenden landed at Playtas, but did not meet with the expected support on the part of Cubans. Both Lopez and Crittenden were taken prisoners and executed. In 1859, President Fillmore refused to join a treaty proposed by England and France, which was to guarantee the possession of the island to Spain. Hostilities committed by a Spanish man-of-war against the American steamer Black Warrior brought on a serious complication between the U. S. and Spain. In Oct., 1854, three ambassadors of the U. S. at European courts, Buchanan, Soulé, and Mason signed the Ostend manifesto, which claimed for the U. S., in case of a refusal on the part of Spain to sell the island, the right to take and annex it. The fear which the election of Buchanan as President of the U. S. caused to Spain was, however, not realized. The Spanish revolution of Sept., 1868, led soon to a rising of the friends of Cuban independence. On Oct. 10, Manuel Carlos Cespedes, a lawyer of Bayamo, issued an address to the Cubans, in which he proclaimed the republic and separation from Spain. On Oct. 20 the Cuban insurgents had the first encounter with the Spaniards at Las Tunas. A provisional government, appointed in Bayamo, promised the speedy abolition of slavery. In April, 1869, a constituent assembly proclaimed the republic of Cuba, and elected Cespedes president. The total abolition of slavery and the introduction of freedom of religion were among the measures decreed by the assembly. The war was carried on on both sides, but in particular on that of the Spaniards, with great severity. The Spanish volunteers even went so far as to defy the authority of Captain-General Dulce, who had to return to Spain. His successor, Caballero de Rodas, was equally unsuccessful in suppressing the insurrection, and was, in Dec., 1870, succeeded by Count de Valmaseda. In April, 1874, the insurrection was not yet suppressed. (See RAMON DE LA SAGRA, "Historia fisica, economica, etc. de la isla de Cuba," 1842–45, 11 vols.; SIEVERS, "Cuba," 1861; LA PEZUELA, "Historia de la isla de Cuba," 1868–69, 2 vols.)

A. J. SCHEM.

Cuba, a township and village of Sumter co., Ala., on the Alabama and Chattanooga R. R. Pop. 480.

Cuba, a post-village of Putnam township, Fulton co., Ill., on the Toledo Peoria and Warsaw R. R. Pop. 568.

Cuba, a township and village of Lake co., Ill. P. 970.

Cuba, a post-village and township of Allegany co., N. Y., on the Erie R. R. and Genesee Valley Canal, 12 miles N. E. of Olean. It has manufactures of leather and other goods, a national and a private bank, and a large trade. It has also six churches and a weekly paper. Pop. of township, 2397.

Cu'bature, the measurement of the volume of a solid body. If the equation to the surface enclosing the body be given in rectangular co-ordinates, its volume is expressed by the triple integral $\iiint dx\,dy\,dz$, where the integration is to be extended to all points of the solid, according to the methods explained in all text-books. When the equation to the surface is given in polar co-ordinates, its volume is expressed by the integral $\iiint r^2 \sin\theta\,dr\,d\theta\,d\phi$.

Cubb Creek, a post-township of Jefferson co., Neb. Pop. 261.

Cube [Gr. κύβος, a "die"], in geometry, a solid body contained by six equal squares. It is also called a regular hexahedron, and is one of the five regular solids. It is a form which often occurs in nature, especially among crystals. In arithmetic the cube of a number is its third power, or the product obtained by multiplying that number by its square. The duplication of the cube—that is to say, the finding of a cube having double the volume of a given cube—is one of those problems which admit of no solution by common geometry, on which, as on the quadrature of the circle and the trisection of an angle, a vast amount of ingenuity has been vainly expended in every age since the dawn of mathematical science. The solid contents of a cube may be expressed by the third power of the number which expresses the length of one of its sides.

Cu'beb [Lat. *cubeba;* Fr. *cubèbe;* Ger. *Kubebe;* Arabic, *kabâbeh*], the dried, unripe fruit of the *Cubeba officinalis* (and probably of other species), climbing woody plants belonging to the order Piperaceæ. The cubeb vine resembles that which produces the ordinary black pepper. Cubebs are brought chiefly from Java, Penang, etc., and are used as an aromatic and stimulant diuretic. Their active properties depend on the volatile oil which they contain. They also have a crystallizable principle called "cubebin," and a balsamic resin. The oil, tincture, and extract are used in medicine.

Cube Root. See RADICAL and ROOT.

Cu'bic Equation, an equation which involves the cube of the unknown quantity. A *pure* cubic equation contains only two terms; as, *e. g.*, $x^3 - 27$; all others are said to be adfected; as, *e. g.*, $x^3 - 5x^2 + 4x + 7 = 1$.

Cu'bic Ni'tre, a commercial name applied to the nitrate of soda, which is largely obtained from the desert of Atacama in Peru. It is used in the arts and as a manure.

Cu'bit [Lat. *cubitus, i. e.* the "elbow;" Gr. πῆχυς, the "fore arm"], a linear measure of the ancients, equal to the length of a man's arm from the elbow to the tip of the middle finger. It is generally stated to be eighteen English inches. The ancient Egyptian cubit, or "cubit of Memphis," was about 20.7 British inches. The mean of Sir Isaac Newton's determinations, from the careful measurements of the great pyramid by Professor John Greaves (published in 1737), made it 20.672. The mean of still more careful measurement by Professor C. Piazzi Smyth in 1865 made it 20.73. According to Newton, the cubit of Babylon was very nearly 24 British inches; the royal cubit of Persia, 21.195 inches; the cubit of the Romans, 17.406 inches; the cubit of the Greeks, 18.1308 inches; the Egyptian cubit in use in 1737, 21.888 inches; the sacred cubit of Moses he calculates not to have been greater than 24.9389 inches, nor less than 24.7262, and its probable value to have been 24.7552 inches. Prof. Piazzi Smyth thinks that he has proved that the unit of measure employed by the builders of the Great Pyramid in laying out the ground-plan of their work was identical with the sacred cubit of Moses, and that its value was 25.025 British inches; which is, according to the most recent determinations, almost exactly the 10,000,000th part of the earth's polar radius. He supposes, therefore, that this unit of measure, which was divinely given, was made by divine intention to be in this exact decimal relation to the invariable line around which the earth revolves. If the British inch be increased by one-1000th part, its becomes what Professor Smyth calls a "pyramid-inch;" and a pyramid-cubit, or sacred cubit, is 25 pyramid-inches, or one-10,000,000th part of the earth's polar radius. Professor Smyth maintains his hypothesis with much ingenuity, but it has not been generally received with favor.

The value of the biblical "cubit of a man" is extremely uncertain. Dr. William Smith, in his "Dictionary of the Bible," has discussed the question pretty fully, and inclines to regard it as having had a value, deduced by Thenius ("Theologische Studien und Kritiken" for 1846) from the Egyptian cubit measure preserved in the Turin Museum, of 23 digits, each digit being 0.7938 British inch = 18.257 British inches.

F. A. P. BARNARD.

Cuck'oo [Lat. *cuculus;* Fr. *coucou;* It. *cucco,* so named from its peculiar note], a name given to many birds of the order Scansores, of the genus *Cuculus* and its allied genera. The common cuckoo of Europe is fourteen inches long, gray, the breast barred with black. It is migratory, and arrives in Europe in the spring. It feeds on worms and insects, builds no nest, but deposits its egg in the nest of another bird, and the proprietor hatches it with her own. The young cuckoo crowds under the other birds, and throws them over the edge to the ground. The great spotted cuckoo (*Cuculus glandarius*) is a native of Northern Africa: it also uses the nests of other birds. It is said that even the hooded crow, a very sagacious bird, is thus deceived by it, and fosters the young cuckoo with care. It

migrates in summer to Southern Europe. The common American cuckoo (*Coccygus Americanus*), sometimes called the yellow-billed cuckoo, is very slender, of a gray-brown color above, a lighter color beneath, and has a greenish

Great Spotted Cuckoo.

lustre. It feeds upon insects and the eggs of small birds. It is a timid bird, and conceals itself in the foliage of trees. Its eggs, from two to four in number, are of a pale blue-green. It does not lay its eggs in the nests of other birds. The black-billed cuckoo (*Coccygus erythrophalmus*) inhabits the same regions as the common American cuckoo. It has a different note, and is less shy; the eggs are of the same color. Other species occur in the U. S.

Cuckoo, a township and post-village of Louisa co., Va. Total pop. 2199.

Cu'cumber [Lat. *cucumis;* Fr. *concombre*], a genus of plants of the order Cucurbitaceæ. The common cucumber (*Cucumis sativus*), a native of Middle and Southern Asia, has heart-shaped leaves, rough with hairs, and oblong fruit. It has been cultivated from the earliest times, and forms an important article of food in Europe and the U. S. Many varieties are cultivated, with fruit from four inches to two feet long. Pickles called gherkins are made from young cucumbers. A sunny exposure and a light, rich soil are best adapted to its culture. Many other species with edible fruit belong to this genus.

Cucumber Tree, the *Magnolia acuminata,* a noble forest tree of the U. S., found from Niagara Falls southward to Georgia, chiefly along the Alleghanies. It is a tall tree, with duller green foliage than in other magnolias, and with inconspicuous yellowish-green flowers. Its wood is light, and is prized for making pumps and canoes. Its cucumber-like fruit is soaked in spirits, and makes a very bitter drink, popularly used as a tonic and anti-rheumatic.

Cucurbita'ceæ [from *Cucurbita* (a "gourd"), one of the most important of its genera], a natural order of exogenous plants, mostly inhabiting the hot countries of both hemispheres, having succulent stems and climbing by lateral tendrils. The fruit (*pepo*) has a thick, fleshy rind, is more or less succulent, and in some species attains a great size. The seeds are flat and ovate, embedded in a pulp, in some kinds dry, and in others juicy. The order contains about 300 species, including the melon, cucumber, gourd, squash, and pumpkin. The roots of some of them, such as the *Momordica dioica* and *Bryonia umbellata* of the East Indies, abound in a bland and edible fecula. The elaterium and the common bryony, however, are remarkable for their acridity, and are sometimes used as drastic purgative medicine. The colocynth, which is valued for its medicinal properties, belongs to this order.

Cud'bear [supposed to be a corruption of *Cuthbert,* from Dr. Cuthbert Gordon, who introduced the manufacture at Leith], a powder obtained from certain lichens by the action of ammoniacal liquids, and used for dyeing various colors. The name of cudbear lichen is often given to one particular species (*Lecanora tartarea*), which abounds on rocks in the Highlands of Scotland, among the Alps, and in the northern parts of Europe. The dyestuff is obtained by macerating this for ten or twelve days in urine with chalk and water. Cudbear does not afford a very permanent color.

Cud'dalore, a maritime town of Hindostan, in Arcot, and on the Coromandel coast, 86 miles S. of Madras. It is one of the most populous towns in the south of India. It has a custom-house, and a port from which cotton goods are exported. It was taken from the English by the French in 1782, but restored to the British in 1795. Pop.

Cud'weed, the name given to many species of the *Gnaphalium, Antennaria,* and *Filago,* belonging to the order Compositæ and sub-order Tubuliflora. The flowers, which are commonly called "life-everlasting," consist mostly of dry involucral scales, and the stems and leaves are more or less covered with white down. The cudweeds are common in Europe and North America, and some of them are used as diaphoretics in domestic medicine.

Cud'worth (Rev. Ralph), D. D., an English philosopher and divine, born at Aller, in Somersetshire, in 1617. His father (also named Ralph Cudworth), a man of genius and learning, was chaplain to James I. He graduated at Emmanuel College, Cambridge; and became master of Clare Hall in 1644, and professor of Hebrew in 1645. In 1654 he was chosen master of Christ's College, and in 1678 was appointed prebendary of Gloucester. He was one of those who were called "Latitudinarians" in theology. His great work, "The True Intellectual System of the Universe" (1678), displays great learning, liberality, and independence of mind. He favored the Platonic philosophy, although in physics he adopted the corpuscular theory. He died July 26, 1688, leaving a "Treatise concerning Eternal and Immutable Morality," published in 1731. A number of his unpublished manuscripts are in the British Museum. His sons appear to have died early. His daughter became Lady Masham and a friend of John Locke. (See Jannet, "De Cudworthii Doctrinâ," 1849; Mackintosh, "View of the Progress of Ethical Philosophy;" Tulloch, "Free Thought in England," vol. ii.)

Cuen'ca, a province of Spain, in New Castile, is drained by the rivers Tagus and Jucar. Area, 6726 square miles. The surface is partly mountainous; coal, copper, iron, and silver are found here. Capital, Cuenca. Pop. 242,231.

Cuenca, a city of Spain, capital of the above province, is picturesquely situated on a rocky eminence on the river Jucar, about 90 miles E. S. E. of Madrid. It has a richly-adorned cathedral, is the seat of a Catholic bishop, and has several convents and hospitals. Here is a fine bridge, erected over the Jucar in 1528. Cuenca was formerly celebrated for its arts, literature, and manufactures. Pop. 7284.

Cuenca, formerly sometimes written **Cuenza,** a city of South America, in Ecuador, the capital of the province of Cuenca, is on table-land 8640 feet above the level of the sea, 189 miles S. of Quito, after which it is the most populous city of Ecuador. It is the seat of a Catholic bishop, and has a cathedral and a university; also several sugar-refineries and potteries. Pop. about 20,000.

Cuesmes, a Belgian town in the province of Hainaut. It has breweries and coal-mines. Pop. 5721.

Cue'vas de Ve'ra, a town of Spain, in Granada, is on the river Almanzor at its entrance into the Mediterranean, 42 miles N. E. of Almería. It owes its thriving condition to recently-opened silver-mines. Pop. 7401.

Cuf'fee (Paul), a negro philanthropist, born in Gosnold, Mass., in 1759. He became a sea-captain, the owner of a vessel, the crew of which was composed of negroes, and acquired a competent fortune. He was deeply interested in the subject of African colonization. Died Sept. 7, 1818.

Cu'fic Wri'ting [so named from the town of Cufa or Koofa, where the transcribing of ancient manuscripts was extensively carried on] was one of the most ancient forms of Arabic writing, and is supposed to have been introduced into Arabia a short time before the period of Mohammed. It was in common use till the tenth century, and afterwards was confined to coins and inscriptions.

Cuichunchulli (*Ionidium parviflorum*), a half-shrub by Peruvian plant of the order Violaceæ, having active emetic and cathartic properties. It is reputed a certain remedy for *elephantiasis tuberculata,* and the same medical

properties are attributed to other species of *Ionidium*. The root of one kind is called white ipecacuanha.

Cuirass' [Fr. *cuirasse*, from *cuir*, "leather"], originally a garment of leather for soldiers, so thick and strong as to be proof against a pistol ball. The term was afterwards applied to a breastplate, or a portion of armor made of metal, consisting of a backplate and breastplate hooked or buckled together. The cuirass is still worn by the British Horse Guards and other bodies of heavy cavalry, called *cuirassiers*.

Cuivre, a township of Audrain co., Mo. Pop. 1480.

Cuivre, a township of Pike co., Mo. Pop. 3271.

Cuja'cius, properly JACQUES CUJAS, a celebrated French jurist, born at Toulouse in 1522. He learned Greek and Latin without a teacher, studied law at Toulouse, and became in 1555 professor of law at Bourges. His lectures on the "Institutes" attracted students from all the countries of Europe. He developed a reform in modern law inaugurated by Alciat. The Roman law received a thorough interpretation from him, and according to its principles, which had until then been adopted partially as expediency suggested, the doctrine of the law was fundamentally renovated. He had in his library 500 manuscripts of the Justinian laws. His works (1st ed. 1577; complete ed. Fabrot, 1658, 10 vols.) have been often reprinted, lately by Prato (1859). Died Oct. 4, 1590. (See PAPIRE MASSON, "Vie de Cujas," 1590; BERNARDI, "Éloge de Cujas," 1775; SPANGENBERG, "J. Cujas und seine Zeitgenossen," 1822.)

Culawhee, a township of Jackson co., N. C. Pop. 520.

Culdees', or **Kildees'** [supposed by some writers to have been derived from the Celtic *cuildich*, a "secluded corner," by others from the Celtic *kelede*, "man of God," and by others from the Lat. *cultores Dei*, "worshippers of God"], were a religious order established in Scotland, England, and Ireland in the latter part of the sixth century. When the monk Augustine had been sent by Gregory, bishop of Rome, as a missionary to the Saxons, he found the northern part of Britain already converted in a great measure to Christianity by the Culdees. Their origin is attributed to Saint Columba, the apostle of Western Scotland, who in 563 founded an institution at Iona, where the order existed as late as 1203. Being invited by Oswald, king of Northumberland, to preach the gospel in England, they sent thither Aidan, whose labors were eminently successful. The Culdee institution at Iona differed essentially from a monastery, though sometimes called by that name. It was rather a place of retirement, where the Culdee fitted himself by study and prayer for missionary labor. Celibacy was not enjoined upon the recluses, they did not acknowledge the papal supremacy, and they were allowed to change their calling for another. "The Culdees," says Ebrard, "read and understood the Scriptures in their original texts. But the Scriptures were more to them than a codex of authoritative doctrines of faith. They were the living word of Christ."

Cul-de-sac [Fr., the "bottom of a bag"], the name given to a street or alley open at one end only, sometimes called a blind alley. Also, in natural history, in buildings, in topography, and in military language, the term is used in an analogous sense for a passage with only one outlet.

Cul'enborg, a Dutch town in the province of Gelderland, 6 miles N. N. W. of Tiel, on the Leck. It is surrounded with a wall. There are manufactures of furniture, stoves, etc., and a trade in corn. Pop. 6192.

Culiacan', a town of Mexico, capital of Sinaloa, on the river Culiacan, 105 miles S. E. of the city of Sinaloa. It has a bishop, a seminary, and a mint. Pop. 10,925.

Culil'awan Bark, called also **Clove Bark,** a valuable aromatic bark, the product of the *Cinnamomum Culilawan*, a tree which grows in the Molucca Islands. It has a pungent taste and an odor resembling that of nutmeg and cloves.

Cul'len, a township of Pulaski co., Mo. Pop. 849.

Cullen (PAUL), D. D., CARDINAL, born in Dublin April 27, 1803, was educated at Rome, became archbishop of Armagh (1850), archbishop of Dublin (1852), and cardinal-priest in 1866. In his "Pastoral Letters" he opposed the mixed system of education, and he has been the main supporter of the Catholic University of Dublin.

Cullen (WILLIAM), M. D., a celebrated British physician, born of poor parents in Lanarkshire, Scotland, Dec. 15, 1712. He acquired his profession amid great embarrassments. In 1756 he obtained the chair of chemistry in Edinburgh, where he practised medicine with success. He published "First Lines of the Practice of Physic" (1775), his chief work, in which novel pathological theories are propounded, and which was translated into all European languages; a "Synopsis of Methodical Nosology" (in Latin, 1780), a "Treatise of the Materia Medica," in which numberless errors were dispelled (1789), and other works. Died Feb. 5, 1790. (See DR. JOHN THOMSON, "Life and Writings of William Cullen," 1832. This biography was completed by DR. CRAIGIE in a second volume, 1859.)

Culle'ra, a fortified seaport-town of Spain, in the province of Valencia, is on the Mediterranean at the mouth of the Jucar, 24 miles S. S. E. of Valencia. Grain, wine, and fruits are exported. Pop. 9814.

Cullo'den, also called **Drummossie Moor,** a battlefield of Scotland, is a desolate table-land, now partly cultivated, in Inverness-shire, 6 miles E. N. E. of Inverness. Here the royal army, commanded by the duke of Cumberland, totally defeated the Young Pretender, April 16, 1746.

Cul'lum (GEORGE W.), an American officer, born Feb. 25, 1809, in New York City, graduated at West Point in 1833; colonel of engineers May 7, 1867, and brigadier-general of volunteers Nov. 1, 1861. He served in the construction of Fort Adams, R. I., 1833–34, 1836–38, and 1858–64; as assistant to chief engineer 1834–36; in building pier, dyke, and lighthouse at Goat Island, R. I., 1836–38; in erecting defences of New London harbor, Conn., 1838–55; in constructing sea-walls and fortifications at Boston harbor, Mass., 1846–47; in organizing engineer troops and preparing engineer and ponton equipage for the war with Mexico 1846–47; as instructor of practical military engineering, etc. at the Military Academy 1848–55, except while travelling abroad for recovery of his health; in building New York assay-office 1853–54; in charge of public works in North and South Carolina, particularly the construction of the defences (including Fort Sumter), lighthouses, and channel improvements of Charleston harbor 1855–58; as member of special boards 1858–60; and in charge of sea-board defences from New Bedford, Mass., to Sound entrance to New York harbor, 1858–64. In the civil war he was A. D. C. (rank of colonel) to Lieutenant-General Scott, general-in-chief, 1861; chief of staff and of engineers to Major-General Halleck while commanding the departments of Missouri and Mississippi and general-in-chief of the armies of the U. S. 1861–64; engaged in establishing defensive works, directing at Cairo operations auxiliary to the Western armies in the field, making armed reconnaissances of Columbus, Ky.; as chief of engineers in campaign and siege of Corinth, and fortifying its approach after its evacuation; as member of special and engineer boards, and in organizing the defences of Nashville, Tenn., the great dépôt of supplies for Western armies; and as superintendent of U. S. Military Academy 1864–66; brevet colonel, brigadier-general, and major-general Mar. 13, 1865, for faithful, meritorious, and distinguished services; member of the board of engineers for fortifications since 1866. He is author of a work on "Military Bridges with India-rubber Pontons," 1849; of "Register of the Officers and Graduates of the U. S. Military Academy," 1850; of "Systems of Military Bridges," 1863; of a "Biographical Register of the Officers and Graduates of the U. S. Military Academy," 1868; of various military memoirs, reviews, reports, etc., 1833–73; and translator and editor of Duparcq's "Elements of Military Art and History," 1863. Retired from active service Jan. 13, 1874.

Culm [Lat. *culmus*, "straw"], the botanical name of the peculiar cylindrical hollow and jointed stem of the grasses. Culm is also a popular name given in some parts of England to anthracite coal.

Culm, a town of Prussia, regularly built on an eminence on the Vistula, 23 miles N. N. W. of Thorn. It pursues weaving, corn trade, and shipping. It was a Hanse town. Pop. 8455.

Culmina'tion [from the Lat. *culmen* (gen. *culminis*), a "top"], an astronomical term signifying the passage of a celestial body over the meridian at the upper transit. The sun culminates at noon or midday, and the full moon culminates at midnight, 12 P. M.

Cul'peper, a county in the N. E. of Virginia. Area, 673 square miles. It is bounded on the N. E. by the Rappahannock, and on the S. by the Rapidan River. The surface is pleasantly diversified by hills and dales; the soil is fertile. Wool and grain are staple products. It is intersected by the Orange Alexandria and Manassas R. R. Capital, Fairfax or Culpeper Court-house. Pop. 12,227.

Cul'peper (THOMAS), SECOND LORD, was one of the persons to whom Charles II. granted the territory of Virginia in 1673. He was the governor of Virginia from 1680 to 1683. Died in 1719. This name in the baronage of England is written Colepeper.

Culpeper Court-House. See FAIRFAX.

Culross', a seaport-town of Scotland, in Perthshire, on

the N. shore of the Frith of Forth, 22 miles N. N. W. of Edinburgh. It is a place of great antiquity. The monastery of St. Serf was founded here about the sixth century. It has remains of Culross Abbey, successively the seat of the Bruce and Dundonald families. Pop. 500.

Cul'tivator, an agricultural implement used in England and the U. S. before planting crops, and in the latter country for loosening the earth between rows of plants. American cultivators are either triangular or rectangular frames, with handles like those of a plough, a greater or less number of plough-like teeth, and with their centre-beams projecting in front for the attachment of wheels and draught clevises. Cultivators are very extensively used and manufactured in the U. S. They are of late frequently called horse-hoes.

Cul'verin [Fr. *couleuvrine;* etymology uncertain], a long cannon used from the fourteenth to the sixteenth century, generally carried a shot of eighteen pounds, and weighed about fifty hundredweight. A demi-culverin was a nine-pounder.

Cul'vert [perhaps from the Fr. *covert,* "covered"], an arched channel of masonry for the purpose of conveying water under ground. It is often built under canals, and in such cases it may be either a siphon or a surface-drain.

Cu'mæ, an ancient and famous Greek city of Campania, situated on the Mediterranean, 11 miles W. of Naples. It was founded conjointly by colonists from Chalcis and Cyme in Asia Minor. According to Strabo, it was the most ancient of the Greek colonies in Italy. It became an opulent commercial city, built several harbors or port-towns, and for a period of 200 years (700–500 B. C.) was the most important city of Southern Italy. The people of Cumæ waged war against the Etruscans, who disputed their supremacy as a maritime power. Cumæ was conquered by the Samnites in 420 B. C., and became a Roman *municipium* in 338. In the second Punic war Hannibal tried to capture it, but failed. Cumæ was famous as the residence of the SIBYL (which see). It was the last stronghold of Italy that held out against the Byzantine army, which captured it from the Goths in 552 A. D. But few remains of Cumæ are now in existence.

Cumaná, a department of Venezuela, is bounded on the N. by the Caribbean Sea and on the S. by the Orinoco. Capital, Cumaná. Pop. 75,828.

Cumaná, a seaport-town of South America, in Venezuela, 1 mile from the Gulf of Cariaco, 180 miles E. of Caracas; lat. 10° 28′ N., lon. 64° 16′ W. It is the oldest European city in America, having been founded in 1521 by Castellon. It has a good roadstead, and an export trade in cattle, cocoa, smoked meat, etc. It has been nearly destroyed by earthquakes several times. Pop. 6000.

Cum'berland [from CYMRY (which see)], the most north-western county of England, is bounded on the N. by Scotland and the Solway Frith, E. by Northumberland and Durham, S. by Westmoreland and Lancashire, and W. by the Irish Sea. Area, 1565 square miles. The surface is mountainous and picturesque. The highest points are Sca Fell, 3100 feet, and Skiddaw, 3022 feet above the sea. The chief rivers are the Esk, Eden, and Derwent. The scenery is adorned by numerous beautiful lakes, including Derwentwater and Ulleswater, the latter of which is 9 miles long. The land is divided into small freeholds. The main crops are wheat, oats, and turnips. Coal, copper, iron, lead, plumbago, limestone, marble, and Silurian slate are found here. The chief town is Carlisle. This county formed part of the ancient CUMBRIA (which see). Pop. in 1871, 220,245.

Cumberland, a county in the N. W. of Nova Scotia, extends from Northumberland Strait to the Bay of Fundy, and is bounded on the W. by Chignecto Bay. Here are rich coal-mines, and quarries from which good grindstones are exported to the U. S. It is intersected by the Intercolonial R. R. Capital, Amherst. Pop. in 1871, 23,518.

Cumberland, a county in the E. S. E. of Illinois. Area, 310 square miles. It is intersected by the Embarras River. The surface is diversified by prairies and groves; the soil is fertile. Cattle, grain, tobacco, wool, and lumber are important products. The Chicago branch of the Central and the St. Louis Vandalia and Terre Haute R. Rs. pass through this county. Capital, Prairie City or Majority Point. Pop. 12,223.

Cumberland, a county in the S. of Kentucky. Area, 375 square miles. Tobacco, grain, and wool are staple products. It is intersected by the Cumberland River. The surface is partly hilly. Capital, Burkesville. Pop. 7690.

Cumberland, a county in the S. W. of Maine. Area, 990 square miles. It is bounded on the S. E. by the Atlantic Ocean, and on the S. W. partly by the Saco River. It contains Sebago Lake and other smaller ponds. It is traversed by several railroads, which meet at Portland, the capital. The soil is fertile. Cattle, grain, and wool are raised. Manufactures and commerce are extensive, the former embracing carriages, lumber, leather, metallic wares, clothing, saddlery, cooperage, etc. Casco Bay here affords facilities for navigation. Pop. 82,021.

Cumberland, a county in the S. S. W. of New Jersey. Area, 480 square miles. It is bounded on the S. W. by Delaware Bay, and intersected by Maurice River. The surface is nearly level. Grain and wool are staple products. It has manufactures of lumber, iron, copper-wares, etc. It is intersected by the West Jersey and New Jersey Southern R. Rs. Capital, Bridgeton. Pop. 34,665.

Cumberland, a county in S. Central North Carolina. Area, 850 square miles. It is intersected by Cape Fear River. The soil is mostly fertile. Wool and corn are raised. The western part is based on granite. Pine lumber, tar, rosin, and turpentine are exported from this county. Capital, Fayetteville. Pop. 17,035.

Cumberland, a county in the S. of Pennsylvania. Area, 545 square miles. It is bounded on the E. by the Susquehanna River, and on the N. by the Blue Mountain. Between this ridge and the South Mountain lies the fertile Cumberland Valley, of limestone formation. Cattle, grain, and wool are raised. There are manufactures of flour, leather, furniture, carriages, saddlery, clothing, etc. etc. It is intersected by the Cumberland Valley R. R. Capital, Carlisle. Pop. 43,912.

Cumberland, a county in E. Central Tennessee. Area, 550 square miles. It is drained by Daddy's Creek. The surface is hilly or mountainous. Tobacco and wool are staple products. Capital, Crossville. Pop. 3461.

Cumberland, a county in Central Virginia. Area, 310 square miles. It is bounded on the N. by James River, and on the S. E. by the Appomattox. The surface is undulating. Tobacco and grain are staple products. Capital, Cumberland Court-house. Pop. 8142.

Cumberland, a township and village of Clark co., Ill. Total pop. 1469.

Cumberland, a township and post-village of Cumberland co., Me. The village is on the Maine Central R. R., 12 miles N. of Portland. Total pop. 1626.

Cumberland, the county-seat of Allegany co., Md., is romantically situated on the Potomac. In population and commerce it is the second city in the State. It is the head of navigation of the Chesapeake and Ohio Canal (leading to Georgetown, D. C.) and the shipping-point for the semi-bituminous coal produced in the vicinity, and which constitutes the principal traffic of that canal. It is 178 miles W. by N. from Baltimore, and is the point of intersection of the Baltimore and Ohio and Pittsburg and Connellsville R. Rs. The Cumberland and Pennsylvania R. R., with its Eckhart branch, also centres here, and affords an additional outlet to the East and North, *viâ* the Pennsylvania system of railways. Its manufacturing industries comprise extensive rolling-mills for rails and bars and factories for other railroad iron, a factory for the manufacture of steel, foundries, machine-shops, flour and cement mills, and numerous minor enterprises. It has one State and two national banks, and two daily and three weekly newspapers. Its mercantile interests employ a large capital. Its hotels are numerous, the "Queen City Hotel," built by the Baltimore and Ohio R. R., being very large and well furnished. Its churches are also numerous; some of them are fine specimens of architectural beauty. An admirable system of waterworks (on the Holly plan) furnishes an abundance of water and good fire protection. The steadily developing coal-trade and its growing iron industries form the chief sources of its prosperity. Pop. 8056; of Cumberland township (No. 13), 1324; (No. 6), 1272. W. E. WEBER, ED. AND PUB. "ALLEGANIAN."

Cumberland, a post-village of Spencer township, Guernsey co., O. Pop. 319.

Cumberland, a township of Adams co., Pa. P. 1455.

Cumberland, a township of Greene co., Pa. P. 1768.

Cumberland, a township and village of Providence co., R. I. The village is on the Providence and Worcester R. R., 10 miles N. of Providence. It has one national bank. Total pop. 3882.

Cumberland, a township and village of New Kent co., Va., 20 miles E. of Richmond. Pop. 1249.

Cumberland (WILLIAM AUGUSTUS), DUKE OF, the third son of George II., king of England, was born April 26, 1721. He commanded the allied army which was defeated by the French at Fontenoy in 1745. He defeated the army of the Pretender at Culloden in April, 1746, and was censured for his cruelty in that battle. During the Seven

Years' war he commanded an English army, which was defeated at Hastembeck in 1757. Died Oct. 31, 1765.

Cumberland and Teviotdale, DUKE OF (Great Britain, 1799), and earl of Armagh (Ireland, 1799), are titles borne by the ex-king of Hanover, who is a prince of the blood in Great Britain, being first cousin to Queen Victoria. His full name is GEORGE FREDERICK ALEXANDER CHARLES ERNEST AUGUSTUS. He was born at Berlin May 27, 1819, and was married Feb. 18, 1843, to the princess Alexandrina Marie of Saxe-Altenburg. He succeeded to the throne of Hanover Nov. 18, 1851, as George V., on the death of his father, Ernest Augustus. He took sides with Austria against Prussia in 1866, and in consequence was deprived of his kingdom, which was annexed to Prussia by decree Sept. 20, 1866. The ex-king is blind, but is a good musician.—His eldest son and the heir to the dukedom is PRINCE ERNEST AUGUSTUS, born Sept. 21, 1845.

Cumberland Court-house, a post-village, capital of Cumberland co., Va.

Cumberland Gap, a narrow pass through the Cumberland Mountains, on the line between Kentucky and Tennessee and at the western extremity of Virginia. It was an important strategic point in the late civil war, and was strongly fortified by the Confederates. It was abandoned by them Jan. 18, 1862, and on the same day was occupied by the national troops under Gen. G. W. Morgan. In Aug., 1862, Gen. E. Kirby Smith outflanked this position by a march through Big Creek Gap, and Gen. G. W. Morgan in consequence was compelled to destroy and evacuate the works. He was hotly pursued northward by a force of Confederates under John H. Morgan. On Sept. 9, 1863, Gen. Frazer, who held the gap with a brigade of Buckner's troops, surrendered after a siege of only four days to Gen. Burnside's troops. The gap itself is a cleft 500 feet deep, and in some places is only wide enough for a road. If well provisioned, it might have been held by a small force against any opposing army.

Cumberland Island, of North America, forms a portion of that coast of Davis Strait which lies between Hudson's Strait and Lancaster Sound.

Cumberland Mountains, a range of the Appalachian system, forming part of the boundary between Virginia and Kentucky. The range extends in a generally S. W. direction across Tennessee, dividing East from Middle Tennessee. These mountains here form an elevated plateau, seldom over 2000 feet high, but at some points nearly 50 miles across. North-eastern Alabama and North-western Georgia are broken by the southernmost extremity of the range. The Cumberland Mountains abound in caves, and in Tennessee they are very rich in coal and iron, containing nearly all the coal this State affords. The range in Tennessee has been described as capable of furnishing "a highway from Kentucky to the Alabama line along its flat top, along which a traveller may pass without once descending, or even without discovering at any time his elevation." On both sides the plateau breaks off in steep sandstone cliffs, the western side much notched, the eastern quite regular. Its immediate sides are from 800 to 1000 feet high on either side. There are places where its upper surface is much broken by ridges and valleys. The iron deposits of this region are very remarkable, and there is every prospect that from the vast mineral wealth, delightful and healthful climate, good soil, and other great natural advantages, the Cumberland Mountain region of Tennessee will become one of the most wealthy and populous regions of the U. S.

Cumberland Presbyterian Church, The, is a growth of the present century. In 1797 a very remarkable revival of religion began to develop itself in South-western Kentucky. The principal minister connected with its early developments was Rev. James McGready. Mr. McGready was a Presbyterian, and was educated in Western Pennsylvania, at what became afterwards Jefferson College, but he commenced his ministry in North Carolina. He was a man of unusual earnestness and power in the pulpit. His earnestness and zeal brought him into collision with the community in which he was laboring. The result was a removal from North Carolina to Kentucky in 1796. He was settled in charge of three congregations—two in Logan co., Ky., Gaspar River and Little Muddy River; and one in Tennessee, Red River, near the dividing-line between the two States.

Mr. McGready's great zeal soon began to show itself in his new field of labor, and in order to bring his people into sympathy and co-operation with him, he proposed to them a written covenant, which they were to subscribe as a pledge of their earnest intention to fulfil its conditions. The measure was an incipient effort towards what was felt to be so necessary—a *great revival of religion.* A copy of this covenant is embodied here, as an illustration of the views and feelings, at the time, of a country pastor and a Christian people, surrounded as they were by a literal and a spiritual wilderness. "When we consider," say the covenanters, "the work and promises of a compassionate God to the poor lost family of Adam, we find the strongest encouragement for Christians to pray in faith—to ask in the name of Jesus for the conversion of their fellow-men. None ever went to Christ, when on earth, with the case of their friends that were denied, and although the days of his humiliation are ended, yet for the encouragement of his people he has left it on record 'that where two or three agree upon earth to ask anything in prayer, believing, it shall be done.' Again, 'Whatsoever ye shall ask the Father in my name, that will I do, that the Father may be glorified in the Son.' With these promises before us we feel encouraged to unite our supplications to a prayer-hearing God for the outpouring of his Spirit, that his people may be quickened and comforted, and that our children, and sinners generally, may be converted. Therefore, we bind ourselves to observe the third Saturday in each month for one year as a day of fasting and prayer for the conversion of sinners in Logan county and throughout the world. We also engage to spend one half hour every Saturday evening, beginning at the setting of the sun, and one half hour every Sabbath morning, beginning at the rising of the sun, in pleading with God to revive his work."

This covenant was evidently not a mere formality. The hearts of the preacher and people were in it. In May of 1797 occurred the first developments of the desired work. It is remarkable, too, that its first appearance was in the case of a female member of the church. She was in full communion, but was led to a re-examination of the ground of her hopes, and the result was a conviction that she "was still in the gall of bitterness and in the bond of iniquity." She sought and found peace and joy in believing. This was a beginning. This occurrence, and a great many like it, made the impression upon the mind of Mr. McGready that a large proportion of the membership of the church were strangers to true religion. This impression gave a coloring to his preaching which it retained as long as he lived. He was terribly severe upon what he regarded as mere formalism. To have a name to *live,* and still to be *dead,* was to him the worst of conditions.

The work advanced slowly until 1799. In this year, at the customary sacramental meeting at Red River in July, there was a great movement. Says Mr. McGready: "Great solemnity pervaded the congregation from first to last, and particularly on Monday the presence of God had an overwhelming influence upon the assembled crowd. The boldest and most daring sinners in the country hid their faces and wept bitterly; and such were the deep impressions made upon their minds that when the congregation was dismissed many remained around the doors of the church, unwilling to retire." They were called back into the house; the preachers encouraged and prayed for them, and many were converted. In the following month, at Gaspar River church, the work went forward in still greater power. The following are specimens: A woman in the assembly in deep distress sent for Mr. McGready, and addressed him thus: "Sir, I was a member of your congregation in North Carolina, and in full communion, but I was deceived; I have no religion, and am going to hell." "An aged man in great distress addressed his wife and children thus: 'We are all going to hell together; we have lived prayerless and ungodly lives; the work for the salvation of our souls is yet to be begun; we must all have religion or we will be damned.'"

In July of 1800 occurred the first camp-meeting that ever was held in Christendom. The plan of the meeting was suggested by the circumstances of the country, and the fact that vast crowds were in the habit of assembling at the sacramental meetings from distances varying from ten to a hundred miles. Great numbers professed religion at the camp-meetings and upon other occasions, and the work spread with wonderful rapidity and power over South-western Kentucky and what was called the Cumberland Country—now Middle Tennessee—lying adjacent.

A large element of the population of these countries was either Scotch-Irish or of Scotch-Irish descent, and the Scotch-Irish are generally Presbyterian in their religious proclivities. It was so in this case. The ministers who co-operated with Mr. McGready were Messrs. William McGee, Samuel McAdoo, William Hodge, John Rankin, Presbyterians, and Mr. John McGee, Methodist. These men were all of Scotch-Irish origin, and had emigrated from North Carolina. It may be mentioned here that when the Cumberland Presbyterian Church came to be fully organized nine-tenths of its ministry, and at least four-fifths of its membership, were of Scotch-Irish descent. This fact is mentioned that the reader may know something of the

material of which this communion was originally composed. Some characteristics are charged upon Cumberland Presbyterians which are in direct conflict with what would be inferred from their paternity. Everybody knows that a Scotch-Irishman is neither a patron of ignorance nor a fanatic in religion. Yet Cumberland Presbyterians have been charged with being fanatical in religion and the patrons of ignorance. Facts, as we shall see, as well as philosophy, vindicate them from the charge. It is utterly without foundation.

The rapid progress and widespread influence of the revival produced the necessity of organising a great many new congregations; and this, of course, created a necessity for more ministerial laborers. The Presbyterian Church could not supply them in the ordinary way. There were no schools, and if schools had been abundant the congregations could not wait until young men would be able to go through such a course of literary and theological training as is customarily required in the Presbyterian Church preparatory to licensure and ordination. No one complained of the requisition, but its fulfilment seemed impracticable under the circumstances. The patriarch* of Presbyterianism in Kentucky visited the region of the revival, and seeing the necessities of the congregations, advised the ministers and leading laymen of the Church to select such young men as they thought promised usefulness, and direct their attention to the work of the ministry, although they might not be able to obtain what was considered a full ministerial education. The counsel seemed practical, and three young men at first were encouraged to prepare themselves for the work as well as they could. These young men presented themselves to the Transylvania Presbytery in Oct., 1801. The presbytery hesitated, but at length, in Oct., 1802, they were all licensed as probationers for the holy ministry. At the same presbytery two others were received as candidates for the ministry. Opposition, however, at once developed itself. In Oct., 1802, the Transylvania Presbytery was divided, and the Cumberland Presbytery was formed, embracing the more immediate region of the revival. The Cumberland Presbytery from time to time licensed a few others and ordained two or three. These were all what were called uneducated men; they were all, however, men of promise, and some of them became distinguished in subsequent years. The opposition was continued in the new presbytery.

There was difficulty from another source. The revival ministers were warm-hearted, and controlled less by theological and technical than by practical, and what they regarded as spiritual, considerations. The young men, too, had not learned to split all the metaphysical hairs of theology, and there were some expressions in the Confession of Faith which seemed to them to teach the doctrine of fatality. This they could not receive, and were allowed to except to it in their licensure and ordination.

There were thus two subjects of dissension between the parties: one was educational, the other theological. The revival ministers did not object to education for the ministry, but to the rigid application of the rule in the circumstances surrounding them. The young men did not object to the Confession of Faith, but to those expressions in it which seemed to them to imply the doctrine of fatality. Their warm-hearted and liberal fathers thought proper to indulge them in their skepticism on this subject. They adopted the Confession of Faith with the single exception. The difficulties became serious, and were finally brought before the synod of Kentucky. The synod of 1804 appointed a committee to attend a meeting of the Cumberland Presbytery and inquire into the condition of things. None of the committee fulfilled the appointment except one, and he was notoriously a persecutor of the presbytery, and was regarded as a spy. Nothing good, of course, resulted. The synod at its next meeting, in 1805, appointed a commission consisting of fifteen members to visit the region in which the difficulties existed, to confer with the Cumberland Presbytery, and to endeavor to restore quiet and harmony. The commission met on Dec. 3, 1805, at Gaspar River meeting-house, in Logan co., Ky. The first measure of the commission was to require of the presbytery a surrender of all the young men who had been licensed and ordained in what they regarded a questionable manner, for a re-examination by the commission, with a view to a confirmation or an annulling of the proceedings of the presbytery in each particular case. It is to be borne in mind that several of the men thus required to be surrendered to the commission were themselves members of the presbytery. The presbytery declined compliance, upon the ground that the constitution of the Presbyterian Church gives to the presbytery alone the power "to examine and license candidates for the holy ministry; to ordain, install, remove, and judge ministers;" that it gives no such power to a synod, much less to a commission of synod, nor to any other judicature of the Church. The commission then called upon the young men to submit themselves for re-examination; they also declined, whereupon the commission passed the following resolution: "*Resolved*, That as the above-named persons never had regular authority from the presbytery of Cumberland to preach the gospel, etc., the commission of synod prohibit, and they do solemnly prohibit, the said persons from exhorting, preaching, and administering the ordinances, in consequence of any authority which they have received from the Cumberland Presbytery, until they submit to our jurisdiction and undergo the requisite examination."

The names of the persons thus proscribed are omitted as a convenience. Four of them were ordained ministers and members of the presbytery; the others, eight in number, were either licentiates, candidates for the ministry, or exhorters. The presbytery took the ground in the controversy that the proceedings of the commission were unconstitutional, and of course that the proscribing act was unconstitutional and void. Nevertheless, from a general respect to authority, and from an obvious desire to procure a reconciliation, and enjoy peace and quietude as far as possible, both the proscribed members, and those who had promoted their induction into the ministry and sympathized with them, constituting a majority of the presbytery, organized themselves into what they called a *council*, determining in this manner to endeavor to carry forward the work of the revival, to keep the congregations together, but to abstain from all proper presbyterial proceedings, and await what they thought would be a redress of their grievances. The synod of Kentucky at its sessions in 1806 dissolved the Cumberland Presbytery, and annexed the members who had not been placed under the ban of the commission to the Transylvania Presbytery.

The council continued their organization from Dec., 1805, to Feb., 1810. By that time they became satisfied that they had nothing to hope either from the synod or the General Assembly. As a last resort, and in order to save what they represent to the General Assembly as "every respectable congregation in Cumberland and the Barrens of Kentucky," two of the proscribed ministers, Finis Ewing and Samuel King, assisted by Samuel McAdam, one of those who had been placed under an interdict by the commission for his participation in what they denominated the irregularities of the presbytery, reorganized the Cumberland Presbytery at the house of Mr. McAdam, in Dickson co., Tenn., on the 4th of Feb., 1810. It was organized as an independent presbytery. It will be observed that it was a reorganization of a presbytery which had been dissolved, and which had received its name from its locality. The Church which grew up from these beginnings naturally took the name of its first presbytery as a prefix. Hence this Church is called, from the circumstances of its origin, "The Cumberland Presbyterian Church." It extends now from Pennsylvania to the shore of the Pacific, but it originated in what was called, at the time, the "Cumberland Country" and from the Cumberland Presbytery. It is hoped that these details will not be considered useless. They are intended to enable the reader to understand what most readers remote from the scene of the transactions do not understand—that a Church of some extent should be so local in its name. The name suggests nothing connected with the denomination except the locality of its origin, and this was accidental, or rather providential.

The new presbytery immediately set forth a synopsis of its theology and the principles of action by which it proposed to be governed. Its theology was Calvinistic, with the exception of the offensive doctrine of predestination, so expressed as to seem to embody the old pagan dogma of *necessity* or *fatality*. Its rules of action were to be presbyterial.

There is no probability that these good and earnest men had any adequate conception of what became the magnitude of the work upon which they were entering. They hardly thought of anything beyond an organization which would enable them, and perhaps their immediate successors, to labor with greater vigor and efficiency in promoting the work to which they thought God in his providence and by his Spirit had called them. We judge now that they did not think of originating a Church, but simply a presbytery. But God rules, and we have a thousand evidences that he ruled in this case.

The new presbytery held its first adjourned meeting in March, the month following its organization. There were present four ordained ministers, six licentiates, and seven candidates for the ministry. These men constituted really the fathers and founders of the Cumberland Presbyterian Church. At the fourth session of the presbytery, held in Oct., 1811, a committee was appointed to meet committees

* Rev. David Rice.

from two of the neighboring presbyteries of the Presbyterian Church, with a view to "conferring on the subject of a reunion, and other matters relative to that harmony which should exist between the members and people of Jesus Christ." This well-meant measure, however, failed of any good effect. Early in the year 1813 the presbytery had become so large that it divided itself into three presbyteries, and constituted the Cumberland Synod. This synod, at its sessions in 1816, adopted a Confession of Faith, catechism, and system of church order in conformity with the principles avowed upon the organization of the presbytery. The Confession of Faith is really a modification of the Confession of Faith of the Presbyterian Church. It was intended by the framers to exclude only the offensive doctrine which had been a principal cause of all the difficulties. The government is Presbyterian.

In 1826 its first college was organized under the supervision of the Church. It was located at Princeton, Ky. It was a manual-labor school. In 1830 its first paper was published under the patronage of the Church. It was a weekly religious and literary journal, also published at Princeton. In 1828 the Cumberland Synod was divided into three synods, and a General Assembly succeeded. The first meeting of the Assembly was held in May, 1829.

At the last meeting of the General Assembly, which was held in May, 1873, there were reported 24 synods, 100 presbyteries, 1223 ministers, 2212 congregations, 98,408 communicants, 59,932 persons engaged in Sabbath school work, and $475,267 in contributions to church purposes. All these estimates are made from defective reports. The stated clerk of the General Assembly says that they would be increased by full reports. Probably a full estimate would place the membership at 120,000.

The Church has under its patronage three weekly newspapers, one quarterly, and two monthlies—one devoted to the interest of females. It has also under its patronage three chartered universities and several colleges, both male and female and mixed. Two of its universities give instruction to both males and females; the other has regular collegiate, theological, law, and medical departments. Cumberland Presbyterians make no great parade of their character, numbers, or work, but they are willing that the world should know both what they are and what they do.

RICHARD BEARD.

Prof. of Theology Cumberland University, Lebanon, Tenn.

Cumberland River, an affluent of the Ohio, rises among the Cumberland Mountains in Kentucky, near the S. E. boundary of that State. It flows nearly westward, crosses the southern boundary of Kentucky, describes an extensive circuit in Middle Tennessee, passes by Nashville, and returns into Kentucky. It afterwards flows northwestward, and enters the Ohio at Smithland. The Cumberland and Tennessee rivers are only about 3 miles apart at a point nearly 20 miles from Smithland. Length, estimated at 650 miles. Steamboats can ascend it to Nashville, about 200 miles from its mouth, and it is navigable above Nashville, at certain seasons, 400 miles.

Cumberland University, at Lebanon, Tenn., belonging to the Cumberland Presbyterians, was founded in 1842. Its presidents have been as follows: F. R. Cossitt, D. D., 1842–44; T. C. Anderson, D. D., 1844–66; B. W. McDonnold, D. D., LL.D., 1867. Its departments are—arts, theology, medicine, natural science, commercial and polytechnic, preparatory. Whole number of graduates, 1260. Amount of "Ball endowment" subscribed, $250,000. Volumes in libraries, 8000. Price of tuition in college, per session, $35. Boarding in clubs, the prevailing method, costs $10 per month. B. W. McDONNOLD.

Cumberland Valley, a post-township of Bedford co., Pa. Pop. 1357.

Cum'bre, La (the summit), a principal pass across the Andes, between Santiago in Chili and Mendoza in the Argentine Republic. Elevation, 12,454 feet above the level of the sea. Men travelling on foot can pass over the Cumbre from May to the end of October.

Cum'bria [named from the CYMRY (which see), its ancient inhabitants], an ancient British principality, comprising Cumberland in England and that part of Scotland which now forms the counties of Ayr, Dumbarton, Dumfries, Lanark, Peebles, Renfrew, and Selkirk. It was ruled by its own kings until about 950 A. D. Scottish Cumbria then became the kingdom of STRATHCLYDE (which see).

Cum'brian Moun'tains, a range or group of mountains in the N. of England, occupying parts of Cumberland, Westmoreland, and Lancashire. This region, called the "English Lake District," is remarkable for its picturesque scenery, and is much frequented by tourists. Here are numerous lakes, the largest of which are Windermere and Ulleswater. These mountains are mostly formed of granite and Silurian rocks. The highest point, Sca Fell Pike, rises 3166 feet above the sea.

Cum'ing, a county in the N. E. of Nebraska. Area, 400 square miles. It is intersected by the Elkhorn River. The surface is undulating; the soil is fertile. Grain and wool are raised. Extensive prairies occur here. It is intersected by the Sioux City and Pacific R. R. Capital, West Point. Pop. 2964.

Cuming City, a post-township of Washington co., Neb. Pop. 543.

Cum'min- (or **Cumin-**) **Seed** [Lat. *cuminum*], the fruit of the *Cuminum Cyminum*, a plant belonging to the order Umbelliferæ. It is the only known species, and is found in Egypt and the adjacent countries. It is an annual with branched stem, thread-like leaves, with umbels of small white or pink flowers. It has been cultivated from remote times for the sake of its seeds, which have an aromatic taste somewhat resembling caraway. In Germany and Holland it is used in cookery. As a medicine it is mostly limited to veterinary practice. It is cultivated in Northern Africa, India, and Southern Europe; but the seed are mostly imported from Sicily and Malta. Oil of cummin is abundantly obtained from the seed. The oil of cummin consists of a mixture of two distinct oils, one called cymene ($C_{20}H_{14}$); the other regarded as a hydride of cumyl ($C_{20}H_{11}O_2.H$). This oil is of a strong bitter, disagreeable taste, with the general properties of the other essential oils.

Cum'ming, a post-village, capital of Forsyth co., Ga., about 40 miles N. N. E. of Atlanta. Gold is found in the vicinity. Pop. 267.

Cumming (ALEXANDER), a Congregational minister, born in Freehold, N. J., in 1729, was ordained to the Presbyterian ministry in New York in 1747, and preached in New York 1750–53, when he was relieved at his own request of his colleague pastorate. In 1761 he was ordained colleague pastor of the Old South church, Boston, Mass., where he thenceforth remained. He died Aug. 25, 1763.

Cumming (ALFRED), a Confederate brigadier-general, was born in Georgia in 1829, graduated at West Point in 1849, became captain in the Tenth U. S. Infantry in 1856, resigned in 1861, entered the Confederate service, and fell at the battle of Jonesboro', Ga., Sept. 1, 1864.

Cumming (JOHN), D. D., F. R. S. E., a popular Scotch preacher, born in Aberdeenshire Nov. 10, 1810. He became in 1833 minister to the Scottish church in Crown court, Covent Garden, London. He has published interpretations of the apocalyptic prophecies, "The Great Tribulation," "The Destiny of Nations," etc. He also is a zealous opponent of the Roman Catholic Church and a defender of the National Church of Scotland.

Cumming (ROUALEYN GORDON), known as the "lion-hunter," was born at Altyre, Scotland, Mar. 15, 1820. He was the son of a baronet, was educated at Addiscombe, and entered a cavalry regiment in the East India service, and afterwards took a commission in the Cape Mounted Rifles in South Africa. While there he distinguished himself by his exploits in killing lions, elephants, and other wild beasts. Of his surprising adventures he wrote an account in book-form, which was highly popular, but after a time fell into a discredit which it hardly deserved. He afterwards became a popular lecturer in Great Britain upon sporting subjects. Died Mar. 24, 1866.

Cumming (WILLIAM), U. S. A., was born in Georgia in 1788, became in 1813 major of the Eighth U. S. Infantry, was wounded at Chrystler's Fields, Nov. 11, 1813, became colonel and adjutant-general in 1814, was wounded a second time at Lundy's Lane, and in 1847 declined a major-generalship. A lawyer by profession, he never practised, being the possessor of a large fortune. In a political contest with George McDuffie of Georgia he was involved in a duel, in which McDuffie was wounded in the shoulder. Died at Augusta, Ga., in Feb., 1863.

Cum'mings, a township of Lycoming co., Pa. P. 277.

Cummings (A. B.), U. S. N., born June 22, 1830, in Pennsylvania, entered the navy as a midshipman April 7, 1847, became a passed midshipman in 1853, a lieutenant in 1855, and a lieutenant-commander in 1862. He served in the steamer Richmond at the passage of Forts Jackson and St. Philip and capture of New Orleans, April 24, 1862, at the passage of Vicksburg, June 28, 1862, and in the engagement with the batteries at Port Hudson, Mar. 14, 1863, where he fell mortally wounded "while he was cheering the men at the guns." The loss which the country and the navy sustained in the death of this gallant officer may be gathered from the following extract from the address of Captain Alden to the officers and crew of the Richmond on Mar. 22, 1863: "With deep sorrow I call you together to announce the death of our late executive officer, Lieutenant-

Commander A. B. Cummings, at New Orleans. It has pleased God to take from among us our gallant friend in the fulness of his energies and usefulness. You all well know the importance of his services in this ship; his conscientious devotion to duty; his justice and even temper in maintaining discipline; his ability in preparing for emergencies, and his coolness in meeting them. All these qualities he brought to his country in the hour of need, and he has sealed his devotion with his life. The fatal cannon-shot struck him when he stood on the bridge, cheering the men at their guns and directing their fire. He was thrown down upon the deck, but his presence of mind still remained. He said, 'Quick, boys! pick me up; put a tourniquet on my leg; send my letters to my wife; tell her I fell in doing my duty.' When below he said to the surgeon, 'If there are others worse hurt, attend to them first. Nolan, are you here, too?' He inquired about Howard, and his thoughts were directly of others and of success in the fight. When told that the noise he heard was from the escape of steam, and that the ship could no longer stem the current, he exclaimed, 'I would rather lose the other leg than go back; can nothing be done? There is a S. wind; where are the sails?'"

FOXHALL A. PARKER, U. S. N.

Cummings (JOSEPH), D. D., LL.D., a Methodist Episcopal theologian, was born at Falmouth, Me., Mar. 3, 1817, and graduated at Wesleyan University in 1840, entered the ministry in 1841, became in 1853 professor of theology in the biblical institute at Concord, N. H., was president of Geneva College (1854–57), and in the latter year became president of Wesleyan University, at Middletown, Conn.

Cum'mington, a post-township of Hampshire co., Mass., the birthplace of the poet Bryant, of Hon. H. L. Dawes, of Luther Bradish, and of Dr. Thomas Snell, the historian and divine. It has manufactures of importance. Fine water-power is furnished by the Westfield River. The town has three churches, and an excellent public library, presented to the town by Mr. Bryant. Pop. 1037.

Cum'mins (FRANCIS), D. D., born near Shippensburg, Pa., in 1752, was one of the framers of the Mecklenburg Declaration of Independence (May, 1775), and in 1780 was licensed by the presbytery of Orange, N. C., to preach. For many years he was the honored pastor of Presbyterian churches in the Carolinas and Georgia. Died Feb. 22, 1832, at Greensboro', Ga.

Cummins (GEORGE DAVID), D. D., an American clergyman, was born near Smyrna, Del., Dec. 11, 1822. He was graduated from Dickinson College in 1841, and was a licentiate in the Methodist Episcopal Church for two years. In 1845 he studied for orders in the Protestant Episcopal Church, in October of the same year was ordained a deacon, and in 1847 a presbyter. For six years he was rector of Christ church at Norfolk, Va., and then successively rector of St. James's church, Richmond, Trinity church, Washington, St. Peter's church, Baltimore, and Trinity church, Chicago. In 1866 he was elected assistant bishop of Kentucky. In Nov., 1873, he resigned his position, withdrew from the Protestant Episcopal Church, and founded the Reformed Episcopal Church, of which he was made presiding bishop Dec. 2, 1873. Died at Lutherville, Md., June 26, 1876. J. B. BISHOP.

Cummins (MARIA S.), a popular novelist, was born at Salem, Mass., April 10, 1827. Her most successful novels were "The Lamplighter" (1853), "Mabel Vaughan" (1857), and "El Fureidis" (1860). The first mentioned had a sale of 70,000 copies in a single year. Died Oct. 1, 1866.

Cum'ru, a post-township of Berks co., Pa. Pop. 2573.

Cunard' (Sir SAMUEL), BART., was born in Nov., 1787. He was the eldest son of a gentleman in Halifax, Nova Scotia. He became the head of the extensive firm of steamship owners, Cunard & Co. He married a lady of Halifax, and in 1859 was made a baronet. Died April 28, 1865, leaving eight children.—He was succeeded in the baronetcy by his son, Sir EDWARD, who married Miss Mary McEvers of New York. Sir Edward Cunard died April 6, 1869.—Sir BACHE CUNARD, the present baronet, was born May 15, 1851. He resides chiefly in the U. S. Became M.P. in 1874.

Cunax'a, the ancient name of a place in Babylonia, on the E. bank of the Euphrates, about 45 miles N. of Babylon. In 401 B. C. a battle occurred here between Artaxerxes Mnemon, king of Persia, and his brother Cyrus (the Younger), who was defeated and killed.

Cundinamar'ca, one of the United States of Colombia, separated by the Central Cordilleras from Antioquía and Cáuca on the W., by the Orinoco from Cáuca and Venezuela on the E., and bordering S. on Cáuca, and N. on Boyaca and Antioquía. The climate varies from the *tierra caliente* of the valleys to the *tierra fria* of the high plateaux, and the products are very abundant. The chief exports are tobacco and cinchona. Chief city, Bogotá. P. in 1870, 409,602.

Cunduran'go, or **Condurango,** a twining plant of the order Asclepiadaceæ, apparently belonging to the genus *Nautonia*, though its botanical relations are not well known. It grows in Ecuador, and has been sold in the U. S. and Europe at fabulous prices as a cure for cancer. It has, however, no favorable effect upon that disease, though it probably has active properties. Its name signifies "condor root," and it is believed by the Indians that the condor uses it as a medicine.

Cu'neiform [Lat. *cuneiformis*, from *cuneus*, a "wedge," and *forma*, "form"], having the form of a wedge; applied to one of the bones of the wrist and to three of the tarsus; also to certain wedge-shaped characters found on ancient monuments. (See next article.)

Cu'neiform (or Arrow-headed) Inscrip'tions. The cuneiform characters used in the Euphrates valley had their origin in a hieroglyphic or picture system of writing. A few inscriptions, in a more primitive style than usual, retain considerable resemblance to the original hieroglyphics, though most of the Assyrian inscriptions preserve very little resemblance to their original pictures. The ordinary characters are made up entirely of wedges, differently arranged, and ranging from a single one to a combination of twenty. Each character is either a syllable or a word, the analysis into consonant and vowel sounds being quite beyond the capacity of the Chaldean scribes. The choice of the wedge as the basis of all the characters is not arbitrary, but results from the employment of soft clay (instead of parchment), which was inscribed with a pointed stylus.

From the earliest historical period, as now, the Euphrates valley has contained races existing side by side, but speaking diverse languages. At present the Persian, the Arabic, and the Turkish represent the three great families of languages, the Indo-Germanic, the Shemitic, and the Turanian; and the same three families are represented by the languages which we find in the early trilingual cuneiform inscriptions—one being in the Turanian Accad language, another in the Shemitic Assyrian, and the third in the Indo-Germanic Persian, or Achæmenian.

The earliest civilization of the Euphrates was Turanian. It is indicated by the genealogy of Genesis x., which represents Asshur as having descended from Cush. This Turanian people, called *Accad*, invented the form of writing which, with the modifications produced by ages of use, was adopted by all the other languages about them. But not being originally an alphabet of simple sounds, but characters representing words, it naturally became encumbered in the transfer with a multiplicity of sounds, which has been a great stumbling-block to those who have not made the language a study.

Thus, for example, in Turanian the word *par* means "the sun," and had its appropriate hieroglyphic, afterwards abbreviated into a conventional character, consisting of one upright wedge with two very short parallel wedges set obliquely by its left side. The meanings "light" and "day" were naturally enough attached to the same character, just as we say that the *sun* is very bright when we mean that its *light* is brilliant, and as an Indian speaks of three *suns* when he means three days. Any other word besides *par*, signifying in Turanian "sun," "light," or "day," was attached to this hieroglyphic as its variant significations and pronunciations. When the character was transferred into the Assyrian language, it kept its significations, but utterly altered its pronunciations. In its sense of "the sun," from *par* it became *samas;* in its sense of "day," it became *imma;* and so with other significations. The same was true in its transfer to the Persian. But another stage of change remains, the syllabic.

It was a very simple step to abbreviate the sound allowed to a character. Thus, in Accad the word *Annap* means God, and is represented by two successive short horizontal wedges followed by a longer upright one. This character was not only employed to represent the idea of God, pronounced *Annap* in an Accad and *Ilu* in an Assyrian inscription, but also to represent the first syllable *an* of *Annap*. In a similar way the character pronounced *pil*, "ear," in Accad, came to represent the simpler syllable *pi*. There were thus as many simple syllables formed as could be made by the combination of twenty consonants with three vowels; it being remembered, however, that when the consonant followed the vowel no distinction was made between the different consonants of a class, whether sibilant, labial, dental, or guttural. Thus *ab* and *ap* are represented by the same character, and so is *as*, *az*, and *a* followed by either one of two other sibilants. When these simple syllables were combined to form words, it became necessary to duplicate the vowel sound of a closed syllable, as in the word *habba*, "sea," which is written with the characters pronounced *ha-ab-ba*.

These different stages of writing will be more or less com-

bined in any Assyrian inscription, so that we may have in the same line simple syllables, like those in *ha-ab-ba*, "sea," complex syllables, like those in *gul-lul-tuv*, "curse," and ideographic signs, like that for *rabu*, "great." And a single sign may have several different values; and cases occur in which, by a perversity of the scribes, the same character is used in two successive syllables of the same word with different values, the practice which allows us to pronounce *viz* one way in "vizier," and another in the contraction for "namely," being carried to an extreme extent, so that there are cases of polyphony in which a single character has as many as five or six distinct values.

The complexity of the Assyrian system of writing is so great that there was for a long time much skepticism about the trustworthiness of the decipherment, although there is scarce a feature of the system that is not paralleled in the existing Japanese writing. But the proofs of its correctness are beyond cavil. They are found in trilingual inscriptions of considerable length, where it is easy to compare the Assyrian with the Persian; in some long inscriptions of which we have a large number of copies, and in which the scribes have written the same word in several different ways, more or less contracted; and finally in the extensive syllabaries are grammatical texts of the monuments, which were prepared, as we prepare dictionaries and spelling-books, for the instruction of learners, and which explain the values of the characters. The proof of the correctness of these readings was first given, so as to make it beyond reasonable question, in 1857, when Sir Henry Rawlinson, William H. Fox Talbot, Esq., Rev. E. Hincks, D. D., and Doctor Jules Oppert prepared independent translations from copies of a long inscription of Tiglath-Pileser. These translations were transmitted in sealed packets to a committee of the Royal Asiatic Society, and opened and compared by them. It was found that they were so nearly identical that it was preposterous to suppose that the true foundation had not been laid for the decipherment of the inscriptions. The amount of these inscriptions collected by Botta and Layard is very great, and includes the complete historical annals of several kings, embracing the details of their various campaigns, a very large number of grammatical and lexicographical tablets, legal and commercial documents, such as bills of sale, despatches to the king from the generals in the field, chronological tables, accounts of eclipses and lunar conjunctions, and indeed almost everything that a people greatly given to writing would care to record. The fortunate discovery of libraries or record-chambers of Sennacherib and Assurbanipal has been of incalculable service.

Language.—Its entire vocabulary and its grammar clearly prove that the Assyrian language belongs to the Shemitic family, and to the same branch of it as the Hebrew and Phœnician, rather than to the Aramæan or to the Arabic branch. And yet it preserves many forms which are nearly or quite obsolete in Hebrew, such as the three case-endings of the noun, and the conjugations of the verb formed with *s* and *t*. The Assyrian is peculiar in its exceedingly rare use of the perfect (preterite) tense. So rarely is it used that the French scholars deny its existence entirely. A large majority of the roots are the same as in Hebrew; the sibilants are preserved, and not changed into dentals, as in Aramaic, which is considerably more remote from the Assyrian than is the Arabic.

Mythology.—The chief Assyrian deity was Asshur, called "chief of the gods," and replaced in Babylon by a deity called *Il* or *Ra*. It is remarkable that no temples were built to this tutelary god of Assyria, although the oldest capital of the country, built before Nineveh, and the country itself, bear his name. His emblem was a winged circle enclosing or surmounted by a human bust.

Subordinate to Asshur is the triad of Anu, Bel, and Hea or Ao, also called Sin. Anu was a very old deity, and in later mythology seems to have presided over the lower regions, and perhaps to have ruled Chaos. Bel, the organizer of the world, judging from his Shemitic name, meaning "lord," corresponds to the Roman Jupiter. Hea, or Ao, is the god of wisdom, the Oannes of Berosus. To this trinity succeeds another, consisting of Iva (Bin), the "æther;" Shamas, the sun; and Sin, the moon. The five planets were identified with the gods Ninip (Adar?), Saturn; Merodach, Jupiter; Nergal, Mars; the goddess Ishtar, Venus; and Nebo, Mercury. With most of the gods were connected corresponding female divinities, of whom the best known is Beltis, wife of Bel, who is the Mylitta of Greek writers, in whose temple every Babylonian woman was obliged to prostitute herself once in her life.

The ancient Babylonians were familiar with the story of the Deluge, as is proved by some very curious mythological tablets lately deciphered by Mr. George Smith, and probably reaching back to the extreme antiquity of over 2000 B. C. In this story Sisit (the Xisuthrus of Berosus) takes the place of Noah, and is warned by Hea to build a ship, that he and his family and individuals of all the animals may escape a flood sent to punish the wickedness of men. The vessel is calked with bitumen and roofed with reeds. Its dimensions are missing, but its breadth and height, unlike those of the biblical ark, are equal. Unlike the ark, it has a pilot. The rain lasts but seven days, and the birds sent out are a dove, a swallow, and a raven. The ark rests on the mountains east of Babylon, when the god lets Sisit and the animals out, and he offers a sacrifice. As a reward for his services he receives the gift of immortality. This story of the Deluge is on the eleventh of twelve tablets, of which one was for each month, this being for the "rainy month."

History.—The most important result of the decipherment of the cuneiform inscriptions is the addition of an almost entirely new chapter to the history of the ancient world. The Babylonians and Assyrians, unlike the early Hindoos, were exceedingly careful to preserve their historical records for posterity. Hundreds of copies exist of a single inscription giving an abstract of the victories of Assurnazirbal; and the very bricks of which a palace was built were stamped with the name of the ruling monarch. The fragmentary and contradictory accounts of Berosus, Ctesias, etc. have been supplemented by an immense mass of contemporary records, quite complete in some reigns, from which we can gain a very clear view of the rise and fall of the Assyrian and Babylonian powers.

The earliest dynasty was an indigenous one, called by various authors Accad, Chaldæan, or Cushite. It began about 2200 B. C., and the names of a few kings are preserved, among whom are Ur-hammu (perhaps the Orchamus whom Ovid reports to have been the seventh after Bel), his son Ilgi, Ismidagon, and Hammurabi, extending to the middle of the sixteenth century B. C., when Thothmes III. overran Mesopotamia, and established a line of Egyptian rulers whom Berosus calls Arabian. After two or three centuries, during which the Egyptians were paramount, we meet the name of Assur-bel-nisis as the founder of the first Assyrian dynasty. He was an insignificant ruler, like his immediate successors, and not till Tiglath-ninip I., about 1300 B. C., was Babylon conquered by the king of Nineveh. Of his successors the most powerful was Tiglath-Pileser I., whose history is quite fully given, and who conquered the Moschi of the Black Sea, Armenia, Western Media, the Syrian Hittites, and a portion of the Phœnician coast. He records it as an extraordinary exploit that he entered a vessel of Aradus and killed a dolphin with his own hand. After some reverses in attempting to subdue the revolted city of Babylon, he succeeded in recovering for Nineveh the political supremacy. His third successor, Assur-rabu-amar, was conquered about 1070 B. C. by the Hittites, and lost all his Syrian conquests, thus allowing the development of the Jewish kingdom under David and Solomon.

The earlier kings of a second Assyrian dynasty, beginning with the usurper Beletaras, are obscure, but with one of them, Vul-nirari II., chronology becomes certain, as we have a nearly complete list of the eponyms for each year for some centuries after his reign, with the names of the corresponding kings, the Assyrians having the habit of naming each year after some public functionary, who corresponded in this respect to the Greek archons and the Roman consuls. The first king of note is the great conqueror Assurnazirpal, who carried his arms to the Mediterranean Sea on the west, and into Media and Persia on the east. His son, Shalmaneser II., extended his conquests —or rather his campaigns, which often issued in only a temporary subjection—into regions beyond those visited by his father, but the most interesting are those in which he conquered Benhadad and Hazael, the successive kings of Damascus, the former of whom was aided by 10,000 troops from Ahab, king of Israel, though his successor, Jehu, gave tribute to Shalmaneser, and thus incurred the enmity of Hazael. Of the successors of Shalmaneser, the second, Vul-nirari III., was a great conqueror, and his wife, Sammuramat, is the Semiramis of Herodotus.

The Assyrian annals give no account of the fall of Nineveh under Sardanapalus, and the identification of his name with that of Assur-nirari by the French Assyriologists depends on a very doubtful conjecture that the character read *nirari* by George Smith, and which appears sometimes to be equivalent to *gabal*, may, in a rare inflectional form of that root, have been *tanagbal*. The resulting name, Assur-tanagbal, would readily become Sardanapalus in Greek. Equally obscure is the biblical Pul, king of Assyria, who about this time received tribute from Menahem, king of Israel. Some scholars assume at this time, which closes the first Assyrian empire, a break in the table of eponyms of forty years, which reconciles these annals with the Jewish history. If this break does not occur, the dates

given for the previous kings must be brought down forty years.

In 744 B. C., Tiglath-Pileser II. commenced a new line of Assyrian monarchs, founding the second Assyrian empire. The reconquest of Babylonia occupied the earlier portion of his reign, while the latter portion was taken up with expeditions against Syria, Phœnicia, and Israel. Pekah, king of Israel, was dethroned by him, and Menahem occupied the throne for eight years, until, taking advantage of Tiglath-Pileser's campaign against Armenia, Pekah again recovered his position. This fact, given by the monuments, explains a discrepancy of eight years between the biblical dates of the Jewish and Israelite kings. Ahaz is mentioned, in the Assyrian as in the biblical records, as an ally of Assyria against Israel, and as doing homage with other kings to Tiglath-Pileser at Damascus. His son, Shalmaneser IV., succeeded him, and after a reign of five years was succeeded by his tartan (or general) Sargon in 721 B. C. Sargon was a great conqueror. It was he who carried Samaria captive, though the biblical record has been thought to imply that it was Shalmaneser. He extended his conquests over Syria, Phœnicia, and Palestine, and conquered the army of Egypt that was assisting the Philistine cities. The king of Egypt and the queen of Arabia gave him tribute. He then ravaged Armenia, portions of Media, Parthia, Albania, Cilicia, and Pisidia. When Babylon revolted he subdued it, placing a satrap of his own in command. He even received the submission of Cyprus, as a granite column discovered in Citium contains the cuneiform record and the representation of Sargon. He was assassinated in 704 B. C., and succeeded by his son Sennacherib, also a famous conqueror. We possess long records of his reign, including full accounts of his campaign against all the countries ravaged by his father, among which was Judah, then ruled by Hezekiah. His son Esarhaddon (681–667) was also a warlike king. He had been viceroy of Babylon before his father's assassination, and made that city his place of residence. He increased the Assyrian domain by an expedition into the Arabian peninsula and by the conquest of Egypt. His son Assurbanipal, the Greek Sardanapalus, was equally successful in war, and reconquered the rebellious Egyptians in three successive campaigns. Tyre was forced to yield after a stout siege, and the daughter of King Bahlu and other princesses were taken into the harem of the conqueror, who here first shows his sensuality. Then followed his treaty with Gyges, king of Lydia (of whose relations with the wife of Candaules, Herodotus tells so curious a story), and his war with Elam, concluded about 655 B. C. by the complete submission of Elam. The Assyrian empire had now reached its greatest extent, including all the known world. From this time till his death, in 726 B. C., his task was to retain his unwieldy conquests, and especially to crush the rebellion of his brother, Saul-Mugina, at Babylon, aided by Tammaritu of Elam. Assurbanipal was a munificent patron of learning, and founded large libraries, a large portion of which is now in the British Museum. He also built many temples and palaces. But his reign, which marks the grandest era in Assyrian history, was the immediate precursor of the overthrow of the empire under his successor by the combined armies of Babylon and Media.

In the cuneiform inscriptions we also have full records of the Babylonian monarchy which succeeded the Assyrian. This empire lasted for less than a century, and of the six kings only three have any note—Nabopolassar, its founder, his son Nebuchadnezzar, who raised it to its highest pitch of power, and Nabonidus, under whom it was overthrown. None of these monarchs were remarkable as warriors, although Nebuchadnezzar in the early part of his reign drove an Egyptian army as far as Pelusium, and destroyed Jerusalem and Tyre. His annals are mainly filled with descriptions of the magnificent public buildings which he erected. Of his lycanthropy the inscriptions give no record. About the time of his death (561 B. C.) the Persian power arose, and gradually assumed more threatening dimensions until Nabonidus, as related by the Greek historians, was conquered, and his son Belshazzar—whom the inscriptions mention as regent under him in Babylon—was killed as described by Daniel. The subsequent history of Babylon belongs to Persian and Greek history.

The inscriptions have greatly increased our respect for the historical authority of Herodotus, and especially of Berosus, whose accounts are always confirmed. The same may be said of the biblical records, which receive great light from these historical monuments in confirmation of their general historical accuracy, although such facts as the overthrow of Sennacherib's army and the insanity of Nebuchadnezzar are omitted.

(Of the works which have appeared on this subject since the decipherment of the inscriptions, the most important are the following: Of Assyrian texts, E. Botta and E. Flandin, "Monuments de Ninevé," 5 vols., Paris, 1849–50 (the vols. i., ii., and v. are filled with representations of Assyrian art); A. H. Layard, "Inscriptions in the Cuneiform Character from Assyrian Monuments," British Museum, 1851 (untrustworthy copies); Rawlinson, Fox Talbot, Hincks, and Oppert, "Inscription of Tiglath-Pileser Translated" (translated in 1857, but published in the "Journal of the Royal Assyrian Society," 1860); Rawlinson and Norris, "The Cuneiform Inscriptions of Western Asia," vols. i., ii., iii., London, 1861–66–70 (the most important body of inscriptions, but without translations); Menant, "Inscr. Ass. de Hammourabi," Caen, 1863; Oppert and Menant, "Les Fastes de Sargon" (with translation), Paris, 1863; also "Grande Inscription de Khorsabad" (with translation), 2 vols., Paris, 1865; George Smith, "History of Assurbanipal" (with translation), London, 1871. Of special grammatical and lexicographical value are the following: Rawlinson, "Commentary on the Cuneiform Inscriptions of Babylon and Assyria," London, 1850; "Babylonian Translation of the great Persian Inscription of Behistun," London, 1851; Hincks, "On Assyrian Verbs" (the first successful attempt at Assyrian grammar), in the "Journal of Sacred Literature," 1855–56; also "The Polyphony of the Assyrio-Babylonian Cuneiform Writing" (from the "Atlantis"), 1863, and "Specimen Chapters of an Assyrian Grammar" (of great value), in "Journal R. A. S.," 1866; Oppert, "Eléments de la Grammaire Assyrienne," Paris, 1860 (first attempt at a complete grammar; uses Hebrew type for Assyrian words—an excellent work, and considerably improved in the second edition of 1868); Menant, "Exposé des Eléments de la Grammaire Assyrienne," Paris, 1868 (nearly the same as Oppert's first edition, only using Assyrian type); Norris, "Assyrian Dictionary," vols. i., ii., iii., London, 1868–70–72 (very valuable from the abundance of quotations in Assyrian type); A. H. Sayce, "Assyrian Grammar," London, 1872 (the most comprehensive manual yet published; uses English letters for Assyrian words). Other important works on Assyrian history, mythology, art, etc. are Layard's "Monuments of Nineveh," vols. i., ii., London, 1851–53 (very fine plates); G. Rawlinson, "Herodotus," vol. i., London, 1858 (contains valuable essays by Sir Henry Rawlinson); Oppert, "Expédition Scientifique en Mésopotamie," vols i., ii., Paris, 1863; Lenormant and Chevallier, "Manual of the Ancient History of the East," vol. ii., Philadelphia, 1869 (contains full abstracts, mainly trustworthy, of Assyrian and Babylonian discoveries); E. Schrader, "Die Keilinschriften und das Alte Testament," Giessen, 1872 (goes through the Old Testament, giving whatever illustrations are suggested from cuneiform discoveries); also "Die Assyrisch-Babylonischen Keilinschriften," Leipzig, 1872 (an exhaustive defence of the readings of the inscriptions).)

William H. Ward.

Cu'neo, a province of Northern Italy, forming part of Piedmont. Area, 2755 square miles. One-half of the province is level, the other half hilly. The chief river is the Tanaro. It produces wheat, maize, hemp, rice, and silk. Pop. in 1871, 597,279.

Cun'ningham, a township of Chariton co., Mo. Pop. 761.

Cunningham, a township of Fluvanna co., Va. Pop. 2771.

Cunningham (Allan), a Scottish author, born at Blackwood, Dumfries-shire, Dec. 7, 1785, worked as a stone-mason in his youth. He removed to London in 1810, and began to write for the newspapers. He was employed as foreman in Chantrey's studio from 1814 to 1841. His "Traditional Tales of the English and Scottish Peasantry," "Songs of Scotland," "Life of Wilkie," and "Lives of British Sculptors, Painters, and Architects" are his best known productions, besides some favorite songs. Died Oct. 29, 1842.—His son, Capt. J. D. Cunningham, has written a "History of the Sikhs."—A second son, Alexander Cunningham, born Jan. 23, 1814, major-general in the Bengal Engineers, has published numerous papers on Indian archæology.—Another son, Peter Cunningham, born April 17, 1816, an industrious writer, is known as the editor of Goldsmith and author of lives of Drummond of Hawthornden, Inigo Jones, and Turner (1852).

Cunningham (Samuel B.), M. D., a medical practitioner of East Tennessee, was born there Oct. 9, 1797. He received his degree at Transylvania University, Ky. He served his generation most faithfully at Jonesboro', Tenn., for nearly fifty years, and his loss was mourned as a public calamity, for to the profession he was one of its purest and brightest ornaments. Died Sept. 4, 1867.

Paul F. Eve.

Cun'ningham's, a township of Person co., N. C. Pop. 1119.

Cupar-Fife, a royal burgh of Scotland, the capital of Fifeshire, is in a beautiful vale on the river Eden, 32 miles

N. of Edinburgh. It has a public library, several newspaper-offices, and manufactures of coarse linens, earthenware, etc. A castle or fortress of the Macduffs, thanes of Fife, formerly stood here. Pop. in 1871, 5105.

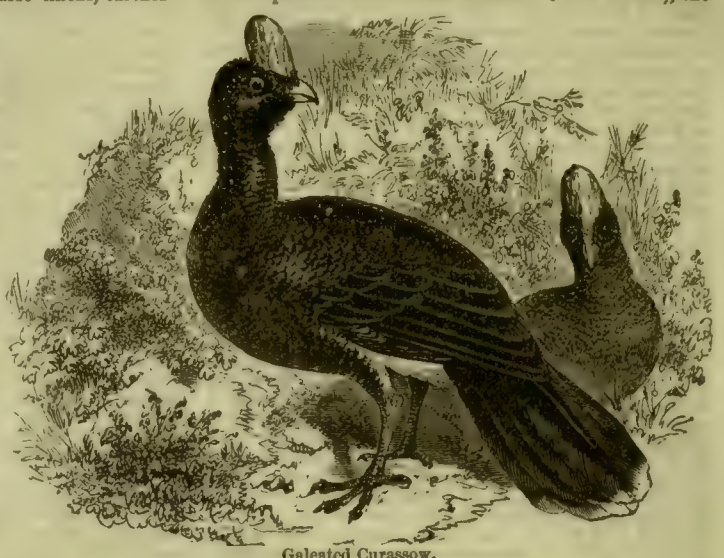
Cu'pel [Fr. *coupelle*, a "little cup"], a shallow and porous vessel, somewhat cup-shaped, generally made of bone-earth. It is used in the process of assaying gold and silver, which are fused with lead upon a cupel. The lead is oxidized in the process and sinks into the substance of the cupel, leaving the metal pure.

Cupella'tion [for etymology see preceding article] is the process of refining precious metals on a cupel, or the separation of one metal from another by the use of a cupel heated in a muffle furnace. (See ASSAY.)

Cu'pid [Lat. *Cupido*], the Roman name of the god of love, corresponding to the Eros [Ἔρως] of the Greek mythology. He was usually represented as the son of Venus, but ancient authorities differ respecting his paternity. He is represented as a beautiful winged boy, bearing a bow and arrows.

Cu'pids, a post-village of Brigus district, on the N. side of Conception Bay, Newfoundland, 2 miles from Brigus. Farming and cod and salmon fishing are carried on. Pop. 1200.

Cu'pola [Fr. *coupole*], a spherical vault or concave ceiling raised over a building. Cupolas are sometimes hemispherical, and are constructed in various other forms. (See DOME.) Cupola is also the name of one form of blast-furnace for the reduction of metallic ores.



Cup'ping [Lat. *cucurbitatio* (from *cucurbita*, a "gourd" or "cup"); Fr. *la ventouse;* Ger. *Schropfen*], in surgery, the application to the skin of small cups from which the air is partly expelled. If it be designed to withdraw blood from the patient, the skin is first scarified, a partial vacuum is produced in the cup by direct suction or by the flame of alcohol or of burning paper, and the mouth of the cup is applied to the scarified surface. "Dry cupping" is the same process without scarification. In this case no blood is drawn, the object being to stimulate a diseased surface or to produce derivative action.

Curaçoa, or **Curaçao,** ku-rą-sō', one of the West India Islands, of a like-named group, belonging to the Dutch, is off the N. coast of Venezuela. Area, 164 square miles. Its N. point is in lat. 12° 24′ N. and lon. 69° 17′ W. The chief article of export is salt, and more recently also cochineal. It is governed by a stadtholder and council. Capital, Willemstadt. Pop. in 1870, 21,089.

Curaçoa, a liqueur which is made of Curaçoa oranges or orange peel, by digesting in sweetened spirits along with a little cinnamon, and often a little mace or cloves. The spirits used contain nearly three and a half pounds of sugar to the gallon. It is imported from Holland.

Cura'ri, Woora'li, or **Woora'ra,** a celebrated arrow-poison used by the South American Indians. Its nature and origin are still unknown, but the principal ingredient is believed by some to be the juice of the *Strychnos toxifera*, a woody vine covered with long reddish hairs, having ovate leaves, rough and pointed, and large round fruit. This is not its probable origin. It is, however, a vegetable extract, and not a snake-poison, as many have conjectured. There is more than one variety of the drug. The poison, when it enters the blood through a wound, causes paralysis, with convulsive motions, followed by death. It may be swallowed in considerable doses with impunity. It is regarded as the most powerful of all sedatives, and the employment of it in cases of tetanus and hydrophobia has been suggested. The best means of preventing its deadly effect is found in artificial respiration.

Curas'sow, the name of several species of birds belonging to the order Gallinæ, having a strong bill, surrounded at the base with a skin sometimes of brilliant color, and on the head a crest of feathers which can be raised or lowered at pleasure. The species are found in the warmer parts of South America, Mexico, and Central America, where they congregate in flocks. They are about the size of turkeys, and their flesh is highly esteemed. They are also very easily domesticated and reared, and are common in the poultry-yards of South America. Among the best-known species are the crested curassow (*Crax alector*), the

Galeated Curassow.

red curassow (*Crax rubra*), and the *Ourax pauxi*, or galeated curassow.

Cu'rate [Lat. *curatus* (from *cura*, "care"); Fr. *curé*], one who has the cure of souls. The term has been variously appropriated to different officers of the Church, but since the close of the sixteenth century in England has been restricted to assistant clergy, deputies, or substitutes. The bishop, or some officer having episcopal authority, appoints the curate's salary and grants his license. There are "temporary" and "perpetual" curates. The temporary or *stipendiary* can be removed at the will of the bishop or vicar. Perpetual curates cannot be thus removed. Their salary is paid from tithes established at the foundation of the chapel, and it becomes the duty of the impropriators to support them. The salaries of curates are too often disproportionate to their services, and they are almost destitute of legal rights, being entirely subject to episcopal authority.

Curcu'lio [the Latin for "weevil"], a name given to many weevils or coleopterous insects of the family Curculionidæ, but perhaps most frequently applied to the *Conotrachelus nenuphar*, a small dark-brown insect, speckled with yellowish-white and black. In spring and early summer it attacks the young fruit, such as apples, pears, apricots, etc., but its object of special attack is the plum. The female makes a crescent-shaped puncture in which she deposits her egg. The egg soon hatches, and the maggot feeds upon the young plum, which generally falls to the ground in a short time, and the larva burrows in the earth, becoming a perfect insect in about three weeks. Several generations are said to appear in one season. The destruction caused by this insect upon all kinds of smooth-skinned fruits is a very serious loss. Another destructive curculio is the plum-gouger (*Anthonomus prunicida*), which occurs very abundantly in the Western States. It makes a round puncture. It undergoes transformation inside the kernel of the plum. Another insect of this genus makes numerous holes in the apple; still another lays her eggs in the cranberry, and then cuts off the stem. The grape curculio (*Celiodes inæqualis*) and other species are very destructive to grapes. Fruit trees and grapevines should be frequently shaken in summer, when the falling curculios may be caught upon a sheet and burned. Swine and sheep render great service by devouring the fallen fruit with the larvæ contained in it. Nearly 10,000 species of this family have been described. They are arranged in more than 630 genera.

Curculionidæ. See WEEVIL.

Curcuma. See TURMERIC.

Curds'ville, a post-township of Buckingham co., Va. Pop. 2101.

Cu'res, an ancient and famous city of Italy, the capital of the Sabines, was near the Tiber, about 25 miles N. N. E. of Rome. The site is occupied by the modern village of Correse. Cures was colonized by Sulla about 100 B. C.

Cur'few Bell, or simply **Curfew** [Fr. *couvre-feu*, *i. e.* "cover the fire" (from *couvrir*, to "cover," and *feu*, "fire")], was a bell rung at eight in the evening as a

signal for extinguishing lights and fires—a practice said to have been introduced into England by William I. in 1068. As the custom existed in France, Spain, and other countries at the same time, it is probable that it was not originated by William I., but the strictness with which he compelled its observance caused it to be attributed to him. The stringency of this law was relaxed by Henry I. in 1103. In the reigns of Edward I. and Edward III. persons were not permitted to be abroad in the city, armed, after curfew. In many parts of England and the U. S. the practice of ringing the bell at eight or nine o'clock still prevails.

Cu'ria (plu. **Curiæ**), the name of the building in which the senate held its sessions in the cities of ancient Italy. Also a subdivision of the Roman patrician tribes, each of which was divided into ten *curiæ*. These tribes were three in number, the Ramnes, Tities, and Luceres, so that there were thirty curiæ. These curiæ contained only the patricians or *populus* proper, but clients were regarded as passive members of the curia of their superior. In early times the curiæ were of the greatest importance. Each curia had its own name, but only a few of these names have come down to us. In later times the curiæ lost their political importance, but long retained their ancient and mysterious religious rites, which were maintained by the priests called *curio* and *flamen curialis*. In still later times even these old offices were sometimes conferred upon plebeians. The curiæ voting together constituted the *comitia curiata*, once a highly important public body with legislative powers; but before the fall of the republic this body had fallen almost into disuse and oblivion, though it still had a formal existence. In it each of the curiæ had one vote, and in each curia each member had one vote. In the language of modern Europe, *curia* is the Latin word for court or place of justice.

Curico', a province of Chili, is bounded on the N. by the province of Colchagua, on the E. by the Andes, on the S. by the province of Talca, and on the W. by the Pacific Ocean. Area, 2948 square miles. The country is mountainous and the soil fertile. Chief town, Curico. Pop. in 1869, 98,859.

Curico, a town of Chili, founded in 1742, is a progressive place, with a college, on the Mataquito. Pop. 5953.

Cur'lew (*Numenius*), a name of a genus of birds of the

Curlew.

order Grallatores, natives of Europe and North America. Curlews have long, slender, and curved bills, long legs, and short tails. They frequent the sea-shore and open moorlands, feeding on worms, mollusks, insects, etc. The common curlew of England (*Numenius arquata*) is pursued by sportsmen partly for its flesh, which is delicate and well flavored, and partly because its wild and shy habits render the pursuit exciting. Among the curlews of North America may be mentioned the long-billed curlew (*Numenius longirostris*) of all the temperate parts of North America. It is twenty-five inches long, the wing measuring about eleven inches. The bill is often eight inches long. It is of a pale-reddish color, with ashy tints and brown-black marks, and longitudinal lines of black. The short-billed curlew (*Numenius hudsonicus*) of the Eastern and Western coasts is two-thirds the size of the foregoing, with a bill about four inches long. The Esquimaux curlew (*Numenius borealis*) is still smaller.

Curl'ing, the name of a Scottish game which has been introduced into Canada and other countries where ice can be found of sufficient thickness. It is played with stones weighing from thirty to forty-five pounds, having handles by which they are hurled over the ice. Sides are made up, generally four against four; a length of ice is chosen, from thirty to forty yards long, and eight or nine feet across. At each end of this rink, as it is called, marks are made consisting of several concentric rings called broughs, and a centre called the tee. The object of the player is to hurl his stone towards the tee with strength and precision, and the interest of the game depends on the skill displayed by the players in placing their stones in good positions, and in driving those of their rivals out of such places. At a certain distance from the tees a score is drawn across the ice, and a stone not passing beyond this counts for nothing.

Curling (Thomas Blizard), M. R. C. S., F. R. S., an eminent English surgeon, born in Jan., 1811, became an assistant surgeon in the London Hospital in 1834, lecturer on surgery in 1846, surgeon to the hospital in 1849, examiner in the University of London in 1859, and fellow of the Royal Society in 1850. He wrote a prize treatise on tetanus (1835), "Diseases of the Testis" (1843), and "Diseases of Rectum" (1851.)

Curlis'ville, a post-village of Monroe township, Clarion co., Pa. Pop. 208.

Cur'ran, a township and post-village of Sangamon co., Ill. The village is on the Toledo Wabash and Western R. R., 7 miles S. W. of Springfield. Pop. 1000.

Curran (John Philpot), an Irish orator, born at Newmarket, near Cork, July 24, 1750, was educated at Trinity College, Dublin, studied law in the Middle Temple, London, and was called to the Irish bar in 1775. As a barrister he was very successful, and was distinguished for his humor and sarcastic speech. He became in 1783 a member of Parliament, in which he acted with the opposition party, of which Grattan was the leader. In 1806 he was appointed master of the rolls in Ireland. Died Oct. 14, 1817. (See Charles Phillips, "Curran and his Contemporaries," 1850; T. Davis, "Life of Curran," 1846.)

Cur'rant [from *Corinth*, in Greece, from which port this fruit was formerly exported], a common name of a kind of small raisin (*Uva passula minor*), the dried berry of a seedless variety of grape which is cultivated in the Levant. Currants are exported from Zante and some of the other Ionian Islands, and are used in cookery as an ingredient in cakes and puddings. Attempts to introduce the currant grape into other regions have thus far been unsuccessful.

Currant [so called from its resemblance to the above fruit], the popular name of the berries of certain species of *Ribes*, low shrubs of the order Grossulaceæ, distinguished from the gooseberries by the flowers, which grow in racemes, and by the fact that the currant bush is never thorny. The red currant (*Ribes rubrum*) is a native of Europe, Asia, and North America, is cultivated in gardens for its pleasant acid fruit, and is much used for the table and for jellies, conserves, etc. "Currant wine" is a domestic drink, made of currant juice, sugar, and water, which is allowed to undergo alcoholic fermentation. The black currant (*Ribes nigrum*) is also cultivated, and in France large quantities of *liqueur de cassis*, a very agreeable and popular variety of currant wine, are prepared from it. More than sixty species of currant are described, about two-thirds of which are American. Several are highly ornamental in cultivation. The varieties of fruit-bearing currants in cultivation are very numerous. They are very readily propagated by cuttings, and in ordinary years will, with a little care, yield a large supply of agreeable and useful fruit. If the ground between the rows is ploughed, hoed, and kept clear of weeds, the productiveness and profit, as well as quality of the fruit, will be much increased.

Cur'rency [from the Lat. *curro;* It. *corrente*, to "run"] is the circulating money of a country. Some writers include bank deposits, bills of exchange, promissory notes, and generally whatever serves as a substitute for money or whatever has "purchasing power." But the great weight of authority and practice confines the meaning of currency to money. If ever finance is to acquire that degree of order and certainty in its relations by which it will be entitled to rank as a science, all the terms of its vocabulary must have a definite and invariable signification. Worcester defines currency to be "the circulating medium; that which passes for money in a country; the aggregate of coin, bills, notes, etc. in circulation;" as "a metallic currency; a mixed currency." The identity of money and currency is established in the U. S. by the co-ordinate use of the two terms; and the character and office of money as a measure and expression of value are so clearly recognized in the Constitution and laws, and in the official acts and documents of the government, as to bar all dispute on the subject. We are not aware of any different use of the term in the official records of any government.

The first care of every society at its origin has been to establish a current money. It is difficult to conceive how the multiplied transactions of modern trade could be carried on without such a medium. Before the precious metals were produced in sufficient quantity to answer the purpose some special commodity was selected, as salt, tobacco, leather, etc. The ruder metals were next adopted. Iron was commonly used by the old Spartans, and copper by the Romans. The revenues of the ancient Saxon kings were paid in kind. William the Conqueror originated the custom of paying them in money. In the time of Servius Tullius (B. C. 578), who was the first to coin money at Rome, the *as* or *pondo* contained a Roman pound of good copper. It was divided into twelve ounces, like the Troyes pound. The English pound sterling in the time of Edward I. contained a pound of silver, Tower weight of a known fineness. The Tower (Tour or Saxon) pound was something more than the Roman, and something less than the Troyes, which was not introduced into the mint of England till the 18th of Henry VIII. The French livre contained a pound Troyes weight in the time of Charlemagne, who took for his monetary unit the pound weight of silver. A gold currency was adopted in France under Saint Louis, and since that time gold and silver have circulated side by side. It was not till Edward III., in the early part of the fourteenth century, that a gold currency was established in England. The Scots money pound contained from the time of Alexander I. to that of Robert Bruce a pound of silver of the same weight and fineness as the English pound sterling. English, French, and Scots pennies contained originally a real pennyweight of silver, the 20th part of an ounce and the 240th part of a pound. The shilling, too, seems to have been originally a denomination of weight. An ancient statute of Henry III. says: "When wheat is at twelve shillings the quarter, then wastel bread of a farthing shall weigh eleven shillings and fourpence." The proportion, however, between the shilling and either the penny or the pound was not constant or uniform. "In every country of the world, I believe," says Adam Smith, who is the authority for most of these details, "the avarice and injustice of princes and sovereign states, abusing the confidence of their subjects, have by degrees diminished the real quantity of metal which had been originally contained in their coins. The Roman *as* in the latter ages of the republic was reduced to the 24th part of its original value." In the latter part of the eighteenth century the English pound and penny contained one-third only, the Scots 1-36th part, and the French 1-66th part of its original value. "The honor of a state," says Adam Smith, "is surely very poorly provided for when, in order to cover the disgrace of a real bankruptcy, it has recourse to a juggling trick of this kind. Almost all states, however, ancient as well as modern, when reduced to this necessity, have, upon some occasions, played this very juggling trick. The Romans at the end of the first Punic war . . . raised two ounces of copper to a denomination which had always before expressed the value of twelve ounces. The republic was in this manner enabled to pay the great debts which it had contracted with the sixth part of what it really owed."

The currency of modern times in all active industrial countries has consisted of gold and silver, and paper money redeemable in coin of those metals. Gold is the common international standard. The greater bulk of silver renders it unsuitable as a medium in the heavy exchanges of commerce, and the more stable value of gold adapts it in all respects to the required service. The more limited production of silver, together with its greater proportionate use in the arts, made it more liable to fluctuation relatively with gold. The fact of its being legal tender on the same footing with gold, made it possible to perpetrate indefinite frauds under cover of the law. "It was only necessary to compare alternately the value of gold with that of silver, and the value of silver with that of gold, to diminish successively the burden of the national debt. Thus, when gold shall have risen in value in comparison with silver, the state would only pay in the latter metal, and private debtors would not fail to follow the example." (*Chevalier.*) England escapes all embarrassment from the double standard by making silver a legal tender to the amount of forty shillings only, and rating the silver coin slightly above its intrinsic value.

The constitution of gold as the medium of international payment has made it indispensable for each nation to adopt a supplemental home medium as a defence against the possibility of being left without any currency whatever for the transaction of its business. It is a normal condition of commerce that the balance of accounts between nations shall alternate from one to another. The most important consequences attend this simple operation. The debtor market, if not provided with a local medium, is at once prostrated and disabled from the prosecution of those productive labors by which alone it can restore itself to rotation as a creditor. The necessity of a supplemental currency as a protection against such ill consequences must have promptly commended the bank-note to the favorable consideration of economists and statesmen. Every argument in its favor has been strengthened by the beneficent influence it has exerted over industrial employments. The next step to that of supplying a local currency was the adoption of a test or standard to which it should be kept equal; otherwise, the inevitable result must follow of its depreciation, whereby the superior currency of gold, the international medium, would be expelled from the country; and so long as that medium could not flow in by commercial law, the nation must remain prostrate and subject to all the disadvantages of an adverse exchange. Such a condition history proves to be a condition of poverty and weakness. There could be no other standard than the international medium itself, gold, and hence its adoption. The primary and fundamental law of a standard is *permanency, invariability.* But at the very threshold of this proposition we encounter a grave obstacle to the attainment of scientific organization in the theory advanced by eminent economists —that the redeeming medium itself is deficient in the essential quality that constitutes a test or measure. "To the qualities which originally recommended gold and silver as currency," says John Stuart Mill, "another came to be added, the importance of which only unfolded itself by degrees. Of all commodities they are among the least influenced by any of the causes which produce fluctuations of value. They have sustained since the beginning of history one great permanent alteration of value, from the discovery of the American mines. . . . In the present age the opening of new sources of supply so abundant as the Ural Mountains, California, and Australia may be the commencement of another period of decline." To this proposition, which is a logical result of the theory that money is nothing more than a selected commodity, it may be answered that the constitution of money is a social agreement to take a certain substance out of the category of commodities, and to put in complete abeyance those properties which make it a subject of trade. To speak of money after this as a commodity of variable price is to break the social agreement, and to restore the subject to its former relations—in fact, to undo what has just been done. But does not Mr. Mill leave out half the case when he assumes that gold has undergone "a great permanent alteration of value"? The only evidence adduced of that alteration is "the increase of prices throughout the commercial world." And are there not other known causes which have contributed to that result? The half of the case overlooked by Mr. Mill is that the human family quadrupled itself or much more in the period named—that it extended its labors, developed countless resources, and opened new markets of consumption in all quarters of the globe. If the world had stood still while the quantity of gold increased, there can be no question that the relation of gold as the standard of the circulating medium would have undergone a change. But the reverse is the fact. A proposition involving consequences so fatal to the construction of a scientific system of currency and finance as that of variability in the standard of value, challenges our scrutiny the more rigorously because of the eminence of the authority by which it is advanced. It is therefore with satisfaction that we quote dissenting opinions from sources equally eminent, and not less deserving of respect. "If any other commodity," says Mr. Ricardo, "less variable could be found, it might very properly be adopted as the future standard of our money; but while gold and silver are the standard, the currency should conform in value to them; and whenever it does not, and the market-price of bullion is above the mint-price, the cur-

rency is depreciated. This proposition is unanswered, and is unanswerable." Likewise, Sir Henry Thornton, who says: "The precious metals when uncoined (or in the state of bullion) are themselves commodities, but when converted into money they are to be considered as a measure of the value of other articles. They may indeed be converted back into commodities; and it is one recommendation of their use as coin that they are capable of this conversion." The theory of invariability was maintained by John Locke also, who believed that "a pound of gold or silver must always be worth a pound of gold or silver, and therefore the apparent variation in the price of gold was only a variation in the price of bank-notes." (For an able exposition of the opposite theory see *Colwell*, p. 404 *et seq.*)

The paper part of a currency is local to the country where it is issued, passing its boundaries, if at all, only into contiguous districts, where the profits of trade outweigh the cost of its conversion into gold. A solitary exception is that of the notes of the Bank of England, which carry a premium above specie in most commercial countries. It was said that the notes of the second Bank of the U. S. were at one time current in China. Even the coins of one country do not circulate as money in another, but are mostly bought up at a discount by the bullion-dealers and sold to shippers. An attempt made some years since to introduce into China a Victoria silver dollar coined at the British mint for the purpose of establishing a convenient medium of remittance, and otherwise encouraging a prestige in favor of British commerce, failed through the jealousy of the Chinese, provoked by the traditional aggressiveness of British commercial policy. The American *trade dollar* has recently met with a better reception, being largely coined at the San Francisco mint on the order of merchants trading with the Asiatic coast, and having been declared "legal money" in China by a voluntary imperial edict. Telegrams to the U. S. mint in San Francisco quickly followed from London to ascertain the extent to which it could be obtained for remittance to China on British account. It is stated also that it mixes indiscriminately with the current coins in India. It seems hence not improbable that the fortunes of the long-famous "pillars" of Spain may be continued in the career of the American trade dollar. May we not indulge a feeling of excusable pride that it owes its favorable reception in the most populous countries of the globe to the absence of all association with schemes of military conquest? *

It has already been said that that part of the currency of every country which is composed of gold, being also the international medium of payment, is liable to be drawn off by the creditor markets, whence arises the apprehension that the banks of the debtor markets may be forced into suspension on their bills. For this reason an extraordinary export of specie creates alarm among the banks of the exporting country, and obliges them to turn upon their customers to pay up their borrowings. The advocates of an exclusively metallic currency build their most plausible argument on this ground. "If there are no bank-bills to protect," they say, "the export of specie pays a debt and strengthens the home market. But with bank-bills to defend, though it likewise pays a debt, it weakens the market as against the bills, and creates pressure and panic." This argument connects the subject of the currency with the *tariff*, since low duties encourage large importations and drain the country of its specie. The advocates of an exclusively paper currency construct their most specious argument on the same facts. "If the whole body of the currency be of a material that cannot be exported, the instrument will always remain to us intact; and whatever inconveniences we may suffer in consequence of the loss of the precious metals, we shall never suffer paralysis of our productive labors through want of money." Or, as the famous Scotch financier, Law, wrote, "If we establish a money which has no intrinsic value, or whose intrinsic value is such that it will never be exported, and the quantity of which shall never exceed the demand in the country, we shall have reached wealth and power." In reply to this the most eminent of the French contemporary economists declared it to be an *axiom* that "a purely conventional money is an impossibility." (Turgot, *Reflexions sur la formation et la distribution des richesses.*) For one of the most fruitful sources of information and argument on the subject at large we cannot do the reader a greater service than refer him to the brilliant publications on economy that issued from the French press in the period of Louis XIV. and following, in which the ideas of Colbert, Richelieu, Say, Montesquieu, Law, Turgot, Quesnay, Necker, Forbonnais, Gournay, and the elder Mirabeau (the author of the doctrine *laisser-faire*) were in fierce conflict. The economical controversies of this period are full of vivacity, and possess an interest bordering on the romantic.

The principles of currency are derived mostly from circumstances exterior to itself. In a country like England, of narrow boundaries, intersected in every direction with railways and telegraphs, the bank-note repeats its service rapidly, and hence the amount required to effect the exchanges in a given time is much smaller, other things being equal, than in a country like the U. S. The term *quantity* is thus compounded with time, distance, geographical extent, etc. The average time of the circuit of currency is the governing term of *quantity*. If, for example, bank-bills to the amount of $1,000,000,000 be required to make the whole of the payments of England for one day, and if it were ascertained that the bills complete an average of five circuits per day, the amount of bills to be kept in issue would be $200,000,000, and no more. But in the U. S. the volume of paper money does not repeat its service more than once a day, in consequence of the greater distances to be overcome and the less perfect system of communication; in which case the amount to be maintained in issue would be $500,000,000. Therefore, not only does the average time of the circulation govern the amount to be kept in issue, but it necessarily governs also the amount of reserve, or "dead weight," as it is sometimes called, to be kept against demands of redemption. The fundamental principle of all currency being stability, permanence, invariability, the paper part of it can be invested with that quality only by convertibility with the standard, gold. It must be thus convertible, *not by force of law*, not by an arbitrary rule, but by virtue of the harmonious and co-operative action of all the parts of the commercial system, so that *no other result could logically follow*. This is a vital proposition of supreme consequence. Let us observe the movements of the great volume of our domestic currency. For the sake of conciseness and simplicity, we may regard the commerce of the world as divided between two markets, New York and London. By the excellence of her financial organization, England has come to be the banker of all other countries in the settlement of their commercial accounts with the U. S. It is therefore not a fiction nor an exaggeration that assigns to these two great capitals the factorship of the globe. The New York Clearing-House is the counter of all our foreign settlements through the agency of London. With respect to our domestic exchanges it is not a law of Congress that constitutes New York the place of our bank-currency redemption, but it is that higher law of the growth and development of nations which has made it so, the law of Congress being no more than the official publication of the fact. In obedience to this fact, the bank-note currency of the U. S., following the course of trade, flows in a thousand streams to New York, where it is converted into specie or its equivalent (bills of exchange on London based on exports), to keep alive in perpetuity the processes of mutual credit and liquidation. While each bank in the country sends as part of its remittance the bills of all other banks, it sends also, in the shape of checks and bills of exchange founded on produce and commodities, the means of redemption. Each bank thus redeems its own issues through its agent or corresponding bank in New York, which terminates that particular circuit of the bank-notes, which are then returned in bulk to the issuing banks, and by them sent out again to repeat the service. The process is the same as that which takes place daily in the Clearing-House at New York, with the same result of redemption, return, and reissue; but the transactions being far apart in their origin, and widely scattered, the demonstration is less apparent to the observer. He has only to remember that every transaction in commerce has two equal sides, a debit and a credit; that these two sides in their sum balance each other; that the representative documents of exchange are collateral with the transit of commodities; and that all these movements of commodities, exchange, redemption, and reissue are in continuous repetition. (See Clearing-House.)

The foregoing exposition is based on the theory of a natural state of commerce, when the domestic and the foreign exchanges are in harmonious rapport, and when specie payments are uninterrupted. Seeing the close connection with the general volume of affairs maintained by the New York Clearing-House,† it is not difficult to understand what an important influence may be exerted from this central point over the field of our domestic exchanges. When our financial system is in a normal condition the banks are the exclusive depositories of the specie of the country, except that part of it which is in circulation. The Clearing-House is therefore fully informed of the amount

* The director of the mint at San Francisco has written that the demand for the trade dollar is likely to be $18,000,000 within the next year. In 1873 the coinage of it was over $2,000,000.

† This does not refer, literally, to the particular association of the New York banks, but it means the place of clearance and settlement, the commercial focus. The designation is used in a purely commercial sense.

available for shipment, and of its depletion by export. If that depletion goes on so rapidly and continuously as to threaten the banking system with a reduction dangerous to its ability of redemption, the house lays its hand on the telegraph-wires and admonishes the banks to the farthest extremities of the country, in a single hour, that their safety consists in the arrest of credit expansion. They must cease to make advances in anticipation of the general returns of our export business. Wise bank-managers are never indifferent to this warning. They conform to it immediately, and the result is a co-operative husbandry of resources, which, if general, can seldom fail to restore confidence and re-establish the equilibrium of our commercial accounts. The difficulty has heretofore been in bringing about the necessary degree of co-operation in a system composed of over 2000 different banks, each grasping after its own and caring little for the common good. When the government forced the New York City banks into suspension at the beginning of the war, it took from the Clearing-House all power of restraint over the country banks; and the adoption of the national system, with the "demonetization" of specie, and the failure of the legal tender as a redeeming medium in its stead, has completely broken the rod of correction formerly held by the Clearing-House, and reduced that association to a mere agency of exchange and settlement between the city banks. The present currency of the U. S. consists of $352,000,000 of bills issued by 2200 banks. These are of the following denominations and amounts: denomination of $1, $5,632,583; $2, $4,148,776; $5, $128,762,465; $10, $99,873,200; $20, $59,102,960; $50, $19,537,300; $100, $27,253,300; $500, $3,419,000; $1000, $618,000—total, $348,347,674. Existing laws provide for an increase of bank issues up to $400,000,000; the legal-tender issue is $382,000,000; the fractional issues are about $50,000,000; the total of paper money is $798,347,674. The proportion of reserve required by law for the banks to hold reduces the active circulation to about $598,347,674. The bank-note currency of the U. S. before the war was $238,671,210. If we add Secretary Chase's estimate of the specie in circulation and held by the banks at the same date, the total was in 1862, $613,671,210. Although the legal-tender issues were intended to supply a redemption medium for the national bank-bills in lieu of specie, they are little used for that purpose. There is practically no regular redemption of those bills, as contemplated by the law. It does not appear by the foregoing statements, which are all official, that the amount of the currency in actual circulation in the U. S. at the present date is quite equal to that reported for 1862. But the estimate of specie adopted by Mr. Chase was probably higher than the amount in actual use. Not less than $100,000,000 was on permanent deposit in the banks.

The present suspended condition of the currency of the U. S. has given rise to many theories for its redemption, and to legislation on the part of Congress, but so far without any sensible improvement. The fact that the bank-bills are secured by a pledge of government stocks, while the legal-tender bills are without such security, having only the public faith to stand upon—while, probably, it gives no better security to the former than is constituted by the latter—may exert an influence against voluntary redemption. It is certainly true that the effective element of attraction—viz. the power to command specie or its equivalent at the point of redemption—is wanting in the legal-tender currency as well as in the bank-bills; and therefore, as nothing is to be gained by pushing forward the bank-bills for redemption, they will not be pushed forward, but will remain in circulation. The most interesting questions connected with currency relate to the source of issue and the limitation of its amount. There is a large party in the country favorable to an exclusive government issue of paper money as the basis of our currency system, whereby it is proposed to save the yearly interest now paid to the banks on the bonds pledged as security for their bills. The amount of issue is to be regulated by absorption of any excess in a bond carrying a low rate of interest, and by reconversion of the bond into currency when there is a deficiency. It is worthy of observation that there is scarcely one of these plans that has the merit of originality. Many of them are from one to two centuries old. Many of them have been tried, and their worthlessness proved by signal failure. It is to be observed also that they are without exception put forth as experimental. No attempt is made to develop a principle or law appropriate to the case. Among other propositions is one to regulate the circulation by the number of heads, called the *per capita* theory. Since, as has been shown (*ante*), quantity in currency is governed by time in conjunction with other terms, and since, also, the use of machinery mostly nullifies the effect of number as to the hands employed, the want of pertinency in the *per capita* theory to the subject is obvious. The present attitude of our treasury managers and of the congressional committees on finance, with respect to the reduction of the currency, is not apparently the result of any specific investigation, nor has it any other source than a mere general preconception that the volume must be in excess, because it is larger than at any former period. The question is one of too great magnitude to be settled on such loose premises. Mr. Ricardo, after a close analysis of the subject, arrives at the conclusion that "the issuers of paper money should never regulate its quantity by the amount already in circulation;" and he adds, "the quantity can never be too great nor too little while it preserves the same value as the standard"—meaning gold and silver. There are other important propositions connected with the action of Congress on the currency which fall more appropriately under the head of NATIONAL BANKING SYSTEM (which see). (For tables of currency in circulation at various periods from the foundation of the government to the present time, see *Fin. Reg.*, RAGUET, 2 vols.; ELLIOT'S *Funding System; Treasury Reports* and *Reports of the Comptroller of the Currency* from 1866 to 1873.) J. S. GIBBONS.

Cur'rent, a township of Dent co., Mo. Pop. 467.

Current River, a township of Randolph co., Ark. Pop. 1378.

Current River, a township of Ripley co., Mo. P. 960.

Current River, a post-township of Shannon co., Mo. Pop. 325.

Current River, of Missouri and Arkansas, rises in Texas co., Mo., flows south-eastward into Arkansas, and enters the Black River in Randolph co. Length, estimated at 250 miles. It is a remarkably clear stream, abounding in fish of good quality. It is navigated by flatboats and steamers to some extent. Jack's Fork enters the main stream from the W. in Shannon co., Mo., and steamboats can ascend nearly to the union of the forks in good stages. The river flows through a hilly mineral region, whose resources are not much developed.

Currents, Electric, etc. See ELECTRICITY, by PRES. HENRY MORTON, PH. D., and MAGNETISM, by PROF. A. M. MAYER, PH. D.

Currents, Marine. The ocean-currents are the great rivers of the sea. They move on steadily through waters comparatively tranquil, often distinguished by a different color and temperature; but unlike the inland streams, which are but threads on the surface of the continents, they are scores, nay hundreds, of miles broad, and their course, as in the American Gulf Stream, extends over a large portion of the globe. The ocean streams are not only found at the surface, but also in deep waters, where they are often moving in different directions.

The main cause of these vast movements of the ocean is found in the difference of temperature between the polar and tropical regions, which acts directly on the waters, and indirectly on them by the winds.

The cold and heavier waters of the polar regions tend incessantly to flow into, and so to displace, the warm and lighter waters of the tropical zone; when both meet, the cold waters sink and disappear below the warm waters, which return as surface-currents towards the polar regions. Hence two series of currents, the cold from the polar, the warm from the tropical, regions. Both, however, are deflected from their straight course by the steady action of the earth's rotation—the polar currents more and more to the W., the tropical currents more and more to the E. The polar currents unite in the tropical zone, and, aided by the powerful influence of the trade-winds, form the so-called *Great Equatorial Current*, which flows westward around the whole globe. These general currents are further modified by the form of the basins of the three great oceans in which they move, in the following manner.

Currents in the Pacific Ocean.—The vast expanse of the Pacific Ocean gives full sway and great regularity to the course of the main currents.

The *Great Equatorial Current* begins to be felt at a distance from the American continent, and, soon embracing the whole width of the tropical zone, flows majestically, at the rate of two or three miles an hour, across that immense basin, being separated into two branches by a central counter-current flowing eastward. Arrested by the coasts of Asia and Australia, it divides.

The S. branch sends an arm southward along the coast of Australia, the *Australian Current*, while the remainder is broken into numerous irregular currents among the islands of the Eastern Archipelago.

The N. branch, reaching the Philippine Islands and Formosa, bends to the N. and N. E., and becomes the *Japanese Current* (or *Kuro-Sivo*), the Asiatic Gulf Stream. This noble stream, with its vast body of deep blue and warm waters, flows swiftly along the eastern coasts of Japan, and, con-

tinuing its slanting course across the North Pacific, reaches the peninsula of Alaska. Turning thence southward, it glides along the coast of Oregon and California, as a cool current, and leaves again the continent of America to re-enter the Great Equatorial Current. Thus the North Equatorial, the Japanese, and the North Pacific Currents form one immense whirlpool in the North Pacific Ocean.

The polar currents are almost absent in the North Pacific Ocean, owing to the shallowness and narrowness of Behring Straits, which are the only passage open to them; but they are all the more mighty in the South Pacific. Here the broad *Antarctic Drift Current*, obeying the impulse of the prevailing winds of that region, carries the polar waters north-eastward to the W. coast of South America. Striking the continent in the southern part of Chili, it divides. The main branch, called the *Peruvian* or *Humboldt Current*, flows to the N. along the coast of Peru, which it bathes with its cool waters, and leaving the continent at its extreme western projection, Punta Parina, flows thence westward, becoming the main feeder of the South Equatorial Current. The smaller branch, turning S. along the coast of Patagonia, bends around Cape Horn, and enters the Atlantic Ocean.

Currents in the Atlantic Ocean.—Owing to the narrowness and irregularity of the basin of the Atlantic Ocean, the Equatorial Current in it has neither the size nor the symmetry it shows in the Pacific Ocean. The northern branch is less marked, and the equatorial counter-current is well defined only near the coast of Africa. The course of the S. branch, however, is very apparent. Proceeding westward from the coast of Africa, it crosses the basin of the Atlantic to the opposite shore of South America, where, at Cape St. Roque, it divides, one branch flowing southward, forming the *Brazil Current*; another to the N. W., the *Guiana Current*. The Brazil Current proceeds along the coast of South America, but a part of its waters, sweeping back towards the S. and E., forms the *South Connecting Current*, which merges itself in the *South Atlantic Current*, and returns with it along the W. coast of Africa into the Equatorial Current. The Guiana Current runs from Cape St. Roque northward across the mouth of the Amazon, along the coast of Guiana, and, uniting with the waters of the North Equatorial in the Caribbean Sea, enters the Gulf of Mexico.

The Gulf Stream originates in the Gulf of Mexico. It is the outlet of the accumulation of the waters of the Equatorial Current in the Gulf of Mexico. It becomes fully apparent at the N. W. of the island of Cuba, where it proceeds with feeble force to the E. Its course is then changed, by striking against the Bahama Banks, to the N.; and it flows with great rapidity along the coast of the U. S., gradually expanding in volume and diminishing in velocity as it proceeds northward. Reaching the latitude of New York, it gradually turns to the E., and crosses the Atlantic basin to the islands of the Azores. Here it divides; the main branch, bending its course southward, enters the tropical regions on the coast of Africa, and is swept back by the force of the North Equatorial Current to the Gulf of Mexico. Thus a great whirlpool is formed also in the North Atlantic Ocean, in the midst of which is accumulated the vast amount of sea-weed which bears the name of Mar de Sargasso. The northern branch continues its slanting course to the British Isles and Norway, and often carries to their shores the tropical seeds and driftwood coming from the West Indies.

The high temperature of the Gulf Stream, as well as its blue color and motion, distinguishes it from all other portions of the ocean. It carries warmth from the tropics to the W. coast of Europe, and gives to the British Isles the genial climate they enjoy even in the high northern latitude in which they are situated.

The Atlantic Ocean is almost the only outlet of the N. polar waters towards the equatorial regions, as the Pacific is that of the Antarctic waters. Under the influence of the earth's rotation the polar currents all crowd to the W. on the American coast. Two main currents, on each side of Greenland, carry the waters and masses of ice from the Frozen Ocean towards the warmer latitudes; the *Greenland Current* along the eastern coast and the *Labrador Current* on the W. form Baffin's Bay. Joining their waters and their icebergs, they flow to Newfoundland, where they meet the outskirts of the warm waters of the Gulf Stream, and, condensing the moisture of that mild atmosphere, produce the everlasting fogs peculiar to that region. Thence following the coast between it and the Gulf Stream, the Polar Current makes itself felt as far as the latitude of New York, where it sinks under the warm waters of the Gulf Stream.

Currents in the Indian Ocean.—In this ocean, surrounded on three sides by continents, the North Equatorial Current is destroyed by the influence of the season winds, called monsoons, which blow alternately from the S. W. and the N. W., and the waters mostly obey the direction of the winds. But the South Equatorial is quite regular, and extends from Australia to Madagascar, where it divides, one branch passing N. of the island, the other along its eastern coast. The N. branch, uniting with the waters from the N., forms the strong current of Mozambique, with which the eastern branch soon joins, and the united current moves on to the Cape of Good Hope. Here the current, slackened by the earth's rotation and the meeting of the Antarctic waters, turns back and returns with them to the E., and reaching the coast of Australia re-enters northward the Great Equatorial. Thus in the three great oceans is kept up a constant circulation of the marine waters on a scale of magnitude which far transcends all similar movements on the surface of the continents.

ARNOLD GUYOT.

Currer Bell. See BRONTÉ (CHARLOTTE).

Currey (RICHARD O.), M. D., born in Nashville, Tenn., Aug. 28, 1816. He graduated in the University of Nashville, and acquired from the celebrated Dr. Troost a taste for geology, mineralogy, and chemistry. He took the degree of M. D. in the University of Pennsylvania. He was elected professor of chemistry in the University of East Tennessee at Knoxville in 1846; he assisted in founding the Shelby Medical College in Nashville, in which he occupied the chair of chemistry. For six or seven years he was editor of the "Southern Journal of Medicine and Physical Sciences," and in 1859 was ordained a minister in the Presbyterian Church. Dr. Currey was a man wholly devoted to duty, and while in charge of 2000 Federal prisoners, as surgeon in the Confederate army, at Salisbury, N. C., he contracted the disease of which he died (1865), by his devotion to them. The U. S. government ordered all of Dr. Currey's property restored to his family when the war ended. PAUL F. EVE.

Cur'rituck, a county which forms the N. E. extremity of North Carolina. Area, 200 square miles. It is bounded on the E. by the Atlantic Ocean. The surface is level; the soil sandy. Corn and some wool are produced. Capital, Currituck Court-house. Pop. 5131.

Currituck, a township of Hyde co., N. C. Pop. 1582.

Currituck Court-house, the capital of Currituck co., N. C., is about 200 miles E. N. E. of Raleigh.

Cur'ry, a county which forms the S. W. extremity of Oregon. Area, estimated at 1500 square miles. It is bounded on the W. by the Pacific Ocean, and intersected by Rogue River. The surface is mountainous, but very fertile. Wool is one of the staple products. The mineral wealth of this county is great. Capital, Ellensberg. Pop. 504.

Curry, a township of Sullivan co., Ind. Pop. 2171.

Curry, a township of Putnam co., West Va. Pop. 1162.

Curry (DANIEL), D. D., a Methodist divine and journalist, was born near Peekskill, N. Y., Nov. 26, 1809, graduated at the Wesleyan University, Conn., in 1827, was the same year principal of the Troy Conference Academy, entered the ministry in Georgia in 1841, and occupied pulpits in Athens, Savannah, and Columbus, S. C. He returned to the North after the division of his denomination through the slavery controversy, and joined the New York Conference, had pastoral charge of important churches in New York and other cities, was three years president of the Indiana Wesleyan University, resumed his labors in the East, contributed largely and ably to the periodical literature of his Church, and in 1864 was appointed editor of its chief official journal, "The Christian Advocate," New York City. He is author of a "Life of Wycliff" and "Metropolitan City of America." He has edited Southey's "Life of Wesley." As a journalist he is able and independent.

Curry (JABEZ LAMAR MONROE), D. D., LL.D., born in Lincoln co., Ga., June 5, 1825, graduated at the University of Georgia in 1843 and at Dane Law School (Harvard College) 1845. He served in 1846 as a Texan ranger during the Mexican war. In 1847, 1853, and 1855 he was a member of the legislature of Alabama; in 1856 presidential elector; from 1857 to 1861 member of Congress; in 1861 elected to the Congress of the Confederate States; in 1864 entered the Confederate army, and at the close of the war was in command of a regiment of cavalry. In 1865 he was elected president of Howard College, Ala.; in 1866 ordained to the Baptist ministry; since 1868 professor of the English language and literature in Richmond College, Va. For twenty-five years past Dr. Curry has deservedly held an influential position in the Southern States.

Curso'res [Lat., the "runners"], an order of birds comprising comparatively few species, but these mostly large, with large, strong, and often long legs, and wings not usually enough developed for flight. The bones are nearly

destitute of air-cells, and the breast-bone has little or no trace of a keel. The hinder toe is generally wanting. The running powers of these birds are remarkable. Among these birds are the ostrich, the rhea, the emeu, the cassowary, the apteryx, and the bustards, though these last are by some placed among the waders and by others among the rasores. Unlike the others, the bustards can fly. The fossil cursores include the *Notornis*, the *Æpyornis*, the *Dinornis*, etc., huge birds, which were undoubtedly much larger than the ostrich, which is the largest of living birds.

Cur'tain [Fr. *courtine*], in fortification, that part of the rampart of the body of the place which lies between two bastions and connects their adjacent flanks.

Cur'tin, a township and village of Centre co., Pa., on the Pennsylvania Central R. R., 21 miles S. W. of Lock Haven. Pop. of township, 459.

Curtin (Andrew Gregg), governor of Pennsylvania, born April 22, 1817, was the son of Roland Curtin, one of the earliest iron-manufacturers in Centre co., who came to this country from Ireland in 1793. He studied law in Dickinson College, canvassed the State in 1844 for Henry Clay, was appointed secretary of the commonwealth in 1854, and was elected governor in 1860, in which post he displayed great energy and promptitude when the first call for troops came at the opening of the civil war. In 1863 he was re-elected by a large majority, and in 1869 was appointed minister to St. Petersburg.

Cur'tis, a township of Roane co., West Va. Pop. 580.

Curtis (Benjamin Robbins), LL.D., an American lawyer, born in Watertown, Mass., Nov. 4, 1809, graduated at Harvard in 1829, and was admitted to the bar in 1832, after which he practised law in Boston. He was appointed a judge of the Supreme Court of the U. S. in 1851, but he resigned that office in 1857. He was one of the counsel who defended President Johnson in his trial before the Senate in April, 1868. He is the author of several volumes of legal reports. Died at Newport, R. I., Sept. 15, 1874.

Curtis (George Ticknor), an eminent legal writer, a brother of the preceding, was born in Watertown, Mass., Nov. 28, 1812, graduated at Harvard in 1832, was admitted to the bar in 1836, and practised law in Boston. He has published, besides other works, a "Treatise on the Rights and Duties of Merchant Seamen" (1841), a "Treatise on the Law of Copyright" (1847), and a "History of the Origin, Formation, and Adoption of the Constitution of the U. S." (2 vols., 1855–58); also "Life of Daniel Webster" (2 vols. 8vo).

Curtis (George William), LL.D., a popular American author and orator, born at Providence, R. I., Feb. 24, 1824. He visited Europe, studied in the University of Berlin, and made an extensive tour in the Levant, from which he returned home in 1850. He published, besides other works, "Nile Notes of a Howadji" (1851), "The Howadji in Syria" (1852), "Lotus-Eating" (1852), and "The Potiphar Papers" (1854). He has also distinguished himself as a popular lecturer on various subjects, and as an orator of the Republican party. President Grant appointed him chairman of the advisory board of the civil service. He is editor of "Harper's Weekly" and of the "Easy Chair" in "Harper's Magazine." He is one of the clearest and tersest writers of the day.

Curtis (Joseph Bridgham), second son of George, and Julia Bridgham, Curtis, was born in Providence, R. I., Oct. 25, 1836. He graduated at the Lawrence Scientific School, Cambridge, Mass., in July, 1856. In 1857 he was employed as a civil engineer on the New York Central Park, and on the breaking out of the civil war he was appointed engineer, with the rank of captain, in the Ninth regiment N. Y. S. M., April, 1861. On Sept. 16, 1861, he became second lieutenant of the Fourth regiment Rhode Island Volunteers, and was made first lieutenant of the regiment Oct. 2 of the same year. He served with Burnside in North Carolina, and was made assistant adjutant-general with General Rodman, June 9, 1862. In Aug., 1862, he became lieutenant-colonel of the Fourth regiment Rhode Island Volunteers. He fought at South Mountain and at Antietam, and while in command of his regiment was killed at Fredericksburg Dec. 13, 1862. (For a fuller account see a memoir by his half-brother, George William Curtis, in "Rhode Island in the Rebellion," by J. R. Bartlett.)

Clarence Cook.

Curtis (Samuel Ryan), an American officer, born Feb. 3, 1805, near Champlain, N. Y., graduated at West Point in 1831, serving at Fort Gibson in Seventh Infantry till he resigned June 30, 1832, civil engineer 1836–41; counsellor-at-law 1841–46; adjutant-general of Ohio 1846; and colonel Second Ohio Volunteers in the war with Mexico 1846–48, serving as governor of Camargo, and by his operations against Gen. Urrea opening Gen. Taylor's communications, and after his regiment was disbanded on Brig.-Gen. Wool's staff and governor of Saltillo. Chief-engineer of several important works 1847–55, counsellor-at-law at Keokuk, Ia., 1855–61; and member of Congress 1857–61, being prominent on the committee on military affairs and Pacific R. R., of which he was a warm advocate. In the civil war he promptly resumed his sword to go to the relief of the capital; was subsequently elected colonel Second Iowa Volunteers, and obtained the rank, Mar. 21, 1862, of major-general U. S. volunteers, serving in various capacities in Missouri 1861–62; in command of Army of the Southwest 1862, engaged in driving the enemy from Missouri, battle of Pea Ridge, and numerous actions on his difficult march of over 1000 miles to Helena, Ark.; on leave of absence to attend the Chicago Convention (its president), which inaugurated the Pacific R. R.; in command of the department of Missouri 1862–63; organizing and directing the forces in the field; in command of the department of Kansas 1864–65, engaged against hostile Indians and forcing Gen. Price to the Arkansas; in command of the department of the North-west 1865, and as U. S. commissioner to negotiate Indian treaties 1865, and to examine the Union Pacific R. R. 1865–66, with which, from its first initiation, he had been closely identified, continuing on the same duty, though mustered out of volunteer service April 30, 1866, till he died, Dec. 26, 1866, at Council Bluffs, Ia., aged sixty. George W. Cullum, *U. S. Army*.

Cur'tius (Ernst), a German Hellenist, born at Lübeck Sept. 2, 1814. In 1837 he visited Athens, where he passed several years. He became, in 1856, professor in Göttingen, and in 1865 in Berlin. He published "The Acropolis of Athens" (1844), "The Peloponnesus" (1852), "Attic Studies," a "History of Greece" (3 vols., 1857–66), translated into English by A. W. Ward (London, 1868–70, 3 vols.), "Seven Maps, illustrating the Topography of Athens" (1868), "Die Gastfreundschaft" (1870), and other works.

Curtius (Georg), a German classical scholar, a brother of the preceding, was born at Lübeck April 16, 1820. He became professor of classical philology at Leipsic in 1862. Among his works are a "Greek Grammar" (1855; 9th ed. 1870), "Grundzüge der Griech. Etymologie" (1862), and "Studies in Greek and Latin Grammar" (3 vols., 1868–71).

Curtius (Marcus), a patriotic Roman youth, who is said to have sacrificed his life for his country about 362 B. C. According to tradition, a chasm opened in the Forum of Rome, which the soothsayers declared could not be filled except by the sacrifice of the chief wealth or strength of the Roman people. Curtius, completely armed, plunged on horseback into the chasm, which immediately closed up.

Curtius (Quintus). See Quintus Curtius.

Cu'rule Chair [Lat. *sella curulis*; the latter word is supposed to be of Etruscan origin], among the ancient Romans, a throne or chair of state, one of the emblems of ancient kingly power, which was retained by the magistrates of the republic. Its use was limited to the consuls, prætors, curule ædiles, censors, the flamen dialis, and to the dictator or his deputies. In later times the emperors, as well as many inferior officers, sat upon it. Curule chairs were at first ornamented with ivory, and later sometimes made of ivory and inlaid with gold.

Curule Magistracies were those of the greatest dignity in ancient Rome, and were so called because the persons who held them enjoyed the privilege of sitting on curule chairs (*sellæ curules*) when engaged in their public duties. (See preceding article.)

Curupaïty, a fort on the left bank of the Paraguay River, in the republic of Paraguay, was in the late war between Paraguay and Brazil, Uruguay, and the Argentine Republic an important position. It was an advanced work of Fort Humaïta, and was only taken by the allies in Mar., 1868, after it had been abandoned by its garrison, and Fort Humaïta had been cut off from the interior.

Curve [from the Lat. *curvus*, "bent"], in geometry, a line which continually changes its direction in accordance with some uniform law, which is expressed by the equation of the curve. In a plane curve all the points lie in the same plane. Other curves are called twisted or curves of double curvature.

Cur'wensville, a post-borough of Pike township, Clearfield co., Pa. It has a national bank, a graded school, several factories, and one weekly newspaper. Iron ore and coal are abundant. Pop. 556.

R. H. Brainard, Ed. Clearfield Co. "Times."

Curzon, de (Paul Alfred), a French landscape-painter, born Sept. 7, 1820, was a pupil of Cabat. He made tours through Southern France, Italy, and Greece, and painted from the sketches collected.

Cusa'nus (Nicholas), Cardinal, an eminent German

scholar, born in 1401, was the son of a boatman of Kues on the Moselle, by name Khrypffs. Doctor of laws from Padua, and early famous for eloquence and erudition, opponent of papal supremacy at the Council of Bâle, then won over to the pope, he was at the head of every progressive movement of the Church. His works appeared at Bâle in 1565; his life by Deux in 1847. Died Aug. 11, 1464.

Cush, the name of a son of Ham; also applied in the Hebrew Scriptures to a country, supposed to be Ethiopia, which is called *Keesh* in the Egyptian inscriptions.

Cush'ing, a post-township of Knox co., Me. Pop. 704.

Cushing (Caleb), LL.D., an able American jurist and scholar, born at Salisbury, Mass., Jan. 17, 1800. He graduated at Harvard College, visited Europe in 1829, and published "Reminiscences of Spain." In 1835 he became a Whig member of Congress, in which he served four consecutive terms. As a political friend of President Tyler he separated from the majority of the Whigs in 1841, and joined the Democratic party. He gained distinction as an eloquent debater. In 1843 he was nominated as secretary of the treasury, but was rejected by the Senate. He was appointed commissioner to China in the same year, and negotiated the first treaty between the U. S. and that empire. Having equipped a regiment at his own expense, he served as colonel in the Mexican war in 1847. He was appointed a justice of the supreme court of Massachusetts in 1852, and was attorney-general of the U. S. in the cabinet of Mr. Pierce from Mar., 1853, to Mar., 1857. He was one of the three lawyers appointed by President Grant to advocate the interests and rights of the Americans before the tribunal of arbitrators who met in Geneva in 1871 for the settlement of the "Alabama claims." Appointed minister to Spain in Dec., 1873, in place of Gen. Daniel E. Sickles, resigned.

Cushing (Luther Stearns), an American jurist, born in Lunenburg, Mass., June 22, 1803. He was reporter to the supreme court of that State, and published eight volumes of reports. He also published a "Manual of Parliamentary Practice" (1845), well known as "Cushing's Manual," and "The Law and Practice of Legislative Assemblies in the U. S." (1855), etc. Died June 22, 1856.

Cushing (Thomas), LL.D., born at Boston, Mass., Mar. 24, 1725, graduated at Harvard in 1744. His father, Thomas, was a prominent and public-spirited citizen. The younger Cushing was Speaker of the Massachusetts house of representatives 1762–74, and a member in 1774 of the provincial and the Philadelphia Congresses. He was regarded in Great Britain as the principal leader of sedition. "One object of the Americans," says Dr. Johnson in "Taxation no Tyranny," "is said to be to adorn the brows of Mr. Cushing with a diadem." He was occupied throughout the Revolution with the affairs of Massachusetts, where he was a judge, and afterwards lieutenant-governor. Died Feb. 28, 1788.

Cushing (William), LL.D., a jurist, born at Scituate, Mass., Mar. 1, 1733. He became chief-justice of the superior court of Massachusetts in 1777, and associate justice of the Supreme Court of the U. S. in 1789. Died Sept. 13, 1810.

Cushing (William B.), U. S. N., born Nov. 4, 1843, in Wisconsin, was appointed to the Naval Academy in 1857, and, being found "deficient in his studies," resigned in 1858. He entered the service as a volunteer officer in 1861, and received a commission as lieutenant in the navy July 16, 1862. He became a lieutenant-commander in 1864, and a commander in 1872. In 1861, Cushing distinguished himself on the Blackwater, in the Sounds of North Carolina, and at New River Inlet; in 1863 he added to his fame by his expedition up the Cape Fear and Little rivers and his brilliant operations on the Nansemond; and in 1864 he covered himself with immortal glory by blowing up the ram Albemarle at Plymouth, N. C. His adventures during the late civil war at Smithfield and Wilmington would alone have sufficed to establish his character for bravery, ability, and sound judgment, while his leading the men of the Monticello in the assault upon Fort Fisher—an act of which any other officer might well be proud—sinks into insignificance compared with his greater and more perilous exploits. Always complimented by his superior officers for his "courage and conduct," several times thanked by the navy department and once by Congress for "distinguished services," Commander Cushing may surely be regarded as the most adventurous of our naval heroes since Decatur died. Died Dec. 1874.

Foxhall A. Parker, U. S. N.

Cushing's Island, in the harbor of Portland, Me., 3 miles from the city, has an area of 250 acres. It is a place of summer resort, and has fine sea-bathing.

Cush'man (Charles H.), U. S. N., born Dec. 6, 1831, in Maine, entered the navy as a midshipman Mar. 24, 1849, became a passed midshipman in 1853, a lieutenant in 1856, and a commander in 1866. He served in the Pembina at the battle of Port Royal, Nov. 7, 1861, and in the iron-clad Montauk at the first attack on Fort Sumter April 7, 1863, and in the many fights of that vessel with the defences of Charleston harbor during the summer and fall of 1863. He was at both the Fort Fisher fights, and led one of the storming-parties in the assault on the fort of Jan. 15, 1865, where he was severely wounded. He was recommended for promotion by Rear-Admiral Porter.

Foxhall A. Parker, U. S. N.

Cushman (Charlotte Saunders), a distinguished American actress, born in Boston July 23, 1816. She made her *début* in 1835, and performed with success in tragedy and comedy. She visited England in 1845, and performed there for several years. Her public readings from Shakspeare and other writers, in the large cities of the U. S. in 1872, were highly successful. In the opinion of many critics she was not surpassed in genius and power by any tragedienne of her time, and she was generally admitted to be the greatest of American actresses. D. Feb. 18, 1876.

Cushman (Henry Wyles), born at Bernardston, Mass., Aug. 9, 1805, was educated at Norwich University, Vt., became lieutenant-governor of Massachusetts, 1851, and a member of the constitutional convention, 1853. Died Nov. 21, 1863.

Cushman (Robert), one of the founders of the Plymouth Colony, was born in England about 1580. He emigrated to Plymouth in 1621, and preached in December of that year the first sermon that was ever printed in America. Died in 1625.

Cusk, Tusk, or **Torsk,** popular names of a marine fish of the cod family, and of the genus *Brosmius*. Various species or varieties occur along the European and American coasts.

Cusp [from the Lat. *cuspis*, a "point"], in architecture, is the point formed by the meeting of two small arches or foils, one of the projecting points of the featherings or foliations in Gothic panels, arches, or tracery.

Cusp, in astronomy, is a point or horn of the moon or of one of the inferior planets.

Cusp, in geometry, a point at which two tangents to a curve coincide. The two branches of the curve may either lie on the same side of the tangent, in which case the cusp is called *ramphoid*, or on opposite sides, when the cusp is *ceratoid*. The cissoid of Diocles furnishes an example of a cuspidate curve with a ceratoid cusp; the cusps of the new moon are ramphoid.

Cusset, a town of France, in the department of Allier. It has manufactures of cotton and wool, vineyards, and mineral springs. Pop. 6575.

Cusse'ta, a township and post-village of Chambers co., Ala. Pop. 1205.

Cusseta, a post-village, capital of Chattahoochee co., Ga., about 18 miles S. E. of Columbus. Pop. 216.

Cussewa'go, a township of Crawford co., Pa. Pop. 1674.

Custard Apple. See Anona.

Cus'ter (George A.), an American officer, born in 1840 in Ohio, graduated at West Point in 1861; lieutenant-colonel Seventh Cavalry July 28, 1866, and brigadier-general U. S. volunteers April 15, 1865. He served in the civil war in the Manassas campaign 1861, engaged at Bull Run; in the Virginia Peninsula 1862, engaged at Yorktown, and aide-de-camp to Maj.-Gen. McClellan in the subsequent operations of the campaign; in the Maryland campaign 1862, engaged at South Mountain and Antietam; in the Rappahannock campaign 1863, engaged on "Stoneman's raid" and at Brandy Station; in Pennsylvania campaign 1863, engaged at Gettysburg (brevet major) and various minor actions; in operations in Central Virginia 1863–64, engaged in numerous skirmishes, etc.; in the Richmond campaign 1864, engaged at Wilderness, Todd's Tavern, Yellow Tavern (brevet lieutenant-colonel), Meadow Bridge, Haw's Shop, Cold Harbor, Trevillian Station, etc.; in the Shenandoah campaign 1864–65, engaged at Opequan (brevet colonel), Cedar Creek (brevet brigadier-general U. S. volunteers), and numerous smaller engagements; in command of the cavalry division in the pursuit of Lee's army 1865, engaged at Dinwiddie Court-house, Five Forks (brevet brigadier-general), Sailor's Creek, and Appomattox (brevet major-general); in command of the cavalry division in the military division of the South-west and Gulf 1865; as chief of cavalry in the department of Texas 1865–66. After the war he was on Western frontier duty, where he was killed June 25, 1876. George W. Cullum, *U. S. Army.*

Custine, de (Adam Philippe), Count, a French gen-

eral, born at Metz Feb. 4, 1740. He served as colonel at Yorktown, Va., in 1781. He commanded brilliantly an army on the Rhine in 1792. His popularity and talents excited the jealousy of the Jacobins, and he was guillotined Aug. 28, 1793. (See his memoirs by D'Hilliers, 1795.)

Custine, de (Astolph), Marquis, a grandson of the preceding, born in 1793, travelled through England, Scotland, Switzerland, Italy, Spain (1835), and Russia, and died in 1857. His work "La Russie en 1839" (4 vols., 1843) created at the time of its publication a profound sensation, and the Russian government deemed it necessary to have an answer to it published.

Cus'tis (George Washington Parke), an adopted son of Gen. Washington, was born in Maryland April 30, 1781. He was a grandson of Mrs. Martha Washington. He produced several plays and orations, and wrote a volume of "Recollections of Washington," which was published in 1860. Died Oct. 10, 1857.

Cus'tom-house [Fr. *douane*], the office at a port of entry where merchants and others are required to pay duties on imported goods, and where vessels are entered and cleared. They are also established at frontier inland towns. The chief officer connected with the custom-house is called a collector of customs.

Cus'tos Rotulo'rum, a Latin term signifying "keeper of the rolls," is the title given in England to the chief civil officer of a county, who is appointed to keep the county records.

Cüstrin', a fortified town in Prussia, in the province of Brandenburg, at the confluence of the Oder and Warthe, 52 miles E. of Berlin. It is surrounded by marshes. The Oder is crossed by a bridge 900 feet in length. Pop. 10,122.

Cutch, or **Kutch,** a portion of Western Hindostan, on the Indian Ocean, lies between Sind and Guzerat, and is separated from the desert by the Runn of Cutch, 7000 square miles of arid land encrusted with salt. Cutch is under the protection of the British. The natives are hardy sailors. The exports are cotton, glue, and oil. The political system is like feudalism, with a sovereign called a *rao* over about 200 chieftains. Capital, Bhooj.

Cutch, a variety of Catechu (which see). It is used in tanning and in dyeing.

Cutch Gunda'va, the most important province of Beloochistan, between lat. 27° and 29° 50′ N., and lon. 67° 20′ and 69° 15′ E., E. of the Brahooick Mountains. Area, about 10,000 square miles. Surrounded by deserts, it is exceedingly fertile, exporting grain, cotton, and indigo. The inhabitants are Juts, with some Hindoos trading in the towns.

Cutchogue, a post-village of Southold township, Suffolk co., N. Y., is situated on the Long Island R. R., 85 miles E. of New York. It has one weekly newspaper.

Cuthæ'ans, a name given by the Jews to the Samaritans (which see).

Cuth'bert, a post-village, capital of Randolph co., Ga., on the South-western R. R., 118 miles S. W. of Macon. It has two female colleges and a high school. One weekly newspaper is issued here. Pop. 2210.

J. P. Sawtell, Ed. Cuthbert "Appeal."

Cuthbert (illustrious for skill), or **Guthbert** (worthy of God), one of the early English saints, born near Melrose-on-the-Tweed, entered the abbey there in 651, and in 664 became its prior, and afterwards prior of Lindisfarne. He took also the bishopric of Lindisfarne in exchange for that of Hexham, to which he was chosen in 684. He had the credit of working miracles. His life was written by Bede. Died Mar. 20, 687.—Cuthbert, abbot of Jarrow, wrote a moving description of the death of the Venerable Bede, 735. (In Twysden's "Decem Scriptores," 1652.)—Cuthbert, twelfth archbishop of Canterbury (741–758), was a friend of Boniface, and sympathized with Pope Zacharias in his efforts to build up the papacy. His letter to Saint Boniface describing ecclesiastical abuses is in Hussey's Bede's "Historia Ecclesiastica."

Cut'ler, a post-township of Washington co., Me. It has manufactures of lumber and boxes. Pop. 925.

Cutler (Lysander), a native of Maine, became colonel of the Sixth Wisconsin Volunteers in 1861, served with the greatest honor in the Army of the Potomac, where he became a major-general, and was twice wounded. Died at Milwaukee, Wis., July 30, 1866.

Cutler (Manasseh), LL.D., an American botanist and Congregational minister, born at Killingly, Conn., May 3, 1742, graduated at Yale in 1765. He described 350 species of plants indigenous in New England. He was a leader of a party that settled at Marietta, O., in 1788. He was also a lawyer and physician, and was a member of Congress (1800–04). Died July 28, 1823.

Cutler (Timothy), D. D. Oxon., an American clergyman, born in Massachusetts in 1685. He became president of Yale College in 1719, a member of the Episcopal Church in 1722, and rector of a church in Boston in 1723. Died Aug. 17, 1765.

Cut'lery [from the Lat. *cultellus*, diminutive of *culter*, a "knife"], a term used to designate sharp and cutting instruments made of iron or steel. The most primitive cutting instruments were flints, shells, etc., which were succeeded by bronze implements and weapons. These were probably used to some extent by the Romans until about the commencement of the Christian era, as bronze surgical instruments have been found at Pompeii. During the Middle Ages several cities of Spain and Northern Italy were renowned for the manufacture of cutting instruments, especially swords. The cutlery of Sheffield in England has been generally regarded as superior to any other, but other European countries and the U. S. now rival England in the quality of their cutlery. Good table-knives are made of steel and iron welded together; the tang (which goes into the handle) and the shoulder are of iron, and the blade is steel. The blades of knives, razors, etc. are usually forged into shape while attached to the bar; they are smithed—that is, beaten upon an anvil—to condense the metal, and slightly ground on a rough stone to finish the shaping and remove the black oxidized surface, which would interfere with the color of the tempering. Cheap table-knives are made of iron entirely, and the difference of price is owing to the greater facility of working, as well as the cost of the material. In many articles made of steel and iron the saving of steel is not the only advantage, for as steel is more brittle than wrought iron, it is desirable that every part except the cutting edge should be of iron. The great value of steel for all cutting implements or those exposed to wearing friction depends on its property of acquiring a great degree of hardness when heated and suddenly cooled, and of softening again by moderately reheating. The dry-grinding of forks, etc. is very injurious to the health of those engaged in it, owing to the particles of steel causing irritation of the lungs and a disease called "grinders' asthma." Pocket-knives are the work of many hands. There are, besides the blades, the separate pieces of the spring, handle, rivets, etc.; the making of each is a distinct trade. The pieces are all finally fitted and put together by the finisher; a two-bladed knife sometimes passes through his hands from seventy to a hundred times.

Cutt (John), one of the founders of the Cutts families of Maine and New Hampshire, is said to have been a Welshman. He came to America before 1646 with Robert and Richard, his brothers, and became a wealthy merchant of Portsmouth, N. H. His brothers became prominent citizens of Portsmouth and Kittery. John was for a time president of New Hampshire. Died Mar. 27, 1681.

Cut'tack, a city, the capital of a district of like name, is on the Mahanuddee River, 250 miles S. W. of Calcutta. It is healthy, and has a temple and mosques, chapels, and manufactures of shoes, brass, and salt. Pop. about 40,000; of district, 1,984,600.

Cut'ter, a small vessel with one mast and a bowsprit, built with especial reference to speed. The distinction between a cutter and a sloop is that in a cutter the jib has no stay to support it. The term "revenue cutters" is applied to those which are employed in the pursuit of smugglers. The cutters belonging to ships of war are clincher-built boats, about twenty-five feet long.

Cut'ting (Francis Brockholst), born in New York City in 1805, graduated at Columbia College in 1825. He was a distinguished lawyer and a prominent Democratic member of Congress in 1853–55. Died June 26, 1870.

Cutting (Sewall Sylvester), D. D., born Jan. 19, 1813, at Windsor, Vt., graduated at the University of Vermont in 1835, ordained pastor of a Baptist church in West Boylston, Mass., 1836, pastor of a Baptist church in Southbridge, Mass., 1837–45, editor of the "New York Recorder" 1845–50 and 1853–55, editor of the "Christian Review" 1850–53, professor of rhetoric and history in the University of Rochester 1855–68, secretary of the American Baptist Educational Commission from 1868 to the present time (1873). He is author of "Historical Vindications of the Baptists," Boston, 1858.

Cut'tings, portions of branches of trees or shrubs employed to produce new plants by the insertion of the lower end into the earth. The willow, currant, and gooseberry are easily propagated in this mode, and many other trees or shrubs will grow from cuttings under favorable circumstances, such as warmth, moisture, and shade. The branches which are young, but not less than a year old, are most adapted for this purpose.

Cut'tle-fish [Ger. *Kuttelfisch*; Fr. *sèche*], a name applied to many dibranchiate cephalopodous mollusks, especially to those of the family Sepiadæ, the species of which are numerous and almost world-wide in distribution. The term popularly includes nearly all the dibranchiate cephalopods. They are characterized by the presence of an ink-bag filled with black or brown "sepia," a substance which the animal ejects when pursued, so as to conceal itself from view by coloring the waters around it. This substance was formerly much employed in making sepia or India ink (now made of lampblack, etc.). This coloring-matter is so permanent that it has occasionally been prepared from fossil specimens. "Cuttle-fish-bone" is in reality the calcareous internal shell of these animals, especially that of the *Sepia officinalis* of Europe. When powdered it is sold under the name of "pounce," and is used for polishing, for tooth-powder, and in making moulds for delicate castings. It was formerly much used in medicine, but is only valuable for its feebly antacid properties. Cuttle-fish have been found of two tons weight in the tropical seas. They are all marine. Many fossil species occur. Several species are found on the Atlantic coast of the U. S. (See SQUID.)

Cuttle-fish: Sepia officinalis.

Cut'ty-Stool [Scottish, *cutty* or *kittie*, a woman of light or worthless character], or **Creep'ie Chair,** formerly a seat in Scottish churches where offenders against chastity were obliged to sit for three Sundays, and receive a reprimand from the minister.

Cut-Worm, a name given by agriculturists to many larvæ, mostly belonging to lepidopterous insects of the family Noctuælitæ, and especially to those of the genus *Agrotis*. They cut off corn, cabbage, and other plants just below the surface of the ground; and one species at least (*Agrotis Cochrani*) climbs apple and pear trees and destroys the young buds. No effective remedy for their ravages is known.

Cuvier, a township of St. Charles co., Mo. Pop. 3174.

Cuvier (GEORGE CHRÉTIEN LÉOPOLD FRÉDÉRIC DAGOBERT), BARON, a celebrated French naturalist, was born at Montbéliard, then in Wurtemberg, whither the family had removed from Jura in the sixteenth century upon embracing Protestantism, Aug. 23, 1769. His father was an officer in a French regiment of Swiss mercenaries. He studied political science at the Carolinian academy in Stuttgart, through the interest of the duke. He was an enthusiastic student from boyhood, and his passion for natural history showed itself in his thirteenth year. He became in 1788 tutor to the son of Count d'Héricy, who lived in Normandy, and remained in this situation nearly six years, at the same time pursuing his studies. Early in 1795 he removed to Paris, where he associated with Jussieu and Geoffroy Saint-Hilaire. He became in July, 1795, professor of comparative anatomy in the Museum of Natural History, and began to form his great cabinet of comparative anatomy. In 1796 he was admitted into the Institute, then just founded. He displayed his genius for classification in a work called "Tableau Élémentaire des Animaux" (1798), and succeeded Daubenton as professor of natural history in the College of France in 1800. In 1801 he commenced the publication of the important "Leçons d'anatomie comparée" (1801–05, 5 vols.; new ed. 1840). He married Madame Duvaucel, the widow of a farmer-general, and was chosen perpetual secretary of the Academy of Sciences in 1802. In 1808 he was appointed councillor to the Imperial University. He displayed a rare faculty of expressing scientific truths in popular and elegant language in his "Discourse on the Revolutions of the Surface of the Globe," in which he propounds the theory of the correlation of forms in organized beings. He was appointed master of requests by Napoleon in 1813, and councillor of state in 1814. He published in 1817 his celebrated "Animal Kingdom" ("Règne Animal distribué d'après son Organisation," in four volumes; new edition by his pupils, 11 vols., with 993 plates, 1836–49), in which he proposed the arrangement of animals in four divisions—the Vertebrata, Mollusca, Articulata, and Radiata. Soon after the restoration of the Bourbons he was appointed chancellor of the University of Paris by Louis XVIII. He was elected a member of the French Academy in 1818, and received the title of baron in 1820. He wrote many able notices of scientific men for the "Biographie Universelle." Among his other works is an excellent "Natural History of Fishes" (1818–30, with the continuation by Valenciennes, 22 vols.), of which eight volumes were finished during his life. As a professor he was distinguished for facility of elocution, clearness of ideas, and the art of fixing the attention in philosophical or historical digressions. He first applied to zoology the natural method, and founded a system on the basis of the invariable characters of anatomical structure. He is regarded as the founder of the science of comparative anatomy, and his knowledge of that science was such that a bone or small fragment of a fossil animal enabled him to determine the order, and even genus, to which it belonged. During the last twelve years of his life he rendered important services as president of the committee of the interior. He was created a peer of France in 1831. Died May 13, 1832. He had several children, but none of them survived him. His disposition was amiable, and his moral character unimpeachable. (See A. DE CANDOLLE, "Notice sur la Vie et les Ouvrages de G. Cuvier;" R. LEE, "Memoir of Baron Cuvier," 1833; L. DE LOMÉNIE, "G. Cuvier, par un homme de rien," 1841; FLOURENS, "Cuvier, Histoire de ses Travaux," 1845.)—The brother of the naturalist, FRÉDÉRIC CUVIER, born June 28, 1773, published, with Geoffroy St.-Hilaire, "Histoire naturelle des mammifères," interesting accounts of the habits of animals.

Cuvillier-Fleury (ALFRED AUGUSTE), one of the editors of the "Journal des Débats," born in 1802, has published "Portraits politiques et revolutionnaires" (1851), "Études historiques et littéraires" (1854), "Études et portraits" (1865–68), etc.

Cuxha'ven, a town of Germany, is on the left bank of the Elbe, at its entrance into the German Ocean, about 60 miles W. N. W. of Hamburg, to which it belongs. It has a good harbor, and is important as the port whence the Hamburg steamers depart when the Elbe is frozen. Pop. 1698.

Cuya'ba, or **Cuiaba,** a town of Brazil, the capital of the province of Matto Grosso, is on a river of its own name. It is a bishop's seat, and has three churches and an imperial hospital. Gold is found in this district. Pop. 7000.

Cuyahoga, kī-ȧ-hō'gȧ, a county of Ohio, bordering on Lake Erie. Area, 426 square miles. It is intersected by the Cuyahoga River. The surface is nearly level; the soil is fertile. Cattle, grain, and wool are staple products. The manufactures are very extensive and varied, including iron, machinery, paper, lumber, leather, furniture, and many other articles. It is traversed by several important railroads, which connect it with Cincinnati, Pittsburg, Chicago, etc. Capital, Cleveland. Pop. 132,010.

Cuyahoga Falls, a post-village and township of Summit co., O., on the Cuyahoga River and the Cleveland Mount Vernon and Delaware R. R., 34 miles S. S. E. of Cleveland. The river is here enclosed between rocky walls nearly 200 feet high, and affords abundant water-power, which is employed in several paper-mills, wire-works, rolling-mills, foundry, soap and glue factory, etc. It has one national bank and one weekly newspaper. Pop. of the village, which is coextensive with the township, 1861.

E. D. KNOX, ED. CUYAHOGA FALLS "REPORTER."

Cuyler, kī'lęr, a township and post-village of Cortland co., N. Y. Pop. 1357.

Cuyler (THEODORE LEDYARD), D. D., born at Aurora, Cayuga co., N. Y., Jan. 10, 1822, graduated at Princeton College in 1841, at Princeton Seminary in 1846, preached three years at Burlington, N. J., was first pastor of the Third Presbyterian church at Trenton, N. J., then pastor of the Market Street Reformed church in New York City, and is now pastor of Lafayette Avenue Presbyterian church, Brooklyn, N. Y., enrolling more members than any other Presbyterian church in the U. S. He is the author of several little works, such as "Cedar Christian," "Empty Crib," "Heart-Life," and "Thought-Hives," all of which have been republished in England. Has also published more than 1500 letters and articles in newspapers and magazines, many of which have been reprinted in Europe.

Cuyp (ALBERT), a Dutch landscape-painter, pupil of his father, Jacob Gerrits Cuyp (1575–1650), was born at Dort in 1606. His works, remarked for atmospheric effects, are many of them in England. Died after 1683.

REVISED BY CLARENCE COOK.

Cuz'co, the most populous department of Peru, is mostly between lat. 13° and 15° S. and lon. 70° and 73° W. Area,

about 45,000 square miles. The surface is mountainous, with extensive table-lands; it is rich in metals, and favorable to grazing and agriculture. Capital, Cuzco. Pop. about 464,000.

Cuzco, a handsome city of Peru, the capital of the above department, is 200 miles N. of Arequipa, and 11,380 feet above the level of the sea; lat. 13° 31′ S., lon. 72° 4′ W. It was formerly the capital of the Incas. It contains a fine cathedral, a university, several convents, and a mint, and is the seat of a bishop. Here are manufactures of cotton and woollen stuffs and jewelry. Massive specimens of ancient Peruvian architecture are visible. Pop. 25,000.

Cyanæ'a [probably named from the nymph *Cyane*], a genus of radiate animals of the class Discophora (jelly-fishes), allied to the Medusæ. The *Cyanæa capillata* is one of the species which are known as sea-nettles. Its severe sting is one of the terrors of sea-bathers at some of the European watering-places.

Cyanæa.

Cy'ane [Gr. Κυανή], the name of a water-nymph of classic mythology, who tried to rescue her playmate Proserpine, and was changed by Pluto into a fountain in Sicily. She is also called the wife of Æolus, god of the winds. The fountain Cyane, near Syracuse, still flows, and gives rise to a considerable river. Here grows the papyrus plant.

Cy'anide, or **Cyan'uret,** a compound of cyanogen with a positive radical. Prussian blue is a cyanide (or rather a ferrocyanide) of iron. The cyanide of potassium is very useful in chemistry and the arts, and is also employed in medicine as a sedative. It is a very active poison.

Cyan'iline ($C_{14}H_{14}N_2$), a direct compound of cyanogen and aniline. It is very unstable, but crystallizes and forms salts with acids.

Cy'anite, or **Kyanite** [from the Gr. κύανος, "blue," and λίθος, a "stone"], a beautiful mineral, sometimes called **Disthene,** is a silicate of alumina. It often occurs crystallized, and generally in broad prisms. It is transparent or translucent, sometimes opalescent, and exhibits various shades of blue. Its formula is $Al_2O_3SiO_2$.

Cy'anogen [from the Gr. κύανος, "blue," and γεννάω, to "produce," referring to "prussian blue," one of its compounds], a compound negative radical composed of two equivalents of carbon with two of nitrogen, represented by the symbol C_2N_2, or, in its capacity of a quasi-element, by Cy. It is a colorless, inflammable, permanent gas, with a specific gravity of 1.806. At the temperature of 45° F., if submitted to the pressure of 3.6 atmospheres, it becomes a transparent, colorless liquid. It has the odor of peach-kernels. Combined with hydrogen, it produces prussic or Hydrocyanic Acid (which see), remarkable for its deadly action upon the animal economy. Cyanogen combines with metals and other positive radicals, and produces a class of compounds known as cyanides, which are analogous in character to the chlorides, iodides, etc. Some of these are of great importance in the arts, as in gilding, electro-plating, photographing, and as tests in the chemical laboratory. Some are used in medicine as sedatives, but they are in general extremely poisonous. Prussian Blue (which see) is one of the most important of the cyanides.

Cyanom'eter [from the Gr. κύανος, "blue," and μέτρον, a "measure"], an instrument for measuring the blueness of the sky. It consists, essentially, of a disk divided into sectors, the several sectors being colored with tints of blue gradually increasing in intensity. Held between the eye and the sky, some sectors will appear deeper, and some lighter in tint than the heavens. That one where the difference is insensible is the measure of the blueness for the time being. F. A. P. Barnard.

Cyano'sis [from the Gr. κύανος, "blue;" Fr. *cyanose*], also called **Cyanopathi'a** [from κύανος, "blue," and πάθος, "affection"], a condition in which the skin of a newly-born infant is of a blue color. It is the result of various congenital malformations and conditions of imperfect development. Frequently the pulmonary circulation is defective. In some cases the foramen ovale remains open as in the fœtal state. The venous and arterial blood are mingled, as is normal before birth. Cyanosis may prove fatal in a few days after birth, but normal development may take place and recovery follow, or the patient may live for years with this undeveloped condition of the blood-vessels.

Cya'thea [from the Gr. κύαθος, a "cup," alluding to the shape of its indusia], a genus of beautiful tree-ferns of the sub-order Polypodiaceæ, found in the tropical regions of the Old and New World. The species are numerous. *Cyathea arborea*, a native of the West Indies, Mexico, and South America, has bipinnate fronds. *Cyathea medullaris*, a New Zealand species, has edible starchy roots.

Cyathophyl'lum [from the Gr. κύαθος, a "cup," and φύλλον, a "leaf," referring to the shape of the polypidoms], a genus of fossil stony corals having a simple or branched polyparium, internally lamellated, the lamellæ having a quadripartite arrangement. This genus is found in abundance in the Devonian measures, and thirty-six species have been described from them. It disappeared at the close of the carboniferous period.

Cyax'ares [Gr. Κυαξάρης; Old Persian, *Uvakshatara*, *i. e.* "beautiful-eyed"] **I.,** a king of the Medes, began to reign in 633 B. C. He waged war against the Scythians, who invaded his dominions, and against Alyattes, king of Lydia. A total eclipse of the sun which occurred about 610 B. C. induced Cyaxares and Alyattes to make peace. Cyaxares and the king of Babylon took Nineveh in 625. He died in 593 B. C., and was succeeded by his son Astyages, who reigned from 593 to 569 B. C.

Cyaxares II., a son of Astyages, grandson of Cyaxares I., and uncle of Cyrus the Great. Though not mentioned by Herodotus or Ctesias, he is named by Xenophon as the successor of Astyages in the Median kingdom, and is probably the same as "Darius the Median" spoken of by the prophet Daniel (v. 31). He is supposed to have reigned in Babylon for two years after its conquest by Cyrus in 538 B. C. He came to the throne of Media in 569 B. C.

Cyb'ele [Gr. Κυβέλη or Κυβήλη], called also **Cybe'be** [Gr. Κυβήβη] and **Rhe'a** [Gr. Ῥεία, Ῥέα or Ῥείη], a goddess of classic mythology, received the appellation of "Mother of the Gods" or "Great Mother." She was supposed to be a daughter of Uranus and Terra, the wife of Saturn (Cronos), and the mother of Jupiter. Her priests were called Corybantes (which see). She was sometimes styled the "Berecynthian mother," from the hill Berecynthus, where she had a temple. She is generally represented riding in a chariot drawn by lions, with a diadem of towers upon her head.

Cycada'ceæ, or **Cyca'deæ** [from *Cycas* (gen. *cycadis*), one of the genera], a small natural order of exogenous plants, indigenous in the tropical parts of Asia and America. They are gymnosperms, and nearly related to the Coniferæ, and are distinguished by their simple stems, large pinnate leaves, and antheriferous cones. The stems, outwardly like palms, are internally exogenous in structure. Thus they approach closely to the endogens, and seem to be a link between the latter and the exogens. This curious order comprises about fifty known species, none of which are natives of Europe. Many of them afford starch, which is wholesome and extensively used as food. Sago is obtained in Japan from the interior of the stem of the *Cycas revoluta*, and a similar substance is produced in the Moluccas by the *Cycas circinalis*. The large seeds of *Dion edule*, which grows in Mexico, afford a starchy food. The caffer-bread trees belong to this order. The Coontie (which see) is the only plant of this order in the U. S.

Cy'chla, a genus of fishes of the family Chromidæ, many species of which are found in the tropical parts of America. They have small and crowded teeth, and are remarkable for the beauty of their colors. Some of them are greatly esteemed for the table.

Cyc'lades [from the Gr. κύκλος, a "circle"], a name given to a group of islands in the Ægean, numbering twelve in all, according to Strabo, so called because they surrounded the sacred island of Delos. These islands are Syra, Delos, Andros, Tenos, Mykonos, Naxos, Paros, Antiparos, Siphnos, Seriphos, Kythnos, and Keos. The present nome of the Cyclades (the tenth of fourteen in the kingdom of Greece) includes, in addition to the above, the following eight islands: Melos, Thera, Kimolos, Pholegandros, Sicynos, Ios, Amorgos, and Anaphe. The surface is mountainous, the soil productive. Pop. of the nome in 1871, 123,299. Area, 926 square miles. Syra or Hermopolis is the most important city.

Cyc'lamen [Gr. κυκλάμινος, from κύκλος, "circle," because it was used for garlands], the name of a genus of plants of the natural order Primulaceæ, having a wheel-shaped corolla, with a long reflexed limb, and flower-stalks twisted spirally after flowering. The species are herbaceous perennials, mostly natives of the south of Europe. Some of them are cultivated in gardens for the sake of the flowers, which are beautiful and fragrant. The root or subterranean stem is acrid and drastic. These properties depend on a peculiar principle called cyclamin.

Cy'cle [Gr. κύκλος, a "circle"], a period of time which finishes and recommences perpetually. The term has been

employed for marking the intervals in which two or more periods of unequal length are each completed in a certain number of times, so that both begin again exactly in the same relations as at first. The cycles used in chronology are three: the cycle of the sun, the cycle of the moon (or Metonic cycle), and the cycle of indiction. The cycle of the sun, or solar cycle, is a period of time after which the same days of the week recur on the same days of the year. If the number of days in the year were always the same, this cycle could only contain seven years; but the order is interrupted by the intercalations. In the Julian calendar, the intercalary day returns every fourth year, and the cycle consequently contains twenty-eight years. This cycle is supposed to have been invented about the time of the first Council of Nice (325 A. D.), but the first year of the first cycle is placed nine years before the commencement of the Christian era. Hence the year of the cycle corresponding to any given year in the Julian calendar is found by the following rule: add nine to the date and divide the sum by twenty-eight; the quotient is the number of cycles elapsed, and the remainder is the year of the cycle. Should there be no remainder, the proposed year is the twenty-eighth, or last of the cycle. In the reformed calendar this rule can only apply from century to century, for the order is interrupted by the omission of the intercalary day every hundredth year. (See DOMINICAL LETTER.) The cycle of the moon is a period of nineteen solar years, after which the new and full moons fall on the same days of the year as they did nineteen years before. This cycle was invented by Meton, an Athenian astronomer, and is known as the "Metonic cycle." It contains 8940 days, which exceeds the true length of the nineteen solar years by nine and a half hours, nearly. On the other hand, it exceeds the length of 235 lunations by seven hours and a half only. The framers of the ecclesiastical calendar, in adopting this period, altered the distribution of the lunar months, in order to accommodate them to the Julian intercalation; and the effect of the alteration was that every three periods of 6940 days was followed by one of 6939. The mean length of the cycle was therefore 6939¾ days, which agrees exactly with nineteen Julian years. The number of the year in the cycle is called the GOLDEN NUMBER (which see). The cycle begins with the year in which the new moon falls on the first of January. To find the number of any year in the lunar cycle, or the golden number of that year, we have this rule: add one to the date and divide by nineteen; the quotient is the number of cycles elapsed, and the remainder is the year of the cycle. Should there be no remainder, the proposed year is the last or nineteenth of the cycle.

The cycle of indictions, or Roman indiction, is a period of fifteen years, not astronomical, but entirely arbitrary. Its origin and purpose are alike uncertain, but it is conjectured that it was introduced by Constantine the Great about 312 of the common era, and had reference to certain judicial acts that took place at stated intervals of fifteen years. It is considered as having commenced on the first of Jan., 313. By extending it backward to the beginning of the era, it will be found that the first year of the era corresponded with the fourth of the cycle. In order, therefore, to find the number of any year in the cycle of indiction, we have this rule: add three to the date, divide the sum by fifteen, and the remainder is the year of indiction.

F. A. P. BARNARD.

Cyc'lic Planes of a Cone, the two planes through one of the axes which are parallel to the planes of circular section of the cone. The perpendiculars to the cyclic planes through the vertex are the focal lines of the reciprocal cone. A sphere around the vertex of the cone is cut by the latter, its cyclic planes, and its focal lines respectively, in a sphero-conic, its cyclic arcs, and its foci, and thus the reciprocal properties of cyclic planes and focal lines give rise to properties of sphero-conics, which are in many respects precisely similar to those of plane conics.

Cyc'lic Po'ets [Gr. οἱ ποιηταὶ κυκλικοί, the "poets of the cycle" or "routine" of mythology], a name originally given to Homer and certain epic poets who followed him, whose works treated of the mythological and heroic ages of Greece. In the second century B. C. these poems were arranged at Alexandria according to the order of the events they narrated. The whole collection was called the "Epic Cycle." The Homeric poems, though originally comprised in this cycle, are always treated as distinct from it, and the name "cyclic poet" became rather one of reproach, signifying a follower of an established "routine." The principal cyclic poets were Arctinus, Lesches, Agias, Eumelus, Stasinus, and Eugamon. Their extant writings are mere fragments.

Cyc'lifying Line, Plane, and **Surface.** The developable surface which contains a given non-plane curve, and which on being unfolded transforms that curve into a circular arc of a given radius, is called the cyclifying surface, corresponding to that radius. Its tangent planes are the *cyclifying planes* of the curve, and its generators the *cyclifying lines*. The theory of cyclifying surfaces is a generalization of that of the rectifying surface; which latter, in fact, is a cyclifying surface corresponding to the radius infinity. The developable osculatrix of a common helix, or of any curve with constant radius of curvature, is a cyclifying surface.

Cy'cloid [from the Gr. κύκλος, a "circle," and εἶδος, "form"], a name given to several important plane curves generated by a point in the plane of a circle when the latter is rolled along a straight line. If the generating point is in the circumference of the rolling circle, a "common cycloid" is generated; if the generating point be outside the circle, it marks a "curtate" cycloid; while if it be a point within the circumference, a "prolate" or "inflected" cycloid is the result. That part of the cycloid which is generated in one revolution of the generating circle is called one "branch" of the cycloid. The branches may be infinite in number. That part of the straight line which is traversed in one revolution of the generating circle is the "base" of one branch. A line bisecting the branch of a cycloid and its base is the "axis." The common cycloid is the "line of quickest descent;" that is, if one point be placed above another, but not in the same vertical line, a falling body will move from the higher point to the lower more quickly along the arc of an inverted common cycloid than by any other course, even if that course be a straight line. If a pendulum be made to vibrate in the arc of a common cycloid, no matter what the length of the arc may be, the time will always be the same. In practice, however, this result has never been attained. Experiments show that cog-wheels with teeth bounded by this curve have their friction reduced to the minimum. (See EPICYCLOID and HYPOCYCLOID.)

Cy'cloid, Companion to the, a name given by Roberval to a curve intimately connected with the cycloid, by means of whose properties he succeeded in 1634 in solving the problem of the quadrature of the cycloid. The curve in question may be conceived to be generated by a point which always remains vertically over the point of contact of the rolling circle and its base, and in the same horizontal line as the describing point. Its area is equal to twice that of the rolling circle. The area of the space between the cycloid and its companion is precisely equal to that of the rolling circle, so that the area of the cycloid itself is three times that of the circle.

Cy'clone [from Gr. κύκλος, a "circle;" *one* is an augmentative suffix], a rotatory storm or whirlwind occurring in the tropical seas, but never on the equator. The diameter is generally about 200 or 300 miles, and sometimes exceeds 500. The centre of the vortex (which is always calm) travels at a rate varying from eleven to thirty miles an hour. Cyclones are perhaps the most destructive of all storms. They rotate from right to left in the northern hemisphere, and from left to right in the southern. According to Humboldt, the velocity of the wind is sometimes from 200 to 300 miles an hour. (See WINDS.)

Cyclopæ'dia [from the Gr. κύκλος, a "circle," and παιδεία, "instruction," "knowledge"] properly signifies a work which takes in the whole circle of learning. The term is often, though incorrectly, applied to a work treating very fully of some one or two important subjects, as Chambers's "Cyclopædia of English Literature," the "Cyclopædia of Anatomy and Physiology," etc. (See ENCYCLOPÆDIA.)

Cyclo'pean Walls, a term applied to certain huge structures or walls of uncemented stones, the remains of which are found in Greece, Italy, and Asia Minor. These structures were so called because they were supposed to have been built by the Cyclopes of mythology. The architecture is very different from that of the historic period. Some persons believe that they were erected by the Pelasgi, more than 1000 years before the Christian era. The Cyclopean walls at Tiryns in the Peloponnesus are formed of unhewn stones from six to nine feet long, and nearly three feet thick. At Mycenæ are found massive walls of stones, which are more accurately fitted and are specimens of an architecture less rude than that of Tiryns. A more advanced style of architecture appears in some remains of Etruria. In the Etruscan masonry called Cyclopean the stones are hewn or squared and laid in horizontal courses, but are not cemented.

Cy'clopism, that form of monstrosity or malformation of the fœtus in which only one eye is present, usually on the median line of the head. (See TERATOLOGY.)

Cy'clops [Gr. Κύκλωψ (*i. e.* "round-eyed"), from κύκλος, a "circle," and ὤψ, an "eye"], plu. **Cyclo'pes,** in classic

mythology, a race of giants or monsters having each one eye in the middle of the forehead. According to Hesiod, they were the sons of Uranus, and were named Brontes, Arges, and Steropes. Homer represents them as gigantic and lawless shepherds and cannibals who lived in Sicily. The most famous among them was Polyphemus.

Cyclops, a genus of minute entomostracous crustaceans, so named from the supposition that the animal had but one eye. It has since been discovered to have two eyes, forming a single spot in the centre of the forehead. The species of *Cyclops* are numerous, and inhabit both salt and fresh waters. Several species occur in the U. S. Whales devour large numbers of the marine species.

Cyclops.

Cyclo'sis [Gr. κύκλωσις, a "going around," from κύκλος, a "circle"], a movement of elaborated sap, *latex*, or granulated protoplasm within the cells or vessels of plants. It was first observed and described by C. H. Schultz. In the milky or colored latex of some species of the genera *Ficus* and *Euphorbia*, and in the celandine (*Chelidonium majus*), it is easily seen under the microscope, but is nowhere more beautiful than in the elongated cells of *Chara* and some other aquatic plants, especially with a magnifying power of about 1200 diameters. It has been observed in the needle-like hairs of the common nettle. There is usually a regular rotation (whence the name) of the granules in each cell, up one side and down the other, with also smaller partial currents in different directions. Huxley considers the cause of the currents to exist in contractions of the protoplasm, too minute to be discerned except through their effects. (See Schultz, "Die Cyklose, etc. in den Pflanzen," Breslau, 1841.)

Cyd'nus [Gr. Κύδνος], a river of Cilicia, flowing through the city of Tarsus into the Mediterranean. It was celebrated for the clearness and coldness of its water. It was anciently navigable up to Tarsus (12 miles), but its mouth is now obstructed by bars. This river was the scene of Cleopatra's celebrated voyage to meet Antony in 41 B. C.

Cydo'nia, an ancient city of Crete, was on the northwestern coast of the island. It was noted for the production of the quince (*Cydonia*).

Cyg'nus (the "Swan"), a constellation of the northern hemisphere between Lyra and Cassiopeia, comprises several bright stars. The parallax of the binary star 61 Cygni was measured by Bessel, who published in 1839 "Measure of the Distance of the Star 61 in the Constellation of Cygnus." By two distinct methods of observation the distance of this star has been shown to exceed 50,000,000,000,000 miles.

Cyl'inder [Gr. κύλινδρος, from κυλίνδω, to "roll"], the name of a genus of geometrical solid figures of which there may be endless species. The most common kind of cylinder is that which is generated by the revolution of a rectangular parallelogram about one of its sides, which line is called the axis of the cylinder. But in order to embrace all varieties of cylinders we must generalize the mode of generation. A cylinder, then, is a solid generated by a line which moves parallel to itself while one end traces on a plane any curve whatever. When the position of the generating line is at right angles to the plane, the cylinder is *right;* when not, it is *oblique*. If the curve traced is a circle, and the line is perpendicular to the plane, the cylinder is a *right circular cylinder*. In all cases the content of the cylinder is found by multiplying the number of square units in the base by the number of linear units in the altitude. A sphere and a cylinder circumscribed to it have a remarkably simple relation to each other, first discovered by Archimedes, their volumes being as 2 : 3.

Cylle'ne [Κυλλήνη], a mountain of Greece, in the northwestern part of Arcadia, was supposed to be the birthplace of Mercury (Hermes), who was called *Cyllenius*, and had a temple on its summit. Height above the sea, 7788 feet. It is now called *Zyria*.

Cy'ma [Gr. κῦμα, a "wave"], in architecture, a term applied to a moulding, so called because its contour resembles that of a wave, being, for example, hollow in its upper part and swelling below. Of this moulding there are two sorts—the *cyma recta*, just described, and the *cyma reversa*, of which the lower part is hollow.

Cym'bal [Gr. κύμβαλον, from κύμβος, "hollow"], a brass musical instrument of percussion, circular in form and about eight inches in diameter. Cymbals are played in pairs by striking one against the other, and produce a loud, harsh sound of no fixed pitch. The best are those made in China and Turkey. Cymbals were employed by the Greeks in the festivals of Bacchus and Cybele.

Cyme [Gr. κῦμα, "swelling" or "sprout"], a flat-topped or convex centrifugal inflorescence—viz. one in which the central flower of each cluster or division opens first, that flower terminating the axis. Linnæus restricted the name to compound inflorescence of this sort, of which the elder (*Sambucus*) and *Viburnum* offer well-marked examples; but modern botanists, making the distinction between flowers from axillary and from terminal buds, employ it as a general term for all forms of inflorescence of the latter kind.

Cym'ry, the name given by the Welsh to their nation. It is frequently extended to the entire branch of the Celtic race to which the Welsh belong. To this branch also belong the people of Bretagne in France and the ancient races of Cornwall, Cumberland, and Strathclyde. Attempts have been made to prove that the Cimmerii and the Cimbri were of this race, but the evidence fails to establish these points. There is reason to believe that a great part of the ancient British race was Cymric, and many Cymric roots appear to have been found in Gaulish and Belgic names. (See Celts and Wales.)

Cynan'chum [from the Gr. κύων, a "dog," and ἄγχω, to "choke" (*i. e.* "dog-bane")], a genus of plants of the order Asclepiadaceæ. *Cynanchum Monspeliacum*, found on the shores of the Mediterranean, produces the Montpellier scammony. Caoutchouc is obtained to some extent from the *Cynanchum ovalifolium*, a native of Penang. Other species have been used in medicine.

Cyn'ics [Gr. κυνικοί, "dog-like," from κύων, a "dog"], a sect of philosophers among the Greeks, so called from their dog-like temper and their disregard of the conventional usages of society. It is difficult to give any satisfactory account of the tenets of this sect, as during all the period of its existence it was in a state of constant fluctuation. Its professed aim was to inculcate the love of rigid virtue and a contempt of pleasure. On this point the testimony of Horace—himself a zealous adherent of the school of Aristippus, the very opposite of the cynical sect—even were there no other, must be held conclusive; and according to his opinion the aim of the cynical philosophy was to induce every man to become "the guardian of real virtue." Diogenes belonged to this sect. It was founded in the fifth century B. C. by Antisthenes, a disciple of Socrates, who sought to imitate his master in disregard of outward splendor and contempt of riches, but his indifference to these things soon degenerated into an ostentatious display of singularity.

Cynoceph'alus [from the Gr. κύων, a "dog," and κεφαλή, "head"], in Egyptian mythology, a dog-faced baboon. The Egyptians held these animals in great veneration, and professed to discover by their aid the periods of the sun and moon. The name is now applied to a genus of African monkeys. (See Baboon.)

Cynosceph'alæ [from the Gr. κύων, gen. κυνός, "dog," and κεφαλή, a "head"], a locality in Thessaly, was the scene of two important battles. In the first the Thebans defeated the tyrant of Pheræ, in 364 B. C. In the second the Roman general Flamininus defeated Philip of Macedon in 196 B. C.

Cynosu'ra [Gr. κυνοσουρά, from κύων, κυνός, "dog," and οὐρά, "tail," probably because four stars of Ursa Minor, including the North Star, were fancied to resemble a dog's tail; Fr. and Eng. *cynosure*], a nymph of Ida, said to have been one of the nurses of Jupiter, who translated her into the constellation of Ursa Minor, which includes the North Star. In the language of poetry it signifies a "point of attraction."

> "Where perhaps some beauty lies,
> The cynosure of neighboring eyes."—*Milton.*

Cynthian'a, a city, capital of Harrison co., Ky., on the South Fork of the Licking River and on the Kentucky Central R. R., 66 miles S. of Cincinnati. It was first settled in 1780, and was named from Cynthia and Anna Harrison, daughters of one of the early settlers. It has two weekly papers and one national bank. It is noted for the manufacture of "Bourbon" whisky. There are eight churches, a graded free school, a female college, two flouring-mills, and two carriage-factories. It is in a very fertile agricultural district, and is the site of a famous race-course. A Confederate force numbering 2200 men, with artillery, under Gen. J. H. Morgan, attacked the place July 17, 1862, garrisoned by 350 Federal soldiers. The place was surrendered, but not till the ammunition was exhausted. On June 11, 1864, Morgan with a large force attacked the place again, and after two days' fighting captured Gen. Hobson with some 1700 men. On the 14th, Gen. Burbridge, with 7000 men, fell upon Morgan (whose men were out of ammunition and

exhausted), and drove him out of Cynthiana with considerable loss. P. 1771. A. J. Morey, Ed. and Prop. "News."

Cynthiana, a township of Shelby co., O. Pop. 1597.

Cypera'ceæ [from *Cyperus*, one of the genera], popularly called sedges, an order of endogenous plants nearly related to the grasses, and natives of all parts of the world. They are distinguished from the Graminaceæ by having stems which are solid and mostly triangular, not round and fistular, and nearly destitute of joints. They have closed sheaths and spiked, chiefly tri-androus flowers, one in the axil of each of the glume-like imbricated bracts, destitute of any perianth, or with hypogynous bristles or scales in its place. The ovary is 1-celled, and contains a single ovule, and the fruit is an achenium. This order comprises about 2000 species, which mostly grow in marshy or moist places. Among them are the sedges (see Carex) and papyrus.

Cype'rus [Gr. κύπειρος, the name of a water-plant], a genus of plants of the order Cyperaceæ, distinguished by hermaphrodite flowers and compound spikes of numerous 2-rowed glumes, without bristles. It contains numerous species, many of which are natives of the tropics, and others of the U. S. Some of them have tubers or corms which are mucilaginous and nutritious. The *Cyperus esculentus* (rush-nut), a native of Southern Europe, is cultivated in Italy, Spain, and France, and bears farinaceous tubers which are as large as a hazel-nut, and are called *amande de terre* ("ground almond") by the French. They are eaten as dessert, and are used in making orgeat. The papyrus plant is often referred to this genus, though separated from it by some botanists.

Cypher. See Cipher.

Cy pres, in law, a rule of construction. (See Interpretation and Construction, by Prof. T. W. Dwight, LL.D.)

Cy'press [Gr. κυπάρισσος, perhaps the Hebrew *gopher*], (*Cupressus*), a genus of evergreen trees and shrubs of the natural order Coniferæ, having globular cones, and very small and scale-like or awl-shaped leaves, which are appressed and imbricated. The wood is valuable and exceedingly durable. The common cypress (*Cupressus sempervirens*), a native of the Levant and Northern Africa, is a tree of a conical form, sometimes growing to the height of a hundred feet or more. On account of its dark green leaves and sombre aspect it has from very early times been adopted as an emblem of mourning. The ancient Greeks and Romans planted it in burial-grounds, and the same custom now prevails in Turkey. The wood has a pleasant smell, is not liable to be injured by insects, and is therefore valuable to cabinet-makers. It is compact and durable. Specimens of this wood preserved in museums are said to be several thousand years old. Some critics believe that the kinds of timber called cedar and gopher-wood in Scripture were the wood of the *Cupressus*. Among the other species of this genus are the *Cupressus thurifera* of Mexico, the resin of which is burned for incense, and the *Cupressus thyoides*, which is a native of the U. S., and is commonly called white cedar. (See Cedar.) The popular name American cypress is given to the *Taxodium distichum*, a large and valuable deciduous tree which grows in swamps in the Southern U. S. It sometimes attains a height of 120 feet, and is about ten feet in diameter at the base. This is valuable for timber, and is planted as an ornamental tree. The cypress of the North Pacific coast is *Thuja gigantea*.

Cyp'rian, Saint [Lat. *Cyprianus*], or, more fully, **Thas'cius Cæcil'ius Cypria'nus,** a bishop of Carthage and Latin Father of the Church, was born in 200 A. D. at Carthage. He was a teacher of rhetoric before his conversion, which occurred about the year 246, and he was chosen bishop of Carthage in 248 A. D. In 250 he retired into the desert to escape from the persecution which was ordered by the emperor Decius. He returned to Carthage in 251, and then assembled a council on the subject of apostates who had lapsed in consequence of persecution. He judged that these should be treated with moderation and lenity. He emphasized the idea of the Church, insisted upon the three orders of the ministry, and stoutly maintained the parity of bishops against the assumptions of the bishop of Rome. He suffered martyrdom under Valerian in 258 A. D. He was eminent for his learning, eloquence, and zeal, wisely tempered with moderation. His works consist of thirteen treatises, the most important of which is his "De Unitate Ecclesiæ," written in 252, besides eighty-one epistles, including a few addressed to him, all of which have reference to ecclesiastical affairs (See Gervaise, "Vie de Saint-Cyprien," 1717; Poole, "Life and Times of Saint Cyprian," 1840.)

Cyprin'idæ [from *Cyprinus*, one of the genera], the name of a family of malacopterous fishes, having only the pharynx or hinder part of the mouth furnished with teeth, the gill-rays few, and no adipose fin. They are fresh-water fishes, and are found in lakes and rivers. This order includes the carp, roach, dace, tench, bream, minnow, gold-fish, barbel, etc.

Cyprinodon'tidæ [from *cyprinus*, a "carp," and ὀδούς, ὀδόντος, a "tooth"], a family of malacopterous fishes allied to the Cyprinidæ, but having the jaws more protractile and toothed. They are found in Asia and America, and in both fresh and salt water. The *Anableps* belongs to this order. (See Anableps.)

Cypripe'dium, a genus of plants of the order Orchidaceæ, comprises several species natives of the U. S., and known by the popular names of lady's slipper and moccason flower. They have beautiful flowers of curious structure, in which the lip is a large inflated sac. They possess sedative properties, and are used to some extent in nervous diseases.

Cy'pris, the name of a genus of minute entomostracous crustaceans of the order Branchiopoda, with the body enclosed in a bivalve shell. The antennæ and feet are furnished with fringed bristles, by means of which they swim with ease. Their horny fossil shells are found in the wealden of England, and several species occur in the triassic rocks of the U. S.

Cy'prus [Turk. *Kibris*; Gr. Κύπρος], an island of Asia, in the N. E. corner of the Mediterranean, is 44 miles S. of Cape Anamoor in Anatolia, and about the same distance W. of the coast of Syria. It is about 140 miles long, and 50 miles broad at the widest part. Area, 3678 square miles. Pop. estimated at 200,000. The interior is occupied by a range of mountains, the highest points of which rise nearly 7000 feet above the sea. These mountains are of limestone formation, and are covered with vast forests of walnut, oak, and other good timber. The soil is generally very fertile, but the island is not liberally supplied with water. The staple products are cotton, wheat, tobacco, madder, silk; also grapes and other fruits. Wine of good quality is also made. A large portion of the population are Greeks. Capital, Nicosia. The foreign consuls reside at Larnica. In ancient times Cyprus was devoted to the worship of Aphrodite or Venus, who was fabled to have here risen from the sea. Her temple was at "Old Paphos," now called *Kuklia*. The original occupants of the island were probably the Japhetic Kittim (Gen. x. 4), who left their name in the old capital, Citium. Cyprus, scarcely ever for any great length of time independent, was held by the Phœnicians from about 1100 to 725 B. C.; by the Assyrians from about 700 to 650 B. C.; by the Egyptians from about 550 to 525 B. C.; by the Persians from 525 to 333 B. C.; and then, after 323 B. C., by the Ptolemies till 58 B. C., when it became a Roman province. In 44 A. D. it was visited by Paul in his first missionary tour. The Saracens (from 649 A. D.) took and retook it several times. Wrested from the Saracens by Richard Cœur de Lion in 1191, it was governed by kings of its own from 1192 to 1489, and belonged to Venice from that time till 1573, when it was conquered by the Turks, who still hold it. Perhaps no country on the face of the globe has changed masters so many times, or holds within its bosom the relics of so many civilizations. Discoveries of the greatest interest and importance have recently been made by Gen. di Cesnola, American consul in Cyprus. (See Cesnola; Unger and Kotchy, "Die Insel Cypern," 1865; "Storia dell' Isola di Cipro," narrata da Romualdo Cannonero, Imola, 1870.)

For many years Cyprus has been a hunting-ground for archæologists. The Codex Cyprius, containing the unmutilated Gospels, was found here in the ninth century, and was carried to Paris in 1673. Pococke saw ruins and tombs; the abbé Mariti, who visited the island in the latter part of the last century, describes marbles, coins, medals, idols, and lamps, but the Turks would not permit diggings. Later, a number of silver bowls were found, one of which, now in the collection of the duc de Luynes, closely resembles those found by Layard at Nimroud. In 1845 a bas-relief in black basalt was found at Larnica, upon which is sculptured the figure of Sargon, king of Assyria, father of Sennacherib. This bore the inscription in cuneiform letters, "From the great king Sargon to his vassal friend, the king of Citium." There had, however, been no systematic

researches undertaken in the island until Di Cesnola began those which have resulted in the magnificent find which will for ever be associated with his name. In the article CESNOLA we have given a summary of the contents of the collection now deposited in the Metropolitan Museum of Art in New York. No complete catalogue has as yet been made out, and therefore it is not easy to give more than a general account of the contents of the collection.

Among the coins are some of the best Greek period, good examples of the Roman imperial times, with others belonging to the Alexanders, the Seleucidæ, and the kings of Cyprus. In bronze, the articles are very curious and valuable, though they have all suffered greatly from decomposition. There are several statuettes of Osiris, of Minerva, of Pomona, and one of a mounted warrior, with Greek initials on the pedestal. Besides these artistic objects there are a multitude of implements—bracelets, anklets, rings, amulets, hair-pins, mirrors and mirror-cases, brooches and buckles, strigils, tweezers, pincers, lamps, modelling tools, vases, cups, tripods, an inkstand with the incrusted ink, shields, spears, battle-axes, javelins, arrow-heads, hooks, and nails, and the small toothed sickles, such as are in use to-day in the island. There are many articles in gold and silver, and gems and stones engraved in intaglio and in relief—carnelian, carbuncle, jasper, garnet, onyx and agate, sapphire and amethyst, with some cameos of paste, one a head of a Cæsar, white on a dark-blue ground. The case containing jewelry is of great artistic and archæological value, and the student will do well to compare its contents with those of the precious case belonging to the Abbot Collection of Egyptian Antiquities in the New York Historical Society. The Di Cesnola jewelry consists of rings, earrings, necklaces, amulets, bracelets, beads, buttons, spoons, and two or three collars of uncommon size and importance. Many of these ornaments are of gold alone, wrought with the pincers and the hammer, twisted, granulated, and embossed, showing great skill in execution and resource and freedom in design. The relationship between all this metal-work and that found in the Castellani and Campana collections (the first lately in Rome, but now in the British Museum; the second in the Louvre) is an extremely interesting subject of study. The objects in marble, alabaster, and stone are very numerous. The most interesting and important are the statues, but besides there are heads of animals, plates, tripods, ointment-boxes, tear-bottles, vases, seals, lamps, small altars, and pedestals.

But the objects in glass and terra-cotta are the most numerous of all, and almost exhaust wonder and curiosity. There are 1700 pieces of glass, and between no two pieces is there more than a general resemblance. The cases surrounding one entire room are filled with this glass, the greater part of it probably of Phœnician make, though found in Greek tombs at Idalium (the modern Dali), and supposed to range from 400 B. C. to 100 B. C. It would be impossible within any reasonable limits to give any satisfactory account of this astonishing collection. The objects consist of plates, cups, bottles—these last of all sizes and shapes—vases, buttons, necklaces, and seals, and one spoon —a unique specimen. Much of this glass has been oxidized by the action of time and burial in the earth, and the result is a splendid iridescence, differing greatly in amount in different specimens, and differing too in the chord of color. In general, the surface of these glass objects is little ornamented, but there are notable exceptions, a few being either fluted, ribbed, or decorated with pressed ornaments or crinkled handles, or with twisted patterns in the glass itself, as in some specimens of Venetian glass.

Nor are the objects in terra-cotta less numerous or less interesting. They are of all periods and races, and the visitor will find his interest divided between the Phœnician pottery and the Greek statuettes, lamps, and vases. The examples of Phœnician pottery are in incredible number; they are of every grotesque shape into which man can pinch, turn, or twist clay, but beautiful or graceful forms are rare, and the ornamentation is made up of circles, single or concentric, lines, zigzags, dots, and animals, principally birds, drawn without other skill than that which knows how to keep a sort of symmetry and proportion. The series of lamps begins with the Phœnician, mere clay scoops, modeled from bivalve shells perhaps, as their oldest vases and bowls are from gourds; then come the Egyptian, and then the Greek, these last generally ornamented on the upper surface with figures in relief so spirited in design that one takes the same pleasure in examining them as in looking at Greek coins or gems of the best period.

The statuettes in terra-cotta are of the highest interest. They are in great variety, and many of them are so odd that it is difficult not to believe them caricatures; but probably we are studying the slow development of the art of sculpture in the island. In one of the cases there are ranged in chronological order statuettes of Venus from the earliest time, some of them most amusing in their deformity, but the series culminates in several little figures of the purest Greek type and of the finest execution. Mr. Hitchcock, from whose account of the collection in "Harper's Monthly" for July, 1872—the best that has been written thus far—ours is mainly condensed, says of these statues that "no museum possesses a single statue of a period so remote as many of these, and some of them are by far the oldest known to exist." (Besides the article in "Harper" above mentioned, see "Die Sammlung Cesnola, beschrieben von Johannes Doell," published in the "Memoirs of the St. Petersburg Imperial Academy of Sciences," 1873, with seventeen pages of beautifully executed lithograph illustrations; also, "The Antiquities of Cyprus, photographed by Stephen Thompson, from a selection made by C. T. Newton, M. A., Keeper of Greek and Roman Antiquities at the British Museum, with an Introduction by Sidney Colvin, M. A.," London, 1873.)

REVISED BY CLARENCE COOK.

Cyr, a township of Aroostook co., Me. Pop. 376.

Cyrena'ica [Gr. Κυρηναία], the ancient name of a region of Northern Africa, now known as BARCA (which see). It is also called Pentapolis, from its five cities, Cyrene, Apollonia, Teuchira, Hesperides, Barca; afterwards Cyrene, Apollonia, Ptolemais, Arsinoë, Berenice. The principal city was Cyrene, from which the name was derived. Cyrenaica was bounded on the W. by Africa Propria, on the E. by Marmarica, and extended southward as far as Libya Inferior. The original inhabitants, now represented by the Berbers, were probably descendants of Phut, the third son of Ham (Gen. x. 6). The Greeks began to colonize this part of Africa about 631 B. C. Till 430 B. C., Cyrenaica was governed by a dynasty of eight kings, four of whom bore the name of Battus, and four the name of Arcesilaus. A democratic republic was then established. In 332 B. C. the people submitted to Alexander. Under the Ptolemies many Jews settled there. In 75 B. C., Cyrenaica became a Roman province, and afterwards a part of the Byzantine empire. In A. D. 616 it was conquered by the Persian Chosroes (Khosroo), in 647 was overrun by the Arabs, and now is under the rule of the Turks, whose authority, however, is hardly more than nominal. Its climate is delightful, and much of its soil very fertile.

Cyre'ne [Gr. Κυρήνη], the capital of Cyrenaica, was situated about 10 miles from the Mediterranean, and 1800 feet above the level of the sea. It was founded about 631 B. C. by a colony of Greeks. Cyrene carried on an extensive commerce with Egypt and Greece through its port called Apollonia. It was the native place of Aristippus, Eratosthenes, the poet Callimachus, and Carneades. Remains of its former magnificence are still visible. The site is now occupied by a poor town called *Grenne* or *Kooreen*.

Cyre'nius, or **Quiri'nus** (PUBLIUS SULPICIUS), a Roman governor (proconsul) of Syria. Recent investigations have rendered it highly probable that he held that office twice—first, from 4 to 1 B. C., when Christ was born (Luke ii. 2), and again from 6 to 11 A. D. (See ZUMPT, "De Syria Romanorum Provincia," 1854.)

Cyr'il, or **Cyril'lus** [Gr. Κύριλλος], SAINT, bishop of Jerusalem, was born, probably at Jerusalem, in 315 A. D. He was ordained a deacon in 334 or 335, a presbyter in 345, and became bishop of Jerusalem in 350 or 351. Acacius, bishop of Cæsarea, who was an Arian and an enemy of Cyril, caused the latter to be deposed by a council in the year 358. He was restored in 359, again deposed in 360, again restored in 362, deposed the third time in 367, and the third time restored in 368. He is said to have predicted the failure of Julian's attempt to rebuild the Jewish temple in 363. He died in 386. The best editions of his works are by Milles, Oxford, 1703, and by Touttée (Benedictine), Paris, 1720. They consist of eighteen catecheses, addressed, in 347 or 348, to catechumens, five addressed to the newly baptized, a homily on the paralytic man, and a letter to the emperor Constantius, describing a luminous cross which he saw in the sky over Jerusalem in 351. His style is diffuse and inflated. His writings have no great doctrinal weight, but are of great archæological and liturgical value.

Cyril, or **Cyrillus,** SAINT, an intolerant and arrogant prelate, born at Alexandria in Egypt. He became bishop of Alexandria in 412 A. D., persecuted the Jews, and was notorious for his fanatical zeal and turbulence. The cruel murder of the accomplished female philosopher Hypatia in 415 has been laid to his charge, but without proof. He had a long controversy with Nestorius on the subject of the Incarnation, and presided over the Council of Ephesus in 431. Cyril died in 444 A. D. The best edition of his works is by Aubert, Paris, 1638, in seven volumes. His commentaries are worthless. His ablest work is the treatise against Julian, in ten books, written in 433.

Cyril, whose name originally was **Constantine,** son of Leon of Thessalonica, and elder brother of Methodius, was born between 810 and 830 A. D. About 850, Cyril went as a missionary among the Chazars in the Crimea; in 861 Methodius went to Bulgaria; and in 863 the two brothers went together to Moravia. They were the apostles of the Slavic race. Cyril invented the alphabet, and translated into the Slavic language the Psalter and all of the New Testament, except the Apocalypse. In 868 he obeyed the pope's summons to Rome, where he died Feb. 14, 869.

Cyril'la [named in honor of Domenico Cirillo], a genus of evergreen trees and shrubs of the natural order Cyrillaceæ. Several varieties of *Cyrilla racemiflora*, a small tree or shrub, occur in the Southern U. S. The clusters of small white flowers appear in June. In cultivation this is one of our finest native evergreens.

Cyrilla'ceæ, a small natural order of evergreen shrubs and trees, mostly North American, several of which occur in the Southern U. S. This order, which includes the genera *Cyrilla*, *Cliftonia*, *Elliottia*, etc., is kindred to the Ericaceæ, and contains no plants of industrial value.

Cyrillic Alphabet, an alphabet invented about 863 A. D. by Saint Cyril, the apostle of the southern Slavi. It was based upon the older Glagolitic alphabet. Some writers, however, make the Glagolitic to be the invention of Cyril, while the so-called Cyrillic they consider to be the invention of Clement, bishop of Welitza, who died in 916 A. D. The Cyrillic, with a number of modifications, is the alphabet used in Russia and some other Slavic countries.

Cy'rus [Gr. Κῦρος (or Κῦρος ὁ παλαιός, *i. e.* "Cyrus the Elder"); Persian, *Kai-Khosrou;* old (cuneiform) Persian, *Kooroosh*], surnamed THE GREAT, the founder of the Persian empire, and the greatest of the Persian heroes, was the son of Cambyses, a Persian nobleman. His mother was Mandane, a daughter of Astyages, king of Media. According to a tradition which Herodotus adopted, Astyages was alarmed by a dream which portended that the offspring of Mandane would become king or conquer Media, and he commanded an officer named Harpagus to kill Cyrus. Harpagus promised to obey the order, but privily committed the infant to the care of a herdsman, who brought him up with his own children. Cyrus, having discovered the secret of his birth, and having inured himself to the hardy habits of the warlike Persians, incited the latter to revolt against the king of Media. He defeated Astyages in battle, and ascended the throne in 558 B. C. He conquered Crœsus, king of Lydia, in 554, and extended his dominions by the conquest of other states. Among his exploits was the capture of Babylon, by diverting the river Euphrates from its channel, in the year 538, while Belshazzar was feasting. This event was foretold by the prophet Isaiah, who declared: "Thus saith the Lord to his anointed, to Cyrus, whose right hand I have holden to subdue nations before him." (Chap. xlv. 1.) Cyrus issued an edict that the Jewish captives who had been deported to Babylon should return to Jerusalem and rebuild their temple. Herodotus states that he afterwards invaded the country of the Scythian Massagetæ, who were ruled by Queen Tomyris, and that he gained several victories over her, but was drawn into an ambush and killed in 529 B. C. According to Xenophon, Cyrus died a natural death at Pasargadæ. He was succeeded by his son Cambyses. (See XENOPHON, "Cyropædia;" DIODORUS SICULUS, books ii., ix., x., xvii., and xxxi.; SCHUBART, "Programma de Cyro," 1743; WETZKE, "Cyrus der Gründer des Persischen Reiches," 1849; RAWLINSON, "Five Great Monarchies," 2d ed. 1871.)

REVISED BY R. D. HITCHCOCK.

Cyrus the Younger was the second son of Darius Nothus, king of Persia, by whom he was appointed satrap of Lydia and Phrygia in 407 B. C. Having formed a design to dethrone his brother Artaxerxes Mnemon, he hired a large army of Greek mercenaries, of whom Clearchus, a Spartan, was the leader. In the year 401 B. C. he moved his army from Sardis, but kept his soldiers in ignorance of their destination. Xenophon the historian took part in this expedition. Cyrus met the army of Artaxerxes at Cunaxa, where, rashly exposing himself in the front, he was killed about Sept., 401 B. C. His character is praised by Xenophon. (See GROTE, "History of Greece;" XENOPHON, "Anabasis" and "Hellenica.")

Cyst [from the Gr. κύστις, a "bladder"], a word commonly used to designate hollow tumors or pathological structures in the form of a bladder. The name is also applied to hollow organs with thin walls, as the gall and urinary bladders. Pathological cysts are frequently transparent and of great tenuity. They are mostly lined by an epithelium, and are either simple or compound, unilocular or multilocular; sometimes they are small and separate, sometimes very large and complex. They are usually filled with a fluid. Some of them are parasitic and of independent animal nature, as the hydatids.

Cysticer'cus [from the Gr. κύστις, a "cyst," and κέρκος, a "tail" (*i. e.* a "tailed cyst")], a name applied to the scolices or larvæ of certain CESTOID WORMS (which see). They are often found in the flesh of pigs and other animals, and sometimes in the human body, causing the tumors known as hydatids. (See HYDATID.)

Cystic Worms. See CESTOID WORMS.

Cyt'isus [Gr. κύτισος], a genus of plants of the order Leguminosæ, sub-order Papilionaceæ, of which some species are popularly called broom. The common broom of Europe is the *Cytisus Scoparius*. (See BROOM.) The genus comprises many species, some of which have beautiful flowers and are cultivated in gardens.

Cyz'icus, a peninsula of Asia Minor, in Anatolia, extending into the Sea of Marmora, is about 70 miles S. W. of Constantinople. It is connected by a narrow neck with the mainland, and is noted for its picturesque scenery. The ancient Greek city of Cyzicus was on this peninsula and on the Propontis. The site of this splendid city is marked by the ruins of an amphitheatre.

Czar [from the Russian *tsar*, a "king"], the title of the emperors of Russia. As early as the twelfth century this title was given by the Russian annalists to the grand duke Vladimir and his successors, but it was not officially used till the sixteenth century. In the year 1505, Basil Ivanovitch assumed the name of samodershez (autocrat), and his son, Ivan the Terrible, caused himself to be crowned czar in 1547. In 1724, Peter the Great added the title *imperator* to that of czar, an assumption of dignity which some of the European powers refused to acknowledge. The wife of the czar was called czarina; she is now styled *imperatritsa*. Among the Russians the czar is popularly termed *hossoudar*.

Czartorys'ki (ADAM GEORGE), PRINCE, a Polish patriot, a son of Prince Adam Casimir, president of the Polish Diet, was born at Warsaw Jan. 14, 1770. He fought against Russia in 1792, was taken to St. Petersburg as a hostage, and gained the favor of the grand duke Alexander, who appointed him assistant minister of foreign affairs in 1802, which position he resigned in 1808. In the revolution of 1830 he supported the Poles against Russia, and was elected president of the new government Jan., 1831, but after the defeat of the Poles in August of that year went into exile. Died in Paris July 16, 1861.

Czas'lau, a town of Bohemia, 45 miles E. S. E. of Prague. Its church, in which the Hussite leader Ziska was buried, is surmounted by a spire said to be the highest in Bohemia. Here Frederick the Great defeated the Austrians May 17, 1742. Pop. in 1871, 5998.

Czeg'led, a market-town of Hungary, is on the railway from Pesth to Temesvàr, about 50 miles S. E. of Pesth. It has some handsome buildings and large breweries; also a trade in red wine. Pop. in 1870, 22,206.

Czensto'chow, a town of Poland, on the river Warthe. Here is a convent which has a dark-colored picture of the Virgin, visited by multitudes of pilgrims, and reputed to have miraculous power. Pop. 14,167.

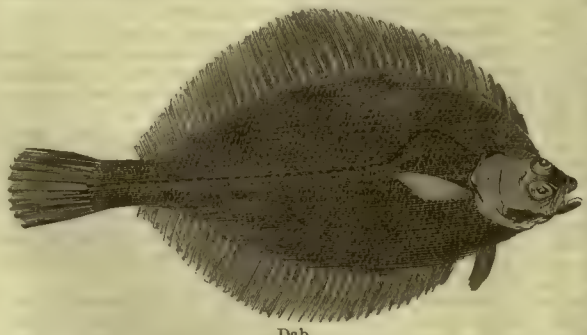
Czerka'sy, a town of Russia, in the government of Kiev, on the Dnieper, 156 miles E. S. E. from Berditchef, is the seat of the hetman of the Saporoj Cossacks. Pop. 13,311.

Czer'mak (JOHANN NEPOMUK), born at Prague June 17, 1828, became in 1865 professor of physiology at Jena. He published, among other works, "The Laryngoscope, and its Practical Value for Physiology and Medicine" (1860), and "Information from a Physiological Study" (1864). Died Sept. 16, 1873, while professor at Leipsic.

Czer'nowitz, capital of the Austrian duchy of Bukovina, is on a hill near the river Pruth, about 160 miles S. S. E. of Lemberg. It is the seat of a bishop of the Oriental Greek Church, has a Greek theological seminary, a gymnasium, a Realschule, a school of midwifery, a provincial library, a chamber of commerce, and manufactures of clocks, hardware, silver-ware, etc. Pop. in 1870, 33,884.

Czer'ny (GEORGE), or **Kara George** (Black George), a Servian chief, born Dec. 21, 1766, was originally a peasant. He became in 1806 the leader of the Servians, who had revolted against Turkey. He defeated the Turks, captured Belgrade in Dec., 1806, and liberated Servia, secretly aided by Russia. When Russia, invaded by Napoleon, could no longer support him, Czerny was driven out by the Turks in 1813. Having returned to Servia, he was murdered in July, 1817, at the instance of Milosch Obrenovitch.—His second son, ALEXANDER KARAGEORGEVITCH, was prince of Servia from 1842 to 1858.

D.



D, the fourth letter of the Phœnician and Hebrew, as well as of the Greek and Roman alphabets. The name in Hebrew (*dâleth*) signifies "door," and the picture of a door was probably its original hieroglyphic form. Some have conjectured that the Greek delta (Δ) derived its form from the triangular door of a tent. The sound of the English *d* is formed by placing the tongue against the gums at the roots of the teeth. But in pronouncing the letter in several other languages (as the Spanish, Arabic, and Persian) the tongue is placed against the teeth themselves, and from this circumstance it is termed a *dental*. In the Sanscrit there are two letters which are represented, though not quite accurately, by the English *d*. The one is truly a dental, being similar to the Spanish *d;* the other is formed by turning the tip of the tongue back against the roof of the mouth, whence it is termed a *palatal*, and sometimes a *cerebral*, letter. *D* is often interchanged with other letters (as *t* and *th* (*θ*)) of the same class. Hence *burned* becomes *burnt, passed* becomes *past*, and so on; and we have such variations as *burden* and *burthen, murder* and *murther*, though the latter is now obsolete.

The sound of dental *d* often approaches, or is actually changed into, that of *th* in *this*. Thus, in Spanish, *d* when between two vowels or at the end of a word, has almost, if not exactly, the sound of *th* in the English word *smother;* the same is substantially true of the Danish; hence the Danish words for "brother" (*broder*) and "mother" (*moder*) have nearly the same sound as their English equivalents. The delta (*δ*) of the modern Greeks has exactly the same sound as our *th* in *this*.

D, in music, is the second note in the scale, and is one tone above C. In chemistry D stands for didymium.

Among the ancient Romans, D (capital) stood for 500, or as an abbreviation it stood for *divus* (a title signifying the "godlike"), and *Decimus*, a name. Among the ancient Greeks *delta* with a mark on it (*δ'*) stood for the number 4.

Dab (*Platessa limanda*), a small, flat fish belonging to the same genus as the flounder. It is common on the more sandy coasts of Great Britain, is found in deeper water than the flounder, and does not enter the mouths of streams. The lemon or smooth dab (*Platessa microcephala*) is a larger species of the same genus, with a smooth body, very small head and mouth, and in color a mixture of brown and yellow shades. The rusty dab (*Platessa ferruginea*) is a rare fish of the New England coast.

Dab.

Daboll' (Nathan), born about 1750, was the author of "Daboll's Arithmetic" (formerly very famous), and also a treatise on navigation. He was a teacher of Connecticut. Died at Groton, Conn., Mar. 9, 1818.—C. L. Daboll, his son, was the inventor of the fog-trumpet. He died Oct. 13, 1866.

Da Ca'po [It., *da*, "from," and *capo*, "head," "beginning"], a musical term, abbreviated thus, D. C., is an instruction to the performer in such airs as end with the first strain to return to the beginning and repeat the first part.

Dac'ca, one of the divisions into which the province of Bengal in British India is divided. Area, 21,418 square miles. Pop. in 1872, 9,317,777. It is divided into five districts, one of which is called Dacca. The district of Dacca forms part of the delta of the Ganges and Brahmapootra. It extends from lat. 23° 12′ to 24° 17′ N., and from lon. 90° 11′ to 90° 58′ E. Area, 2897 square miles. The surface is low and level; the soil is well adapted to the production of rice. Capital, Dacca. Pop. in 1872, 1,853,416.

Dacca, a city, the capital of the above district, is in Bengal, on the Burha Gunga, a navigable stream connected with the Ganges, 127 miles N. E. of Calcutta. It was once a populous city, but its prosperity has declined. It contains several ruined palaces, 180 mosques, 119 pagodas or Hindoo temples, a government college, and several hospitals. Dacca was formerly celebrated for the manufacture of fine muslins, poetically termed "evening dew" and "flowing water." This manufacture is now extinct. Magnificent ruins of palaces, bridges, caravanserais, etc. are visible here. Pop. about 70,000.

Dace, a fish of the family Cyprinidæ, of the same genus (*Leuciscus*) with the roach, and not unlike it in form; the mouth is larger and the scales smaller. The upper parts are dusky blue, shading into white on the belly; the cheek and gill-covers are silvery white. Its flesh is not greatly esteemed. Dace are gregarious, swimming in shoals, and spawning in June. There are several species which inhabit clear, quiet streams, and are found in various parts of Europe and the U. S. Some of the American species are assigned to other allied genera.

Dace.

Dace'lo [an anagram of *alcedo*, a "kingfisher"], a genus of Australian kingfishers, of which several species have been observed. Of these, the best known is the *Dacelo gigas*, or "laughing jackass," a rather large and handsome bird of New South Wales. It takes its popular name from its harsh, dissonant cry, which greatly resembles the so-called laugh of the hyæna, and is not altogether unlike the bray of the ass. This cry is uttered at early dawn. The bird inhabits hollow trees, and feeds upon fish, reptiles, insects, etc.

Dacelo gigas, or "Laughing jackass."

Da'ci, also called **Ge'tæ,** an ancient barbarous people who inhabited Dacia. They are supposed to have emigrated from Thrace to Dacia before the time of Alexander the Great. Their name, "Getæ," is thought by critics to be identical with "Gothi" or Goths. If this opinion is correct, the Daci were a Germanic people.

Da'cia, a former country of Europe, was occupied by the Daci, a warlike people. It was bounded on the N. by the Carpathian Mountains, and on the S. by the Danube. The Dacians waged against the Romans a long defensive war which began in 10 B. C., when Augustus sent an army to conquer them. In the reign of Domitian they compelled the Romans to pay tribute. Trajan conquered Dacia, and reduced it to a Roman province in 106 A. D. It was formally relinquished by Hadrian (117–138) on his accession to power, and yet remained under Roman masters till the time of Aurelian (270–275), when the Romans finally withdrew within the Danube, leaving the country to the Goths. This province comprised the eastern part of Hungary, Transylvania, Moldavia, and Wallachia.

Dacier (Anne Lefèvre), a learned French lady, the wife of André Dacier, was born at Saumur in Mar., 1654.

She was instructed in Greek and Latin by her father, the learned Tannegui Lefèvre, became a resident of Paris in 1672, and was employed by the duke of Montausier to edit several Latin authors for the use of the dauphin. She was married to André Dacier (1651–1722), librarian of the king, the translator of Plutarch, and editor of the Delphine Horace, etc., in 1683. She produced French translations of Anacreon (1681), of Terence, of Homer's "Iliad" (1699), and of the "Odyssey" (1708). As an enthusiastic admirer of Homer and other ancient poets, she was engaged in a famous controversy with La Mothe, and wrote her "Traité de cause de la corruption du goût." (See Burette, "Éloge de Mme. Dacier.") Died Aug. 17, 1720.

Da Cos'ta (J. M.), M. D., an eminent American physician, was born in the island of St. Thomas, in the West Indies, Feb. 7, 1833, and received his medical education at Philadelphia and in Europe. He became professor of the practice of medicine at the Jefferson College in Philadelphia in 1872. He has published, besides other works, an excellent treatise on "Medical Diagnosis" (3d ed. 1872).

Dacota. See Dakota, by L. P. Brockett, M. D.

Dac'tyl [from the Gr. δάκτυλος, a "finger," because, like the dactyl, a finger has one longer and two shorter parts], the name of a metrical foot in Greek and Latin poetry, consisting of a long and two short syllables, as *cărmĭnă*. The term is also applied in the English and other languages to a foot or measure consisting of one accented and two unaccented syllables, as *destiny*. In Latin hexameters the next to the last foot is almost always a dactyl.

Dactylology. See Deaf and Dumb.

Dactylop'terus [from the Gr. δάκτυλος, a "finger," and πτερόν, a "wing"], a genus of acanthopterygian fishes of the family Triglidæ, remarkable for the great development of the pectoral fins. The beautifully-colored species *Dactylopterus orientalis* (commonly known as the Indian flying gurnard) is found throughout the Indian Ocean and Archipelago. It is very striking in form, having large pectoral fins and two curved spines (or filaments) between the head and dorsal fin, the foremost of which is much elongated. Shoals of this fish are often seen flying above the surface of the water, and occasionally touching the summits of the highest waves.

Dactylopterus.

Dac'tylos [Gr. δάκτυλος, a "finger"], a finger's breadth, an ancient Greek measure, equal to 0.7586 inches.

Da'cusville, a post-township of Pickens co., S. C. Pop. 1356.

Dadd (George H.), M. D., a veterinary surgeon, born in England in 1813, removed to the U. S. in 1839, and became well known as a writer upon veterinary science and kindred topics.

Dade, a county which forms the S. extremity of the mainland of Florida, comprising also a part of the "keys" or islands. Area, 4400 square miles. The surface is low and level, and mostly occupied by the Everglades, in which multitudes of small islands are interspersed in an expanse of shallow water. Capital, Biscayne. Pop. 85.

Dade, a county which forms the N. W. extremity of Georgia. Area, 160 square miles. The surface is finely diversified by valleys, and by mountains called Lookout Mountain and Missionary Ridge. Grain and wool are the chief products. It is intersected by the Alabama and Chattanooga R. R. Capital, Trenton. Pop. 3033.

Dade, a county in the S. W. of Missouri. Area, 498 square miles. It is intersected by Sac River, an affluent of the Osage. The surface is undulating; the soil is fertile. Cattle, grain, tobacco, and wool are produced. Capital, Greenfield. Pop. 8683.

Dadeville, a post-village, capital of Tallapoosa co., Ala., 50 miles N. E. of Montgomery, on the Savannah and Memphis R. R., 30 miles N. W. of Opelika. It has a mineral spring, two weekly newspapers, a female institute, and other schools. Pop. of township, 1266.

J. M. Oliver, Ed. and Prop. "Tallapoosa News."

Da'do, an Italian word signifying a "die," is applied in architecture to the cubic block which forms the body of a pedestal, and is between the base and the cornice. The term is also applied to the wainscoting of a room.

Dæd'alus [Gr. Δαίδαλος], a personage of Greek mythology, was celebrated as an inventor and mechanical genius. He was the reputed inventor of the auger, saw, and other tools. According to tradition, he built the Labyrinth of Crete, the temple of Apollo at Cumæ, and fabricated wings with which he flew from Crete to Sicily. He was the father of Icarus (which see).

Dædălus of Sicyon, son and pupil of Patrocles, himself a distinguished artist, flourished about 400 B. C. He made for the Eleans, after their victory over the Lacedæmonians, the trophy which they erected in the grove Altis. Besides this he fashioned statues of several athletes, a Victory, and others enumerated by Pausanias.

Henry Drisler.

Daet, a town of Luzon, one of the Philippine Islands, capital of the province of North Camarines, is about 140 miles S. E. of Manila. Pop. about 7500.

Daf'fodil [Gr. ἀσφόδελος; Lat. *asphodelus*], the English name of those species of *Narcissus* which have a large bell-shaped corona. The common daffodil (*Narcissus Pseudo-narcissus*) is a native of England, having showy yellow flowers. Another species, called *Narcissus minor*, is cultivated in gardens for the sake of the flowers, which open early in spring.

Dagg (John Leadley), D. D., LL.D., born in Middleburg, Va., Feb. 13, 1794, pastor of the Fifth Baptist church, Philadelphia (1825–34), principal of Alabama Female Athenæum (1836–44), president of Mercer University (1844–54), and professor of systematic theology to 1856. He is author of "A Manual of Theology," "Church Order," "Moral Science," used as a text-book in several colleges, "Evidences of Christianity," etc.—all valuable and popular works.

Dag'gett (David), LL.D., an able American lawyer and jurist, born at Attleborough, Mass., Dec. 31, 1764. He was a Senator of the U. S. from 1813 to 1819, and was appointed in 1826 Kent professor of law at Yale College, of which he was a graduate. He became chief-justice of Connecticut in 1832. Died April 12, 1851.

Daggett (Oliver Ellsworth), D. D., an American scholar and divine, son of David, noticed above, born Jan. 14, 1810, at New Haven, Conn., graduated at Yale College (1828), ordained pastor of the South church, Hartford, Conn. (April 12, 1837), pastor of the First Congregational church, Canandaigua, N. Y., nearly twenty-three years, afterwards was professor of divinity in Yale College about three years, and is now pastor of the Second Congregational church, New London, Conn.; author of several printed sermons, of many articles in the "New Englander," and also one of the compilers of the "Connecticut Hymn-Book," issued in 1845.

Daghestan' [from the Persian *dagh*, "mountain," and *stan*, "country"], a province of Russia, extends along the western coast of the Caspian Sea, from lat. 41° to 43° N., and is mostly between lon. 46° and 50° E. It is bounded on the S. W. by the Caucasus Mountains, and the surface is generally mountainous. Area, 11,039 square miles. Chief town, Derbend. The country belonged to Persia until 1812, when it was ceded to Russia, but the Russian rule was not fully established until the submission of Schamyl in 1859. Pop. 449,096.

Dag'obert [Lat. *Dagobertus*] **I.,** king of the Franks, born about 602 A. D., succeeded his father, Clotaire II., in 628. He died in 638, leaving two sons, Sigebert, king of Austrasia, and Clovis II. of Neustria.

Da'göe, or **Da'go,** an island of Russia, in the Baltic Sea, is a part of Esthonia, and is separated from the island of Oesel by the narrow Sele-Sund. It is nearly 34 miles long and 15 miles wide. Area, 234 square miles. Its soil is not fertile. The inhabitants (partly Swedish and partly Esthonian) number about 10,000. There are forests upon the island. The exports are fish, and cattle of a small and peculiar breed.

Da'gon [a diminutive of endearment, and apparently masculine, from the Hebrew *dag*, "a fish"], a Philistine god, human down to the waist, with the tail of a fish; embodying the idea of fertility. The Phœnicians also had a fish-god, Dagon. The identity of the Assyrian Dagan with the Phœnician Dagon, affirmed by some, is denied by others.

Dags'borough, a hundred and post-village of Sussex co., Del. The village is about 12 miles S. E. of Georgetown. Total pop. 2599.

Daguerre (Louis Jacques Mandé), the inventor of the daguerreotype, was born at Cormeilles in 1789. He became a skilful scene-painter, and was one of the inventors of the diorama. Daguerre and Niepce (1765–1833) began to make experiments in photography conjointly in 1826. After the death of Niepce, Daguerre succeeded in forming indelible images on metallic plates by the chemical action of light. He continued to make improvements in photography. Died July 12, 1851.

Daguer'reotype [named from Daguerre, its inventor], the first successful (now obsolete) form of the photograph. A polished plate of silvered metal was exposed in darkness to the vapor of iodine mixed with bromine, or of iodine alone, until it took a reddish-yellow tint. It was then exposed to the luminous image of the camera, and quickly transferred to a dark room. Here the plate (on which no image was visible) was exposed to vapor of mercury, which brought out the figure by blending with that part of the surface which had been affected by the light in the camera. Next the plate was washed in a solution of hyposulphite of soda, which removed the unaltered iodobromide of silver, and left the picture untouched. The principles involved are discussed under PHOTOGRAPHY, by PROF. C. F. CHANDLER, PH. D., LL.D. (which see).

Daguscahon'da, a post-village of Elk co., Pa., is at the junction of the Daguscahonda R. R. with the Philadelphia and Erie R. R., 5 miles W. of St. Mary's. There are coal-mines in the vicinity.

Dahl'en, a town of Germany in the Prussian Rhine province, in the circle of Geldern, has extensive manufactures. Pop. in 1871, 6162.

Dahl'green, a township of Carver co., Minn. Pop. 1303.

Dahl'gren (JOHN A.), U. S. N., born Nov. 13, 1809, in Philadelphia, entered the navy as a midshipman Feb. 1, 1826, became a passed midshipman in 1832, a lieutenant in 1837, a commander in 1855, a captain in 1862, and a rear-admiral in 1863. On the 22d of April, 1861, through the abandonment of his trust by Capt. Franklin Buchanan, Dahlgren, then on ordnance duty, became commandant of the U. S. navy-yard, Washington, and to his firmness and sound judgment at that crisis the government was indebted for the preservation of the yard from falling into the hands of the Confederates. In the fall of 1862 Dahlgren was detached from the navy-yard, and appointed chief of the bureau of ordnance, and in June, 1863, became commander-in-chief of the South Atlantic blockading squadron, relieving Rear-Admiral S. F. Dupont of that command in the harbor of Port Royal, S. C., July 6, 1863. He at once commenced active operations in conjunction with Gen. Gillmore, U. S. A., which speedily resulted in the possession of the greater part of Morris Island and the silencing of Fort Sumter, and secured a safe anchorage for the monitors inside the bar of Charleston, thus effectually putting a stop to the blockade-running which had been before so successfully practised, and reducing Charleston to a place of no importance for the rest of the war. After the fall of Charleston in 1865, Dahlgren resigned his command, and in 1866 was appointed commander-in-chief of the South Pacific squadron, in the discharge of which duty he remained for two years. In 1868 he was a second time appointed chief of the bureau of ordnance, from which station he was relieved at his own request in 1870, and ordered to the command of the navy-yard at Washington, where he died July 12, 1870.

Rear-Admiral Dahlgren was a man of most exemplary character, of great personal bravery, and of rare ability. He is the author of the following works, viz.: "Exercise and Manœuvre for the Boat Howitzer U. S. N." (1852), "System of Boat Armament U. S. N." (1852), "Ordnance Memoranda" (1853), "Shells and Shell-guns" (1856); and it is mainly to his labors that the navy is indebted for the great improvement in its ordnance which has taken place since 1840. The 9-inch and 11-inch Dahlgren "smooth-bores" are still the favorites of American seamen, and for lightness, range, and accuracy combined the Dahlgren howitzer is unsurpassed by any boat-gun in the world. (See ARTILLERY.) FOXHALL A. PARKER, U. S. N.

Dahlgren (ULRIC), an American officer, born in 1842, was a son of Rear-Admiral Dahlgren. He was aide-de-camp to Gens. Burnside and Hooker, distinguished himself by several acts of gallantry, and lost a leg at Hagerstown in July, 1863. He commanded a body of cavalry in a raid against Richmond, the outer works of which he assaulted. During the retreat from that city he was killed Mar. 4, 1864.

Dahl'gren Gun [named from Admiral Dahlgren, its inventor], an improved form of ordnance used for howitzers, heavy artillery, and especially in naval gunnery. It having been demonstrated that in ordinary cast guns the weight of the metal forward is greater than is needed, and that by far the greatest strain in firing is at the breech, Dahlgren greatly increased the relative size and weight of the breech, with the best results. These guns are chiefly used by the U. S. forces. (See ARTILLERY.)

Dah'lia [named in honor of Andrew Dahl, a Swedish botanist], a genus of plants of the order Compositæ and sub-order Tubulifloræ. They are natives of Mexico, and the numerous varieties cultivated are chiefly derived from two species—*Dahlia coccinea* and *Dahlia variabilis*. New varieties are easily obtained by the artificial fecundation of one with the pollen of another. Dahlias have recently become very popular, being conspicuous for their varied and exquisite colors and regularity of form. The tuberous roots of these plants, although not agreeable in taste, are used as food in Mexico. A light and moderately rich soil, with plentiful moisture, appears to be best adapted to the cultivation of dahlias.

Dahl'mann (FRIEDRICH CHRISTOPH), a German historian, born at Wismar May 13, 1785. He became in 1822 professor of history at Kiel, in 1829 professor of political economy in Göttingen, and was in 1837, on account of his protest against the abolition of the fundamental law by King Ernest Augustus, deprived of his chair. In 1842 he was appointed professor of history at Bonn. In 1848 he was one of the leaders of the constitutional party. His chief works are a "History of Denmark" (3 vols., 1840–43), a "History of the English Revolution" (6th ed. 1864), and a "History of the French Revolution" (3d ed. 1864). A biography of Dahlmann has been published by Springer (1870). Died Dec. 5, 1860.

Dahlone'ga, a post-village, capital of Lumpkin co., Ga., is on a hill about 66 miles N. N. E. of Atlanta. Gold-mines have been opened in the vicinity. Here was before the war a branch mint of the U. S.; the building has recently been converted into the North Georgia Agricultural College, attended by 125 students. The village has one weekly newspaper. Pop. 471. The name of Dahlonega is a compound of Indian and English. When gold was first discovered here the Indians flocked in from the surrounding country. The Cherokees then inhabited this part of Georgia. *Nega* was the Indian word for yellow, and they called gold *dalla-nega*, yellow dollar, putting the adjective after the substantive. The village that soon grew up here in the midst of the gold-region took the Indian name of Dalla-nega; the spelling, however, was afterwards changed by the introduction of the *h* and *o*, as it now stands. Pop. 471. ED. "MOUNTAIN SIGNAL."

Dahlonega, a post-township of Wapello co., Ia. Pop. 623.

Daho'mey, a kingdom of Western Africa, in Guinea, is bounded on the S. by the Gulf of Guinea, and partly on the W. by the river Volta, which separates it from Ashantee. Its limits are not exactly defined. Area, estimated at about 4000 square miles. The surface is generally level, but the northern part is diversified by hills, which are covered with luxuriant forests. The soil is fertile. Maize, cotton, sugar, yams, tobacco, beans, pease, and manioc are cultivated here. The cocoa-nut tree and other species of palm flourish. Among the wild animals are lions, tigers, and elephants. The people are pagans. The tiger is the principal fetish. The Dahomans are bloodthirsty and abject, but hospitable and courageous. They can only approach their despot by crawling with their faces in the dust. The monarch once a year sprinkles his ancestors' graves with human blood. No one can take a wife except by gift or purchase from the sovereign. At the death of a king the multitude of wives in his seraglio set to butchering one another till checked by the successor. The king has a standing army of about 6000 female warriors. Capital, Abomey. Pop. about 180,000. (See FORBES, "Missions to Dahomey," 1851; BURTON, "A Mission to Dahomey," 1864.)

Daimiel, a town of Spain, in the province of Ciudad Real, 20 miles E. N. E. of the city of Ciudad Real. It has a Gothic church, a town-hall, and a hospital; also manufactures of linen and woollen fabrics and blond lace. Pop. 12,500.

Daimio, dī'me-o, the title of the feudal lords of Japan. They are 264 in number, and have exercised in their own districts the powers of petty sovereigns. Eighteen of these daimios were virtually independent within their own dominions, and hence arose many impediments to the intercourse of the Japanese with Europeans. The recent revolution in Japan brings this old feudalism to an end. (See JAPAN.)

Daingerfield, a post-village of Titus co., Tex., 17 miles S. E. of Mount Pleasant. It has one weekly and one monthly newspaper. Pop. 272.

Dai'ry [supposed to be derived from an old English word, *dey* or *day*, "milk"], the department of farming which includes the production of milk; also the house or apartment where milk is kept, and where butter, cheese, etc. are manufactured. (See BUTTER, by PROF. C. F. CHANDLER, PH. D., LL.D., and CHEESE.)

Da'is [Fr. *dais*, a "canopy;" It. *desco;* probably akin to the Ger. *Tisch*, a "table"], in architecture, the platform

at the upper end of a dining-hall where stood the table for distinguished guests; also the canopied seat for those who sat there. Mediæval writers used this word with considerable latitude, one of its significations being a canopy over a shrine or statue.

Dai'sy [from the Anglo-Saxon *dæges-age, i. e.* "day's eye"], a genus (*Bellis*) of small perennial plants of the order Compositæ. The daisy is a native of Europe, and very common in Great Britain, where its delicate crimson-tipped flower has been immortalized by Burns and other poets. The variety called "hen and chickens" has the main flower-heads surrounded by smaller ones, with short stems growing from the summit of the scape. New and very beautiful varieties have lately been introduced by the florists. In Scotland this flower is called gowan. A few species of *Bellis* have been discovered in the S. W. portion of the U. S.

Dako'ta, a Territory of the U. S., in the N. central portion of the Union, lying W. of the Red River of the North, and bisected diagonally by the Missouri River. It lies between the parallels of 41° 40′ and 49° N. lat., and between the meridians of 96° 25′ and 104° W. lon. from Greenwich. The greater part of its southern boundary lies along the parallel of 42° 30′, but at its S. E. extremity it extends southward to the mouth of the Big Sioux River. The Territory is bounded on the N. by British America, and in part by the new province of Manitoba; on the E. by the States of Minnesota and Iowa; on the S. by Nebraska; and on the W. by the Territories of Wyoming and Montana. Its greatest length is 414 miles, and its greatest width 360 miles. Its area is 150,932 square miles, or 96,595,840 acres, including a detached portion, 2000 square miles in area, lying W. of Wyoming Territory.

Face of the Country.—The Missouri River traverses the whole Territory nearly from N. W. to S. E., and with its many tributaries—of which the Big Sioux, Vermilion, and Dakota on the E. side, and the Niobrara, which forms part of the southern boundary, the White (or, as it is sometimes called, the White Earth) River, the Wakpashicha or Bad River, the Big Cheyenne or Good River, the Moreau River, the Ree or Grand River, Heart River, and Little Missouri on the W. side—drains the greater part of the Territory, and furnishes more than 1000 miles of steamboat navigation. The Red River of the North forms the eastern boundary of the Territory for 200 miles, and discharges its waters through Lake Winnipeg into Nelson's River and Hudson's Bay. It has numerous small tributaries in Dakota, but except the Pembina, which drains the north-eastern portion of the Territory, they are mostly small. The only other considerable streams not connected with the Missouri or its affluents are the Little Souris or Mouse River, an inlet or tributary of Souris Lake, and the stream which connects the Turtle Lakes with Minnewakan or Devil's Lake. The whole region E. and N. of the Missouri River is studded with great numbers of small lakes. The largest of these is Minnewakan or the Devil's Lake, the waters of which are brackish, though liked by the buffaloes. It has an area of about 400 square miles. Tchanchikahah, Long Lake, Big Stone Lake, Lake Traverse, Wood Lake, the Turtle Lakes, Lake Kampeshka, and several others are considerable bodies of water. The surface of the Territory is greatly varied. In the south-eastern portion is a plateau or range of highlands which attains at its highest point an elevation of 2046 feet above the sea. This is called the Coteau des Prairies. W. of this, but with a considerable depression between (the valley of the Dakota River), is another range of highlands, known as the Coteau de Missouri. This extends to the banks of the Missouri, which in Central Dakota is 1300 feet or more above the sea. Northward of the Coteau des Prairies extends for 200 miles the valley of the Red River of the North, about forty or fifty miles in width, and sloping northward, from an elevation of about 1000 or 1100 feet at Breckenridge to 700 or 800 feet at Pembina. W. of this, another plateau, somewhat higher and not quite so fertile, extends to the western line of the Territory, and indeed to the foot-hills of the Rocky Mountains in Montana. W. of the Missouri the country rises gradually, and in the S. W. culminates in the Black Hills, an outlying range of the Rocky Mountains, in which, however, there are no considerable summits in the Territory. In the extreme southern and south-western portion lying between the Big Cheyenne and the White River is a large tract extending into N. W. Nebraska, known as Les Mauvaises Terres or the Bad Lands, perfectly sterile, and furrowed and ridged, by the action of water-currents upon the blue clay, into the most fantastic forms.

It will be seen then that nearly the entire surface of the country is composed of plateaus of greater or less elevation, but none of them so high as those of Wyoming and Colorado. Scattered over these plateaus are numerous isolated buttes (peaks or summits), usually not rising more than from 500 to 1500 feet above the plains; these buttes have received the most fanciful names, such as Dog's Ears, Deer's Ears, Eagle's Nest, Bull Butte, Maison du Chien (House of the Dog), Slim Butte, White Clay Butte, etc. etc.

Although a large portion of the surface of this Territory consists of prairie, there is a supply of timber sufficient for the use of settlers in nearly every locality, and the margins of most of the rivers are fringed with a fine growth of different varieties of forest trees. In the neighborhood of the Black Hills extensive forests of excellent pine and other timber are found.

The basin of the Red River of the North consists mostly of open grassy plains, affording an abundant and nutritious pasturage through a great portion of the year, and with little labor and expense an ample supply of food may be secured for the keeping of live-stock during the severe winters of this high northern latitude. This region has long been noted for its extensive fur-trade, and although its agricultural capacities are of the highest order, the aversion of the fur-traders and trappers to the extension of the settlements has hitherto prevented the immigration which would otherwise doubtless have tended towards this favored portion of the Territory.

The climate of Southern Dakota is comparatively mild, but in the northern portions the winters are long and severe. The annual precipitation of moisture is twenty inches, and so distributed throughout the year as to be amply sufficient for the perfect maturity of the crops.

The climate and soil of Dakota are exceedingly favorable to the growth of wheat, corn, and other cereals, while all of the fruits and vegetables raised in the Northern States are here produced in the greatest perfection.

Geology and Mineralogy.—The geology of Dakota is very simple. The greater part of its surface-rocks belong to the cretaceous system and to formations still more recent. The only considerable exceptions are the valley of the Red River of the North, in which salt-springs and streams have been found, indicating that there the Silurian rocks had been reached, as all known salt-springs in the U. S. issue from that formation; and the region of the Black Hills, in which are found gold, silver, copper, coal, iron, salt, and petroleum, showing that it belongs to the earlier systems. Prof. F. V. Hayden in 1867 made a careful survey of these hills, and found that coming from the cretaceous rocks there was, first, a belt of three or four miles in width, surrounding the whole mass of Jurassic rocks; within this a similar belt of carboniferous rocks; then a somewhat narrower belt of granitic and metamorphic rocks; and that the interior mass, a tract forty by sixty-five miles in extent, was wholly, on its surface, of the Potsdam sandstone formation. Some of the summits in this tract attain a height of 6500 feet. The upheaval of the region of which Dakota forms a part began in the N. E., in the valley of the Red River, and continued towards the S. W., though probably the Black Hills emerged from the flood before some of the intervening lands. From the Red River of the North we pass S. W. over a broad cretaceous belt, and enter a newer formation when we cross the Missouri. This is the tertiary, and nearly one-half of Dakota is found to be no older than the tertiary belt along the Atlantic and Gulf, and not so old as most of the Pacific slope. The part known as the Bad Lands, W. of the Missouri and extending into Wyoming, belongs to the tertiary group of the cenozoic system. There is a desolate geological sepulchre. The fossils are most interesting and remarkable. The surface has been cut by aqueous agencies into columns and buttresses, monumental domes, and massive walls with cathedral majesty. These are filled with fossil skulls, jaws, teeth, and thigh-bones of various races of mammals of which scarce a single specimen is familiar to the anatomist of the present day. The region in its other characteristics is forbidding. The water is brackish and very bad. The earth is burned by the sun in summer, arid, ashy, and almost of chalky whiteness. It is a treeless waste, in winter the abode of snow and tireless storms—a domain of death and desolation. About the Yellowstone River was the last of the inland seas to be drained, and the most recent geological formations and fossils are there found. Eastern Dakota belongs mainly to the cretaceous age. At Sioux Falls, however, there is an upheaval of azoic rocks, over which the Sioux River passes, descending 100 feet in about half a mile. This rock is now known under the name of Sioux quartzite. It is very hard, being one of the most perfectly metamorphosed rocks known to science. It is from a rosy to a flesh-red color. At Sioux Falls it is nearly horizontal, dipping at a very slight angle to the S. or S. W. The river at this point flows nearly due N. by a long S-shaped curve. Neither the upper nor lower limit or surface of the rock has been accurately determined,

but the facts known show it to be 400 feet in thickness, and it may be much more. It is also found at the N. W. point of Iowa, and at places E. and N. E. of Sioux Falls. It also appears at intervals W. of these for fifty miles, and is largely exposed on the Dakota River in township 101, of range 58 W. It was metamorphosed from a pure sand by powerful igneous agency. The red pipestone of the Indians was changed at the same time from small pockets or drifts of fine pure clay, lying between the larger masses of sand, and both received their color from iron. A reddish-colored sandstone is found in large amount along the Dakota River for many miles, but does not appear until about twenty-five miles above Yankton. It is abundant, easily quarried and wrought, and very useful for all building purposes. The Sioux quartzite is strictly an unstratified rock, but is divided often quite regularly by transverse lateral and vertical rifts. It breaks by reason of these into rough blocks and slabs, rendering it available for most substantial and enduring building. It cannot be finely dressed, but is proof against time and elemental erosion. In the absence of hard limestones and other stratified economical rocks it must become valuable for foundations, exposed walls, and heavy substructures. Along the Missouri, and particularly at Yankton and above, is the chalk-rock, as it is commonly called. It is a soft, white, or blue-tinted impure carbonate of lime. It has some other alkalies in its composition. It appears in considerable amount in the hills along Clay and Turkey creeks, in the north-eastern parts of Yankton county. When exposed to water and freezing on the surface of the ground it decomposes slowly, and is slaked to a fine impalpable powder, and when wet has a soft and soapy feel. It does not produce good lime. It has, however, been employed considerably in building, and is durable when placed above the ground upon good foundations. Fossil fishes and shells, with sharks' teeth in great numbers, are found in the chalk-rock and the dark-red sandstone on the Dakota River, while the Sioux quartzite is clearly without fossils of any kind. From Sioux Falls to the edge of the chalk-rock, in Yankton county, is not more than fifty miles, while the cretaceous formation extends eastward into Iowa for some distance. Between these is included—in theory at least—the Silurian, Devonian, and carboniferous systems. We are, therefore, not denied the hope of discovering coal. But over the whole area is spread the deep drift formation, with a gently undulating prairie surface, which has no precipitous bluffs or deep ravines to expose the actual succession of rocks. Only in the places mentioned do the rocks named appear at the surface, though search for coal is soon to be made by an organized company at Vermilion. They are preparing for deep boring at different points. It is feared, however, that the coal-bearing rocks are pinched out, as in North-western Iowa, and that coal may be found, if at all, only in detached and isolated outlying pockets. The valley of the Red River of the North is a very rich level or gently undulating region of the highest character for agriculture, and, more than any other part of the Territory, favored with timber and water. With many windings the general course of the river is N., and it receives numerous tributaries from Dakota, several of which are streams of good size. These have pure water, and along all of them are heavy belts of timber of hard varieties.

The mineralogy of Dakota has not been minutely studied. The cretaceous rocks yield most of the forms of hydraulic cement, and when burned make a lime of indifferent quality. The lignite-beds yield a fair quality of coal, though it has not yet been sufficiently tested to determine its relative value. The salt-springs of the Red River region produce a good and very pure salt. The Black Hills region forms a part of the Dakota Indian reservation, and there has been very little opportunity of studying the minerals *in situ*. It is known, however, that the various mineral forms of silver, copper, iron, quartz, and silica are plentiful in that region.

Climate.—The isothermal line of 70° average summer temperature—which is that of Philadelphia, Pittsburg, Chicago, and Southern Minnesota—passes through Central Dakota, crossing in the Territory the parallel of 47° N. lat. The isothermal for the winter temperature of those cities would pass very near the southern line of the Territory. The cold is sometimes severe in winter, but it is dry cold, and is more easily borne than a much higher temperature when damp and chilling. The climate is considerably milder on the same parallels than that of Minnesota, not being affected by the damp atmosphere from the great lakes. In Northern Dakota the winters are long, and there is considerable snowfall, but the spring opens about the 20th of March, and the vegetation comes forward rapidly, and all crops mature except the later and larger varieties of Indian corn. The heats of summer are much moderated by the elevation of the plateaus. Northern Dakota is an excellent resort for invalids not too far reduced. The rainfall does not usually exceed, throughout the Territory, twenty inches per annum, and from sixteen to eighteen inches of this fall during the summer months. Southern Dakota has a fine climate, and on its fruitful soil the cereals, potatoes, and other root crops are as successfully cultivated as anywhere on the continent. Small fruits, as strawberries, raspberries, whortleberries, cranberries, plums, grapes, etc., grow wild in great profusion, and when cultivated yield astonishing crops. The soil of the Red River region is rich and fertile, as is that of Southern Dakota. The Bad Lands are sterile, and, unless they possess mineral wealth, will hardly prove very profitable. There is good land around the Black Hills, as well as in North-western and Central Dakota, but there is a large admixture of gravel with some of it; yet the proportion of land which would yield good crops without irrigation is much larger than in most of the Western Territories.

Zoology, etc.—The wild animals are those of the eastern slope and plateaus E. of the Rocky Mountains generally, but they are found in much greater abundance than in most of the Territories. Dakota is the paradise of the trapper and hunter of furs, and most of the Indian tribes whose home is in the Territory are largely engaged in collecting furs. Pembina, in the extreme N. E. of the Territory, was for many years one of the most important settlements and trading-posts of the Hudson's Bay Company, and vast quantities of furs were shipped from it. The buffalo is now more abundant in Northern Dakota than anywhere else. The musk-ox sometimes, though rarely, appears there. The moose, elk, and one or two species of deer are found there. Of beasts of prey, the bears (both the black and cinnamon species) are plenty; the panther, wild-cat, lynx, wolf, badger, wolverene, pine and stone marten, the skunk, the mink, and several varieties of foxes, are the principal. Among smaller animals, there are the gopher, the prairie-dog, the rabbit, several species, squirrels of several species, and quite an army of the smaller rodents. The birds are essentially those of the Mississippi and Missouri valleys, and include a wide range, from the great eagles and vultures to the tiny humming-birds or the sad-voiced pewit. The rivers and lakes abound with fish, and reptiles are not wanting, though venomous ones are not abundant. The vegetation of Dakota Territory is not remarkable, though it is far from being a treeless region. The valley of the Red River of the North has its forests of hard-wood trees—the oak, hickory, beech, birch, maple, etc.; the other rivers have strips of timber along their banks, though generally of cottonwood or other inferior woods. Around the Black Hills there is a heavy growth of timber, mostly pine, spruce, and fir. In the Bad Lands there is no timber. In S. E. Dakota the settlers are planting many trees, which do well, and will eventually supply that region with abundant and valuable timber.

Agricultural Products—According to the census of 1870, there were in the Territory that year 302,376 acres of land taken up as farms, of which 42,645 were under cultivation and 259,731 used as pasturage or wood lands. The value of these farms was $2,085,265, and of farming implements, $142,612. The value of all farm products that year was $495,657; of animals slaughtered or sold for slaughter, $22,066. Home manufactures are put down at $1677; forest products at $700, market-garden products at $500, and wages paid to farm laborers at $71,156. The amount of wheat grown was 170,662 bushels, all but 202 bushels spring wheat; Indian corn, 133,140 bushels; oats, 114,327 bushels; barley, 4118 bushels; buckwheat, 179 bushels. The number of horses reported was 3243; of neat cattle, 56,724; of sheep, 1901 (evidently an error, as the wool produced the same year was stated at 8810 pounds); of swine, 2033; and the total value of live-stock was stated at $779,952. The amount of hay cured was 13,347 tons; of tobacco, not given; of sorghum syrup, 1230 gallons; of potatoes marketed, 50,177 bushels; peas and beans, 456 bushels; honey, 110 pounds; clover, grass, and flax seed not reported. The dairy products were butter, 209,735 pounds; cheese, 1850 pounds. These statistics represent very inadequately the present agricultural condition of Dakota. The extension of several railroad lines into the Territory has brought in a large influx of immigrants of the agricultural class, and it is safe to say that the agricultural products of 1873 were more than fourfold those of 1870.

Manufacturing Industry.—The report of manufactures in Dakota Territory is obviously very defective. Of fifteen counties, ten are returned as having no manufactures, probably from the negligence of the assistant marshals. The entire number of manufacturing establishments is 17, of which 15 reported an aggregate of 324 horse-power; they employed 91 hands—89 men and 2 boys; the amount of capital was $79,200; of wages paid, $21,106; of raw material used, $105,997; and of annual products, $178,570. Of these manufactories, 10 were saw-mills, employing 68 hands and $37,400 capital, paying $14,256 wages, using $32,772

worth of raw material, and producing $72,280 worth of lumber; 2 were flour or grist mills, employing 5 hands and $13,000 capital, paying $2450 wages, using $60,600 of raw material, and producing flour and meal to the value of $80,990; 2 were breweries, employing 7 hands and $12,000 capital, paying $1700 wages, using $5075 worth of raw material, and producing malt liquors valued at $9500; 2 were tin or sheet-iron ware factories, employing 4 hands and $14,000 capital, paying $900 wages, using $4050 of raw material, and producing goods worth $10,000; and 1 was a wheelwright-shop, employing 7 hands and $2800 capital, paying $1800 wages, using $3500 of raw material, and producing $5800 worth of work. The true report of manufactures in the Territory in 1873 would give nearly ten times these amounts.

Railroads.—It is only within the last two years and a half that any of the numerous projected railroad lines of this region have entered the Territory. There are now (Oct., 1873) three railroads which have penetrated Eastern Dakota—viz. the Northern Pacific, completed as far as Bismarck on the Missouri River, and graded a considerable distance farther. From Fargo, where it enters the Territory, to Bismarck, on the Missouri, is 196 miles nearly due W., and about on the parallel of 46° 52′ N. lat. From the Missouri westward its course will trend slightly to the N., crossing the 47th parallel on the meridian of 102° 30′, and continuing N. of that parallel till it approaches the Yellowstone River. The Dakota division of the Winona and St. Peter's Railway enters the Territory in about lat. 44° 42′, and running about 30 miles N. W., turns suddenly to the W. for 20 miles more to Lake Kampeshka on the Big Sioux River. The region through which it passes in Dakota has very few inhabitants, but it is a fine agricultural section. The Dakota Southern Railway extends from Sioux City, at the mouth of the Big Sioux River, the western terminus of several railways, to Yankton, the capital of Dakota, a distance of 61 miles. There are, then, about 308 miles of completed railway in the Territory. Aside from the farther prosecution of the Northern Pacific, which may be delayed for a time, the St. Paul and Pacific, whose road is now completed to Breckenridge on the Red River of the North, has two branches under way—one continuing up the valley of the Red River to Moorhead; the other in Minnesota to St. Vincent, nearly opposite Pembina. From Yankton railroads are projected in all directions—one to Sioux Falls, and thence into Minnesota; another along the valley of the Dakota River to connect with the Northern Pacific; another along the Missouri Valley to Fort Sully; another due E. into Iowa, and two S. into Nebraska. The sparse population of Dakota will prevent these and some other projected railways from being completed for some years, but eventually this Territory must be gridironed with railways in order to its development.

Finances.—In 1870 the total assessed value of real and personal estate in Dakota Territory was $2,924,489; the actual value, according to the estimates of the U. S. marshal and his deputies, was $5,599,752. That this valuation has greatly increased during the past three and a half years is unquestionable, but there are no existing data to show, accurately, the amount of the increase. The tax of 1870 was $13,867, the greater part a county tax. The debt of the counties was $5761. Since that time Yankton co. alone has bonded itself for $200,000 for the completion of the Southern Dakota Railway.

The *commerce* of Dakota is small, and mostly confined to the shipment of grain and stock by way of the Missouri River and its tributaries and the Southern Dakota Railway. From the Red River region there are shipments of furs to a considerable extent. The opening of the new railroads, and the demands for food, lumber, railroad ties, etc. along their route and by their employés, will develop this commerce healthily.

Banks.—There was in Jan., 1873, one national bank (at Yankton), with a capital of $50,000, and three private banking-houses. There are no savings banks, and no fire or life insurance companies.

Population.—The true population of Dakota, of all races, according to the census of 1870, was 40,501, of whom 12,887 were white, 94 colored, 27,520 Indians, of whom 1200 were out of tribal relations, and 26,320 were nomadic or belonged to various tribes not located. The greater part of these Indians were members of the different bands of the Dakotas or Sioux, the most formidable and warlike of all the northern tribes, though there are a few Mandans, Rees, Gros Ventres, and Assiniboines. The Territory was not organized till 1861, and a considerable portion was cut off in 1868 to aid in forming the Territory of Wyoming. The population of what now constitutes the Territory (except nomadic Indians) in 1860 was 4837. Of the 14,181 inhabitants, not Indians, in 1870, 9366 were natives of the U. S., and 4815 of foreign birth. Of those of foreign birth, 1218 were born in Great Britain and Ireland, 1179 in Norway, 906 in British America, 563 in Germany, 324 in Austria and Bohemia, 380 in Sweden, 115 in Denmark, and the remainder in the various smaller states of Europe and Spanish America. Of the entire population, 8878 were males and 5303 females; of the native population, 5562 were males and 3804 females; of the foreign, 3316 were males and 1499 females. Of the white population, 8255 were males and 4632 females. Of the whole population, 10,640 were over the age of ten years; of these, 7047 were males and 3593 females. Of these, 5887 were engaged in all classes of occupations, of whom 2522 (all males) were engaged in agriculture, 2704 (2562 males and 142 females) in professional and personal services, 204 (all males) in trade and transportation, 457 (439 males and 18 females) in manufacturing, mining, and mechanical industries. The density of the population, including Indians, for the whole Territory, was in 1870 about one person to 3.78 square miles. South-eastern Dakota is, however, settled much more thickly than this.

Education.—Notwithstanding its small and scattered population, Dakota has given much attention to education. In 1871 she had 31 school-houses, 36 schools, 53 teachers, and 1785 pupils, the entire number reported in the census as of school age; and of those of school age (5 to 21), 1767 were enrolled, and 1700 was the average attendance. In 1870 there were 35 educational institutions (34 of them public schools), with 52 teachers (48 of them in the public schools), and 1255 pupils, of whom 1223 were in the public schools. The total income of all the educational institutions was $9284, of which $8684 belonged to the public schools. Of the inhabitants ten years old and over, 1563 could not write, of whom 914 were whites, 31 colored, and 618 Indians. Of the whites, 709 were over twenty-one years of age, 91 from fifteen to twenty-one years, and 114 from ten to fifteen years; 411 of the whole number were females. There is an organized school system under the Territorial school law, with a superintendent and deputy-superintendent of public instruction, and county superintendents in 1872 in seven counties. There was reported in 1870 but one private or parochial school in the Territory, Dakota Hall at Yankton, under the direction of the Episcopal Church. There are no colleges, universities, professional or scientific schools.

Libraries.—In 1870 there were 5 public libraries reported, with 2788 volumes; 14 private libraries, with 6938 volumes; in all, 19 libraries, with 9726 volumes.

Newspapers.—There were in 1870 three weekly newspapers—two political and one miscellaneous—having an aggregate weekly circulation of 1652 copies, and an annual issue of 85,904 copies.

Churches.—In 1870 there were 17 churches of all denominations reported, 10 church edifices, with 2800 sittings, and church property valued at $16,300. The number has materially increased in the three and a half years since the census was taken. In 1870 there were 2 Baptist churches—no particulars reported; at the close of 1872 there was 1 association, 10 churches, 8 ministers, and 170 members. In 1870, 1 Congregational church was reported, 1 church edifice, 200 sittings, $5000 of property; in 1872 there were 9 churches, 5 ministers, 161 members, 380 children in Sabbath schools. In 1870 there were 2 Episcopal churches, 2 church edifices, with 350 sittings, and $4000 worth of church property; in 1872 there were four churches, 6 clergymen, 168 communicants, 99 children in Sabbath schools, 1 parochial school; contributions, $2750. In 1870 there were 3 Lutheran churches, 3 church edifices, 900 sittings, $2100 church property; in 1872 there were 11 churches, 6 ministers, and about 450 communicants. In 1870 there were 5 Methodist churches, 1 church edifice, 500 sittings, and $1200 of church property; in 1872 there were 19 churches, 15 ministers in full connection, 860 members, and church property valued at $7000. In 1870 there were 4 Roman Catholic congregations, 3 church edifices, 850 sittings, $4000 worth of church property; in 1872 there were 4 churches, 5 or 6 stations, 4 church edifices, 6 priests, and about 1500 adherent population.

Constitution, Courts, etc.—The Territorial constitutions are very similar to each other, and are generally intended to be temporary in their character, a convention forming a new constitution when the Territory is ready to become a State. In all cases the Territorial governor and secretary of state are appointed by the President of the U. S., as well as the chief-justice and assistant justices. The auditor, treasurer, and superintendent of public instruction are chosen by the qualified electors. In Dakota every male inhabitant, except Indians not taxed, idiots, and convicts, having attained the age of twenty-one years, and being a resident of the Territory, is entitled to vote and is eligible for office. There is a very good school law, and a militia law passed in 1867, under which a militia force of eight companies has been organized. The judicial power is vested in a supreme

court, district courts, and probate courts. There are three districts. The Territory is entitled to one delegate in Congress, who is elected by the people, and has the right to speak, but not to vote.

Counties.—It is difficult to ascertain how many organized counties there are in the Territory. The latest maps have forty-eight counties or more laid down, with their boundaries defined, but the census of 1870 gives but fourteen, and only thirteen of these voted in 1872. There are some white inhabitants in portions of the Territory not yet organized as counties. The Indian reservations in the Territory, including one which stretches into Montana, occupy 36,203,200 acres, or about three-eighths of the Territory—viz. the Yankton reservation, on the Missouri River, in the S. part of the Territory, 400,000 acres, for the Yankton Sioux; the Sisseton and Wahpeton reservation, of 1,241,600 acres, a triangular tract lying partly on Lake Traverse; another tract, of 345,600 acres, belonging to the same bands of Sioux at Minnewakan or Devil's Lake; a reservation of 25,000,000 for ten bands of Sioux, about 22,000 in all, lying in the S. W. part of the Territory, W. of the Missouri; the Ponca reservation, of 576,000 acres, near the mouth of the Niobrara; and the reservation of the Arickarees, Gros Ventres, and Mandans in the N. W., extending into Montana, and including 8,640,000 acres. The counties named in the census, all of them organized since 1861, were—Bonhomme, 608 inhabitants; Brookings, 163; Buffalo, 246; Charles Mix, 152; Clay, 2621; Deuel, 37; Hutchinson, 37; Jayne, 5; Lincoln, 712; Minnehaha, 355; Pembina, 1213; Todd, 337; Union, 3507; Yankton, 2097. The unorganized portion of the Territory in 1870 contained 2091 inhabitants. Of these counties, Jayne has either been relinquished or its name changed, while Turner, Armstrong, Moody, Richland, and perhaps one or two more, have been organized. The principal towns are Yankton, which has about 1500 inhabitants; Vermilion, Elk Point, Sioux Falls, Canton, Bonhomme, and in the N. Fargo and Pembina. In the unorganized part, Fort Sully and its vicinity, Fort Rice, and Fort Buford, all on the Missouri River, have a considerable population around them.

History.—Dakota is a portion of the old Missouri, or, earlier, the Louisiana Territory, ceded to the U. S. in 1803. It was first organized as a Territory Mar. 2, 1861, and then included the entire territory from the northern boundary of Nebraska, and W. thereof, from the forty-third parallel, to the line of British America, and from the western boundary of Minnesota to the Rocky Mountains. Subsequently (in 1863) the Territory of Idaho (now including both Idaho and Montana) was set off from it, and in 1868, by several exchanges, the present Territory of Wyoming was set off from Dakota. By these exchanges a tract of 2000 square miles, lying W. of Wyoming Territory, and between 44° and 44° 30′ N. lat., came into the possession of Dakota, and still remains a part of her territory, though separated from the remainder by the whole breadth of Wyoming. It is adjacent to the Yellowstone Park region. In 1862 the members of Little Crow's band of Sioux, having undertaken a marauding expedition into Minnesota, attacked Breckenridge in that State, a town at the junction of the Bois de Sioux and the Red River of the North, directly across the river from Fort Abercrombie in Dakota Territory, and having massacred the settlers at Breckenridge, crossed the river and laid siege to Fort Abercrombie, about Aug. 26. Early in September they made two assaults on the fort, but were repulsed with heavy loss, and were finally brought to bay at Wood's Lake, where they were utterly defeated, and many of the worst Indians taken prisoners, of whom thirty-eight were afterwards hung. In 1863 the Indians were again troublesome, and murdered about thirty Minnesota settlers; and it was resolved to punish them so thoroughly that they would not venture again upon such outrages. Accordingly, two expeditions were sent out—one under Gen. Sibley, with between 2000 and 3000 men, by way of Breckenridge and Fort Abercrombie, to Minnewakan or Devil's Lake, where the great body of hostile Indians were said to be gathered; the other, under command of Gen. Sully, to ascend the Missouri River from Sioux City, to cut off the retreat of the Indians whom Gen. Sibley should attack, and finally form a junction with him. Though this result was not accomplished, both expeditions were successful. Gen. Sibley had several engagements with the Indians in the latter part of July, 1863, and defeated and drove them to and across the Missouri. Gen. Sully was detained until the beginning of September from ascending the Missouri, but on the 3d of that month he encountered a large force of Indians at White Stone Hill, 130 miles above the Little Cheyenne River, a part of whom had been at the engagement with Sibley. He defeated them completely with heavy loss, and took 156 prisoners. Since that time the Sioux have been content to remain upon their reservations.

Governors of the Territory.

William Jayne.....1861–63	Andrew J. Faulk.....1866–69
Newton Edmonds.....1863–66	John A. Burbank.....1869–73

As a Territory, Dakota has no electoral vote.

L. P. Brockett.

Dakota, a county in the S. E. of Minnesota. Area, 570 square miles. It is bounded on the N. and N. E. by the Mississippi River, and on the N. W. by the Minnesota. The surface is undulating or nearly level; the soil is very fertile, and based on limestone. Extensive prairies occur here. Grain, wool, hay, butter, etc. are staple products. It is intersected by the Milwaukee and St. Paul and the Hastings and Dakota R. Rs. Capital, Hastings. Pop. 16,312.

Dakota, a county in the extreme N. E. of Nebraska. Area, 350 square miles. It is bounded on the N. and E. by the Missouri River. The surface is diversified by undulating prairies, and by numerous groves of hard timber. The soil is fertile. Cattle, grain, and hay are raised. Capital, Dakota. Pop. 2040.

Dakota, a post-village and township of Stephenson co., Ill. The village is on the Western Union R. R., 7 miles N. E. of Freeport. Pop. of township, 952.

Dakota, a post-village, capital of Humboldt co., Ia., on the Des Moines River, 15 miles N. of Fort Dodge. It has one weekly newspaper, two churches, a court-house, and flour and carriage manufactures. Humboldt College is 1 mile N. of the town. Pop. of village, 162; of Dakota township, 676.

J. Van Meter, Ed. "Independent."

Dakota, a post-twp. of Waushara co., Wis. Pop. 477.

Dakota City, the capital of Dakota co., Neb., is on the W. bank of the Missouri, 5 miles S. of Sioux City, Ia. It is the initial point of the Sioux City and Columbus R. R., and at the crossing of the Omaha and North-western and St. Paul and Northern Nebraska R. Rs. It contains a large brick court-house, the district land-office, two schools, one weekly newspaper, and two churches. Pop. 300; of township, 595. C. F. Bayha, Pub. "Mail."

Dako'ta In'dians, a race or collection of tribes or "bands" of American savages, often called **Sioux,** who inhabit Nebraska, Wyoming, Dakota, etc. Among these tribes are the Santees, Yanktons, Sissetons, Brulés, Minikanyes, Unkpapas, Ogalallahs, and Tetons. They formerly occupied the country as far E. as the Mississippi, which they ceded to the U. S. in 1851. The language of the Dakotas shows them to be of a different stock from most of the Indian tribes. The languages of the Assiniboines, the Pawnees, the Osages, the Comanches, the Crows, and others belong to the same class with the Dakota tongue. The name "Dakota" signifies the "allied." (See Riggs, "Dakota Grammar" and "Dictionary.")

Dakota River, Rivière à Jacques, or **James River,** rises in the N. E. part of Dakota. It flows nearly southward, and enters the Missouri River about 8 miles below Yankton. Its whole length is estimated at 600 miles.

Dal'amow, a city of India, in Oude, on the Ganges, 68 miles above Allahâbâd. It has two antique temples of Siva, and is reputed a holy place. Pop. about 10,000.

Dalaradia. See Dalriada.

Dal'berg, von (Karl Theodor Anton Maria), LL.D., a German prelate and author, born of a noble family at Herrnsheim Feb. 8, 1744. He became in 1802 archbishop of Mentz and arch-chancellor of the empire. Napoleon gave him in 1806 the title of prince-primate of the Confederation of the Rhine. He wrote, besides other works, "Contemplations on the Universe;" but in German literature his name is best known from the liberality he showed towards the young Schiller. Died Feb. 10, 1817.

Dalber'gia [named in honor of Nicholas Dalberg, a Swedish botanist], a genus of trees and shrubs of the order Leguminosæ, having pinnate leaves. The fruit is a flat membranous pod containing one to three seeds. All the species are natives of tropical climates, and several of them afford valuable timber. The wood of the sissoo of Bengal, the *Dalbergia Sissoo,* is extensively used and highly prized in India. The East Indian rosewood is the timber of *Dalbergia latifolia.*

Dale, a county in the S. E. of Alabama. Area, 740 square miles. It is intersected by the Choctawhatchee River. The soil is generally sandy, and covered by forests of pine. Cattle, corn, oats, rice, cotton, tobacco, and wool are produced. Capital, Newton. Pop. 11,325.

Dale, a township of McLean co., Ill. Pop. 1188.

Dale, a township of Chesterfield co., Va. Pop. 1803.

Dale, a township of Outagamie co., Wis. Pop. 991.

Dale (Richard), an American commodore, born near

Norfolk, Va., Nov. 6, 1756, entered the merchant service when only twelve years of age, serving until the commencement of the Revolution, when he was made a lieutenant in the marine service of Virginia. He was shortly after captured by an English vessel, and while confined on prison-ship his old companions, who surrounded him, influenced him to take sides with England, and he actually engaged on board a cruiser against his native State; he was wounded at an early day, and during his convalescence realized the error he had committed, and firmly resolved to stand by his own country in the future. He entered the U. S. navy in 1776 as midshipman, was captured in 1777, and confined in prison in London nearly two years, when he made his escape in disguise. He hastened to France, and embarked with Paul Jones, who soon made him a lieutenant of his own ship, and became much attached to him. In the action with the Serapis he greatly distinguished himself, and was wounded. Returning to this country in 1781, he was appointed a lieutenant in the U. S. navy, and while serving on the Trumbull he received his third wound, and was captured for the fourth time. In 1794 he was made a captain, and a commodore in 1801. He served in command of a squadron during the Tripolitan war, and on his return to the U. S. resigned in 1802. Died Feb. 24, 1826.

Dale (Samuel). See Appendix.

Dalecar'lia (*i. e.* "the land of the men of the dales"), or **Dalarne,** a former province of Sweden, now forming the län or county of Kopparberg. It is famous for its beautiful mountain-scenery, its forests of pine, and its mines of iron and copper. The Dalecarlians are a brave and patriotic people, and as a reward for their fidelity they all have the privilege of taking the hand of the king of Sweden when they meet him. Area, 12,127 square miles. Pop. in 1869, 175,927.

Dale City, called also **Meyer's Mills,** a post-village of Summit township, Somerset co., Pa., 100 miles S. E. of Pittsburg, on the Pittsburg Washington and Baltimore R. R., is on the Casselman River, and contains one iron-foundry, two planing-mills, one flouring-mill, one stone-ware manufactory, two newspapers, two banks, six churches, two hotels, furniture-works, etc.

Suhrie & Smith, Pubs. of "Independent."

Daleites, a body of Scotch Independents who were Calvinists and followers of David Dale (1739–1806), a benevolent manufacturer, the father-in-law of Robert Owen. The Daleites became affiliated with the Sandemanians for a time, but later were Independents. They never had more than one or two congregations.

Daleville, a post-township of Dale co., Ala. Pop. 997.

Dalf'sen, a town in Holland, on the Vecht, 4 miles E. of Zwolle. Pop. 5549.

Dalhou'sie, a seaport, capital of Restigouche co., New Brunswick, at the mouth of the Restigouche River. It ships large quantities of salmon, lumber, and lobsters. Pop. about 600.

Dalhousie, Earls of (1633), Barons Ramsay of Dalhousie (1619) and of Kerington (Scotland, 1633), Barons Panmure (United Kingdom, 1831).—Fox Maule, eleventh earl, was born April 22, 1801. He became a Whig member of Parliament in 1835, and was secretary at war from July, 1846, to Feb., 1852. In April, 1852, he succeeded his father as Lord Panmure. He was minister of war in the cabinet of Lord Palmerston from 1855 to Feb., 1858. In 1860 he became earl of Dalhousie. Died July 1, 1874.

Dalhousie (James Andrew **Ramsay**), Earl and Marquis of, a British statesman, born near Edinburgh April 22, 1812, was a son of the ninth earl of Dalhousie. He was returned to Parliament for Haddington by the Conservatives in 1837, and succeeded to the earldom on the death of his father in 1838. In 1845 he was appointed president of the board of trade by Sir Robert Peel. He was retained in that office by the Whig prime minister who came into power in 1846, and he became governor-general of India in 1847. His administration was successful, though his somewhat aggressive policy contributed to produce the mutiny of 1857. He annexed Pegu, Oude, the Punjâb, and Berar to the British dominions, and developed the resources of India by canals and other public works. In 1849 he was created marquis of Dalhousie. He returned to England in 1856, and died, without male issue, Dec. 19, 1860. (See Arnold, "History of the Marquis of Dalhousie's Administration of British India," 1863–64, 2 vols.)

Da'lias, a town of Spain, province of Almería, is about 4 miles from the sea and 20 miles W. S. W. of the city of Almería. It has mines of lead and antimony. Pop. 9414.

Dal'las, a county in W. Central Alabama. Area, 890 square miles. It is intersected by the navigable Alabama River, which is joined by the Cahawba in this county. The surface is uneven; the soil is fertile. Cotton, corn, rice, and oats are produced. It is traversed by the Alabama Central and the Selma Rome and Dalton R. Rs. Capital, Selma. Pop. 40,705.

Dallas, a county in S. W. Central Arkansas. Area, 850 square miles. It is bounded on the E. by the Saline and on the W. by the Washita River. Salt and other minerals are found. The surface is undulating; the soil is fertile. Cattle, maize, and cotton are produced. Capital, Princeton. Pop. 5707.

Dallas, a county in S. W. Central Iowa. Area, 576 square miles. It is traversed by the Des Moines and Raccoon rivers. The soil is fertile. Cattle, grain, wool, hay, butter, etc. are produced. It is intersected by the Des Moines Valley and the Chicago Rock Island and Pacific R. Rs. Capital, Adel. Pop. 12,019.

Dallas, a county in S. W. Central Missouri. Area, 576 square miles. It is intersected by the Niangua River. The surface is diversified by prairies and forests; the soil is fertile. Grain, tobacco, and wool are staple products. Limestone is found here. Capital, Buffalo. Pop. 8383.

Dallas, a county in the N. of Texas. Area, 900 square miles. It is intersected by the Trinity River, and also drained by the West Fork of that river. The soil is fertile. Cattle, grain, cotton, wool, and fruit are raised. It is intersected by the Houston and Texas Central R. R. Capital, Dallas. Pop. 13,314.

Dallas, a township of Calhoun co., Ark. Pop. 383.

Dallas, a post-village, capital of Polk co., Ark., is about 170 miles W. S. W. of Little Rock.

Dallas, a post-village, capital of Paulding co., Ga., is about 32 miles W. N. W. of Atlanta. Here occurred a battle between Gen. Sherman and Gen. Johnston in May, 1864.

Dallas, a township of Huntington co., Ind. Pop. 1483.

Dallas, a township of Dallas co., Ia. Pop. 338.

Dallas, a post-township of Marion co., Ia. Pop. 1066.

Dallas, a township of Taylor co., Ia. Pop. 604.

Dallas, a township and post-village of Clinton co., Mich., on the Detroit and Milwaukee R. R., 10 miles W. of St. John. Total pop. 1360.

Dallas, a township of De Kalb co., Mo. Pop. 807.

Dallas, a township of Harrison co., Mo. Pop. 551.

Dallas, a township of Holt co., Mo. Pop. 1285.

Dallas, a township and post-village of Webster co., Mo. Pop. 1255.

Dallas, a post-village, capital of Gaston co., N. C., about 170 miles W. by S. from Raleigh. Pop. 299; of township, 4006.

Dallas, a township of Crawford co., O. Pop. 370.

Dallas, a post-village, capital of Polk co., Or., on the Rickreal River, 15 miles W. of Salem. It has a weekly newspaper.

Dallas, a post-township of Luzerne co., Pa. Pop. 985.

Dallas, a city, capital of Dallas co., Tex., on the Trinity River, 3 miles below the mouth of Elm Fork. It is the point of crossing of the Houston and Texas Central and the Texas and Pacific R. Rs., 265 miles N. N. W. of Houston and 186 miles W. of Shreveport, La. It has three weekly and one daily newspaper. A street railway runs from the court-house square to the railroad dépôt. This town was settled in 1841. John W. Swindells, Pub. "Herald."

Dallas (Alexander James), an American statesman, born in the island of Jamaica June 21, 1759. He emigrated in 1783 to Philadelphia, where he practised law, and published in 1790 "Reports of Cases in the Courts of the United States and Pennsylvania" (4 vols.). In 1801 he was appointed a district attorney of the U. S. He became secretary of the treasury in the cabinet of Madison in Oct., 1814, when the national revenue was insufficient and the public credit was impaired. He wrote an able report to Congress recommending the establishment of a national bank, raised money by a loan, and restored the public credit. He resigned office in Nov., 1816. Died Jan. 16, 1817.

Dallas (George Mifflin), LL.D., an American statesman, a son of the preceding, was born in Philadelphia July 10, 1792. He studied law, and was admitted to the bar in 1813. In 1824 he supported Gen. Jackson as a candidate for the office of President. He was elected in 1831 to the Senate of the U. S. for a short term, which expired in Mar., 1833. He was sent as minister to St. Petersburg in 1837, returned in 1839, and was elected Vice-President of the U. S. in 1844, when Mr. Polk was chosen President. In

1846 he gave his casting vote in the Senate for a revenue tariff bill, which was opposed by the protectionist party. In Feb., 1856, he was appointed minister to England, where he remained until 1861. Died Dec. 31, 1864.

Dallas Centre, a post-village of Adel township, Dallas co., Ia. Pop. 133.

Dallas City, a city of Hancock and Henderson cos., Ill., on the Mississippi, 240 miles above St. Louis and 18 miles N. of Carthage. It has several manufactories and one weekly newspaper.

Dallas Plantation, a township of Franklin co., Me. Pop. 159.

Dalles City, or **The Dalles,** a post-village, capital of Wasco co., Or., is on the S. bank of the Columbia River, about 120 miles by water E. of Portland. It has one weekly newspaper and a large woollen factory. The navigation of the river is here obstructed by rapids. Pop. 942.

W. M. Hand, Ed. "Mountaineer."

Dalles of the Columbia, a narrow portion of the Columbia River, 45 miles above the Cascades. The river here rushes violently through a chasm only fifty-eight yards wide, enclosed between steep walls of basaltic rock. *Dalle* is a French word signifying "flag-stone," and also a "spout" for water.

Dalles of the St. Louis, The, a beautiful series of rapids in the St. Louis River, near Duluth, Minn. The river falls 400 feet in four miles over a bed of slate.

Dalling, Lord. See Bulwer (Henry Lytton),

Dall' O'ngaro (Francesco), an Italian revolutionist and author, born at Odezzo (near Venice) in 1808, became a priest, but was suspended for his independent preaching. He then renounced the Church, and became a revolutionary journalist in Triest, whence he was expelled in 1847. In 1848 he established a journal at Venice called "Fatti, e non Parole." He took an active part in the revolutionary movements of that year, and was compelled to leave Italy. He became a contributor to several journals in Paris. In 1859 he returned to Italy, and became professor of literature at Florence. He has published tales, dramas, and lyric poems.

Dalma'nia, a genus of trilobites which has many species in the Silurian and Devonian rocks of the U. S. Of those the best known is *Dalmania limulurus* of the Niagara limestone.

Dalma'tia, a portion of the ancient Illyricum, now the southernmost province of Cisleithan Austria, is a long, narrow tract bounded on the N. by Croatia, on the N. E. by Herzegovina, and on the S. W. by the Adriatic Sea. It includes a number of islands. Area, 4940 square miles. Pop. in 1869, 456,961. With the exception of about 80,000 Greeks and a few Protestants and Jews, the population belongs to the Roman Catholic Church. About 89 per cent. of the population are Slavic and 10½ per cent. Italian; 28 per cent. of the children attend school. The coast is bold and indented with bays which form good harbors. The surface is diversified with mountains (the Dinaric Alps) of limestone formation, the highest of which, Mount Orien, rises 6332 feet above the level of the sea. The soil in some parts is fertile, and produces wheat, oats, potatoes, maize, wine, and olives. Good timber for shipbuilding is procured on the islands. The chief towns are Zara, Spalato, Ragusa, and Cattaro. Dalmatia was conquered by the Romans in the time of Augustus. In the seventh century it was taken by the Slavonians, who founded in it a kingdom which lasted until 1050. In the Middle Ages it belonged to Hungary. In the fifteenth century it fell under the power of the Venetians, who ceded it to Austria in 1797. In 1805, Napoleon annexed it to the kingdom of Italy, and in 1810 to the kingdom of Illyria. It reverted to Austria in 1814. The district of Cattaro in 1869–70 revolted against Austria, in consequence of changes in their old system of military service. After some concessions to the national pride of the Dalmatians, the revolt was suppressed in the latter year. (See Noë, "Dalmatien," 1870.)

Dalmatia, a township of Halifax co., N. C. P. 2796.

Dalmat'ica, or **Dalmat'ic,** a mantle with long sleeves formerly used in Dalmatia. It was worn by the nations who were called barbarians by the Greeks and Romans. It was afterwards adopted by deacons when assisting the priest at the altar. It is still worn by deacons in the Greek and Roman Catholic churches, though in a different form.

Dalri'ada [a word which appears to have signified the "country of the race of Riada," an Irish chieftain], the ancient name of a region in Ireland now known as the "Route," the northern half of the county of Antrim. Some of the race of Riada are said to have settled in Argyleshire, Scotland, where they founded a petty kingdom called also Dalriada. More than twenty kings of this line in Scotland are mentioned before the Dalriads (or Scots) and the Picts became united under Kenneth MacAlpine, who became the first king of Albany. The region S. of the Irish Dalriada was called Dalaradia, probably from another chieftain who governed it.

Dalrymple. See Hailes, Lord, and Stair, Earls of.

Dalrym'ple (Alexander), a Scotch traveller, a younger brother of Lord Hailes, born July 24, 1737, entered the East India Company's service and explored many islands in the Eastern Archipelago. He was appointed hydrographer to the East India Company in 1779, and to the admiralty in 1795. He wrote several geographical works. Died June 19, 1808.

Dal'ton, a post-village, capital of Whitfield co., Ga., on the Western and Atlantic R. R., 99 miles N. N. W. of Atlanta. It is the S. terminus of the East Tennessee Virginia and Georgia, S. E. terminus of the Nashville and Chattanooga, E. terminus of the Memphis and Charleston, and N. E. terminus of the Selma Rome and Dalton R. Rs. It has one weekly newspaper and a heavy trade in grain. Pop. 1809.

Dalton (Dolten's Station post-office), in Thornton township, Cook co., Ill., is the junction of the Pittsburg Cincinnati and St. Louis and the Chicago Danville and Vincennes R. Rs., 20 miles S. of Chicago.

Dalton, a post-township of Wayne co., Ind. P. 766.

Dalton, a township of Aroostook co., Me. Pop. 445.

Dalton, a township and post-village of Berkshire co., Mass., on the Boston and Albany R. R., 146 miles W. of Boston. Here are important manufactures of paper, machinery, woollens, and cotton goods. Pop. 1252.

Dalton, a township of Muskegon co., Mich. Pop. 401.

Dalton, a township and post-village of Coos co., N. H., on the Boston Concord and Montreal R. R., 112 miles N. of Concord. It has manufactures of starch and lumber. Pop. 773.

Dalton, a post-village of Sugar Creek township, Wayne co., O. Pop. 412.

Dalton (John), F. R. S., an English chemist, the author of the atomic theory, was born at Eaglesfield, in Cumberland, Sept. 5, 1766. He taught and gave lectures on physical science, and resided in Manchester. In 1802 he announced his important theory of the constitution of mixed gases. The development of the laws of combining proportions and the atomic theory he explained in the first volume of his "New System of Chemical Philosophy" (3 vols., 1808–27). (See Chemistry.) He wrote a number of scientific treatises, which were inserted in the "Philosophical Transactions," etc. Died July 27, 1844.

Dalton (John C.), M. D., an eminent physiologist, born at Chelmsford, Mass., Feb. 2, 1825, graduated at Harvard in 1844. He took the degree of M. D. there in 1847. In 1859 he published an excellent "Treatise on Human Physiology," of which the fourth edition, enlarged, appeared in 1867. Among his other works is a "Treatise on Physiology and Hygiene for Schools, Families, and Colleges" (1868). He is professor of physiology and hygiene in the New York College of Physicians and Surgeons. His original observations in embryology and other departments of physiology have given him a wide reputation. He is the author of the article on Embryology in this work.

Dalton City, a post-village of Moultrie co., Ill., on the Paris and Decatur R. R., 29 miles N. W. of Mattoon.

Dalton-in-Fur'ness, a town of England, in Furness, Lancashire, 18 miles W. N. W. of Lancaster, and 3 miles from the sea. Here are iron-works and iron-mines. Near Dalton are the ruins of the splendid Furness Abbey, founded in 1127 by Stephen, who was afterwards king.

Dal'tonism, an inability to distinguish colors, was so called because the celebrated John Dalton and his brothers had a defect in vision in consequence of which red, blue, and green appeared alike. (See Color-Blindness.)

Da'ly (Charles P.), LL.D., was born of Irish parentage in New York City, Oct. 31, 1816, was admitted to the bar in 1839, became judge of common pleas in that city in 1845, and chief judge in 1857. He was author of articles in the "New American Cyclopædia," lecturer at the Columbia College Law School, published a history of the courts of New York (1855), a memoir of Chancellor Kent, and many papers on banking, law, science, etc. He has been president of the American Geographical and Statistical Society, and a prominent member of the Ethnological Society.

Damages. See Measure of Damages, by Prof. T. W. Dwight, LL.D.

Damân', or **Damaun,** a seaport-town of Hindostan, in Guzerat, is on the Indian Ocean, about 100 miles N. of Bombay. It belongs to the Portuguese. The harbor affords a good shelter from the S. W. monsoon. Shipbuilding is carried on here. Damân is at the mouth of the Damân Ganga or Damân River. Pop. about 7000.

Daman (an animal). See HYRAX.

Damanhoor' (anc. *Hermopolis Parva*), a town of Lower Egypt, capital of the province of Bahreh, is about 40 miles E. S. E. of Alexandria. It has manufactures of cotton and wool. Pop. 10,000.

Damar', or **Demar,** a town of Arabia, in Yemen, 60 miles S. S. E. of Sana. It has a citadel, a college, and about 5000 houses.

Damariscot'ta, a township and village of Lincoln co., Me. The village is on the Knox and Lincoln R. R., 20 miles N. E. of Bath, and on the Damariscotta River. It has a national bank, some shipbuilding and other manufactures, and a coasting-trade. Total pop. 1232.

Damasce'nus (JOANNES), a learned theologian, born in Damascus about 700 A. D. About the age of thirty he retired to the monastery of St. Saba, near Jerusalem, where he devoted his time to the study of philosophy and theology and to the composition of religious works. His chief work is "An Accurate Exposition of the Orthodox Faith," which is not so much a well-wrought system of divinity as a digest of the teachings of his predecessors, such as Athanasius, Basil, the Gregories, Chrysostom, and others. He first applied to scholasticism the philosophy of Aristotle. Died between 754 and 787 A. D. He was canonized by the Latin and the Greek churches.

Damascenus (NICOLAUS), a Greek historian and philosopher, born in Damascus in 74 B. C., was a friend of Herod, king of Judæa, at whose court he lived. He wrote, besides other works, a "Universal History," of which fragments are extant.

Damas'cius [Gr. Δαμάσκιος], a pagan philosopher, born in Damascus about 480 A. D. He taught the Neo-Platonic philosophy at Athens, and when Justinian in 529 prohibited the pagans from teaching, he retired to the court of Chosroes, king of Persia. He wrote a work entitled "Doubts and Solutions of the First Principles," which is still extant.

Damas'coville, or **Damascus,** a post-village of Butler township, Columbiana co., O. Pop. 94.

Damas'cus [Arab. *Sham el Kebeer* or *es Shereef* ("the great" or "the holy")], a celebrated city of Asiatic Turkey, in Syria, is situated on a triangular plain at the eastern base of the Anti-Libanus, 58 miles E. S. E. of Beyroot; lat. 33° 27′ N., lon. 36° 25′ E. The plain of Damascus, regarded by the Arabs as the fairest of the four earthly paradises, is about 70 miles in circumference, and extremely fertile, irrigated by the river Barada and other streams, and adorned with gardens and orchards. The magnificent appearance of this city from afar has been celebrated by ancient and modern travellers. Numberless cupolas and minarets are seen clustered about the towering mass of the great mosque. Within, the streets are narrow, and many of them have a gloomy and decayed appearance. The houses are mean in external aspect, and present a dead wall to the street, but the interiors are often elegant and richly furnished. Fine marble-paved courts ornamented with fountains and shrubs, rooms with arabesqued roofs and walls, are the common features of the houses of the rich Damascenes. Damascus continues to be Oriental in all its features and characteristics. The city is oval in form, surrounded by a picturesque wall with stately towers and gates, and intersected by the broad street which the Romans called Via Recta. The great mosque, 650 feet in length and 150 in breadth, was built by the Christians in the form of a cross, but has been occupied by the Mussulmans since 705 A. D. Damascus has 248 mosques, many of them with splendid minarets. The huge quadrangular citadel, with massive towers, forms part of the city wall. No wheeled carriages or vehicles are used in the streets. There are important manufactures of cotton, silk, and woollen fabrics, jewelry, saddlery, glass, and arms. The Damascus blades, for which this city was once famous, have lost their high reputation. The bazaars, said to be finer than those of Cairo or Constantinople, are well supplied with European manufactures, in which Damascus has an extensive trade, carried on by means of camels and caravans, with Bagdad, Bassorah, Persia, etc. Here is assembled annually a large caravan of pilgrims, merchants, and other travellers, sometimes as many as 50,000, destined for Mecca. The date of the foundation of Damascus is not known, but it was a city in the time of the patriarch Abraham. (See Gen. xiv.) During the Hebrew monarchy it was the capital of Syria. It passed afterwards successively under the dominion of the Assyrians (740 B. C.), Babylonians (604 B. C.), Persians (540 B. C.), Macedonians (333 B. C.), Romans (65 B. C.), Saracens (634 A. D.), and was finally captured by the Turks in 1516. Here the apostle Paul was converted and preached the gospel. Damascus is one of the sacred cities of the Mohammedans, and has long been known for the fanaticism of its inhabitants. In 1860 the Druses entered the city and massacred a large number of the Christians. The present population is variously estimated at from 150,000 to 300,000, among whom there are about 15,000 Christians and 6000 Jews. (See PORTER, "Five Years in Damascus.")

REVISED BY A. J. SCHEM.

Damascus, a township and village of Henry co., O. Pop. 1179.

Damascus, a township and post-village of Wayne co., Pa., near the New York and Erie R. R. Pop. 2823.

Damascus Blades, a name given to sword-blades of the highest excellence, formerly made at Damascus in Syria. Since the time of the Crusades they have been famous for their beautifully watered and lined appearance, as well as for their exquisite temper, which enabled them, when skilfully handled, to cut, not only bars of iron, but to divide films of gauze floating in the air. It is said that good blades of this kind can be bent into a hoop, and will fly back to their original shape without injury. The secret of their manufacture is unknown, but it is said that the Russians have recently produced swords which equal the best Damascus blades in beauty and temper.

Dam'ask, the name given to certain rich stuffs of silk and linen because they were first manufactured at Damascus, whence the trade was carried to Venice, Lyons, and Genoa. The cloth is woven with flowers and regular figures, and in modern times is often made of worsted or worsted and cotton mixed. The fashion of wearing it was adopted in England by Henry V. and Edward IV. Damask tablecloths are said to have been first imported from France into England in 1575.

Damaskeen'ing [from *Damascus*, where the art was practised with great success], the ornamenting of steel or iron by inlaying with other metals, such as gold or silver. There are several methods of performing it.

Damas'tes, son of Dioxippus, a Greek historian, was a native of Sigeum. He is called by Suidas a pupil of Hellanicus, and flourished about 440 B. C. Several works are ascribed to him, as "An Account of Events in Greece," "On the Ancestors of those who Warred against Troy" in two books, "A Catalogue of Nations and Cities," and a treatise "Of Poets and Sophists." Besides these, he composed a "Periplus," which is referred to by later geographical writers. Very few fragments remain, collected in MÜLLER'S "Fragm. Histor. Græc.," vol. ii., pp. 64–67.

HENRY DRISLER.

Dam'asus I. [Fr. *Damase*], SAINT, born, some say in Rome, others in Spain, in 306 A. D., was elected bishop of Rome in 366. A rival named Ursinus was at the same time elected by a party, but Damasus was recognized by the emperor Valentinian. Although elected by the Arian faction, he strenuously opposed Arianism. He employed violent methods, but was a man of learning and taste. We are indebted to him for Jerome's new version of the Latin Bible. He improved the church service by introducing the Psalter. He also wrote hymns, two of which are given by Daniel in his "Thesaurus Hymnologicus." He is said to have been the first to employ rhyme. Died Dec. 10, 384 A. D.—DAMASUS II., a German, and probably a Bavarian, was consecrated pope July 17, 1048, and died Aug. 9 of the same year. (See JAFFÉ, "Regesta Pontificum Romanorum.")

Dam'bool', a village of Ceylon, 45 miles N. W. of Kandy. Here is a mass of rock about 550 feet high, in which are cave-temples devoted to the worship of Booddha, and profusely adorned with sculpture and images. Among these is a colossal image of Booddha, hewn out of the rock. These temples, which are partly artificial, were constructed about 100 B. C.

Dame's Quarter, a post-township of Somerset co., Md. Pop. 1565.

Damia'ni (PIETRO), known as SAINT PETER DAMIAN, an influential Italian prelate, born at Ravenna about 998 A. D. He was appointed cardinal-bishop of Ostia in 1057. He opposed simony and other corrupt practices of the clergy, and was a friend of Pope Gregory VII. He was a voluminous writer, and morally and intellectually one of the first men of his time. He is honored as one of the doctors of the Church. Died Feb. 22, 1072.

Da'mianists, a sect originating in the sixth century, were the followers of Damianus, a Monophysite patriarch

of Alexandria, who taught a novel theory with regard to the Divine essence and the three Persons of the Godhead. They nearly agreed with the Sabellians. They are sometimes called *Angelists*.

Damia'nus, a distinguished Sophist and rhetorician of Ephesus, of whom an account is given by his friend Philostratus in his lives of the Sophists. In his youth Damianus had attended the lectures of Adrianus and Ælius Aristides, and he formed himself after the model of these. He taught rhetoric in his native place with great success. He was a man of wealth and of great liberality, and erected for his fellow-citizens a beautiful portico. He appears to have left no writings. HENRY DRISLER.

Damiet'ta, a town and river-port of Lower Egypt, is on the right bank of the E. mouth of the Nile, about 8 miles from the Mediterranean and 110 miles N. by E. from Cairo; lat. 31° 25′ N., lon. 31° 47′ E. It is meanly built, but has some good mosques and marble baths. The harbor is not good, and a bar at the mouth of the river prevents the entrance of large vessels. The modern town was founded in 1251 a few miles S. of the ancient *Tamiathis*, which in the time of the Crusades was a strong fortress of the Saracens. The cloth known as *dimity* was first manufactured in this town, and received from it its name. Pop. in 1871, 28,913.

Damiron (JEAN PHILIBERT), a French philosopher, born at Belleville (Rhône) May 10, 1794, was a pupil of Cousin. Among his works is an "Essay on the History of Philosophy in France in the Seventeenth Century" (2 vols., 1846). Died in 1862.

Damm (CHRISTIAN TOBIAS), a learned Greek scholar and theologian, was born in 1699 at Geithain, near Leipsic. He was appointed pro-rector in 1742, and afterwards rector of the Kölnisches Real-Gymnasium in Berlin, but was displaced in 1764 on a charge of Socinianism, founded on his translation of the New Testament. He died in 1778. Besides the New Testament, he translated the works of several Greek authors, and published editions of both Greek and Latin writers. His principal work, and that by which he is now known among scholars, was his Homeric and Pindaric Lexicon, Berlin, 1765, 4to, edited by J. M. Duncan, Glasgow, 1824, 4to, and still further improved by Rost, Leipsic, 1836, 4to. HENRY DRISLER.

Dam'mar, or Dâmar [from the Hindostanee and Malay *dâmar*, "resin"], the name of a valuable varnish produced by the dammar pine (*Dammara orientalis*), of the natural order Coniferæ. This tree is a native of the Molucca Islands, and is distinguishable from most of the other trees of its order by the broad, lanceolate, leathery leaves. It grows to an immense height, and on its trunk, which is often nine feet in diameter, are many huge knots. The tree is not valuable as timber. The resin is used in varnishes, but not being permanent, it cannot take the place of copal and amber. It is sometimes used in photography. The kauri pine (*Dammara australis*) produces kauri resin or kauri gum. It is a native of New Zealand. Black dammar is obtained from the Molucca Islands; it has a strong resinous odor, and is black when dried; it is used as pitch, and by distillation a kind of turpentine is obtained from it. It is the product of a tree of the natural order Amyridaceæ. *Canarium microcarpum* is of the same order, and is also a native of the East. It yields a substance called dammar, which is used as oakum in shipbuilding. When mixed with chalk and the bark of reeds it becomes hard as stone. Various other trees yield resins called dammar.

Da'mo, daughter of Pythagoras, to whom he left his memoirs (ὑπομνήματα), with strict injunctions not to allow them to pass out of his family. This injunction she obeyed, though in great poverty and tempted with offers of considerable sums of money. She transmitted them to the care of her daughter Bitale. HENRY DRISLER.

Dam'ocles [Gr. Δαμοκλῆς], a Syracusan parasite and courtier who lived at the court of Dionysius the Elder, and was the subject of an experiment recorded by Cicero. As an antidote to his fond admiration of regal luxury and happiness, the tyrant invited him to a sumptuous banquet over which a sword was suspended by a single hair.

Da'mon, a distinguished musician of Athens, celebrated also as a Sophist. Plutarch ascribes to him the invention of one form of the Lydian melody. He taught Pericles music, and was his adviser also in many of his political measures. Plato has spoken highly of the abilities of Damon. Late in life he was banished from Athens, no doubt from the objectionable character of his political opinions. HENRY DRISLER.

Da'mon and Pyth'ias (or **Phin'tias**), two Syracusans and disciples of Pythagoras, celebrated for the fidelity of their friendship. Pythias was condemned to death by Dionysius, who kept Damon as a hostage while the former went home to settle his affairs. Pythias returned punctually, to the surprise of the tyrant, who pardoned him, and desired to be a partner in their friendship.

Damoph'ilus of Bithynia, called by Suidas a philosopher and Sophist, was reared by Salvius Julianus, who was consul under Marcus Antoninus. He wrote a number of works, of which Suidas says he found the following in the libraries: "Philobiblus, concerning Books worth Possessing," and "Concerning the Life of the Ancients." (The notices of Damophilus are collected by MÜLLER, "Fragm. Hist. Græc.," vol. iii., p. 656.) HENRY DRISLER.

Dam'ophon, or Demophon, a statuary of Messene, flourished about 370 B. C. He adorned Ægium, Messene, and Megalopolis with his works, which were chiefly statues of Parian marble and of wood. Pausanias mentions among the most important of his works a statue of Lucina, one of Æsculapius, of the Mother of the Gods, of Mercury, and of Venus. He was also employed to repair the Olympian Jupiter of Phidias, the ivory of which had become loosened in many places. HENRY DRISLER.

Damoph'yle, one of the large group of Greek lyric female poets who were pupils, companions, and followers of Sappho. She flourished about 610 B. C., and was a Pamphylian by birth, but Pamphylia was largely Greek. Like her mistress Sappho, she instructed other young women. She wrote love-poems, and composed those hymns to Artemis which were sung at Perga. None of her works are now extant, and very few facts with regard to her are known.

Damox'enus, a comic poet of the new Attic comedy, probably reaching back also into the middle. He is referred to by Athenæus, who with Suidas has preserved the titles of two of his comedies, and has given considerable extracts from one of them. All that remains of his writings has been collected by MEINEKE, "Fragm. Comic. Græc.," vol. iv., pp. 529–36. HENRY DRISLER.

Damp'er [from *damp*, to "check," originally to "smother," akin to the Ger. *Dampf*, "vapor," and *dämpfen*, to "suffocate," "smother," or "quench"], a valve used to lessen the aperture of a chimney or air-flue for the purpose of checking combustion by diminishing the quantity of air. In the construction of the pianoforte a damper is used. This consists of a drop cushioned with flannel, which, falling on the string, checks the vibration, and gives distinctness to the passages and clearness to the sound.

Dam'pier (WILLIAM), an English navigator, born in Somersetshire in 1652. He joined in 1679 a party of buccaneers who crossed the Isthmus of Darien, captured several Spanish vessels, and molested the settlements. In 1684 he made a voyage to the East Indies, from which he returned to England in 1691, and published an interesting narrative, entitled "A Voyage Round the World." In the service of the government he conducted in 1699 an expedition to the South Sea, and explored the western coast of Australia, the coast of Papua and other islands. He returned home in 1701, and published a narrative of this voyage.

Dam'pier Archipel'ago is near the N. W. coast of Australia, about lat. 21° S. and lon. 117° E. It comprises Enderby, Depuch, Lewis, and other islands. Dampier Strait, between Papua and Waigeeo, is 35 miles wide.

Dampremy, a town of Belgium, near Chatelet. It has coal-mines and glass-factories. Pop. 5235.

Damps [Ger. *Dampf*, "vapor;" see etymology of DAMPER], the noxious exhalations of mines and excavations. The carburetted hydrogen of coal-mines is called *fire-damp*, and carbonic acid gas mixed with carbonic oxide is termed *choke-damp*.

Dam'son [a contraction of *Damascene*, from Damascus], a variety of the common plum. It is a small, oval fruit, made use of in preserving. In England it is much used as a confection called *damson cheese*. It is cultivated in the U. S.

Dam, Tinker's, is the wall of dough or chewed bread which a tinker puts around the hole which he is stopping, so as to confine the melted solder to that point. After it is once used it of course loses its value, so that its name is often employed in popular slang as a symbol of utter worthlessness.

Damug'go, a populous and dirty town of Africa, in Upper Guinea, on the Niger, in lat. 7° N., lon. 7° 50′ E. The houses are mostly built of mud.

Dan [Heb. דָּן], a son of the Hebrew patriarch Jacob. Also a part of Palestine occupied by the tribe of Dan, and bounded on the W. by the Mediterranean. Joppa was its principal town. Dan (or Laish) was an ancient city in the extreme northern part of the Promised Land.

Dan, a river of Virginia and North Carolina, rises in

the southern part of Virginia, flows in a generally eastward direction, and crosses the boundary between those States five or six times. After a course of about 200 miles, it unites with Staunton River at Clarksville, Va. Below this junction the stream is called the Roanoke.

Da'na, a post-township of Worcester co., Mass., on the Athol and Enfield R. R. Pop. 758.

Dana, a village of Carbon co., Wy., on the Union Pacific R. R., 100 miles N. W. of Laramie.

Dana (Charles Anderson), a journalist, born at Hinsdale, N. H., Aug. 8, 1819, studied two years at Harvard University, did not graduate owing to a disease of the eyes, but received the degree of A. M. He edited the "Harbinger," was a contributor to the Boston "Chronotype," was connected with the New York "Tribune" from 1847–58, and is now editor of the "Sun." He edited "The Household Book of Poetry" (8vo, 1858), and in connection with George Ripley edited "The New American Cyclopædia." He was assistant secretary of war (1863–64).

Dana (Edmund Trowbridge), J. U. D., political economist and publicist, a brother of R. H. Dana, Jr., born at Cambridge, Mass., Aug. 29, 1818, was educated at the University of Vermont, the Cambridge Law School, and the German universities, and published translations of works on public law, etc. Died May 18, 1869.

Dana (Francis), LL.D., an American statesman and jurist, born at Charlestown, Mass., June 13, 1743, was a son of Judge Richard Dana. He was admitted to the bar in 1767, and joined the "Sons of Liberty." In 1776 he was chosen a member of council of Massachusetts, at that time the supreme executive power in the State. He was a delegate to the Congress of 1777, which formed the Confederation, and to the Congress of 1778. In Nov., 1779, he sailed to Europe as secretary to John Adams, who was sent to negotiate a treaty of peace and commerce with Great Britain. In Dec., 1780, Mr. Dana was appointed minister to Russia, in the capital of which he remained nearly two years. Having returned to Boston in 1783, he was appointed a judge of the supreme court of Massachusetts in 1785. He was chosen in 1787 a delegate to the convention which formed the Constitution of the U. S., but his judicial duties and ill-health prevented his attendance. He voted for that Constitution as a member of the State convention convened to ratify it in 1788. He was chief-justice of Massachusetts from 1791 to 1806. In politics he was a Federalist. Died April 25, 1811. He was the father of the poet Richard H. Dana.

Dana (James), D. D., a Congregational theologian, born at Cambridge, Mass., May 11, 1735, graduated at Harvard in 1753, and was pastor of the First church at New Haven, Conn. (1789–1805). He published (1770–73) an "Examination of Edwards on the Will," in which he strongly opposed the doctrine of utilitarian morality, and ably defended the freedom of the will. Died Aug. 18, 1812.

Dana (James Dwight), LL.D., an eminent American naturalist and geologist, born at Utica, N. Y., Feb. 12, 1813, graduated at Yale in 1833. He published a "System of Mineralogy" (1837), of which a new edition, greatly improved, appeared in 1868. He sailed with Capt. Wilkes as geologist of the exploring expedition sent out by the government in 1838. Some results of this exploration appeared in his "Report on Zoophytes" (1846), a "Report on the Geology of the Pacific" (1849), a "Report on the Crustacea" (1852–54), etc. He married a daughter of Prof. Benjamin Silliman, settled at New Haven in 1846, and became one of the editors of the "American Journal of Science." In 1855 he was elected professor of natural history and geology at Yale College. Among his works are an excellent "Manual of Geology" (1862) and "Corals and Coral Islands" (1872). Prof. Dana combines with the habit of close and accurate observation powers of mind which place him in the very foremost rank of philosophic naturalists.

Dana (James Freeman), M. D., a brother of Dr. S. L. Dana, was born at Amherst, N. H., Sept. 23, 1793, graduated at Harvard in 1813, studied medicine in Boston, and chemistry in London. He subsequently took the degree of M. D. (1817), became professor and lecturer on chemistry, etc. at Harvard, Dartmouth, and the New York College of Physicians and Surgeons. He was the author of "Chemical Philosophy" (1825), and of many scientific papers and other works. Died April 14, 1827.

Dana (Napoleon Jackson Tecumseh), an American officer, born April 15, 1822, in Maine, graduated at West Point in 1842, and May 29, 1862, major-general U. S. volunteers. He served as an infantry officer till 1848, and then as an assistant quartermaster till he resigned, Mar. 1, 1855. He served chiefly at frontier posts 1842–45; in the military occupation of Texas 1845, in the war with Mexico 1846–47, engaged at Fort Brown, Monterey, Vera Cruz, and Cerro Gordo (severely wounded and brevet captain), and on quartermaster duty 1848–55. He was a banker at St. Paul, Minn., till the beginning of the civil war, when he became colonel First Minnesota volunteers, and served in guarding the upper ferries of the Potomac 1861, in Shenandoah Valley 1861–62, in Virginia Peninsula 1862, engaged at Yorktown, West Point, Fair Oaks, Peach Orchard, Savage Station, White Oak Swamp, Glendale, and Malvern Hill; in Maryland campaign 1862, engaged at South Mountain and Antietam (severely wounded); in command of the defences of Philadelphia 1863; in operations in the department of the Gulf 1863–64, engaged at Fordoche Bayou, expedition to the Rio Grande, and the occupation of Matagorda Bay; and in command of the district of Vicksburg and of West Tennessee 1864, and of the department of Mississippi 1864–65. Resigned May 25, 1865, and is now engaged in mining operations in California.

George W. Cullum, *U. S. Army.*

Dana (Richard), an able American lawyer, born at Cambridge, Mass., July 7, 1699, was the father of Francis Dana, noticed above. He graduated at Harvard in 1718, practised law at Boston with success, and was an active promoter of the popular cause in the period which preceded the war of Independence. Died May 17, 1772.

Dana (Richard Henry), a poet, born at Cambridge, Mass., Nov. 15, 1787, a son of Chief-Justice Francis Dana, was educated at Harvard College, studied law, and was admitted to the bar of Boston in 1811. He was one of the editors of the "North American Review" in 1818 and 1819. In 1821 he published "The Dying Raven," a poem. His poem entitled "The Buccaneer" (1827) was praised by Prof. Wilson of "Blackwood's Magazine" in these terms: "We pronounce it by far the most powerful and original of American poetical compositions." He published in 1833 a collection of his poems and prose works, including some essays which originally appeared under the title of "The Idle Man," in 1821–22.

Dana (Richard Henry, Jr.), an eminent American lawyer and author, a son of the preceding, was born at Cambridge Aug. 1, 1815. He entered Harvard College in 1832, but suspended his studies on account of the weakness of his eyes in 1834. He then performed as a common sailor a voyage to California, of which he wrote an interesting and popular narrative entitled "Two Years Before the Mast" (1840). Having graduated at Harvard in 1837, he studied law under Judge Story, and was admitted to the bar in 1840. He published in 1841 "The Seaman's Friend, containing a Treatise on Practical Seamanship," and also an edition of Wheaton's "International Law" in 1865. He was one of the founders of the Free-Soil party in 1848, and an orator of the Republican party in 1856.

Dana (Samuel Luther), M. D., LL.D., an American chemist and writer on agriculture, was born at Groton, Mass., July 11, 1795. He was employed as chemist of the Merrimack Print-Works at Lowell, and invented a method of bleaching cotton goods which was extensively adopted. Among his works are the "Muck Manual" (1842) and an essay on manures (1843). Died Mar. 11, 1868.

Dana (Samuel Whittlesey), son of Dr. James Dana, noticed above, was born at New Haven, Conn., July, 1757, graduated at Yale in 1775, was a member of Congress (1796–1810), and U. S. Senator (1810–21). He was a leading Federalist. Died July 21, 1830.

Dana (William H.), U. S. N., born May 27, 1833, in Athens, O., entered the navy as a midshipman May 1, 1850, became a passed midshipman in 1856, a lieutenant in 1858, a lieutenant-commander in 1862, and a commander in 1869. He served in the North Atlantic blockading squadron and the Western Gulf blockading squadron in 1863 and 1864, participating in the attack on Port Hudson, Mar. 6, 1863, and commanded the gunboat Winona, South Atlantic blockading squadron, from the latter part of 1864 to the close of the civil war. Died at the naval hospital, Chelsea, Mass., Mar. 5, 1872.

Foxhall A. Parker, U. S. N.

Dan'aë [Gr. Δανάη], in classical mythology, was a daughter of Acrisius, king of Argos, who confined her in a brazen tower because an oracle had predicted that her son would kill her father. She became the mother of Perseus, whose father, Jupiter, is said to have obtained access to her in the form of a golden shower.

Dan'aid [for etymology see below], an ingenious hydraulic machine, consisting essentially of two hollow cylinders, placed one within the other, with a (comparatively) narrow space between; the inner cylinder closed at bottom, the outer having an aperture at the bottom in the centre. Between the two bottoms are partitions radiating from the centre to the circumference, but the annular

cylindrical space is without partitions. The whole is sustained by a vertical axis, about which it turns easily. A jet or stream of water being now admitted into the annular space, as nearly tangential horizontally to the cylindrical surface as possible, sets the machine in motion, at first by mere friction, but presently the living force imparted to the water by revolution, acting on the radial partitions of the base, accelerates the velocity and increases the force. Experiments show that this machine utilizes from 70 to 75 per cent. of the power due to the hydraulic head. The name seems to have been suggested by the fable of the Danaïdes pouring water for ever into a vessel, from which it continually escapes. F. A. P. Barnard.

Dana'ides [Gr. Δαναΐδες], the fifty daughters of Danaus, a mythical king of Egypt, were married to fifty sons of Ægyptus, their uncle. By order of their father, each of the Danaides, except one, killed her bridegroom on the wedding-night. They were doomed in Tartarus to pour water for ever into a vessel perforated with holes.

Dan'bury, a post-borough and semi-capital of Fairfield co., Conn., is at the northern terminus of the Danbury and Norwalk R. R., which is 23 miles long, and connects with the New York and New Haven R. R. It is 69 miles N. N. E. of New York. It has two national banks, a weekly newspaper, two savings banks, several hat-factories, one sewing-machine factory, one boot-and-shoe factory, two shirt-factories, and one foundry. It has extensive waterworks, a town farm for the indigent, and a cemetery of remarkable beauty. It was settled in 1684, and burned by the British in April, 1777. Pop. 6542; of township, 8753.
J. M. Bailey, Ed. "Danbury News."

Danbury, a post-township of Grafton co., N. H., on the Northern R. R., 30 miles N. W. of Concord. It has three churches, and manufactures of shoes and leather. P. 796.

Danbury, a post-village, capital of Stokes co., N. C., about 112 miles W. N. W. of Raleigh. It has one weekly newspaper.

Danbury, a township of Ottawa co., O. Pop. 1252.

Dan'by, a township and post-village of Ionia co., Mich., on the Detroit Lansing and Lake Michigan R. R., 16 miles S. E. of Ionia. Pop. 1176.

Danby, a township and post-village of Tompkins co., N. Y., 8 miles S. of Ithaca. Pop. 2126.

Danby, a township and post-village of Rutland co., Vt., on Otter Creek and the Harlem Extension R. R., 18 miles S. of Rutland. It has a number of stores, one weekly newspaper, and manufactures of lumber, leather, boxes, cheese, and marble. Pop. 1319.
J. C. Williams, Ed. "Otter Creek Valley News."

Danby (Francis), A. R. A., a landscape-painter, born near Wexford, Ireland, Nov. 16, 1793. His works are marked by fine light-effects. Among his works are a "Sunset at Sea after a Storm" (1824), "Christ Walking on the Sea" (1827), "The Embarkation of Cleopatra on the Cydnus" (1827), and "Caius Marius among the Ruins of Carthage" (1848). Died Feb. 17, 1861.

Danby (Thomas **Osborne**), Earl of, marquis of Caermarthen and duke of Leeds, an English Tory statesman, born in 1631. He gained the favor of Charles II., and became in 1673 lord treasurer, and the most powerful of the king's ministers. In 1674 he was created earl of Danby. He was committed to the Tower by the Commons on a charge of treason in 1678, and was confined five years. In 1689 he was appointed president of the council by William III., and in 1694 was created duke of Leeds. Died July 26, 1712.

Dan'by's, a township of Pike co., Ala. Pop. 1743.

Dance of Death [Mediæval Lat. *chorea Machabæorum*; Fr. *la danse Macabre* or *la danse des morts*; Ger. *Todtentanz*], an allegorical representation of the power of Death over all classes and conditions of men. The name "Dance of Death" is derived from the mocking activity usually displayed by the skeleton figure of Death as he leads away his victims. As for the name "Macabre" sometimes given to this subject, it has much puzzled scholars, and has produced many absurd etymologies. The only one of these that needs to be noticed is that which connects the word with the Maccabees of the apocryphal Old Testament. These seven martyrs for the Law were never popular nor much known in the Western Church, and their legend has nothing in it that connects them with this subject. The most reasonable explanation of the origin of the word is that it is derived from the Egyptian anchorite Macarius, one of the most famous of the hermit-saints. His legend connects him directly with warnings of death to the living. Though, as he was a Greek saint, his pictures are rare in the West, yet he is twice represented in the cemetery of Pisa—the Campo Santo—once by Pietro Laurati, and again in the fresco attributed to Orcagna and mentioned below. Vasari expressly tells us that the aged saint who is showing the three dead bodies to the hunting-party was meant for Saint Macarius; and it is possible that his name may in time have come to be applied to the subject of which this fresco is a famous illustration.

Traces of the idea which was the foundation of the mediæval acted dramas and pictured or sculptured representations of this subject are to be found in Italo-Greek and Roman antiquity. Douce says that on a sarcophagus found near Cumæ are sculptured three dancing skeletons, and that the same subject is on a Roman lamp and in a Pompeian fresco. On an antique gem in the Royal Gallery at Florence there is engraved an old man piping to a dancing skeleton; and though the introduction of the skeleton is rare, yet it is common enough to find on the Roman sarcophagi such representations of life interrupted by death as will abundantly connect the moralizing of those times with that of the Middle Ages. Probably the earliest of the modern treatments of this subject were in the form of dramatic representations—moralities—acted in churches. As early as 1453 a Dance of Death is recorded to have been acted in the cathedral of Besançon after mass, and we may suppose that this was not the only instance. Originally, it would seem that the "Dance of Death," which, in the fifteenth and sixteenth centuries, was made to include a considerable number of people, was restricted to a few. As early as the thirteenth century there appeared a French poem called "Li Trois Mors et li Trois Vis;" that is, "Les Trois Morts et les Trois Vifs." "This poem relates that three noble youths when hunting in a forest were intercepted by the like number of hideous spectres or images of Death, from whom they received a terrific lecture on the vanity of human grandeur." (*Douce.*) In 1335, Orcagna painted in the Campo Santo at Pisa his Triumph of Death, one of the earliest pictures of this subject, where three kings, with their ladies, companions, and servants, returning from hunting, come suddenly upon three open coffins containing the bodies of three persons, one of them a king, in various stages of decay. In his "Pardoner's Tale" Chaucer has also introduced a most powerfully imagined variation of the same theme. Death (for so we understand it), under the disguise of an old man, appears to three riotous young men who in their bravado are in search of Death, to destroy him in punishment of his many murders, and directs them to a certain tree in the forest where he says he had left him sitting. They find him there in an unlooked-for fashion.

The "Dance of Death," whether as a series of pictures showing the skeleton conqueror carrying away popes, kings, cardinals, bishops, priests, abbots and abbesses, nuns, queens, ladies, and lords, the bride and the bridegroom, judges and scholars, merchants, warriors, ploughmen, market-women, and little children, or only a selection of a few of these, was painted "not only on the walls, but in the windows of many churches, in the cloisters of monasteries, and even on bridges, especially in Germany and Switzerland. It was sometimes painted on church-screens, and occasionally sculptured on them, as well as on the fronts of domestic dwellings. It occurs in many of the manuscripts and illuminated service-books of the Middle Ages." (*Douce.*) It is also found carved in wood, and made the subject of tapestries; and in one of Holbein's finest drawings in the museum at Bâle it is used to decorate a dagger-sheath. The subject had a wide popularity, and examples abound in England, Germany, and France, but fewer in Italy, and, so far as we know, none in Spain, though mention is made by some writers of an example in the palace of St. Ildefonso. (Qu. *bishop's* palace at Alcala?) Mr. George Street, however, a most careful and accurate observer, in his "Gothic Architecture in Spain" does not mention a single picture or sculpture of this subject. Douce gives a list of places where Dances of Death were painted, and among them we find Paris, Dijon, Bâle, Lübeck, Anneburg, Erfurth, Lucerne, Amiens, Rouen, Fécamp, Strasbourg, London, and Salisbury, with others less important. Most of these have disappeared; the one still to be seen on the old bridge at Lucerne has been very much repainted. Douce considers the oldest mentioned example to be that executed for the church of the Innocents at Paris in 1434. Among the most famous ones was that at Bâle (long erroneously attributed to Holbein, who was not born till near a half century after it was painted) in the cloister of the Dominican monastery. Tradition says that this was made between 1431 and 1443, at the instance of the prelates who assisted at the great Council of Bâle, and in allusion to a plague that raged at one time during its sitting. The monastery, having fallen into decay, was destroyed in 1806 to make room for certain municipal improvements, and the frescoes went with it. But, perhaps, what keeps the name of the Dance of Death most securely

in men's minds is the series of wood-cuts indissolubly connected, whether rightly or wrongly, with the name of Holbein. These cuts originally appeared in a book of which the following is the title: "Les simulachres et | historiées faces | de la mort autant ele | gammēt pourtraictes que artifi | ciellement imaginées. A Lyon Soubz lescu de Cologne | M.D.XXXVIII. 4to;" and at the end, "Excudebant Lugdu | ni Melchior et | Gaspar Trechsel | fratres 1538." In the first edition above cited there were only forty-one cuts; in later editions, which followed one another with great rapidity, they were increased, until in that of 1547, also published at Lyons, there were forty-nine. Holbein's relation to these cuts is still, after much laborious and learned investigation, very obscure: it may be that we owe nothing to him but a more artistic draughtmanship, by which new life was given to the old compositions, and it is at least possible that he had no hand in them whatever. (See PEIGNOT, "Recherches sur les Danses des Morts," Dijon and Paris, 1826; "The Dance of Death," with a Dissertation, etc. etc., by FRANCIS DOUCE, London, 1833; LANGLOIS, "Essai historique, philosophique, et pittoresque sur les Danses des Morts," 2 vols., 50 plates, Rouen, 1852; MASSMANN, "Literatur der Todtentänze," Leipsic, 1841. "La Danse Macabre: Histoire fantastique du XV. Siècle," by PAUL LACROIX, 1832–38, sometimes cited as an authority, is only a romance after the manner of Hugo's "Notre Dame.") CLARENCE COOK.

Dan'cing, a succession of rhythmical movements of the body, often accompanied by music. Dancing is of very early origin. The ancients constituted it a part of their religious observances, and danced before their altars and the images of their gods. The ancient Egyptians ascribed its invention to their god Thoth. All the different passions were expressed in dancing by the Greeks, and the dance of the Eumenides or Furies was so expressive of vengeance that it inspired the beholders with terror. The attitudes of the public dancers were studied by the Greek sculptors in order to delineate the passions. Aristotle ranks dancing with poetry. The Spartans were required to train their children in this art from the age of five. This was publicly done, to train them for the armed dance, and was accompanied by songs or hymns. In ancient times, dancing in private entertainments was performed by professionals. The Romans counted it disgraceful for a free citizen to dance except as a religious rite.

In Egypt there are dancing and singing-girls, who improvise verses and are called *almeh*. In India there are nautch- (nâtch-) girls, who dance on public occasions. Among savages dancing is still used as a religious rite or as a sort of state ceremony on important occasions. Among civilized nations it is a frequent mode of recreation. By many it is believed to have immoral tendencies, and is doubtless liable to serious abuse.

Dancing Ma'nia, an epidemic disorder of the fourteenth, fifteenth, and sixteenth centuries, similar to chorea. It is supposed that much imposture prevailed in many forms of this epidemic, but there were also many cases in which the subject entirely lost control of the will. This disorder is even now known in Abyssinia. Something similar to it in Italy was ascribed to the bite of a spider called the tarantula, but its greatest prevalence was in the cities of Germany during the Middle Ages. At Aix-la-Chapelle, in 1374, there appeared on the streets crowds of dancing men and women, apparently excited thereto by the frantic demonstrations at the festival of St. John. The dancers were said to be unobservant of outward things, but sensible of visions. They appeared to lose all self-control, and would dance till they fell as if dead, and would sometimes beat out their brains upon the ground. The mania extended to the Low Countries, as well as Cologne, Metz, and Strasburg, and caused much demoralization. Exorcism was at first found remedial, and cold water, as applied by Paracelsus in the sixteenth century, was very efficacious. At the beginning of the seventeenth century the St. Vitus's Dance, as the disorder was then called, was abating, and is now almost unknown. The "St. Vitus's Dance" of our day is CHOREA (which see). The excesses of the French "prophets" of the last century and the convulsive disorders sometimes seen in the camp-meetings of our own country are probably of similar character with the dancing mania. (See J. F. C. HECKER, "Tanzwuth," 1833, translated into English by B. G. Babington, M. D.)

Dan'delion [from the Fr. *dent de lion*, "lion's tooth," probably from the shape of its leaves: Ger. *Lowenzahn*], the *Taraxacum dens-leonis*, an herbaceous plant of the natural order Compositæ, with a perennial fusiform root. The leaves spring immediately from the root, are long, feather-shaped, with the divisions toothed, smooth, and of a fine green color. The plant grows spontaneously in most parts of the globe. The leaves when very young are tender, and are often used as a potherb, and it is cultivated and brought to market in considerable quantities for this use. It is a popular remedy with many medical practitioners in this country and Europe, having gentle tonic powers. The root is sometimes prepared and ground with coffee, the taste of which covers that of the dandelion.

Dan'dolo (ENRICO), a celebrated Venetian statesman and general, born in 1108. He was eminent for learning and eloquence. In 1192 he was elected doge of Venice, the maritime power of which he greatly increased. He also extended the bounds of the republic in Dalmatia and Istria. Having formed an alliance with the leaders of the fourth crusade, he furnished vessels to transport their army to the Levant in 1201, and took command of the combined forces. They attacked Constantinople, and took it by storm in 1204. The throne was offered by the crusaders to Dandolo, but he declined it. He was blind in his old age. Died June 1, 1205.

Dan'dridge, a post-village, capital of Jefferson co., Tenn., on the French Broad River, 30 miles E. of Knoxville.

Dane, a county in S. Central Wisconsin. Area, 1235 square miles. It is bounded on the N. W. by the Wisconsin River, and drained by the Catfish, which is the outlet of the Four Lakes. These lakes, the largest of which is 6 miles long, lie near the middle of the county. The surface is finely diversified by hills and prairies; the soil is fertile. Cattle, grain, potatoes, wool, tobacco, hay, butter, etc., are produced. The manufactures include wagons, harnesses, and flour. It is intersected by the Milwaukee and St. Paul and the Chicago and North-western R. Rs. Capital, Madison. Pop. 53,096.

Dane, a township and post-village of Dane co., Wis. Pop. 1043.

Dane (NATHAN), LL.D., an American jurist, born in Ipswich, Mass., Dec. 27, 1752, graduated at Harvard in 1778. He was one of the most able lawyers of New England, and a member of the Continental Congress in 1785–88. In 1787 he framed the ordinance for the government and organization of the North-west Territory, in which he inserted a clause prohibiting slavery. He served in the State senate for several years (1794–98). He published "An Abridgment and Digest of American Law" (9 vols., 1823–29). In 1829 he gave $15,000 to Harvard College, to found the Dane professorship of law. Died Feb. 15, 1835.

Da'negelt, or **Danegold** (*i. e.* "Dane-money" or "Dane-tax"), a tribute of one shilling levied on every hide of land by the Anglo-Saxon kings for the purpose of defending the country against the Danes. It was subsequently increased to two shillings, and was continued to the reign of Stephen.

Da'nelag [an Anglo-Saxon term signifying "Danish law"]. Under the later Saxon and earlier Norman kings of England this name was applied to fifteen or more counties of the north and east of England, where the Danish language and customs prevailed in consequence of the invasions and conquests of that race.

Dan'forth, a township of Washington co., Me. P. 313.

Dan'iel ("God is Judge," or "God will judge"), one of the four greater Hebrew prophets, was a youth when he was carried with many other Jewish captives to Babylon in 605 B. C. Whether he was of royal, or only of noble descent, cannot be determined. He was educated at the court of Nebuchadnezzar, and was eminent for learning and wisdom. His skill in the interpretation of dreams procured for him the favor of the king, who appointed him governor of the province of Babylon and chief of the Magi. He explained the handwriting on the wall at Belshazzar's feast about 538 B. C. After the capture of Babylon by the Medes and Persians, Daniel gained the favor of Darius the Mede, and was the first of three presidents who had authority over the 120 satraps of the empire. He also "prospered in the reign of Cyrus the Persian," and appears to have remained in Babylon when the other Jews returned to Jerusalem. He probably lived to the advanced age of at least ninety years.

Daniel, Book of, an important canonical book of the Old Testament, assigned by some to the prophetic books, and by others to the Hagiographa or *Chetubim*. (See BIBLE.) The book has commonly been divided into two parts, of six chapters each—the first six historical, the last six prophetical. Some recent critics maintain that the first seven chapters treat of the world-power in relation to the kingdom of God; the last five chapters treat of the kingdom of God, and its development in relation to the world-power. The book is remarkable both for its miracles and its prophecies. The close general correspondence of these prophecies with the recorded facts of history has led some writers to the belief that the book is not the work of Daniel,

as it purports to be, but that it was written by some unknown person at a much later period. This view, which is as old as the time of Porphyry, has been revived and maintained by Collins, Semler, De Wette, Ewald, and others. On the other side, the evidence for the genuineness of the book is satisfactory to the representatives of orthodox theology. Among the points in its favor are the following: 1. The New Testament decidedly affirms its authority in many places. 2. The Maccabean literature and the Septuagint translation show that the book was in existence before the date assigned to it by rationalists (175 B. C.). 3. The book was written partly in Hebrew and partly in the older Chaldee, as might naturally occur at the period when it purports to have been written. This point appears decisive in favor of the genuineness of the work. 4. So far is the book from being a copy of history, that even now the historical application of some of its parts is a matter of controversy. 5. It is remarkably free from the characteristic beliefs of the later Judaism. The exegetic and controversial literature upon the book of Daniel is very extensive.

Daniel (Hermann Adalbert), an eminent German divine and geographer, born in 1812, was until 1870 professor in the pedagogium in Halle. His chief theological works are "Thesaurus Hymnologicus" (5 vols., 1841–56) and "Codex Liturgicus Ecclesiæ Universæ," etc. (4 vols., 1847–54); his best geographical works are "Leitfaden für den Unterricht in der Geographie" (68th ed. 1872) and "Handbuch der Geographie" (3d ed., 4 vols., 1870–71). Died Sept. 13, 1871. (See "H. A. Daniel, ein Lebensbild," 1872.)

Daniel (Peter Vyvian), a lawyer, born in Stafford co., Va., in 1785, graduated at Princeton in 1805. He became a member of the privy council in 1812, and was several times re-elected. He became an associate justice of the Supreme Court of the U. S. in 1841. Died May 31, 1860.

Daniel (Samuel), an English poet, born at Taunton in 1562, was educated at Oxford. He lived in London, where he associated with Shakspeare and Marlowe, and was employed as tutor to Anne Clifford, who became countess of Pembroke. In 1603 he was appointed master of the queen's revels. He wrote, besides other poems, "The Tragedy of Cleopatra" (1594), an historical poem "On the Civil Wars of York and Lancaster" (1595), "Musophilus" (1599), and a History of England" (1613–34). His English is pure, free from affectation and pedantry. Died Oct. 14, 1619.

Daniel (William Coffee), M. D. See Appendix.

Dan'iell (John Frederick), F. R. S., D. C. L., an English natural philosopher, born in London Mar. 12, 1790. He published "Meteorological Essays" (1823). In 1831 he became professor of chemistry in King's College, London. He was the inventor of the first form of galvanic battery by which it was made possible to maintain a current sensibly constant for a long period of time, and for this most valuable improvement he received the Copley medal in 1837. In 1839 he published an "Introduction to Chemical Philosophy." His is one of the great names of electrical science. Died Mar. 13, 1845.

Dan'ielsonville (West Killingly Post-office), a borough of Killingly and Brooklyn townships, Windham co., Conn., on the Quinebaug River and on the Norwich and Worcester R. R., 26 miles N. N. E. of Norwich. It has two large cotton-mills, several shoe-manufactories, two weekly papers, one bank, five churches, and excellent schools.

J. Q. A. Stone,
Ed. and Prop. of "Windham Co. Transcript."

Dan'ielsville, a post-village, capital of Madison co., Ga., about 85 miles E. N. E. of Atlanta.

Da'nish Language and Literature. The Danish language in its present shape is the result of a long, generally slow, but at certain periods sudden and almost violent, development of the old tongue, which as late as 800 years after Christ was spoken with very slight modifications throughout the whole of Scandinavia, and which still exists as a living language in Iceland. The two most remarkable periods of its development fall in the latter part of the sixteenth and the latter part of the eighteenth century. In the first epoch the Reformation, in the latter the French Revolution, brought the whole mental life of the Danish people in such a commotion that ampler means of expression became necessary. New words burst forth with new ideas; new forms followed the new logic; new phrases blossomed with the new passions. In both cases the German language served as a pattern, but its influence was in both cases legitimate and highly beneficial. The Danish language stands to-day as an original and self-consistent growth, as an independent and well-defined organism. It has a great part of its vocabulary in common with the German language, but the forms of the words are so differently cast that only the scholar can recognize the kindred material. Its grammar and phrases are singularly like those of the English language; a Danish book translated word by word would give readable English, while the same process would produce only nonsense in the German language. Its style is more precise, but less pathetic, than that of the German language; more truthful, but less brilliant, than that of the French; more fanciful, but less sympathetic, than that of the English. It is not a beautiful language, but it is a highly developed one. Its speech has a monotonous sound, its main vowel being a mixture of *a* and *e*, and its most characteristic consonant a weak *d*; but its rhythm is capable of a most delicate and infinitely varied modulation. A foreigner can never learn to speak it with elegance, and even the native who resides for a long time among foreigners loses the most impressive graces of its accent.

The Danish literature began immediately after the Reformation, and began on such a scale as to make the student expect an Elizabethan era. The Bible was translated; the history of the country was written; the old popular songs, which had been composed two or three centuries earlier, and handed down by tradition from generation to generation, and which at this very day constitute an important element of Danish civilization, were collected and printed in a remarkably clever edition. Great scientists whom the world has heard of appeared; Tycho Brahe made his observations, and the tables he left furnished the material from which his disciple Kepler abstracted the famous laws which bear his name; Niels Hemmingsen was a sharp and subtle theologian of a singularly pure and powerful mind. Comedies and tragedies were written both in Latin and Danish, and performed with great splendor in the streets of the great towns by the students of the colleges, to the instruction and amusement of the population. In every field of literature and art there were activity and energy. But this splendid beginning ended in a sudden and utter failure. Niels Hemmingsen was condemned to silence, Tycho Brahe was exiled, the stage grew dumb, and the songs which were gathered from the lips of the people mouldered on the shelves of the library. For two centuries there was no literature in Denmark, except the king's orders for new taxes and the queen's bill of fare for sumptuous court-dinners; and both were written in German. Now and then a great scientist appeared, as Thomas Bartholinus, the celebrated anatomist, and Ole Rómer, who figured out the velocity of light. Now and then a little song flew out, or an awkward endeavor was made of imitating some classical pattern. But these feeble tokens of life make only the general misery more conspicuous. It was two centuries before literature in Denmark took a new start, but then it did it with success, and Ludwig Holberg (1684–1754) became the founder of a great and noble literature, which has proved a highly beneficial instrument in educating and elevating the Danish people.

Holberg was a Norwegian by birth; his ideas were English and his patterns French, but the materials he used were exclusively Danish, and he handled them with such a penetrating power of understanding, with such a happy talent for interpretation, and with such a superiority of judgment, that it has been said of him, with truth, that if the whole of Denmark were swallowed by the ocean, and nothing left but Holberg's comedies, the world would have a perfectly clear and exhaustive idea of Danish society at that time. It is evident, however, that an author must be possessed of original ideas which take hold of the minds of the people, and original patterns which express the people's taste, if he really shall create a literature, form a literary school, and awaken the slumbering genius of the nation. But with Holberg both ideas and patterns were borrowed, and died out among the Danes with him; and when he, nevertheless, is called the father of the Danish literature, it needs a little explanation. Holberg did not create a literature, but he created a public. He aroused the attention of the people for literary affairs. He taught them how to use a book as a means of education and enjoyment. He wrote exactly what they needed and liked, and whenever the interest slackened a little he whipped them with his satire until their attention was fully awake. There were ten readers in Denmark when he began; there were ten thousand when he finished. Next, he did not call forth new authors, but he made authorship possible. Before his time an author in Denmark was a beggar who tried to win a patron for his book by a high-flown dedication, and who was paid for his work by a miserable alms from the patron. Holberg brought his books to the market through a bookseller, without any patron or dedication, and the immense success with which his courage was rewarded made authorship a profession and bookselling a trade in Denmark. Finally, in his comedies, he gave the Danish literature one of its finest treasures. They are an inexhaustible source of refreshing and invigorating enjoyment. His characters are not deep; they lack psychology; but they are well defined and sharply drawn,

and they carry along with them an historical significance which makes them highly interesting. His expressions are not elegant, but they are exceedingly witty, and they have a fluency and abundance which in the mouth of a well-trained actor make them sound like a merry song. His plots are without interest, considered as pictures of life, but they are eminently well fitted for showing off the character by help of the situation, and peals of laughter always accompany the performance of these plays.

The period following immediately after Holberg's death was very curious—talents which ran wild and passions which fought against their own ideas: great exertions ending with bagatelles, and great energies producing nothing but noise: passionate debates about trifles, and sentimental wailings about nonsense; and all this done in the greatest good earnest, and with the fullest confidence that it was great. But the period is very interesting when viewed as a time of preparation; for so it was. Just with the new century he appeared who in the full sense of the word is the father of the Danish literature—he who truly is the representative of the genius of the Danish people—Adam Oehlensläger (1779–1850). Every one of Oehlensläger's earlier works—when he grew older he repeated himself—became a new influence in the Danish civilization; it opened a new mine, and scientists, poets, and artists gathered to work it. In his great epos, "The Gods of the North," and in several tragedies, "Hakon Jarl," "Palnatoke," "Hagbart and Signe," etc., he gave a sublime and, in an artistic respect, perfect representation of the old pagan Scandinavian civilization, and by these works the study of Scandinavian antiquities became a popular interest, and pictures and ideas from the olden times, when Scandinavia was one, became an essential part of every man's education in Denmark, Norway, and Sweden; nay, they became a passion in every man's heart; and the political world has already heard something about this passion. In his comedy, "The Play of St. Hans' Night," he gave a most lovely and charming picture of life as it is led by the Danish middle class, and Heiberg, Hertz, Overskou, and Hostrup followed the track with such a power and variety of talent that the theatre of Copenhagen during a whole generation exercised an influence on Danish culture hardly surpassed by that of the university. Most deeply, however, Oehlensläger influenced the Danish people by his "Aladdin;" by this work he touched the moral character of the people. "Aladdin" is a kind of drama which in a series of most brilliant pictures shows the contrast between the born genius who enters the world as he would his own house, and the ambitious, restless energy which toils and conquers only to fail at last. It is true that this book extricated Danish character from much narrow pedantry, in which an antiquated education kept it entangled; but it is also true that it allured the youth into a dream of being born geniuses from which it was hard to awaken.

It must be remembered that contemporary with Oehlensläger lived Thorwaldsen, the greatest modern sculptor; Örsted, the discoverer of electro-magnetism; Rask, the founder of comparative philology; Martensen, the leader of the speculative school of theology; Gade, one of the finest and mightiest composers of our time; and that each of these men had a number of pupils, and each of these pupils an audience. Furthermore, it must be remembered that these exertions in science, art, and literature were made by a people comprising only two millions of souls, two-thirds of which—namely, the whole peasantry—lived in utter dulness, and the remaining third was not possessed of any extraordinary wealth. It will then easily be understood that the literary glory of this period was also a danger. Life became a refinement, instead of a development; illusion took the place of reality. But, fortunately, there came a warning. In a long series of very elaborate writings, Sören Kierkegaard (1813–54) gave a sublime but austere exposition of the fundamental ideas of Christianity, and from this standpoint he criticised the life around him with the most biting sarcasm and an awe-inspiring severity. The effect was a painful silence. A feeling of guilt visited many a heart. But help there was none. Sören Kierkegaard's criticism was crushing, and his ideals were too strong. He would, no doubt, have left the whole Danish civilization prostrate and lame for a long time if it had not contained an undercurrent which he did not see, and which lay outside of his criticism.

But there was from the very beginning of the period a spirit at work—awakened by Oehlensläger, yet deeper than he, nursed by all the fruits which science and art presented, but blended with a passionate craving for reality, and supported by an eminently practical talent. Bishop Grundtvig (1784–1871), a great poet, a great scholar, a great preacher, but greatest as a character, was the representative of this spirit. For nearly half a century he and his disciples kept aloof from the general current of events, and lived as an obscure party. But when the day of collapse came, he stood in the gap with the means of reconstruction. He found two powerful allies, kindred natures, though not disciples, in Carl Ploug, Denmark's greatest lyrical poet, and a most eloquent newspaper writer, and Rasmus Nielsen, a thinker of rare acuteness and a most brilliant lecturer. Both these men, like Grundtvig himself, were men not only of literary talents, but of great literary merits; but literature was to them not an aim, but an instrument. The idea was to throw away all finery, all that had not vigor and breadth enough to become public property; to make religion and patriotism the basis of civilization, and living influence and practical consequence the test of all its elements; and then by an extensive scheme of education to lift the whole mass of the people up into this reconstructed civilization. And this idea was accepted with such an enthusiasm, and its realization inaugurated with such success, that the small tablet on which the Danish people records its life, is, in this moment, one of the most interesting parts of the great picture of modern civilization. CLEMENS PETERSEN.

Dan'ites, among the Mormons of Utah, a secret organization of men who are believed to have taken an oath to support the authority and execute the commands of the leaders of their sect at all hazards. Many massacres, robberies, and murders, committed during the earlier history of Utah, are ascribed to the Danites.

Danka'li, an independent state of Abyssinia, is bounded on the N. E. by the Red Sea, and on the S. W. by a range of mountains. It is about 250 miles long. The climate is very hot; the soil is arid and poor. The inhabitants are ferocious, treacherous, and fanatical Mohammedans. They number about 70,000.

Dan'nebrog [etymology uncertain], the ancient battle-standard of Denmark, bearing the figures of a cross and crown. It was fabled to have fallen from heaven at the battle of Volmar in Esthonia (1219) during a crusade against the heathens. It was twice taken in battle and twice recaptured. In 1500 a mere fragment remained.—The ORDER OF THE DANNEBROG is the second of the Danish orders of knighthood. It is said to have been founded in 1219, but fell into decay, and was restored in 1671.

Dan'necker, von (JOHANN HEINRICH), a German sculptor, pupil of Pajou in Paris and of Canova (1785–90) in Italy, born near Stuttgart Oct. 15, 1758. Having returned to Stuttgart in 1790, he was appointed professor of sculpture. He produced admirable busts of Schiller, Lavater, and other men of his time. He excelled in the expression of individual character. Among the best productions of the Canova classicism are his Ariadne and Sappho, and a colossal statue of Christ. Died Dec. 8, 1841.

Dannelly (JAMES), a minister of the Methodist Episcopal Church South, born in Georgia Feb. 4, 1786. He joined the South Carolina Conference in 1818. He was of the Boanerges type, and labored extensively and successfully in North and South Carolina and Georgia. He died in South Carolina April 28, 1855. T. O. SUMMERS.

Dannemo'ra, a post-township of Clinton co., N. Y. It contains the Clinton State prison, and has mines of iron ore. Pop. 1512.

Dan'nevir'ke (the "Danish Work"), a boundary-wall in Sleswick, built by the Danes against the Franks about 808, from the Baltic to the North Sea. The original line can be traced from the town of Sleswick to Hollingstedt. The line of the Dannevirke was restored in 1848 by a system of strong fortifications known as the "Great" and the "Little Dannevirke." They were evacuated by the Danes Feb. 5, 1864, and destroyed by the allies.

Dan River, a township of Caswell co., N. C. Pop. 1910.

Dan River, a township of Patrick co., Va. Pop. 2778.

Dan River, a township of Pittsylvania co., Va. It contains the city of Danville. Pop. 10,306.

Dans'ville, a post-village of Ingham township, Ingham co., Mich. Pop. 443.

Dansville, the largest town in Livingston co., N. Y., situated at the head of the Genesee Valley, and the present terminus of the Dansville and Avon branch of the Erie R.W. It contains a hygienic institute, eight churches, one seminary, three banks (one national), two weekly newspapers, two paper-mills, mower and reaper works, a woollen mill, a foundry, a pail-factory, and tanneries. P. 3387; of North Dansville township, 4015. F. J. ROBBINS, ED. "EXPRESS."

Dansville, a township of Steuben co., N. Y. P. 1981.

Dan'te Alighie'ri, one of the greatest of poets, was the son of a lawyer in Florence, in which city he was born May 14, 1265. Boccaccio, whose life of Dante, first published in 1477, is the best authority we have on the subject, says that Dante was of Roman origin, of the stock of the Frangi-

pani, one of whom, by the name of Elisco, came to Florence and settled there, founding the family of the Elisei. A descendant of this founder, named Cacciaguida, married a lady of the Aldighieri family of Ferrara, and giving the name of his wife's family to one of his children, it came about that they substituted it for their own family name. After a time the *d* was dropped, and the name became Alighieri; and Boccaccio says it was spelled so down to his own day. But it has been variously spelled in later times; among the changes that have been rung on the original, that of *Allighieri* is the most common. The arms of the family—a golden wing (*ala*) on an azure field—would seem to be, as is so often the case, a pun upon the name, and to fortify the old spelling. The name of Dante, by which the poet was baptized, is commonly said to be an abbreviation of Durante, but Boccaccio says nothing of this, and at the end of an eloquent enumeration of the gifts Italy had received from Dante, he somewhat obscurely plays upon the name, intimating that no other than that of the "giver" (*dante*) would become him.

Little is known of either the father or mother of Dante. His mother's name is said to have been Bella, and she was his father's second wife. His father died while Dante was yet a child, but he seems to have been carefully instructed, and he had such a leaning to books, and such an aptitude for study, that in the end he became master of all the learning of his time. Among his teachers was Brunetto Latini, a distinguished grammarian and the author of two poems, "Il Tesoro" and "Il Tesoretto," and he is believed to have studied at the universities of Padua and Bologna. He delighted in music and in painting; among his friends were the musician Casella and the painter Giotto, both of whom he celebrates in his great poem; and in the "Vita Nuova" he speaks of himself as on one occasion drawing an angel on a tablet while thinking of Beatrice.

When he was nine years old he first saw Beatrice, the daughter of a wealthy Florentine, Folco Portinari, a child of eight years. Dante has described his mystic love for Beatrice in that most exquisite poem the "Vita Nuova," and she appears again in his "Divine Comedy" as his guide through Paradise. This love never found its earthly close; and there have not been wanting those who declare that it was a purely imaginary worship of an imaginary being, the Beatrice of the "Vita Nuova" and of the "Paradiso" not having been Beatrice Portinari at all. However this may be, Beatrice Portinari married Simone de' Bardi, and died in her twenty-fourth year. Dante himself married, in his twenty-sixth year, Gemma, a lady of the powerful family of the Donati.

Our knowledge of his life is at best but fragmentary. He fought in the battle of Campaldino, in which the Florentines defeated the men of Arezzo, and he was with his countrymen again when they took Caprona from the Pisans. There are traditions that he studied medicine and that he entered the Franciscan order, but there is no certain foundation for these stories, any more than for the many others that have been devised to fill up the gaps in the obscure story of his life. In the great contest between the Guelphs and the Ghibellines, Dante at first sided with the former: he was a Guelph by birth and education, and he had fought on the two occasions we have mentioned with the Guelphic party in Florence against the Ghibellines of other cities.

In 1300, when he was in his thirty-fifth year, he became chief of the Priori—public officers who held office only for two months. While he was in office a local dispute split the Guelph into two subdivisions, calling themselves the Bianchi (*whites*) and the Neri (*blacks*). In the rage of party the Neri proposed to appeal to Charles of Valois, then fighting for the pope against the emperor, but the Bianchi, to which faction Dante belonged, opposed the measure, and he induced the Priors to settle the question by banishing the heads of both parties. Of course this made both factions his enemies; the Bianchi charged him with favoring the Ghibellines, and the Neri with favoring the Bianchi, and it had an ill look for Dante that the Bianchi were allowed to return to Florence before their time of exile had expired. The excuse was, that the place they had been banished to was unwholesome, and, indeed, Dante's friend, Guido Cavalcante, died there; besides, Dante declared that he was no longer in office at the time of the recall.

The demand for the mediation of Charles still being loud, Dante was sent as ambassador to Pope Boniface VIII. to urge him to discountenance the project. But the pope deluded Dante with vague promises, and secretly gave his voice for Charles, so that the Bianchi lost ground. The Neri, gaining power and influence, became masters of the city, and at once proceeded with all the cruelty of party against the absent Dante, denouncing him as a peculator, fining him in a large amount, and banishing him for two years. Later he was condemned to perpetual banishment, and threatened with burning at the stake if he should dare to return to Florence.

After wandering far and wide, destined never again to see his wife, living upon the hard charity of some and the cold hospitality of others, he sought the roof of one who seems to have been a true friend, Guido Novello da Polenta of Ravenna, and, after fifteen years of exile, died there in 1321, on the 14th of September, in his fifty-seventh year. Of his children by Gemma Donati, three sons died young, a daughter entered a convent, and two sons, Jacopo and Piero, followed their father into exile, and gained some reputation as scholars in Ravenna, where the race, according to Leigh Hunt ("Stories from the Italian Poets"), though extinct in the male line, was still surviving in 1846, through a daughter, in the noble house of Serego Alighiari.

In his long and weary exile Dante's steps have been reverently traced through many cities of Italy, and even beyond her boundaries as far as Paris, and even to Oxford. That he ever saw England there is no good reason to believe, and the visit to Paris rests upon the slenderest evidence, though there seems some likelihood that he visited France. He describes the tombs at Arles as if he had seen them, and the dikes of Flanders; and if he really went so far north, he would hardly have failed of Paris, where were those miniature-painters, speaking of whom he says "they call their art 'illuminating' in Paris." In Italy they point out his haunts at Siena, at Arezzo, in Bologna, and doubtfully in other places, and unhappily too truly in Verona, with Can Grande della Scala, and at last in Ravenna, where his bones still repose, though repentant Florence has asked for them again and again in vain. Once in his lifetime she gave him leave to return, on condition of paying a certain sum of money and asking forgiveness—conditions which he justly refused and nobly resented.

From Boccaccio's life of Dante we give a few particulars of the poet's appearance and habits; if we had space we should like to translate also the remarkable story Boccaccio tells illustrative of his power of mental concentration—a match for Alcibiades' famous story of Socrates (Plato, "The Banquet"). Unhappily, no portraits of Dante exist from which we can get an accurate notion of how he looked. The portrait painted by Giotto in the Palazzo dell' Podestà at Florence, in which Dante was represented between Brunetto Latini and Corso Donati, is so defaced that it is virtually lost, nor do any good copies of it exist. In the church of Santa Croce at Florence there is an altar-piece by Giotto, in which is a portrait of Dante, but it is small and so difficult to be seen that its existence is hardly known. The well-known mask of Dante, said to have been taken after death from the poet's face, though it has been the foundation of all the later pictures of Dante, and may well serve as a likeness, since it is every way characteristic, is of doubtful authenticity. Its origin cannot be certainly traced, and it is doubted if the art of casting in plaster was known so early. Perhaps the best portrait of Dante is preserved in the following description by Boccaccio: "Our poet was of middle stature, and after he reached mature age went somewhat stooping. His movements were grave and full of mansuetude. He went always clad in plain garments of such a fashion as became his years. His face was long, with an aquiline nose, and eyes rather large than small; his jaw was large, and the under lip protruded beyond the upper. His complexion was dark, and both his hair and his beard were thick, black, and crisp, and in his aspect he was always melancholy and brooding. By which it came to pass that one day in Verona (the fame of his works, and especially of that part of his Comedy which is called Hell, having gone abroad and become known to many men and women) he was passing before a door where several women were sitting, when one of them in a low voice, yet not so low but that he and those who were with him heard it, said to the other women, 'Look at that man, who goes down to hell, and comes back again when he pleases, and brings news of those who are down there!' To which speech one of the others answered in good faith, 'I believe that what you say is true; don't you see how his hair is crisped and his complexion browned by the heat and the smoke below?' In his eating and drinking he was most temperate, taking food only at the ordinary hours, and then never passing the bounds of necessity, nor showing any excess of liking for one kind more than for another."

Besides the "Vita Nuova" and the "Commedia," to which the epithet of "Divine" was given later by some editor, the title given by Dante being "The Comedy of Dante Alighieri, a Florentine by birth, but not by manners," Dante wrote a treatise on the vernacular tongue, "De Vulgari Eloquio," a commentary on some of his own minor poems, "Il Convito" ("The Banquet"), and a trea-

tise "De Monarchia," in which he eloquently advocates the cause of the empire as against the pope.

Books on Dante and his poem are in such number that the mere mention of their titles would fill pages. At the end of our article on the "Divine Comedy" the reader will find the names of the principal editions and translations. Works more especially relating to Dante himself are Boccaccio's "Vita di Dante," 1544; the notes and appendices to Longfellow's translation of the "Divine Comedy;" Ampère's "Grèce, Rome, et Dante;" Leigh Hunt's "Stories from the Italian Poets;" the introduction to W. M. Rossetti's translation of the "Inferno;" and the introduction to J. A. Carlyle's noble translation of the same; T. Carlyle's "The Hero as Poet" in "Heroes and Hero Worship;" and in French, besides Ampère's interesting essay above mentioned, the sections on Dante in the "Histoire Litteraire de la France au quatorzième siècle, par Victor le Clerc," Paris, 1865, short but full of meat; and, in an entirely different sort, Balzac's "Les Proscrits," of which Dante at Paris disputing with the Churchmen is the hero. But a complete account of Dante's life, or what is known of it, is much wanted in English, nor does it exist in any language.

As we close this article the great work on which Prof. Ferrazzi has been so long engaged is completed, and in it will be found all that is known of Dante and his works, down to the minutest detail—a work in which an Italian worshipper of Dante has labored with a more than German thoroughness and patience. The title is "Enciclopedia Dantesca, di Gius. Jacopo, Prof. Ferrazzi," 4 vols., Bassano, 1871. (See also "Dante secondo la tradizioni e i novellatori," E. Papanti, Livorno, 1873.)

Clarence Cook.

Danton (Georges Jacques), a famous French demagogue, born at Arcis-sur-Aube Oct. 28, 1759. He practised law in Paris before the Revolution. Having a tall stature, a muscular frame, an ardent temperament, and the voice of a Stentor, he was well qualified for a revolutionist and agitator. "Nature has given me," said he, "the athletic form and harsh expression of Liberty." Danton and Marat founded the club of Cordeliers, which equalled or surpassed that of the Jacobins in violence and in hostility to the royalists. In 1791, Danton was appointed *procureur-substitut* for the city of Paris. As a favorite orator of the populace he instigated the bloody insurrection of Aug. 10, 1792, which initiated the Reign of Terror. Danton then became minister of justice, and shared the supreme power with Robespierre and Marat. When the French people were alarmed by the approach of the Prussian invaders, their confidence was restored and their martial ardor excited by a powerful speech which Danton made Sept. 2, 1792, which closed with this phrase: "De l'audace, encore de l'audace, et toujours de l'audace!" Having been elected to the Convention, he resigned the office of minister, and became the leader of the Mountain. He voted for the death of the king, and established in Mar., 1793, the revolutionary tribunal. He co-operated with Robespierre in the destruction of the Girondists, and was a member of the Committee of Public Safety. Robespierre regarded him with jealousy, and resolved to sacrifice him. Danton was aware of, but seemed reckless to his danger. In Mar., 1794, he was arrested and taken before the revolutionary tribunal. When asked his name and residence, he answered, "My name is Danton; my dwelling will soon be in annihilation, but my name will live in the Pantheon of history." He exhibited after his condemnation his usual intrepid demeanor, and was guillotined April 5, 1794. "Nothing," says Lamartine, "was wanting to make Danton a great man except virtue." (See Lamartine, "History of the Girondists;" Thiers, "History of the French Revolution;" Des Jardins, "Vie de Danton," 1851.)

Dant'zic [Ger. *Danzig*], a fortified city and seaport of West Prussia, is on the left bank of the Vistula, 3½ miles from its entrance into the Baltic Sea; lat. 54° 21′ N., lon. 18° 40′ E. It is traversed by the rivers Motlau and Radanne, which here enter the Vistula, and is the terminus of a railway from Berlin, 250 miles to the W. S. W. The mouth of the Vistula is obstructed by sand-bars, which prevent the access of vessels drawing more than nine feet of water. Dantzic is surrounded by walls, and defended by a citadel and outworks. It contains a fine cathedral, commenced in 1343 and finished in 1503; numerous Lutheran and Roman Catholic churches; an exchange; a town-hall; a gymnasium; two grammar-schools; schools of navigation, midwifery, and commerce; a school of arts and trade; an observatory, a public library, a museum, and an arsenal. Excellent timber is exported from this place, and great quantities of wheat out of Poland. The granaries on the Speicher Island, on which fire is prohibited, are capable of storing two to three millions of bushels. Much of this grain comes down the Vistula and Bug on rude floats. The exports amount to 89,500,000 annually. Dantzic was founded in the tenth century or earlier. It was occupied by the Teutonic Knights from 1310 till 1454, when it became a free state under the protection of Poland. It also was for a long time one of the cities of the Hanseatic League. On the partition of Poland in 1793 it was annexed to Prussia. Dantzic has been twice besieged. The first and most famous siege was made by the French in the winter and spring of 1807, after the conquest of Prussia by Napoleon. The remnants of the Prussian army endeavored to defend the strong places of Pomerania. Dantzic was held by 15,000 Prussians and 6000 Russians, provided with 800 pieces of artillery and immense supplies, and commanded by Gen. Kalkreut. The besieging party, commanded by the veteran Marshal Lefebvre, consisted of the tenth army corps and Saxon and Baden troops. The famous engineer Gen. Chasseloup de Laubat directed the siege operations. The investment was completed Mar. 14, 1807. Gen. Kalkreut, after a vigorous defence, during which the allies vainly made attempts to raise the siege, capitulated on the 21st of May to avoid an impending assault. The utmost skill of the French engineer and the science of the French artillerist were illustrated in this siege (carried on over frozen ground, and with the trenches sometimes filled with snow), which sustained and enhanced the reputation they had already acquired throughout Europe. Marshal Lefebvre was created duke of Dantzic; "the French annals had not before furnished an instance of so brilliant a recompense. Napoleon in this followed the example of the ancients, who bestowed upon their generals the names of the places or the nations of which she had made conquest."

The second siege was more properly a blockade made by the allies (Prussians and Russians) in the winter and spring of 1813 after Napoleon's disastrous Russian campaign. Gen. Rapp, commanding the tenth corps, held the place, and brilliantly maintained himself until the cessation of hostilities (June 10) under the armistice concluded between Napoleon, Alexander, and the Prussian king. Pop. in Dec., 1871, 89,121. Revised by J. G. Barnard, *U. S. Army*.

Dan'ube [anc. *Ister* and *Danubius*; Ger. *Donau*; Hun. *Duna*], a river of Europe, inferior in size only to the Volga, is formed from the union of two streams, called the Brigach and Brege, which rise in the eastern part of the Black Forest, in lat. 48° 6′ N. and lon. 8° 9′ E., 2650 feet above the level of the sea. The Danube is from 1750 to 1850 miles long, and drains an area estimated at 300,000 square miles. The average fall of the river is eighteen inches per mile. It is joined in its course by over fifty navigable rivers. Flowing in a north-easterly direction from its source, through Würtemberg and Bavaria, it passes Ulm, where it becomes navigable for vessels of 100 tons. From the S. it receives the Iser and the Lech, flows past Ingolstadt to Ratisbon, then proceeding in a south-easterly direction, enters Austria. In its course eastward to Presburg, the Danube receives from the S. the Inn and the Ens, and from the N. the March. In the neighborhood of Vienna and Linz its waters often divide and form islands, among which are the Great and Little Schütt, sometimes called the Golden Gardens. After leaving Presburg its course changes to the S. E., and passing Pesth it flows directly S., and enters the Hungarian plain, where it is constantly forming new channels. Leaving Orsova, the Danube passes the Iron Gate, a rocky pass 1400 yards wide. This rapid prevented the upward progress of vessels drawing more than two and a half feet of water. The obstruction having been to some extent removed, vessels of eight or nine feet draught can now pass at certain times of the year. The river farther on forms the boundary between Bulgaria and Roumania. Having received the Sereth and Pruth from the N., and after forming several deltoid islands, it flows eastward into the Black Sea. The mouth by which the greater number of ships enter is called the Sulina. Jetees have recently been constructed here for the protection of shipping. In 1871 the number of clearances at the Sulina mouth was 2224, of an aggregate tonnage of 546,510. The Danube is an important commercial highway, and flows through a grand and picturesque country.

Danube, Regulation of, consists essentially in changing the course of the Danube opposite Vienna, by confining its current to a straight, deep channel along a well-constructed quay, thus diverting it from a broad and intricate system of shallow channels, none of which were conveniently available for navigation to the city. A large area of land will be reclaimed for agricultural purposes, and a fine water-front will be secured. The work was commenced in 1869, under a commission appointed by the government, and is expected to cost not less than 30,000,000 florins, equal to about $15,000,000. W. P. Blake.

Dan'ube, a post-township of Herkimer co., N. Y. Pop. 1324.

Dan'vers, a township and post-village of McLean co., Ill. The village is on the Indianapolis Bloomington and Western R. R., 36 miles E. S. E. of Peoria. Total pop. 1760.

Danvers, a post-town of Essex co., Mass., at the intersection of the Newburyport branch of the Boston and Maine and the Lawrence branch of the Eastern R. Rs., 18 miles N. by E. from Boston. It has one national bank, one savings bank, two weekly newspapers, extensive manufactures of shoes, brickyards, lumber and coal wharves on Porter's River at Danvers Port, eight churches, an iron-foundry, a carpet-factory, a new State insane asylum, etc. There are four post-offices and eight railroad stations in the township. Pop. 5600. ED. "MIRROR."

Dan'ville, a post-village of Shipton township, Richmond co., Quebec (Canada), on the Grand Trunk Railway, 87 miles E. by N. of Montreal. It has a weekly newspaper. Pop. about 600.

Danville, a post-township of Morgan co., Ala. Pop. 1159.

Danville, a post-village, the capital of Yell co., Ark., is on the Petit Jean River, about 40 miles from its mouth. It has a church, a school, one flour-mill, and one newspaper. J. B. BEZZO, ED. "ARGUS."

Danville, a city, the capital of Vermilion co., Ill., is situated on the Vermilion River, at the convergence of the Toledo Wabash and Western, the Indianapolis Bloomington and Western, the Chicago Danville and Vincennes, the Paris and Danville, the Evansville Terre Haute and Chicago, and the Danville and Tuscola R. Rs. It has 3 newspapers and 1 magazine, 2 car-shops, 8 hotels, 23 factories, 6 coal-mines, 10 churches, 3 banks (one national), a public park, a free library, and 1 high and 5 graded schools. Pop. 4737; of outside township, 2434. ED. "TIMES."

Danville, a post-village, capital of Hendricks co., Ind., on the Indianapolis and St. Louis R. R., 19 miles W. of Indianapolis. It has one national bank, one private bank, two weekly newspapers, good public buildings, a fine location, and good schools. Pop. 1040.
JOHN N. SCEARCE, ED. "UNION."

Danville, a township and post-village of Des Moines co., Ia., on the Burlington and Missouri River R. R., 13 miles W. N. W. of Burlington. Pop. 1604.

Danville, a post-village, capital of Boyle co., Ky., is on a branch of the Louisville and Nashville R. R., 96 miles S. E. of Louisville. It is the seat of Centre College, the Danville Theological Seminary (Presbyterian), the Southern Collegiate Institute, the Caldwell Female Institute, and a State asylum for the deaf and dumb. It has two national banks and one weekly newspaper. Pop. 2542.
ED. "KENTUCKY ADVOCATE."

Danville, a township of Blue Earth co., Minn. Pop. 557.

Danville, a post-village, capital of Montgomery co., Mo., 80 miles W. of St. Louis. It has one weekly newspaper. Pop. of township, 2254.
L. A. THOMPSON, ED. "THE RAY."

Danville, a post-township of Rockingham co., N. H. It has manufactures of lumber. Pop. 548.

Danville, a post-borough, capital of Montour co., Pa., is on the North Branch of the Susquehanna and on the Lackawanna and Bloomsburg, the Philadelphia and Reading, and the Danville Hazleton and Wilkesbarre R. Rs., 50 miles S. W. of Wilkesbarre and 67 miles N. by E. from Harrisburg. It contains two national banks, one semi-weekly and two weekly newspapers, a large steam printing-office, seven blast-furnaces, six rolling-mills, and numerous other manufactories. Good iron ore, limestone, and anthracite coal are found in the vicinity. Pop. 8436.
BRADLEY & GORDON, PUBS. "MONTOUR AMERICAN."

Danville, a post-village of Caledonia co., Vt., 20 miles E. N. E. of Montpelier, on the Portland and Ogdensburg R. R. It has one national bank, an academy, and a graded school, one weekly newspaper, and manufactures of lumber, woollen goods, and threshing-machines. Owing to its mountain scenery, it is a summer resort. Pop. of Danville township, 2216. N. H. EATON, ED. "NORTH STAR."

Danville, a post-village of Dan River township, Pittsylvania co., Va., on the falls of Dan River, at the terminus of the Lynchburg and Danville R. R., and on the Richmond Danville and Piedmont R. R., 141 miles W. S. W. of Richmond. Leaf tobacco is largely exported. It has one national and two private banks, two weekly newspapers, an iron-foundry, fifteen tobacco-factories, machine-shops, and mills. It is the seat of Roanoke Female College and another female institute. The principal trade is in leaf tobacco. Pop. 3463.
ABNER ANDERSON, ED. "REGISTER."

Daph'ne, a genus of trees and shrubs of the order Thymelaceæ, having a 4-cleft, funnel-shaped perianth, eight stamens, and a 1-seeded succulent fruit. The leaves are sometimes deciduous and sometimes evergreen, and are more or less acrid. The berries are poisonous, but the flowers of some species are beautiful and of exquisite fragrance. The garou bush (*Daphne Gnidium*) of Southern Europe, and the mezereon, both used in medicine, belong to this genus. The spurge laurel (*Daphne Laureola*) is a native of Great Britain. Paper is made in India from the bark of the *Daphne cannabina;* it is called Nepaul paper, and is distinguished for smoothness and durability.

Daphne, a celebrated grove and sanctuary of Apollo, 5 miles S. W. of Antioch in Syria, was frequented by heathen pilgrims and voluptuaries. Here was a temple of Apollo, surrounded by beautiful groves of laurel and cypress trees, gardens, and baths. This place was appropriated to the indulgence of licentious pleasures, and was the scene of an almost perpetual festival of vice.

Daphne [Gr. Δάφνη], in Greek mythology, a nymph beloved by Apollo. To escape from him she besought the aid of the earth, which opened to receive her, and she was transformed into a laurel tree.

Daph'nis [Δάφνις], in Greek mythology, a beautiful youth of Sicily, was the son of Mercury and a nymph of the country. He was reared amid beautiful groves of laurel (δάφνη), whence his name, and was taught by Pan to play on the pipe. He became a herdsman, and tended his herds on Mount Ætna, where he won the love of a naiad, who for his supposed unfaithfulness punished him with blindness. Having prayed his father for relief, Mercury transferred him to heaven. The invention of bucolic poetry was ascribed to him. The story of Daphnis forms the subject of the first idyll of Theocritus, and the name frequently occurs as a character in descriptions of pastoral life.
HENRY DRISLER.

Da Pon'te (LORENZO), an Italian poet, born at Ceneda Mar. 10, 1749. He became Latin secretary to the emperor Joseph II. in Vienna, where he composed several operas. After he had resided for some years in London, he emigrated to New York in 1805. About 1828 he was appointed professor of Italian in Columbia College. He wrote the libretto for Mozart's "Don Giovanni" and other works. Died Aug. 17, 1838.

Dar'abgherd', a town of Persia, in the province of Farsistan, 155 miles S. E. of Sheeraz. It is in an extensive plain, amidst groves of oranges and lemons. It was formerly a large and important city, and now has a population of 10,000 to 15,000.

D'Arblay, MADAME (originally FRANCES **Burney**), an English novelist, born at Lynn-Regis June 13, 1752, was a daughter of Charles Burney, the musician. Burke, Dr. Johnson, Garrick, and other *literati* frequented her father's house and listened to his musical concerts, and in these assemblies she was a silent and diffident spectator. Her first novel, "Evelina," published anonymously in 1778, had a great success. In 1782 she produced "Cecilia." She was second keeper of the robes to Queen Charlotte (1786–91), and wrote an interesting relation of court experience in her "Diary and Letters" (7 vols., 1842–46). In 1793 she was married to Count d'Arblay, a French exile. She died at Bath Jan. 6, 1840.

Darboy (GEORGES), a French ecclesiastic, born Jan. 16, 1813, became, in 1839 teacher of philosophy and theology at the seminary of Langres, in 1859 bishop of Nancy, and in 1863 archbishop of Paris. At the Vatican Council he was a decided opponent of papal infallibility, but he recognized it when it was promulgated. On April 5, 1871, he was arrested by the Communists, and when the government troops took the city he was with five others shot at the prison of La Roquette. Among his prominent works are "Les saintes femmes" (1850), "Les femmes de la Bible" (2 vols., 5th ed. 1859), "La vie de St. Thomas à Becket" (2 vols., 2d ed. 1860).

Dar'by, a township of Madison co., O. Pop. 988.

Darby, a township of Pickaway co., O. Pop. 1548.

Darby, a township of Union co., O. Pop. 1142.

Darby, a post-borough of Delaware co., Pa., on Darby Creek, 7 miles S. W. of Philadelphia, with which it is connected by a horse-railroad. Pop. 1205, or, including Darby township, 2200.

Darby (WILLIAM), an American geographer and statistician, was born in Pennsylvania in 1775. He was an officer under Jackson, serving in Louisiana, and assisted

in the survey of the boundary between the U. S. and Canada. He died at Washington, D. C., Oct. 9, 1854. He was the author of numerous works, among which are a "Geographical Description of Louisiana" (1816), "Geography and History of Florida" (1821), a "Geographical Dictionary," and a number of gazetteers and other works.

Darbyites. See PLYMOUTH BRETHREN.

Darcet (JEAN PIERRE JOSEPH), a French chemist, born Aug. 31, 1777, was the son of Jean Darcet (1727–1801), director of the porcelain manufactory at Sèvres, who established the combustibility of the diamond. He added several useful discoveries to practical chemistry, important improvements in the manufacture of powder and in the composition of bronze and steel, the production of soda from common salt, etc. Died Aug. 2, 1844.

Dardanelle, a post-village of Yell co., Ark., on the Arkansas River, about 80 miles above Little Rock. It has two weekly newspapers, two steam flour-mills, a planing-mill, a steam cotton-gin, four churches, and two public schools. Pop. 926; of township, 1838.

J. B. BEZZO, ED. DANVILLE "ARGUS."

Dar'danelles (anc. *Hellespontus*), called also the **Strait of Gallip'oli,** a narrow channel connecting the Sea of Mármora with the Ægean Sea, and forming a part of the boundary between Europe and Asia. It extends from lat. 40° to 40° 30′ N.; is bounded on the N. W. by Turkey and on the S. E. by Asia Minor, and is about 40 miles long. The width varies from 1 to 4 miles. A rapid current runs from the Sea of Mármora south-westward. The Dardanelles is strongly fortified on both sides by forts and batteries. Two castles on the opposite shores occupy the sites of the ancient Sestos and Abydos. The Hellespont is historically famous for the floating bridges thrown across it by Xerxes the Great. It is scarcely less renowned as the scene of the loves of Leander and Hero, the subject of a famous epic poem by Musæus.

Dar'den (MILES), a person remarkable for his great size, was born in North Carolina in 1798. He was a man of active habits until he was fifty-five years old, when corpulency compelled him to lead a quiet life. He was seven and a half feet high, and weighed at his death over 1000 pounds. Died in Henderson co., Tenn., Jan. 23, 1857.

Dardenne, a township and village of St. Charles co., Mo., on the St. Louis Kansas City and Northern R. R., 30 miles W. N. W. of St. Louis. Pop. 3092.

Dare, a county in the N. E. of North Carolina, bordering on the Atlantic Ocean and Albemarle Sound. It was formed from Currituck, Hyde, and Tyrrel cos. since 1860. Capital, Manteo. Pop. 2778.

Dare (VIRGINIA), the first child born among the English colonists in America, was born at Roanoke (now in North Carolina) in Aug., 1587. She was a granddaughter of the governor, John White. Her fate, like that of all the colony, is unknown.

Da'res, a Trojan, companion of Æneas, distinguished for his skill in boxing. At the games in honor of Anchises in Sicily, Dares challenged all competitors, but was defeated and nearly slain by the aged Entellus.

HENRY DRISLER.

Dares, a priest of Vulcan in Troy, to whom was ascribed an Iliad, written before that of Homer on palm leaves. Ælian states that he knew the work as existing in his own day (150 A. D.), but that work, whatever its character, must have been the production of some post-Homeric writer. There is still extant, under the name of Dares Phrygius, a narrative in prose of the destruction of Troy ("De Excidio Trojæ Historia") in forty-four chapters. A letter prefixed, addressed to the historian Sallust, states that this narrative was translated from the Greek by Cornelius Nepos, who met with the original in Athens. The Latinity shows the production to be of a later age than that of Nepos. It is probably, according to Dederich, a collection of extracts from different sources made in the sixth or seventh century. It was edited, along with "Dictys Cretensis," by Madame Dacier, as one of the volumes of the Delphin classics, Paris, 1680; most recently by Dederich, Bonn, 1835. HENRY DRISLER.

Dar'foor', a country of Central Africa, in the E. part of Soodân, is mostly included between lat. 10° and 16° N. and lon. 26° and 29° E. Its limits are not accurately defined. Area, about 106,000 square miles. The northern part is level, sandy, and nearly destitute of water. A ridge of mountains called Marrah extends through the central part. The soil produces maize, rice, millet, sesame, tobacco, and beans. The rainy season begins in June and continues till September. The people are Mohammedans, a mixture of Arabs and negroes. Darfoor carries on a trade with Egypt by means of caravans, and exports slaves, ivory, copper, hides, and ostrich feathers. Pop. about 4,000,000. It is ruled by a sultan who has despotic power and resides at Tindelly. The chief commercial town is Kobbe.

Dar'gan (EDWARD S.), a distinguished lawyer and jurist in Alabama, a native of North Carolina, first taught school, then studied law, and upon being admitted to the bar settled in Mobile. In 1844 he was elected mayor of the city; from 1845 to 1847 he was representative in Congress. He was the first proposer of the line of adjustment finally adopted on the settlement of the Oregon question with the British government. On his return from Congress he was elected judge of the supreme court of Alabama.

Dar'ic [Gr. *δαρεικός*, said to be derived from Darius], an ancient Persian gold coin, having on the obverse an archer crowned and kneeling, and on the reverse a quadrata incusa or royal palla. Several of these coins are preserved in European collections. The daric is essentially the same coin as the Greek *chrysus* (*χρυσοῦς*) and *stater* (*στατήρ*) of gold, and also the Roman *aureus* (which, like *χρυσοῦς*, signifies "golden"), though the last-named coin appears to have varied more in weight than the Greek stater, averaging about 121 grains. The Daric weighed two Attic drachmæ = 133 grains Troy, or in later times considerably less. It was used in Greece, as well as in Asia. Its value in American gold would be nearly seven dollars, but, owing to the difference of purchasing power in gold at different periods, its true value cannot be accurately stated.

Da'rien, a township and post-village of Fairfield co., Conn., on the New York and New Haven R. R., 35 miles S. W. of New Haven. Total pop. 1808.

Darien, a port of entry and capital of McIntosh co., Ga., is on the Altamaha River, 12 miles from the sea and 60 miles S. S. W. of Savannah. Pine lumber is exported from it. Pop. 547.

Darien, a township and post-village of Genesee co., N. Y., on the Erie R. R., 25 miles E. of Buffalo. Total pop. 2054.

Darien, a township and post-village of Walworth co., Wis., on the Western Union R. R., 50 miles W. of Racine. Pop. 1583.

Darien', Gulf of, a portion of the Caribbean Sea, in the United States of Colombia, is bounded on the W. by the Isthmus of Darien (or Panamá). It receives the river Atrato.

Darien, Isthmus of. See PANAMA.

Darius, eldest son of Artaxerxes Mnemon, was designated by that monarch as his successor to the Persian throne. When Darius was fifty years old, his father, according to custom, asked the king-elect to choose any gift which it was in the father's power to confer. By an established rule such a choice must be complied with at whatever cost. Darius chose Aspasia (or Milto), the beautiful and favorite Greek mistress of his father and of his late uncle, Cyrus the Younger. Though much enraged at this request, the old king promised to leave the matter to the decision of Aspasia, who preferred Darius. The king, however, broke his promise, and devoted the concubine to the service of the gods and to a celibate life. The anger of Darius at this act prompted him to enter into a conspiracy against his father, but the design was discovered and the prince put to death.

Dari'us [Gr. *Δαρεῖος*; old Egyptian, *Ntreiousb*; modern Persian, *Dara* or *Darab*; Heb. *Daryavesh*; old Persian (cuneiform), *Daryahwsh*] **I.,** or **Darius Hystaspis,** king of Persia, was the son of Hystaspes, a member of the noble family of Achæmenidæ. He was called Gushtâsp in the legends of Persia. He was one of seven noble Persians who conspired against and killed the usurper Smerdis, whom he succeeded in 521 B. C. He married two daughters of Cyrus the Great, and organized the extensive empire which Cyrus and Cambyses had enlarged by conquest. Babylon revolted against him, but was after a long siege reduced to subjection in 516. Soon after this date he conducted a large army against the nomadic Scythians of Europe, whom he was not able to conquer or defeat. He sent a great army to conquer and chastise the Greeks, some of whom had offended him by aiding the Ionians in their revolt against Darius. His army was routed at the great battle of Marathon, 490 B. C. He was preparing to renew the invasion of Greece, when he died in 486 or 485 B. C., and was succeeded by his son Xerxes, who reigned from 486 or 485 to 465 B. C. (See GROTE, "History of Greece.") There is little doubt that at first the name Darius was a title rather than a proper name.

Darius II., called **Darius Ochus,** or **Nothus,** king of Persia, was a natural son of Artaxerxes Longimanus. He married Parysatis, his aunt, a daughter of Xerxes I.

In 424 B. C. he deposed and succeeded the usurper Sogdianus, who had killed Xerxes II., the lawful heir. His reign was ignoble, and disturbed by the rebellions of several satraps. He had sixteen brothers and half-brothers, who were illegitimate sons of Artaxerxes. His character was weak, and he was the slave of the eunuchs of his court. He died in 405 B. C., and was succeeded by his son Artaxerxes Mnemon.

Darius III., surnamed CODOMANNUS, the last king of the ancient Persian monarchy, was a descendant of the preceding. He ascended the throne in 336 B. C., on the death of Arses. In the year 334 his empire was invaded by Alexander the Great of Macedon, who gained a victory at the river Granicus. Darius, commanding in person, was defeated at Issus in 333, and again at Gaugamela, near Arbela, in 331 B. C. He retreated towards Bactriana, pursued by the victorious army, which had nearly overtaken him when he was murdered by Bessus, one of his satraps, in the year 330. The wife and daughters of Darius were captured at the battle of Issus. Alexander married his daughter Statira.

Darius Hystaspis. See DARIUS I.

Darius Ochus. See DARIUS II. (For a good succinct account of these Persian kings, see RAWLINSON, "Manual of Ancient History," 1869.)

Darius the Median. See CYAXARES II.

Darjeel'ing, a sanitary station of British India, in the Sikkim Himalaya, is situated at an elevation of 7400 feet above the level of the sea, on the side of a large basin or hollow in which the river Runjeet flows. It is 308 miles N. of Calcutta, and commands a magnificent view of the snowy ranges of the Himalaya to the N. and W. The climate is salubrious, although the annual rainfall is great—*i. e.* about 120 inches.

Dark Ages, a term somewhat vaguely applied to the period between the fall of the Roman empire and the revival of letters about the thirteenth century. As this revival occurred earlier in Italy than in Northern Europe, the Dark Ages may justly be said to have been of longer duration in the North than in the South. (See MIDDLE AGES.)

Dark Cor'ner, a township of Anderson co., S. C. Pop. 1178.

Darke, a county of Ohio, bordering on Indiana. Area, 609 square miles. It is drained by Greenville and Stillwater creeks. The surface is nearly level; the soil is fertile. Cattle, grain, tobacco, wool, hay, butter, and lumber are produced. Carriages, clothing, saddlery, etc. are manufactured. It is intersected by the Dayton and Union R. R. and the railroad which connects Columbus with Chicago. Capital, Greenville. Pop. 32,278.

Darke (WILLIAM) was born near Philadelphia, Pa., in 1736; removed with his parents to Virginia in 1740; served under Braddock at his defeat in 1755; and served throughout the Revolutionary war in the American army, in the latter part of which he held a colonel's commission. He became an influential citizen and a major-general of Virginia militia, served in Ohio and at St. Clair's defeat (Nov. 4, 1791), acting as lieutenant-colonel of the levies, and fighting with desperate valor against the Miamis. He was dangerously wounded, and his youngest son was killed. Died in Jefferson co., Va., Nov. 26, 1801.

Darkhan', Mount, a lofty granite mountain in Mongolia, in lat. 47° 36′ N., lon. 110° 10′ E., is 140 miles S. E. of Oorga. Here is a monument erected to the memory of Genghis Khan, to honor whom the Mongolians assemble here annually.

Dar'ley (FELIX O. C.), an eminent American designer, born in Philadelphia June 23, 1822. He became a resident of New York City in 1848. He has illustrated the novels of J. Fenimore Cooper, Irving's "Sketch-Book," "Rip Van Winkle," some of the works of Dickens, etc. His outline illustrations of Judd's "Margaret" are among his most remarkable productions.

Dar'ling, a river of Australia, in New South Wales, is formed by numerous branches which rise on the western declivity of the Australian Alps. They converge into a central basin of clay, where their channels unite and separate again into branches in a singular manner. Below the union of these branches the Darling flows south-westward through arid plains, and enters the Murray near lat. 34° S. The main stream is about 600 miles long.

Darling (GRACE), an heroic Englishwoman, born at Bamborough Nov. 24, 1815, was a daughter of the keeper of the Longstone lighthouse, on one of the Farne Islands. She rescued nine persons from the wreck of the steamer Forfarshire, Sept. 7, 1838. A public subscription of about £700 was raised for her. Died Oct. 20, 1842.

Dar'lington, or **Darnton,** a market-town of England, in the county of Durham, on the Skerne, near its junction with the Tees, 18 miles S. of Durham. It has a fine church built in the twelfth century, with a tower 180 feet high. The town is well built, and is connected by railway with Stockton and other places. It has manufactures of Brussels carpets, optical glasses, worsted yarn, and brassware. Pop. in 1871, 27,730.

Darlington, a county in the N. E. of South Carolina. Area, 800 square miles. It is bounded on the N. E. by the Great Pedee River, and intersected by Black Creek. The surface is undulating; the soil is partly sandy, and is fertile near the streams. Cotton, corn, rice, and cattle are raised. It is intersected by the Wilmington Columbia and Augusta R. R. and the Cheraw and Darlington R. R. Capital, Darlington. Pop. 26,243.

Darlington, a post-village of Dublin township, Harford co., Md. Pop. 168.

Darlington, a township and post-village of Beaver co., Pa., 15 miles S. W. of New Castle. Pop. 1811.

Darlington, a post-village, capital of Darlington co., S. C., is on the Cheraw and Darlington R. R., 75 miles E. N. E. of Columbia, and 30 miles S. of Cheraw. One weekly newspaper is published here. It has five churches, a Masonic hall, and two steam-mills.

J. M. BROWN, ED. "SOUTHERNER."

Darlington, a post-village, capital of La Fayette co., Wis., is on the Pecatonica River and on the Mineral Point R. R., about 50 miles S. W. of Madison. It has two weekly newspapers and four churches, good water-power, a large flour-mill, and other manufactures, and is an extensive market for grain and live-stock. Pop. of Darlington township, 2773. J. G. KNIGHT, PUB. "DEMOCRAT."

Darlington (WILLIAM), M. D., LL.D., an American botanist, born in Chester co., Pa., April 28, 1782, practised medicine at West Chester. He was a Democratic member of Congress in 1815–17 and 1819–23. He published a valuable work on the plants of Chester county, entitled "Flora Cestrica" (1837), "Agricultural Botany" (1847), "Memorials of John Bartram and Humphry Marshall" (1849), and several other works. He organized societies for the study of natural history and botany in West Chester, where he was a bank president. He imparted his own enthusiasm for science to others, and did much to develop the literary and social culture of the community. The *Darlingtonia Californica*, a curious sarraceniaceous plant of the Pacific States, was named in his honor. As a botanist his fame was deservedly high, but he was better known in Europe than in his own country. Died April 23, 1863.

Darlingto'nia [named by the late Dr. John Torrey in honor of Dr. William Darlington, noticed above], a genus of herbs of the natural order Sarraceniaceæ, comprising but one known species, the *Darlingtonia Californica*, a perennial plant of California. Its leaves are all radical, and resemble somewhat closely those of the Sarracennias of the Atlantic States, but the size of the leaves of the *Darlingtonia* is much the larger, the length in some instances exceeding two feet. The leaves are hollow and twisted, the upper part being turned over into a hood-like dome or vault, beneath which is the orifice which opens into the cavity or pitcher of the leaf. On either side of the opening two lobes depend, which may be taken to represent the true leaf, in which case the ascidium or pitcher must be considered as representing the petiole or leaf-stalk. Inside the pitcher the remains of insects are often found, their exit being impeded by long slender hairs within the leaf. The flower-stalk is sometimes four feet high, single, and furnished with bracts; the flower regular, nodding, and single, and about two inches across; the calyx straw-colored, of five sepals, all pointed; the five petals are pale purple, the stamens, twelve to fifteen, nearly hidden by the top-shaped ovary, upon which there is a style with a five-parted stigma. The capsule is five-celled, many-seeded, and one inch long. This plant is the representative of the Sarracennias of the Atlantic States, and with them and the *Heliamphora* of South America constitutes the whole natural order as far as it is known at present.

The name *Darlingtonia* was given by De Candolle to a proposed genus of herbs of the order Leguminosæ, but it having been shown that the plants assigned to that genus belonged rather to the genus *Desmanthus*, the name was dropped. The same result followed the attempts of several other botanists thus to honor Dr. Darlington, until at last, by a happy choice, this remarkable plant was selected to bear his name. The genus is well marked, and the name *Darlingtonia* can hardly fail to be a permanent one.

Darm'stadt, a town of Germany, capital of the grand duchy of Hesse-Darmstadt, is on the river Darm and on the Frankfort and Mannheim Railway, 15 miles S. of

Frankfort-on-the-Main. It is at the north-western extremity of the Odenwald. It consists of an old and a new town, both surrounded by walls. The former is ill-built, but the new town has wide and handsome streets. It has five public squares, and two ducal palaces, one of which contains a library of 200,000 volumes and a valuable collection of 700 paintings. One of the Madonnas, supposed to be a copy of a Dresden Holbein, was a few years ago, by competent critics, pronounced a true Holbein, and even a better picture than the Dresden Madonna. Pop. in 1871, 39,584, including the suburb Bessungen.

Dar'nel (*Lolium temulentum*), a grass well known in Europe, and naturalized in the U. S. The glumes are as long as the spikelets, or longer, and the spikelets have five to seven florets which are awned. The seeds of darnel are reputed poisonous, but recent researches are said to have established their harmlessness. It is often infested by ergot, and this may account for its poisonous qualities.

Darnetal, a town of France, department of Seine-Inférieure, on the Aubette, 2½ miles E. of Rouen. It has two Gothic churches, and manufactures of flannels and other woollen goods. Pop. 5909.

Darn'ley, Earls of (1725), Viscounts Darnley (1723) and Barons Clifton (Ireland, 1721), Lords Clifton (England, 1608).—John Stuart Bligh, sixth earl, B. A., born April 16, 1827, succeeded his father Feb. 11, 1835.

Darnley (Henry **Stuart**), Lord, born in England in 1541, was a son of the Scottish earl of Lennox. His mother was a niece of Henry VIII. of England. He had a handsome person, but was profligate and deficient in intellect. In 1565 he married Mary queen of Scots, whom he soon offended by his insolence and other faults. He also procured the assassination of Rizzio, which aroused her deepest indignation. The isolated house in which he lodged was blown up with gunpowder at the instance, it was suspected, of his wife, and he was killed Feb. 9, 1567.

Darrtown, a post-village of Milford township, Butler co., O. Pop. 258.

Dar'ter [so called from their manner of seizing their prey], (*Plotus*), a genus of birds, natives of warm climates,

Darter.

sometimes called snake-birds from the length of the neck. They are nearly allied to the cormorants, but they have a long, slender, straight, and sharp-pointed bill. They devour great numbers of fish. The common darter (*Plotus Anhinga*) is found along the coast of the Southern States.

Dart'ford [Saxon, *Darentford*], a town of England, in Kent, on the river Darent, and on the London and Gravesend Railway, 17 miles by rail E. S. E. of London. It lies in a narrow valley between two steep hills. It has cotton and silk printing-works, large powder-mills, and manufactures of machinery, iron, and paper. Watling Street, an ancient Roman road, crosses the river here. Edward III. held a tournament at Dartford in 1331, and Wat Tyler's insurrection broke out here in 1381. Pop. 5314.

Dartford, a post-village, capital of Green Lake co., Wis., on the outlet of Green Lake, 65 miles N. N. E. of Madison.

Dart'moor, an elevated moor or table-land and royal forest in the south-western part of Devonshire, England, noted for its rugged scenery and its cyclopean relics of prehistoric races. The royal forest and its adjuncts extend about 20 miles from E. to W. and 22 from N. to S., being one fifth of the whole area of Devonshire, and measuring more than 130,000 acres. Elevated considerably above the surrounding country, it culminates in Yes Tor, 2050 feet above the level of the sea. The geological formation of Dartmoor is chiefly granitic, but large masses of trap occur. Copper, tin, and manganese are found. The soil is mostly peat, which in some places is twenty-five feet deep. The moor affords pasturage. Many of the dells are fertile, and the region abounds with mosses and lichens. Among the antiquities of Dartmoor we may mention the Gray Wethers, a ruin of an ancient circular temple, and the remains of a large pre-historic village at Grimspound. The forest of Dartmoor was granted by Henry III. to his brother Richard, earl of Cornwall, and since 1337 a part of Dartmoor has been annexed to the duchy, but not to the county, of Cornwall. Dartmoor is famous as the seat of a prison, near Prince Town, in which, during the war of 1812–15, a large number of American sailors were confined. Their sufferings were at times very great.

Dart'mouth, a seaport-town of England, in Devonshire, 32 miles S. by W. from Exeter, picturesquely situated on the terraced side of the right bank of the estuary of the Dart, near the ocean. The entrance to the river is defended by a castle and batteries. The chief exports are woollen goods, cider, and barley. Six steamers and about 240 sailing vessels belong to this port, which is a bonded one, its jurisdiction extending about 40 miles along the coast. Here Richard Lion-heart assembled the crusading fleet in the spring of 1190. Dartmouth was incorporated by charter of Edward III. in 1342, was attacked by the French in 1404, was taken by Prince Maurice in 1643, and recaptured in Jan., 1645–46, by Fairfax. Pop. in 1871, 4978.

Dartmouth, a post-village, seaport, and township of Nova Scotia, in Halifax co., is on Halifax harbor, half a mile N. of the city of Halifax. It has a lunatic asylum, a gold-mine, a marine railway, boiler and engine works, foundries, tanneries, etc. P. about 2500.

Dartmouth, a township and post-village of Bristol co., Mass. The village is 6 miles S. W. of New Bedford. The town has fifteen churches, lumber and salt works, and other manufactures, but is chiefly agricultural. It has several good harbors. Total pop. 3367.

Dartmouth College, the fourth of the New England colleges in chronological order—preceded only by Harvard, Yale, and Brown—was an offshoot of Moore's charity school, an institution for the education of Indian youth, established in Lebanon, Conn., in the year 1754, by the Rev. Eleazar Wheelock, D. D. The school was subsequently removed to Hanover, N. H., a charter for a college, to be connected with it, and yet a distinct institution, having been obtained. This charter was issued Dec. 13, 1769, by John Wentworth, the last of the royal governors of New Hampshire. Dr. Wheelock was its first president, and in view of the interest taken in the school by Lord Dartmouth, an English nobleman, and of his benefactions to it, his name was given to the college. One of the most signal events in the history of the institution is the controversy out of which arose the famous Dartmouth College case. The legislature of New Hampshire passed an act in 1816, changing the name of the institution to "Dartmouth University," and embracing other important and undesirable modifications. To this act the trustees were opposed, and with the design of testing its constitutionality, they brought an action before the supreme court of the State. By this tribunal the legislature was sustained, and appeal was taken to the Supreme Court of the U. S., John Marshall being then chief-justice. The cause of the college was there argued by Daniel Webster and other able counsel, and fully sustained by the court. The university organization was dissolved, and the old college board of trustees sustained. This great battle was fought by them not for themselves only; the principles concerned were vital to many other

institutions. Dartmouth, in comparative poverty, was thus instrumental in vindicating and establishing the sacredness of private trusts.

The college has had seven presidents: Eleazar Wheelock, D. D., inaugurated in 1769; John Wheelock, LL.D., in 1779; Francis Brown, D. D., in 1815; Daniel Dana, D. D., in 1820; Bennet Tyler, D. D., in 1822; Nathan Lord, D. D., in 1828; the present incumbent, Asa Dodge Smith, D. D., LL.D., in 1863. The whole number of its alumni, as given in the "Triennial" for 1870, is 3676. Of these, more than 900 have entered the ministry. Perhaps the two professions that have drawn most largely upon the institution have been those of teaching and the law. A single class might be named, one-fourth of whose members have been either college presidents or professors; and it has been stated that at one time there were residing in Boston, Mass., no less than seven sons of the college, including Daniel Webster and Rufus Choate, "who were justly regarded as ranking among the brightest luminaries of the law."

While the institution has aimed from the beginning at a high religious tone, it is not sectarian. Most of the trustees and teachers are of the orthodox Congregational connection. As to methods of teaching, while the college has ever been conservative, it welcomes all real improvements. It holds to a carefully devised curriculum, but has divers options, both as to courses and particular studies. It retains and honors the ancient classics, but it favors science also. Of late much more has been expended on the scientific appointments of the institution than on the classical. The various departments are as follows: 1, the old academic department, with its four years' curriculum; 2, the Chandler scientific department, with a regular course, chronologically parallel to that of the academic; 3, the agricultural department, so called, or "the New Hampshire College of Agriculture and the Mechanic Arts," based on the Congressional land-grant, and having a regular three years' course; 4, the engineering department, or the "Thayer School of Civil Engineering;" 5, the medical department, or the old New Hampshire Medical College. The last catalogue embraces a faculty of instruction thirty-one in number, and in all the courses of study 408 students. Within the last seven years more than $500,000 have been secured for the various departments. Two new college buildings have also been erected, making the whole number eight; the ground has been broken for another, and arrangements are in progress for the erection of a fire-proof library building. The number of volumes in the different libraries has risen to 46,000; large additions have been made to the philosophical and chemical apparatus and the various museums, and the astronomical observatory has been furnished with one of the best telescopes in the country.

A. D. Smith.

Dartmouth, Earls of, and Viscounts Lewisham (Great Britain, 1711), Barons Dartmouth (England, 1682).—William Walter Legge, fifth earl, born in 1823, was M. P. for South Staffordshire 1849–53, and succeeded his father Nov. 22, 1853.

Dar'trey, Earls of (United Kingdom, 1866), Barons Cremorne (Ireland, 1797), Barons Dartrey (United Kingdom, 1847).—Richard Dawson, first earl, K. P., born Sept. 7, 1817, succeeded his father as Baron Cremorne Mar. 21, 1827.

Daru (Napoléon), Count, a son of the following, was born at Paris June 11, 1807, served in the army in his youth, and in 1832 entered the Chamber of Peers. After the accession of Napoleon III. he became a prominent Orleanist. For a short time in 1870 he was minister of foreign affairs under Ollivier, when by his interference in the affairs of the Vatican Council he became very unpopular.

Daru (Pierre Antoine Noël Bruno), Count, a French statesman and author, born at Montpellier Jan. 12, 1767. In the Reign of Terror he was confined in prison, where he translated the odes and epistles of Horace in verse. He became a member of the Tribunate in 1802, a councillor of state in 1805, and intendant-general of the imperial household. In the campaigns against Prussia and Austria (1806–09) he accompanied Napoleon, whom he served with ability as a diplomatist and financier. In 1815 he was elected president of the French Academy. Among his works is a "History of Venice" (1819). Died Sept. 5, 1829. (See Lamartine, "Éloge du Comte Daru.")

D'Arusmont (Madame Frances), a distinguished reformer, better known by her maiden name as Fanny Wright, was born at Dundee, in Scotland, Sept. 6, 1795. Her father was an intimate friend of Adam Smith, Dr. Cullen, and other distinguished men of that age, so full of new theories for the improvement of the conditions of human life. It was through this source that she drew inspiration and courage for her future career, which was characterized by benevolence, unselfishness, perfect honesty, and complete fearlessness. In her youth she published a defence of the doctrines of Epicurus, entitled "A Few Days in Athens." She was in the U. S. from 1818 to 1821, and then visited France, but returned in 1825, and purchased land where Memphis, Tenn., now stands for her famous experiment for the instruction and enlightenment of the colored race. After a number of years of expensive and unsuccessful effort, her people were freed and sent to Hayti. She lectured in many parts of the Union on social, religious, and political questions with such freedom as to incur much opposition. She was for a time associated with Robert Owen at New Harmony, Ind., and his son, Robert Dale Owen, went with her to Tennessee to assist in that philanthropic if misdirected effort for the benefit of the slaves to which we have referred. She visited France, and in 1838 married M. d'Arusmont, but the union was unfortunate, and with her daughter she returned to the U. S. She died at Cincinnati, O., Dec. 14, 1852. Besides other works, she published "Views on Society and Manners in America," a tragedy called "Altorf" (1819), and "Lectures on Free Inquiry" (1836). (Her life has been published by J. Windt, 1844, and by A. Gilbert, 1855.)

Dar'villes, a township and village of Dinwiddie co., Va. The village is 25 miles S. W. of Petersburg. Total pop. 3082.

Dar'win, a post-township of Clark co., Ill. Pop. 1012.

Darwin (Charles Robert), F. R. S., an eminent naturalist, a son of Dr. R. W. Darwin, F. R. S., and grandson of Dr. Erasmus Darwin, noticed below, was born at Shrewsbury, in England, Feb. 12, 1809. He was educated in the grammar-school of his native town, at the University of Edinburgh, and at Christ's College, Cambridge, where he took his degree of M. A. in 1831. The same year he sailed with Capt. Fitzroy, of H. M. ship Beagle, as volunteer naturalist in the survey of the coast of South America, etc. After his return, in 1836, from this voyage, in which he sailed round the globe, Mr. Darwin published a "Journal of Researches into the Geology and Natural History," etc. (1839; 2d ed. 1854; New York ed. 1846), which has been pronounced the "most entertaining book of genuine travels ever written." In 1839 he married his cousin, Emma Wedgwood, granddaughter of Josiah Wedgwood. Mr. Darwin published (1840–42) the "Zoology of the Voyage of the Beagle," a treatise on "Coral Reefs" (1842), on "Volcanic Islands" (1844), and "Geological Observations" (1846). His monograph on the Cirripedia (1851–53) would have given him a lasting reputation as a philosophic observer had he never written anything else. In 1859 he published his "Origin of Species by Means of Natural Selection," a work which has gone through many editions at home and abroad, has attracted much attention, and given rise to warm controversy in all civilized countries. It is universally conceded that this treatise displays profound knowledge of the facts of natural science and great powers of generalization. His style is clear and even elegant, his temper is moderate and always courteous, and his statements of fact may be said to be always accurate. He published a work on the "Fertilization of the Orchids" (1862), the "Habits and Movements of Climbing Plants" (1865), "Domesticated Animals and Cultivated Plants" (1867), the "Descent of Man" (1871), which has attracted scarcely less attention than the treatise on the "Origin of Species," and which is indeed a continuation of that work. He has also published "The Expression of the Emotions in Man and Animals" (1872). Mr. Darwin is a member of many learned societies, and has been the recipient of numerous medals and other distinctions. He is perhaps equally eminent in geology, zoology, and botany. (See Darwinism, by Profs. E. L. Youmans and J. H. Seelye; and Evolution, by Prof. H. Hartshorne.) Charles W. Greene.

Darwin (Erasmus), M. D., F. R. S., an English poet and philosopher, born at Elton Dec. 12, 1731. He studied at Cambridge and practised at Lichfield, from which he removed in 1781 to Derby. He gained distinction as a physiologist, and also as a poet. His "Botanic Garden" (1791), formerly very popular, is a poetical treatise on botany, full of extravagant imagery. Among his works are "Zoonomia, or the Laws of Organic Life" (1793), "Phytologia" (1800), and the "Temple of Nature" (1803). Many of his ideas on physiology contained the germs of important truths. Died April 18, 1802.

Dar'winism, a term applied to a particular theory of development originated by Mr. Darwin. Darwinism, while based on the doctrine of evolution, is not identical with it. Darwinism is an attempt to explain the law or manner of evolution. (See Evolution.) It is well known that man can, by pursuing a certain method of breeding or cultivation, improve, and in various ways modify, the character of the different domestic animals and plants. By always selecting the best specimens from which to propa-

gate the race, those features which it is desired to perpetuate become more and more strongly developed, so that what are admitted to be mere varieties sometimes acquire, in the course of successive generations, a character as strikingly distinct, to all appearance, from those of other varieties, as one species is from another species of the same genus. Hence it is inferred that what we call species were originally only varieties. Mr. Darwin maintains that a system of influences, not wholly unlike to those which man brings to bear in the breeding of animals, is found in the circumstances with which they are often surrounded in a state of nature.

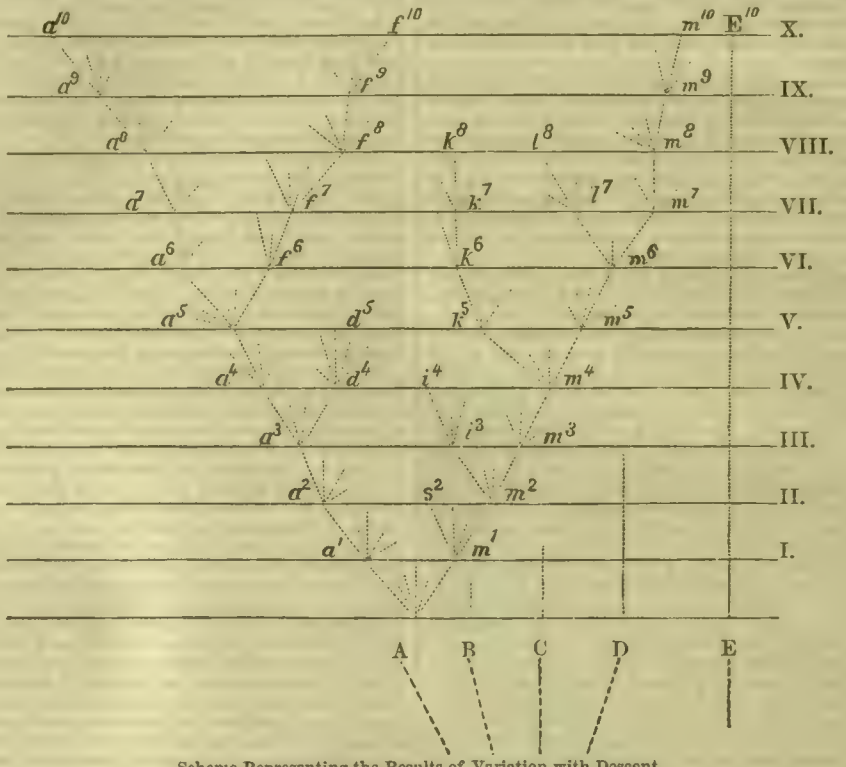
Plants and animals in a state of nature are subject to certain external conditions, which influence and limit them in various ways. Among these are climate, station, character of soil, food-supply, and the number and kind of living beings with which a given organism is surrounded. The workings of these conditions of existence are, for the most part, complex and obscure, but enough has been made out to show that where a variety has once appeared, the influence they exert upon it is quite analogous to that exercised by man in selective breeding.

Organized beings, as a rule, are gifted with enormous powers of increase. Wild plants yield their crop of seed annually, and most wild animals bring forth their young yearly, or oftener. Should this process go on unchecked, in a short time the earth would be completely overrun with living beings. It has been calculated that if a plant produces fifty seeds the first year, each of these seeds growing up into a plant which produces fifty seeds, or altogether 2500 seeds, the next year, and so on, it would, under favorable conditions of growth, give rise in nine years to more plants by five hundred trillions than there are square feet of dry land upon the whole surface of the earth. But fifty seeds a year is far below the reproductive capacity of many plants.

The elephant is reckoned the slowest breeder of all known animals, yet Darwin says "that it will be under the mark to assume that it begins breeding when thirty years old, and goes on till ninety, bringing forth three pairs of young in the interval." If this be so, at the end of the fifth century, there would be alive fifteen million elephants, descended from the first pair. Slow-breeding man has been known to double his numbers in twenty-five years, and, according to Euler, this might occur in a little over twelve years. But, assuming the former rate of increase, and taking the population of the United States at thirty millions, in six hundred and eighty-five years their *living* progeny would have each but a square foot to stand upon were they spread over the entire globe, land and water included. Cases could be given of introduced plants which have become common throughout whole islands in a period of less than ten years; and Dr. Falconer states that there are plants which now range in India from Cape Comorin to the Himalayas that were imported into that country from America since its discovery.

It is thus obvious that the rates of reproduction of living beings are by no means adjusted either to the supply of nutriment, or even to the space to be occupied. The room is fixed and the food is limited, while the ratio of increase is so enormous that each species, if unchecked, would ultimately usurp the whole area and monopolize the earth. But millions of species are doing the same thing, so that the inevitable result is conflict, the war of races, destruction of life everywhere, and, as a result, what Mr. Darwin calls *the struggle for existence*. All over the globe, on the land and in the sea, animals and plants, high and low, are driven into this struggle by their ever-increasing numbers and the limited means of subsistence. The warfare is one of life and death; and its result, the perishing of multitudes and the survival of comparatively few—the numbers remaining being in equilibrium with the supply of the means of subsistence.

Now, the result of this strife cannot be a matter of chance. Which shall be destroyed, and which preserved, must depend upon determinate conditions. Obviously, those individuals or varieties having some advantage over their competitors will stand the best chance to live, while those destitute of such advantage will be liable to destruction. Some by superior vigor may be able to withstand a degree of heat or cold, moisture or dryness, which would be fatal to others. Of those that are pursued, the most fleet will escape, while the slower will be captured. Those which from greater strength or agility are best able to supply themselves with food in time of scarcity, or which have superior adaptation to the nature of the food which the locality affords, will be able to displace those lacking these advantages. Briefly, the animals best adapted to the requirements of the situation in which they are placed are the ones that will live and have descendants, while those less in agreement with these surrounding conditions will as certainly disappear. This process of sorting is continually going on. Nature may metaphorically be said to *choose* which shall be preserved and which destroyed: and this is what Mr. Darwin terms "Natural Selection," and what Mr. Herbert Spencer calls the "Survival of the Fittest."



How races continually encroach on each other's areas, the stronger outrunning and extirpating the weaker in the competition of existence, is well shown by the spread of European plants and animals in New Zealand. Doctor Hooker states that the cow-grass has taken possession of the roadsides; dock and water-cress choke the rivers; the sow-thistle is spread all over the country, growing luxuriantly up to 6000 feet; white clover in the mountain districts displaces the native grasses; and the native (Maori) saying is: "As the white man's rat has driven away the native rat, as the European fly drives away our own, and the clover kills our fern, so will the Maories disappear before the white man himself."

That this kind of struggle among living creatures has always been going on, and must always continue to do so, is obvious; and any one can see that it must be a winnowing and improving process, those least adapted to the situation giving way before those better adapted, while the struggle may be so close and sharp that a very trifling advantage will turn the scale. But Mr. Darwin saw farther into the case than this. It was his merit to discover that natural selection is capable of *producing* fitness between organisms and their circumstances, and of discerning the importance of the consequences that follow.

We have seen that universal variability, small in amount, but in every direction, and fluctuating about a mean condition in normal circumstances, is characteristic of living organisms; let us now see how this tendency may be made to advance in one direction, by natural selection, so as to produce divergence of characters by indefinite modifications of the forms of life. "A soil possessing some ingredients in unusual quantity may supply to a plant an excess of the matter required for a certain class of its tissues, and may cause all the parts formed of such tissues to be abnormally developed. Suppose that among these are the hairs clothing its surfaces, including those which grow on its seeds. Thus furnished with somewhat longer fibres, its seeds, when shed, are carried a little farther by the wind before they fall to the ground. The young plants growing up from them, being rather more widely dispersed than those produced by other individuals of the same species, will be less liable to smother one another, and a greater number may therefore reach maturity and fructify. Supposing the next generation subject to the same peculiarity of nutrition, some of the seeds borne by its members will not simply inherit this increased development of hairs, but will carry it farther; and these, still more advantaged in the same way as before, will, on the average, have still more numerous chances of continuing the race. Thus by the survival, generation after generation, of those possessing these longer hairs, and the inheritance of successive increments of growth in the hairs, there may result a seed deviating greatly from the original. Other individuals of the same species, subject to the different physical conditions of other localities, may develop somewhat thicker or harder coatings to their seeds, so rendering them less digestible by the birds that devour them. Such thick-coated seeds, by escaping undigested more frequently than thinner-coated ones, will have additional chances of growing up and leaving offspring; and this process, acting in a correlative manner through successive years, will produce a seed diverging in another direction from the ancestral type. Again, elsewhere some modification in the physiologic actions of the plant may lead to an unusual secretion of an essential oil in the seeds, which, rendering them unpalatable to creatures that would otherwise feed on them, may diminish the destruction of the seeds, so giving an advantage to the variety in its rate of multiplication; and this incidental peculiarity proving a preservative," will, as before, be gradually increased by natural selection, until it constitutes another divergence. Now, in these and countless analogous cases we see that plants may become better adapted, or re-adapted, to the aggregate of surrounding agencies, not through any *direct* action of such agencies upon them, but through their *indirect* action—through the destruction by them of the individuals which are least congruous with them, and the survival of those that are most congruous with them. All these slight variations of function and structure, arising among the members of a species, serve as so many experiments; the great majority of which fail, but a few of which succeed. Just as we see that each plant bears a multitude of seeds, out of which some two or three happen to fulfil all the conditions required for reaching maturity and continuing the race, so we see that each species is perpetually producing numerous slightly-modified forms deviating in all directions from the average, out of which most fit the surrounding conditions no better than their parents, or not so well, but some few of which fit the

conditions better; and doing so, are enabled the better to preserve themselves, and to produce offspring similarly capable of preserving themselves.

Most naturalists now admit that the principle of adaptive modification or natural selection is potent in the production of *varieties;* yet it seems a tenable position to regard varieties as incipient species. That there is no distinct line of separation between varieties and sub-species, and between sub-species and species, is shown by the inability of naturalists in many cases to distinguish between them. Hundreds of instances might be given where what one naturalist regards as a species, another of equal authority ranks as a variety. Mr. Darwin, therefore, holds that in the past periods of time this principle has played the leading part in producing the diversities of life, and he has constructed a diagram to show how these divergences have

Scheme Representing the Results of Variation with Descent.

arisen. It attempts to represent "the probable action of natural selection through divergence of character, and extinction, on the descendants of a common ancestor."

The letters A to E are intended to represent the species of a genus widely distributed, and as in large genera the species often resemble each other in unequal degrees, this is shown by the letters standing at unequal distances. The species A is supposed to be extensively diffused, so as to embrace a wider diversity of conditions, and to be highly variable. The branching and diverging dotted lines proceeding from A are intended to represent its varying offspring. The variations may be slight, unequal, diverse, appear at different times, and endure for unlike periods. The short intermediate lines represent varieties which become extinct, while the most divergent lines represent those which survive and give rise to new species. That the intermediates should die out and the extremes stand the best chance of living, results from the theory. The more they resemble each other and the parent form, the more restricted will they be to the same set of conditions, and the fiercer will be that struggle for existence which is a cause of the destruction of closely-competing races. On the other hand, the more divergent the descendants of any particular species in structure and habits, the more diverse will be the conditions that they can make available, the less the competition, and the greater the chance of survival.

The intervals between the horizontal lines are each intended to represent a thousand generations. When a dotted line reaches across one of these intervals to a horizontal line, and is there marked by a small numbered letter, it is supposed that a sufficient amount of variation has been accumulated to form a fairly well-marked variety. Now, after a thousand generations, according to the diagram, the species A has produced two such varieties, marked a^1 and m^1. These remaining exposed to the same conditions which made their parents variable, and with a tendency to variability which is itself hereditary, tend to vary in nearly the same manner as their parents varied; also, being but slightly modified, and inheriting those general advantages which made the genus and the parent species large, they in turn are favorably situated for the production of new varieties. Their most divergent variations will generally be preserved during the next thousand generations, and thus is produced variety a^2, which, on the principle of divergence, will differ more from the species A than did variety a^1. From m^1 two varieties, m^2 and s^2, have sprung, which differ from each other, and more considerably from their common parent A. The line of succession is seen to be broken at regular intervals. This is intended to designate when each successive form has become sufficiently distinct to be recorded as a variety; but these breaks are imaginary, and might have been inserted anywhere after intervals long enough to have allowed the accumulation of a considerable amount of divergent variation. At the end of ten thousand generations the species A is supposed to have produced three forms, a^{10}, f^{10}, and m^{10}, which from wide divergence will have come to differ largely from each other, and from their common parent. If the amount of change has been small in the time represented by the space between each horizontal line, these three forms may be only well-marked varieties; if, however, we suppose that each space represents time enough for considerable change to have taken place, they may have reached the position of sub-species, or even, with a still greater amount of change, to that of well-defined species.

The broken lines at the bottom of the diagram are supposed to lead up from an unknown species which was the common ancestor of the several species represented by the capitals. From this unknown ancestor, through variation and the action of natural selection, there descended five species, constituting a separate genus. One of these species is supposed to have been highly variable, and, standing at the extreme of the genus, to have gone on varying and improving without coming in conflict, until it became the parent of several new species. E represents a species which has gone on without change. (See EVOLUTION; also the article on the "Development Hypothesis," by the present writer, in the first volume of JOHNSON'S "Natural History.")

E. L. YOUMANS.

A CRITICISM ON DARWINISM.

Transmutation of Species never yet Observed.—Professor Huxley, after having elaborately advocated the Darwinian hypothesis, nevertheless declares it as his "clear conviction that, as the evidence now stands, it is not absolutely proven

that a group of animals, having all the characteristics exhibited by species in nature, has ever been originated by selection, whether artificial or natural."*

It is well to keep this fact in mind. The Darwinian hypothesis, however plausible in its statement or ingenious in its application, is, at the best, only a possible, and wholly wants the evidence which can translate it into the actual, explanation of the facts to which it applies. That species vary, and some of them to a great extent, is admitted by all, but in no recorded observation do they cease to be the same species still. The cable which holds a ship to its moorings may be swayed by the waves and still not snap asunder. The moon varies in the time of her revolution around the earth, in her celestial longitude and latitude, in the motion of her nodes and perigee; and these variations were seriously thought, for a time, to require some new statement for the law of gravitation, until Clairaut demonstrated that these variations furnished a surprising exemplification of the law. Cuvier has shown,† from Egyptian monuments and mummies, that the animals which lived in that country in the earliest records of its civilization are identical in species with those which live there to-day; and Agassiz has shown,‡ from the coral-reefs in Florida, that the animals of the Gulf of Mexico were of the same species 30,000, and probably 200,000, years ago, as in the present time. Though man has been able to secure numerous and often surprising variations within a given species, he has never succeeded in obliterating the original lines of specific distinction, or in bringing out anything more prominent in their place. An Ancon sheep is no less a sheep, however much its legs may be like an otter's. House-pigeons are house-pigeons still, whether carriers, or pouters, or fantails, or tumblers. The racer, the dray-horse, the barb has not changed its one specific characteristic, however different these varieties may be. The dog has been associated in close companionship with man from the earliest history, and, more than any other animal, has been subjected to decisive experiments continued through many generations, in order that every possible variation from the original stock might be secured. The result is apparent. The differences of dogs strike the dullest eye. And yet an authority inferior to none declares that "under the extremest mark of variety so superinduced, the naturalist detects the unmistakable generic and specific characters of the *Canis familiaris*."§ Moreover, the dog himself sees this likeness, notwithstanding the difference. Two dogs of very different varieties treat each other, on meeting, very differently from what either of them would treat or be treated by a wolf or a fox.

The same is the case with all the plants upon which man has made such copious and careful experiment. Not a single instance of one species changing into another has yet been found. The differences have been sufficient to induce some careful naturalists to suppose their *possible* prolongation into difference of species, and some have thus been led to regard this possibility as though it were already translated into an actual fact. But the fact is still wanting, and however plausible as a conjecture, or however accordant with favorite theories of the universe, the Darwinian hypothesis may be, we must not forget that as long as we lack the first fact in its proof, it is a conjecture alone.

Moreover, these variations, which man has secured by "artificial selection," if we look at them closely are not favorable to the conjecture. These deviations from the typical form and state, instead of being improvements out of which superior species may be gained, are monstrosities only kept up by man's care. The species left to itself sloughs them off. As soon as the introduction of merino sheep rendered it no longer an object to raise Ancons, the latter variety disappeared, and for years no remnant of it has been seen.‖ Dogs show a continual tendency to revert to the common type.¶ Prichard has also shown,** in reference to other domestic animals—the hog, the horse, the ass, the sheep, the goat, the cow, the cat, and gallinaceous fowls—originally transported by the Spaniards and others from Europe to this continent, that in instances where they have got out of man's hands and run wild in the woods, they have lost all the most obvious appearances of domestication, and have approximated to the type which may be supposed to have belonged to the species in its original state. Darwin himself declares that in his pigeons, even with breeds of hundreds of years' standing, he was often met by sudden returns in color and other striking appearances to the original type.†† The same is true with our cultivated plants. The extended varieties which man has brought out in some of these—*e. g.*, the cabbage, the turnip, the beet, the potato—and from which he derives such benefit, are only kept up by constant cultivation. The plant left to itself reverts to its wild and, to man, its comparatively useless, state.

Now, while all these things show that the transmutation of species has not a fact which can prove it, and is at the best but a conjecture, they also render most unlikely the conjecture itself. For in the numberless species which have been minutely observed, over a great space and for a long time, if there were such a tendency to transmutation, how is it possible that no actual case of it has ever been found? Why are not cases occurring all the time and before our eyes? Mr. Darwin admits the force of this inquiry, but we cannot yield to the fitness of his reply. He argues that in the struggle for life the improved offspring would exterminate the inferior progenitor, and that thus the old form disappears by the very process of the formation of the new.‡‡ But if this be true, and if the process of formation be going on before our eyes, why not that of disappearance also? In many animals the duration of the individual life is so short, and the succession of generations so rapid, that if this process of transmutation were actually at work, how could it fail to have furnished, thus far, a single instance of its accomplished fruits? Mr. Darwin often speaks of the frequent uncertainty of specific and even of generic distinctions, and these are sometimes so obscure that even the great Cuvier ranked the barnacle as a mollusk, while it is now classed as an articulate and a crustacean. But this uncertainty and liability to error certainly admits a far other interpretation than what Mr. Darwin adduces. If the species be sometimes separated by such narrow and almost indeterminate bounds, how does it happen that we never see these limits passed over, provided the transition be as easy as is claimed? It is hard to say whether certain living things are representatives of vegetable or animal life. Different naturalists make very different divisions of the innumerable protozoa, some calling animals what others name plants; but if the distinction between the two be of such little account, why has no member of the one class ever been seen passing over into the other? How is it that such a phenomenon—*e. g.*, as the growth of the highest *alga* into the lowest *zoophite*—a phenomenon for which sharp eyes have sought, and which is not only natural but inevitable on the Darwinian hypothesis, and whose discovery would make the fame of any observer—has never yet been seen?

Geological Evidence.—If one species springs from another by a long-continued process of slow variation and natural selection, the steps through which a parent has become lost in his descendants are very many—indeed, are practically innumerable. "If my theory be true," says Mr. Darwin,§§ "numberless intermediate varieties, linking most closely all the species of the same group together, must assuredly have existed." Therefore, also, if the theory be true, some evidence of these intermediate varieties must assuredly exist in the geological record. But no such evidence appears. Looking through all the vast cycles of time which geological changes are supposed to imply, we find the same clear distinctions of species as we observe in the historic period. Upon this there is no dispute. Mr. Darwin admits it,‖‖ and so do his disciples.¶¶ This fact is sufficient to startle, if not to stagger, the boldest advocate of the theory. Mr. Darwin acknowledges it to have the gravest force, but its weight is not essentially lessened by his very ingenious attempt to remove it. His explanation rests, in the main, upon the extreme imperfection of the geological record. This record gives us only a few disconnected leaves—and these often wellnigh effaced, and written in a changing dialect—of a great history, in which, if we could only decipher the faded lines and recover the missing parts, we should find the connections which, it must be acknowledged, we now lack. Sir Charles Lyell adds the weight of his high authority to the same scale. "It is scarcely possible," says this eminent geologist, "to exaggerate the defectiveness of our archives."*** "In the solid framework of the globe, a great part of what remains is inaccessible to man, and even of that fraction which is accessible, nine-tenths are to this day unexplored."††† But the facts which the palæontologist offers are neither few nor inconsiderable. There are over 30,000 species of animals already discovered in the different formations. How is it, then, that these 30,000 species have

been preserved, and are found clearly defined, while not a single individual in a transition state appears? Many of these species are represented in the rocks by thousands of individuals, and if the Darwinian hypothesis be true, and these individuals are only instances of species growing into and out of one another, why are the terminal links of the chain alone preserved? The intermediate links do not differ from these except as would be required by the minutest series of gradations; how, then, if they ever existed, have they now so completely disappeared? The general imperfection of the record is no answer here, for we take the record as it is, and however imperfect, there ought surely to be seen, in the vast number of fossil species actually discovered, some of the missing links, if they ever existed. To Mr. Darwin's explanation of this staggering fact a German professor has applied the calculus of probabilities, with noticeable results.* If we suppose that of each species a hundred individuals have been found, and that between any two species there were only ten intermediate varieties—a number much smaller than Mr. Darwin claims—then the probability against the exclusive appearance of distinct species would be inconceivable millions to one. In exact terms, the probability that out of the millions of fossils which are found, no one should appear from which the process of transmutation could be positively affirmed, is as 1 : 10^{100}; *i. e.*, the exact probability of the Darwinian hypothesis, when judged by the actual facts of palæontology, is no more than 1 : 1 with a hundred ciphers annexed!

But this is not the only bar which geology sets in the way of this hypothesis. Some of the lowest and simplest orders of organized beings—*e. g.* the corals—are found among the first forms of life, and also among the latest. But how should this be? In the struggle for existence they should either tend to develop into something higher or they should not. But in the latter case the very ground of the hypothesis slips from under it, while in the former these lower forms ought long since to have disappeared.

But on the same ground it would seem as if we should find everywhere a law either of deterioration or development, but the facts are otherwise. Take the class of fishes. It is impossible to affirm that the present offers any fuller or more varied development of the entire class than has before been manifested, nor on the other hand that it has degenerated in regard to numbers, powers, bulk, or range of modification.† One consideration, however, seems clear—viz., that those species best adapted to afford mankind wholesome food, such as the cod, the herring, the salmon, the turbot, have greatly predominated at the period immediately preceding and accompanying the advent of man. It is certainly difficult to see what advantages, in the struggle for existence, these possessed above the bony garpikes which they have superseded.

"In the vast physical changes to which the earth has been subjected since the neozoic epoch, no revolutions seem more sudden or more pronounced than that connected with the glacial period. Yet the dicyclotherian mammoth lived before it, and passed through the ordeal of all the hard extremes which it involved, bearing his organs of locomotion and digestion all but unchanged."‡ But how was this possible if species are so unstable and susceptible of such transmutation as the Darwinian hypothesis claims?

Still further: if one species has arisen out of another, all the geological facts indicate that this must have been suddenly and not gradually. For the fact proclaimed by palæontology is that species appear suddenly, and disappear suddenly in successive strata.§ They are as common in the uppermost bed in which they occur as in the lowest or any intermediate bed. They neither increase successively in numbers, nor do they gradually dwindle down; none of the fossil remains, thus far discovered, show signs of a gradual improvement or of a slow decay.‖ Moreover, the origination of varieties, so far as we can observe it, is sudden, and not slow. The first Ancon sheep appears to have been as perfect as any of his descendants. Persons have been born with six fingers on each hand and six toes on each foot, and have propagated this peculiarity to their children and their children's children, but no cause could be seen in any apparent previous preparation for such a phenomenon. A few years ago there were exhibited two dwarf and idiotic children as specimens of the race of the ancient "Aztecs," but these children were found to have been born at San Salvador, dwarfed and of defective brains, of parents who neither in themselves nor in their other children revealed any such deviation from the normal type.

In the oldest fossiliferous rocks we find suddenly appearing, and at the same time, low and also highly organized structures, representing the four great types into which Cuvier has so successfully classified the animal kingdom. Radiates, mollusks, articulates, and vertebrates spring to life simultaneously and suddenly. Below these, absolutely no traces of life appear. If it be said that the lower rocks have been subjected to igneous agency, by which organic existences have totally disappeared, which might otherwise have been found, Agassiz has shown¶ that in the great continent of North America the palæozoic rocks have undergone so little alteration that the remains of the earliest representatives of the animal and vegetable kingdoms are as well preserved as in later formations. If it be said that any one of these types has been developed out of the other, Von Baer has shown** the impossibility of this from the facts of their embryonic growth and structure.

Natural Selection cannot Account for the Changes which it is assumed to Produce.—It is very difficult to see how that gradual development of organs which this hypothesis assumes could have taken place in any such way as Mr. Darwin affirms. If we were presented with a single fact of such development, we should be obliged to assent to it, whether we could explain it or not; but we must remember that not one such fact is furnished, and we must therefore test the doctrine on its intrinsic probabilities. How, then, shall an organ be gradually developed by "natural selection" and in a "struggle for life"? How can the organ give any aid in the struggle for life while it is in a process of formation, and thus how should natural selection have anything to do with its formation? What sort of an agency, *e. g.*, could natural selection have in the formation of mammary glands and their secretions? How do these help the individual in the struggle for life? According to the hypothesis, every new organ must have been in a process of slow growth through many generations, and therefore with numberless individuals which did not need it, and could not use it at all. But the doctrine of natural selection affirms that only those peculiarities which are favorable for the struggle for life would have the advantage to perpetuate themselves; how, then, could organs unformed grow into their perfect form through long-continued generations? The force of this is not weakened by the existence of animals with so-called rudimentary organs. Some insects in deep caves are without eyes; others near the mouth of the cave can see, though indistinctly; while others still, nearly related to these, but living outside the cave, have perfect eyes;†† but instead of inferring that there is a progress here by which no eyes have grown into eyes, it is certainly possible, and it is much more credible, that there is a retrogression, where insects with perfect eyes have lost them because placed where they could not see. The continued disuse of an organ is often followed by its loss, and we can easily see the reason for this; but this does not help us at all in conceiving how an organ which does not exist at all could ever come into existence by any process of natural selection.

Upon this notion of natural selection the facts of reproduction seem absolutely without meaning. It is no advantage to the individual to reproduce its kind. Indeed, with some insects the individual dies in the act of reproduction. The reproductive, which is one of the most pow-

† Owen, "Palæontology," p. 150.

‡ Falconer, "Palæontological Memoirs," vol. ii., p. 253.

§ Prof. Youmans' explanation of this point (given in Johnson's "Natural History," pp. 33, 34) should be presented here:

"It is alleged that the great geological breaks in the course of past life, and the abrupt appearance of multitudes of new species, disprove their origin by gradual development. But the apparent suddenness of their appearance is, without doubt, illusory. It has been proved that the same effect might be produced by the migration of races from inhabited regions to a continent slowly rising from the sea. The following example will show how such breaks might arise in the regular course of geological change: 'Between England and the United States the ocean-bottom is being covered with a deposit of chalk—a deposit that has been forming, probably, ever since there occurred that great depression of the earth's crust from which the Atlantic resulted in remote geologic times. This chalk consists of minute shells of Foraminifera, sprinkled with remains of small Entomostraca, and probably a few pteropod shells, though the sounding-lines have not yet brought up any of these last. Thus, in so far as all high forms of life are concerned, this new chalk-formation must be a blank. At rare intervals, perhaps, a polar bear, drifted on an iceberg, may have its bones scattered over the bed, or a dead decaying whale may similarly leave traces. But such remains must be so rare that this new chalk-formation, if visible, might be examined for a century before any of them were disclosed. If now, some millions of years hence, the Atlantic bed should be raised, and estuary or shore deposits laid upon it, these deposits would contain remains of a flora or fauna so distinct from anything below them as to appear like a new creation. Thus, along with continuity of life on the earth's surface, there not only *may* be, but there *must* be, great gaps in the series of fossils; and hence the gaps are no evidence against the doctrine of evolution.'"

¶ Ibid., vol. i., p. 25.

** "Ueber die Entwickelungsgeschichte der Thieren," vol. i., pp. 160 and 224.

†† Pfaff, "Die Neuesten Forschungen u. s. f.," p. 113.

erful of all impulses, is not for the sake of the individual, but for the species. How, then, can "natural selection" have anything to do with it? "If it profit a plant," says Mr. Darwin, "to have its seeds more and more widely disseminated by the wind, I can see no great difficulty in this being effected through natural selection." * But pray what profit is it to the individual plant to have its seeds thus disseminated, and how, therefore, should natural selection, which "*can act only through and for the good of each being*," † effect this? It is the species only that can thus be profited, and hence, if natural selection have any effect, it is for the profit and permanence, and not for the origination, of species.

"It is conceivable," says Mr. Darwin, "that flying-fish, which now glide far through the air, slightly rising and turning by the aid of their fluttering fins, might have been modified into perfectly winged animals." ‡ Such phrases as "it is conceivable," "I see no difficulty in supposing," "I can see no insuperable difficulty in believing," "it seems to me unlikely," etc., are often used by this author to introduce suppositions which he soon employs as though they were actual facts by which his deductions could be proved. But let us look at this supposition of the flying-fish with the sharp eyes of a naturalist not apt to be led away by his fancy. "Some naturalists," says the great Cuvier, "seeing that more or less use of an organ sometimes increases or diminishes its strength and size, have fancied that habits and outward influences, for a long time continued, might gradually change the form of animals to a degree which would ultimately bring out a difference of species. These writers consider the organized body as a plastic material to be moulded as with the fingers. But the moment they carry out their notion into details, they render themselves a laughing-stock. Whoever should venture seriously to suggest that a fish, by means of a dry habitat, might see its scales disparting into feathers and itself becoming a bird, would only prove thereby his most profound ignorance of anatomy. What relation is there between the complicated and admirable organization of the feather, so perfectly adapted to the nature of the bird, and a scale that might be conceived as disparting itself? Moreover, a scale is of such a nature that it would not be disparted by drying; and yet this is but a sample of what these boasted writers propose!" §

The Law of Hybridity.—Mr. Darwin gives much attention to this law, and adduces many and curious instances to show that interbreeding tends to deterioration, that strength comes from crossing, and that varieties of new vigor, which might develop into new species, may come from individuals of different species. But that interbreeding tends, in certain instances, to deterioration and sterility, may, for aught we know, be a natural consequence of the inheritance of disease, which close interbreeding may perpetuate, and which crossing might tend to remove. Now, no well-authenticated cases of perfectly hybrid animals are known. Mr. Darwin himself admits this, ‖ but argues that such cases are intrinsically possible, because we do know of numberless instances where varieties, when crossed, are not only fertile, but their progeny often surpass in fertility their parents. But the true inference from this is not the one he has drawn. These facts teach us rather the real and ineradicable difference between species and varieties. Moreover, the instances which Mr. Darwin adduces furnish themselves the gravest difficulties to his hypothesis. For if close interbreeding tends to sterility, and if somewhat remoter unions diminish this tendency, and if when these unions are of two varieties the cross-breeds are more fertile than either pure stock, and if the difference between varieties and species be only one of degree and not of kind, how does it happen that when the divergence has passed over just that degree which separates the variety from the species, the whole tendency is instantly reversed, and the mongrel, if produced, is sterile? ¶

Gradation not to be Confounded with Progress.—In the organic world an individual passes through stages of growth, each of which, compared with the preceding, marks a grade of progress. This is the individual's development, in which case, however, it is not, strictly speaking, true to say that the higher has been developed out of or by the lower, for the lower and the higher spring alike from a deeper source. They are both the unfolding of what lay mysteriously folded up in the germ before any manifestation of the individual life had appeared. So the facts teach us, and so a sound philosophy would declare. But though we might look upon gradation here as equivalent to progress, this by no means proves that it is such elsewhere. There is a gradation in the colors of the prism, but it would be absurd to call this a progress in any such sense as though one color had grown out of another. In like manner a gradation of species does not involve a progress of species, and we only confuse ourselves if we confound the two. Because a system of nature can be represented, in the contemplation of which we pass, by regular and successive steps, from the lowest and simplest structure to the highest and most complex, it by no means follows that the higher has proceeded from the lower, or that either has been evolved out of the other. Now, we need to remember that in natural history no such gradation can yet be represented. There are broad gaps which require prodigious leaps of the imagination to span. Mr. Darwin urges that these gaps are apparent, but not real. They seem such only to our defective knowledge. If we had the whole field instead of detached portions before us, we should find, he claims, the gaps filled up and the gradation perfect. This we may admit. It seems possible, though as yet far from being proved. The discovery of the intermediate forms between the *Palæotherium* and the hoofed quadrupeds of to-day, which Cuvier desiderated, may no longer be lacking,** but the proof that the *Palæotherium* is the progenitor of our present existing hoofed quadrupeds is not advanced one jot by this discovery. *Palæotherium* and *Equus* remain just exactly as distantly related as before, notwithstanding all the help toward consanguinity which *Paloplotherium*, *Anchitherium*, and *Hipparion* can furnish. Indeed, the ease with which gradation becomes translated into progress, and the readiness with which this mistake is made to prove the transmutation of species, is somewhat surprising to one who thinks closely. The imagination, not to say the fancy, would seem to have a more prominent part to play in these processes than a faculty of rigorous logic.

In the assignment of the links which are fancied to connect man, through the anthropoid apes, with the orang-outang and gibbon, it is argued that a perfect gradation is a sufficient warrant for the inference that the man has, in process of time, been evolved from the monkey. Now, we should not forget that the postulate here is only a fancy. The gradation is so far from perfect—indeed, is so grossly imperfect except in certain superficial characteristics—that the most accomplished naturalists declare that "man is the sole species of his genus and the sole representative of his order and sub-class." †† While the studies of Duvernoy upon the gorilla, and of Gratiolet and Alix upon the chimpanzee, have shown that a monkey of the highest grade is none the less a monkey and none the more a man than one of the lowest, ‡‡ Pruner-Bey has also shown that in the most salient characteristics of the two there is an inverse order of development, which not only destroys the gradation, but makes it impossible that the higher should ever have descended from the lower. §§ And if we pass from anatomical and physiological qualities to the higher psychological distinctions, we find a difference which cannot be bridged by degrees, though extended to infinity.

But even if there are men so sunk in a savage state that the difference between them and the people of the highest civilization seems greater than that which divides some monkeys from others, we have at least just as good reason for saying that the lowest has degenerated from the highest, as that the highest has been developed from the lowest. The history of men is full of instances of deterioration. If we weigh it simply by number, whether of years or of nations or of individuals, degeneration and decay vastly preponderate. Where is the civilization now of Tyre, and Carthage, and Babylon, and Nineveh? and where are the arts which built the Great Pyramid and Baalbec? All over the world we have evidence of a tendency among nations and men to sink away from civilization into barbarism, but history does not show an instance of a nation rising by its own efforts from barbarism to civilization. "To believe," says Mr. Darwin in his latest book, "that man was aboriginally civilized, and then suffered utter degradation in so many regions, is to take a pitiably low view of human nature." ‖‖ But, alas! this is exactly the view which the sad facts of history oblige us to take, and we must square our views of human nature to the actual facts of the case, whether or not it would better suit our desires and our theories to have them otherwise. The incontestable fact is, that human nature reveals no inherent impulse to improve or perfect itself. History gives unnumbered cases of a downward tendency, but not a single instance of a self-evolved progress. The lamp which lights one nation in its

advancement has been always lighted by a lamp behind it. Civilization is never indigenous; it is an exotic plant wherever found. This is the simple truth of history, which makes all such discussions as Mr. Darwin's respecting the descent of man as false to fact as they are abhorrent to philosophy.

"By the constant working of his brain," says Carl Vogt, "man gradually emerges from his primitive barbarism."* But, aside from the crude materialism of which this writer is so fond, and which this sentence might illustrate, it is fair, again we say, to ask for some little evidence that this "constant working of the brain" starts from its own accord. We have not a particle of such evidence, and such a supposition is not only unsupported by a single fact, but is contradicted by all the facts of history. (See Prof. SEELYE'S argument against Darwinism in Johnson's "Natural History," vol. ii.) J. H. SEELYE.

Dash'iell (ROBERT LAWRENSON), D. D., was born in Salisbury, Md., 1826, graduated with honor at Dickinson College 1846, joined the Methodist Baltimore Conference 1848, and occupied prominent pulpits in the Middle States down to 1868, when he was elected president of Dickinson College, Pa. He was appointed corresponding secretary of the Missionary Society of the Methodist Episcopal Church in 1872.

Dash'kof (EKATERINA ROMANOVNA), PRINCESS, a Russian lady eminent for her talents and learning, was born of a noble family Mar. 28, 1743. She became the wife of Prince Dashkof and a friend of the empress Catharine II. She was one of the chiefs of the conspiracy which dethroned Peter II. Soon after this event she lost the favor of Catharine, and passed several years in a tour through France, Germany, and Italy. Having returned home in 1782, she was appointed president of the Academy of Sciences at St. Petersburg. She was the first president of the Russian Academy, founded in 1784, and she superintended the compilation of a great dictionary of the Russian language. Died Jan. 16, 1810. (See "Autobiographical Memoirs of her Life," published in English in 1840.)

Da'sya [from the Gr. δασύς, "hairy," a term very applicable to some of the species], a genus of red Algæ, of the order Rhodomelaceæ, nine or ten species of which are found in the U. S., and seven species in the British Islands. They have pear-shaped spores, borne in ovate conceptacles upon the smaller branches. The genus includes some of our finest sea-weeds.

Da'syure [from the Gr. δασύς, "hairy," and οὐρά, the "tail"], (*Dasyurus*), a genus of carnivorous marsupial quadrupeds, allied to the opossums, but having only eight incisors in the upper and six in the lower jaw, and only twelve molars in each jaw. They also differ from the opossums in the absence of a hinder thumb, a prehensile tail, and in the want of a cæcum. They are all Australasian. The ursine dasyure (*Dasyurus* or *Diabolus ursinus*), or Tasmanian devil, abounded in Van Diemen's Land when it was first colonized. It is as large as the badger. The tail is half as long as the body, and like it is covered with coarse black hair with white bands. It is very wild, and makes its home in the ground. The spotted dasyure (*Dasyurus macrurus*) is the size of a cat, has a tail as long as the body, and is of a deep brown color, spotted with white. This and a smaller species (*Dasyurus Mangir*), called the wild-cat, are natives of Van Diemen's Land, and both are very destructive to poultry. All the dasyures are fierce nocturnal quadrupeds, and cannot be tamed.

Da'ta (plu.), [from the Lat. *do, datum*, to "give"], signifies "things given" or admitted; quantities and facts given, known, or admitted, by which to find things or results unknown; in geometry, the quantities or conditions which are assumed to be known in any problem. Thus, in the problem, *Given the base, altitude*, and *area, to construct the triangle*, the data are: 1, that the figure is a triangle; 2, that it has a certain straight line for its base; 3, that its vertex is at a known distance from its base; and 4, that its area has a known magnitude.

Dat'ames, fourth century B. C., a Persian general and satrap, born of a Carian father and Scythian mother; his principal fields of action were Asia Minor and Syria. He experienced the fate accorded to many distinguished commanders of antiquity, such as Sertorius, master of Spain eight years in the first century B. C., and Viriathus, second century B. C., and in modern times, Wallenstein and Guise, when they sought to maintain their independence against despotism, or when they became dangerous to royalty. Too strong to be crushed out by force of arms, they were taken off by treachery and assassination, as was Datames about 362 B. C. He is known to modern times only by short notices of Diodorus of Sicily, about 50 B. C., and of Polyen the Macedonian, second century A. D., author of "Strategemata," and through a very interesting account of him by Cornelius Nepos (first century B. C.), who considers him the most valiant and capable of barbarian—that is, foreign—generals, with the exception of the two Carthaginians, Hamilcar and Hannibal; as one who owed his success not to the command of great armies, but to an individual ability almost unequalled. From what is to be gathered from the scanty details furnished, he must, in one respect resembling the greatest of all generals of all times, Hannibal, have been more remarkable for stratagem than strategy, although not deficient either in tactics or strategy. Frontinus, a military writer of consular dignity and Roman commander-in-chief in Britain towards the end of the first century A. D., in his "Strategematica and Strategicon" (Scott's translation, 1811, 185), cites an evidence of his consummate judgment, under fire, so to speak, similar to, but far better than, that which in 1646 distinguished Turenne in respect to the Wennarians when transferring their services to the Swedes. At first very successful in putting down an extensive confederated revolt, and thereupon invested with the command of the army destined to subject insurgent Egypt, Datames fell into disfavor with the Persian monarch Artaxerxes. Finding himself mistrusted and imperilled, he set up for himself, and was victorious over the powerful forces sent against him. Found too great to be conquered, he was betrayed by a friend, and in a conference murdered (exactly like the great Sertorius) about 362 B. C. To few men of whom so little is known has a greater reputation been accorded, demonstrating that Datames made himself felt and obtained a name whose grandeur like a set sun is apparent from the continuing glow beyond the mountains which conceal the orb which irradiates the sky.

J. WATTS DE PEYSTER.

Da'tary [Lat. *datarius*, from *datum*, "given" (usually the first word in the *date* of papal documents; for example, "Datum Romæ apud Sanctum Petrum," etc., "Given at Rome January 1st," etc.)], the chancellor of the pope; a high dignitary of the Roman Catholic Church, who has the power in some cases of granting requests, instead of the pope himself. This arrangement was introduced to relieve the pope from the pressure of unimportant business. The datary is assisted by a pro-datary and a sub-datary.

Date [Fr. *datte;* from the Gr. δάκτυλος (*i. e.* a "finger," and also a "date," so called from its shape); Lat. *dactylus;* Sp. *dátil*], the fruit of the date-palm (*Phœnix dactylifera*), a native of the north of Africa and the south-west of Asia. It also grows in Southern Europe, and to some extent in the Southern U. S. The stem grows to the height of thirty to sixty feet, is straight, and crowned with from forty to eighty smooth pinnate leaves or fronds eight to ten feet long, with lanceolate acuminate leaflets. The tree bears many spadices, each of which on the female tree bears from 180 to 200 dates, weighing in the mass from twenty to twenty-five pounds. This tree is one of the most highly prized of all the palms, furnishing food to millions of the human race. On the N. coast of Africa, in Persia, and in Arabia dates form a chief article of food. They contain 58 per cent. of sugar, combined with gum, pectin, etc. They are used both fresh and dried, and are prepared for market by pounding and pressing them into a solid mass. Both wine and vinegar are made from them by fermentation, and in Persia an ardent spirit is distilled from them. At the top of the stem is a soft pith, which, with the young leaves surrounding it, is called "palm cabbage," and is much esteemed as food. The undeveloped panicles of flowers are also eaten, and "palm wine" is made by fermentation of the sap, of which each tree yields from three to four quarts daily for ten days or a fortnight. The roasted seeds are used in North Africa as coffee. These seeds are also ground and an oil expressed from them, the paste which remains being used as food for cattle. Baskets are made from the leaf-stalks, and mats and bags from the leaves. The fibrous parts at the base of the stalks are made into cordage, and the wood is used in the construction of buildings. The toddy-palm (*Phœnix sylvestris*) of India is perhaps a variety of this species. Like several other palms, it yields "jaggery" or palm-sugar.

Date [from the Lat. *datum*, "given," from *do, datum*, to "give," occurring in such phrases as the following: "Given under my hand, this seventh day of April," etc.; see DATARY], a word used to denote the exact time when anything was done. The careful observance of dates is of the utmost importance in the proper writing of history. One of the best works on this subject is "L'Art de vérifier les Dates," written by the Benedictines of St. Maur. (See CHRONOLOGY.)

Date Plum. See DIOSPYROS.

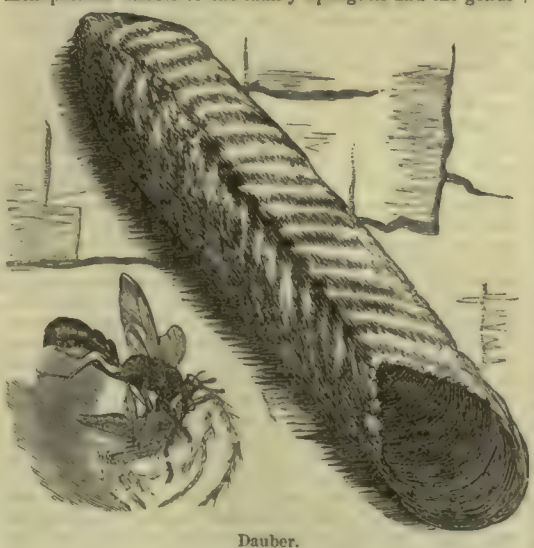
Dath'olite [from the Gr. δάθος, "turbid," and λίθος, a "stone"], a mineral composed of boracic acid, silica, and lime, with a little water. It occurs massive, and also crys-

*"Lectures on Man," p. 468.

tallized in rhombic prisms, the edges and angles of which are cut off by planes. It becomes opaque when heated, hence the name.

Datisca'ceæ [from *Datisca*, one of the genera], a small natural order of plants related to the Begoniaceæ, consisting of trees and herbs, principally native of the milder regions of Europe and Asia. *Datisca cannabina*, which is very similar to hemp in its general features, is a native of Crete, and is valuable as a tonic. An amylaceous substance called *datiscin* is obtained from it. It also yields a yellow dye.

Dative Case. See Declension, by J. Thomas, LL.D.



Datu'ra [Arab. *tâtûrah*], a genus of exogenous herbs of the order Solanaceæ, natives chiefly of warm climates in both hemispheres. The *Datura Stramonium* (thorn-apple, Jamestown or "Jimson" weed of the U. S.) is naturalized in this country, and furnishes the drug Stramonium (which see). Many other species are cultivated in greenhouses for the beauty of their flowers. They all possess narcotic properties similar to those of belladonna.

Daub (Karl). See Appendix.

Daubenton (Louis Jean Marie), M. D., an eminent French naturalist, born at Montbar May 29, 1716. He studied medicine in Paris, and began in 1742 to assist Buffon in the preparation of his great work on natural history. He was well qualified for this task by his sound judgment, scrupulous accuracy, and patient industry, which enabled him to rectify some of Buffon's errors and hasty theories, and to enrich the work with many new and important facts in the anatomy of animals. In 1745 he was appointed curator and demonstrator of the cabinet of natural history in Paris, of which he had charge for nearly fifty years. He became professor of natural history in the College of France in 1778. He contributed many scientific articles to the first "Encyclopédie," edited by Diderot. Died Jan. 1, 1800. (See Cuvier, "Notice sur la Vie de Daubenton.")

Daubeny (Charles Giles Bridle), M. D., F. R. S., an English chemist and naturalist, born at Stratton in 1795. He was for many years professor of chemistry, botany, and rural economy in the University of Oxford. He visited the U. S. in 1837. Among his works are a "Description of Active and Extinct Volcanoes, with Remarks on their Origin" (1826), a "Sketch of the Geology of North America," and "Lectures on Agriculture" (1841). Died Dec. 12, 1867.

Dau'ber, a name applied to various mud-wasps, hymenopterous insects of the family Sphegidæ and the genus

Dauber.

Pelopæus, natives of various parts of America, some of the species being quite common in the U. S. This name is given on account of the remarkable nest which the mother-insect constructs, bringing lumps of mud in her mouth, which she arranges into cells, inwardly very smooth and regular, but outwardly looking like masses of clay. In these cells she lays her eggs, one in each cell, and with it she seals up a large number of spiders, alive, but paralyzed by her sting. The eggs hatch, the grub feeds on the spiders, goes into the pupa state, and finally, having burst its cocoon, gnaws through the wall of earth and escapes a perfect insect.

D'Aubigné (Jean Henri **Merle**), D. D., an eminent Swiss divine and historian, born at Geneva Aug. 16, 1794. His father's name was Louis Merle. Having been ordained as a Protestant minister, he preached about five years at Hamburg, and removed to Brussels in 1823. He became in 1831 professor of church history in a college at Geneva. His principal work is a "History of the Reformation in the Sixteenth Century" (1835), translations of which have obtained extensive circulation in Great Britain and the U. S. In 1863 he began to publish a "History of the Reformation in Europe in the Time of Calvin." He also published the "Protector (Cromwell), a Vindication" (1848). He is most praised for the vivacity of his style, the fervor of his piety, and the pronounced orthodoxy of his opinions. He died at Geneva Oct. 21, 1872.

D'Aubigné (Théodore Agrippa). See Aubigné, d'.

Daubigny (Charles François), a French painter and engraver, born Feb. 15, 1817, studied with his father and Paul de la Roche, and spent three years in Italy. Among his numerous works are "The Harvest," "The Banks of the Eure," etc. His pictures show a careful study of nature. He also made many drawings for books and illustrated newspapers.

Daufus'kie Island, one of the Sea Islands of Beaufort co., S. C., lying S. W. of Hilton Head Island. Its northern point is in lat. 32° 8′ 42″ N., lon. 80° 49′ 58″ W.

Dau'lis, an ancient city of Greece, in Phocis, at the foot of Mount Parnassus. Its position rendered it an important military station. Its site is occupied by the modern village of *Daulia*, 9 miles N. W. of Livadia.

Dau'mer (Georg Friedrich), a German pantheist, born at Nuremberg Mar. 5, 1800. He published, besides other works, a "System of Speculative Philosophy" (1831) and "Philosophy, Religion, and Antiquity" (1833). Several of his works were noted for his violent attacks upon the Christian religion. In 1858 he joined the Roman Catholic Church, since which time he has published a number of works from a Catholic point of view.

Daun, von (Leopold Joseph Maria), Count, an Austrian general, born at Vienna Sept. 25, 1705. He served with distinction against the Turks, and became a field-marshal in 1754. He was commander-in-chief of the imperial army in the Seven Years' war. On June 18, 1757, he defeated Frederick the Great at Kolin, where the loss of the Prussians was very severe. On Oct. 14, 1758, he gained a victory over Frederick at Hochkirchen. On Aug. 15, 1760, he was defeated at Liegnitz, and on Nov. 3, 1761, at Torgau. He was appointed president of the Aulic council in 1762. Died Feb. 5, 1766.

Daunou (Pierre Claude François), a French statesman and author, born at Boulogne Aug. 18, 1761. He was elected in 1793 a member of the National Convention, in which he acted with moderation and opposed the proscription of the Girondists. He was the first president of the Council of Five Hundred, and a member of the committee which formed the constitution of the year VIII. (1800). He was editor of the "Journal des Savants" from 1816 to 1838, and became professor of history in the College of France in 1819. He published an "Essay on the Temporal Power of the Pope" (1810) and a "Course of Historical Studies" (20 vols., 1842 *et seq.*). Died June 20, 1840. (See Walckenaer, "Notice sur la Vie de Daunou," 1841.)

Dau'phin [Lat. *delphinus*], the former title of the eldest son and heir-apparent to the king of France. It was originally the title of the sovereign lords of the province of Dauphiné. In 1349, Humbert, lord of Vienne, dying without issue, bequeathed his possessions to Charles of Valois, on condition that the heir-apparent to the throne of France should bear the title of dauphin of Vienne. This title was abolished at the revolution of 1830.

Dauphin, a county in S. E. Central Pennsylvania. Area, 530 square miles. It is bounded on the W. and S. W. by the Susquehanna River, and intersected by the Swatara. The surface is diversified by parallel mountain-ridges and valleys, among the former of which is the Kittatinny or Blue Mountain. Mines of anthracite coal are worked in the county. Cattle, grain, wool, tobacco, hay, butter, and timber are produced. There are manufactures of iron, leather, furniture, carriages, brick, lime, metallic wares, machinery, and a great variety of other goods. It is intersected by the Northern Central and the Schuylkill and Susquehanna R. Rs. Capital, Harrisburg. Pop. 60,740.

Dauphin, a post-borough of Dauphin co., Pa., on the Northern Central R. R., 8 miles N. W. of Harrisburg, at the S. W. terminus of the Schuylkill and Susquehanna R. R. Pop. 739.

Dauphiné, a former province in the S. E. of France, is now comprised in the departments of Drôme, Hautes-Alpes, and Isère. The chief towns were Grenoble, Vienne, Gap, and Valence. After it had been long governed by counts called *dauphins*, it was ceded to the crown of

France in 1349. It was bounded on the W. by the river Rhone.

Dauw, or **Burchell's Zebra** (*Asinus Burchelli*), a

Dauw.

wild ass of Southern Africa, resembling the true zebra, but not so beautiful, its stripes being far less brilliant, and not distributed over the whole body. It feeds in troops on the plains, while the zebra lives in the mountains. It has been domesticated, and in the Jardin des Plantes at Paris has long been acclimatized.

Dav'enant (Sir William), an English dramatic poet, born at Oxford in 1605. He succeeded Ben Jonson as poet-laureate in 1637. He was a royalist in the civil war, and was confined for two years in the Tower. His principal work is "Gondibert," an epic poem. Died April 17, 1668.

Dav'enport, a city and river-port of Iowa, the capital of Scott co., is pleasantly situated on the Mississippi at the foot of the Upper Rapids, 330 miles above St. Louis and 184 miles W. by S. from Chicago. It is now the most populous city in the State. It occupies the base and higher parts of a bluff which rises gradually and extends along the river three miles. The bluff commands extensive and beautiful views of the river and of the town of Rock Island on the opposite side of the Mississippi. The Chicago Rock Island and Pacific R. R. here crosses the river on a new iron bridge, which cost over $1,200,000. This city is the southern terminus of the Davenport and St. Paul R. R., and is also the terminus of the Chicago and South-western R. R. It contains twenty-five churches, Griswold College, a business college, a city training-school, the largest and most successful system of common schools in Iowa, the Roman Catholic academy of the Immaculate Conception, an opera-house, three national and two savings banks. Three daily (English), four weekly and three monthly, and one daily German paper are issued here. It has manufactures of machinery, woollen goods, farming implements, glue, corn-sugar, furniture, five lumber and fine flouring-mills. Davenport has fine waterworks, which cost $600,000, comprising 20 miles of pipe, and 260 hydrants, horse-railroads, five public parks, a fire department, and gasworks costing $400,000, and is the market of a large farming region. Coal abounds in the vicinity. Large quantities of grain are shipped here. Pop. in 1860, 11,267; in 1870, 20,038; of Davenport township, 3414. Charles H. Playter,
City Ed. of the "Daily Democrat."

Davenport, a township and post-village of Delaware co., N. Y., 18 miles S. of Cooperstown. It has important manufactures. Pop. 2187.

Davenport (Edward L.), an excellent actor, was born in Boston, Mass., in 1816. His *début* was at the Lion Theatre, Providence, R. I., as Passion Will to Booth's Sir Giles Overreach, which last is one of his own best characters. He first appeared in Philadelphia (his present residence, 1873) at the Walnut Street Theatre in 1838. He has played with success in Europe and in the principal American theatres.

Davenport (F. O.), U. S. N., born Oct. 3, 1842, in Michigan, graduated at the Naval Academy in 1860, became a lieutenant in 1862, and a lieutenant-commander in 1866. He served at the naval battery near Alexandria, Va., in the summer of 1861, and on board the gunboat Scioto during the bombardment and passage of Forts Jackson and St. Philip and at the capture of New Orleans, April 24, 1862.
Foxhall A. Parker, U. S. N.

Davenport (Henry K.), U. S. N., born Dec. 10, 1820, in Georgia, entered the navy as a midshipman Feb. 19, 1838, became a passed midshipman in 1844, a lieutenant in 1852, a commander in 1862, and a captain in 1868. He was present at the capture of the "Barrier Forts," China, in 1856, and at the bombardment and capture of Forts Hatteras and Clark, N. C., in 1861. He was in command of the steamer Hetzel, North Atlantic blockading squadron, from the latter part of 1861 to the end of 1864, was in action with gunboats on James River in 1861, and commanded a column of gunboats at the capture of Roanoke Island and Elizabeth City, N. C., in 1862. He was for more than a year senior officer in the sounds of North Carolina, during which period he participated in many battles and skirmishes while co-operating with the army, at one time receiving the thanks of the officer commanding Fort Anderson for saving his troops from capture by a superior force. In 1865–66 he commanded the Lancaster and Powhatan in the Pacific Ocean, and in 1871 was appointed to the command of the frigate Congress, in which service he died Aug. 18, 1872. Captain Davenport was a thorough seaman, and when he died had seen twenty-two years of actual service at sea.
Foxhall A. Parker, U. S. N.

Davenport (John), B. D., an eminent Puritan divine and colonist, was born at Coventry, England, in 1597, was educated at Oxford, and entered the Anglican priesthood. In consequence of his Puritanical principles and practice he was obliged to leave the Established Church in 1635. In 1637 he came to Boston, Massachusetts Bay, and in 1638 became one of the founders of the New Haven colony. In 1639 he became one of the "seven pillars" of the government. He protected Goffe and Whalley, the regicides, and in 1668 became minister of the First church, Boston, where he died Mar. 15, 1670.

David, a town of Colombia, in Veragua, is on the Isthmus of Panama and near the Pacific Ocean. It has a trade in coffee, hides, rice, etc.

Da'vid [Heb. דּוֹד, "beloved;" Gr. Δαβίδ or Δαυίδ: Arab. *Dâood*], one of the most remarkable characters in history, a son of Jesse, was born at Bethlehem in Judæa about 1080 B. C. In his youth he followed the occupation of a shepherd, and he appears to have acquired great skill as a musician. When about twenty-two years of age he was received into the household of Saul, king of Israel, who, we are told, was troubled with an "evil spirit." David, by playing upon the harp, soothed and "refreshed" Saul, and "the evil spirit departed from him." Not long afterwards, David slew in single combat a Philistine giant named Goliath, and, according to the promise of the king, received Michal, Saul's daughter, in marriage. But Saul was offended by the praises which David received for his prowess, and not only regarded his son-in-law with bitter jealousy, but made repeated attempts upon his life. David was obliged to fly for safety to Achish, king of Gath. In 1055 B. C., Saul was slain in a battle with the Philistines, after which David was made king of the tribe of Judah, reigning at Hebron for seven years, while Ishbosheth, Saul's son, was in power on the E. side of the Jordan, and for two years was obeyed by all the tribes except Judah. After the murder of Ishbosheth, in 1048 B. C., David became king of the whole nation. He was victorious in all his wars, and under his sway the kingdom of Israel acquired great prosperity and power. One of his sorest trials was the rebellion and death of his favorite son, Absalom. David died in 1015, and Solomon, his son, succeeded to the throne. In David all the feelings and passions appear to have been singularly intense and powerful, and by them he was again and again betrayed into great faults, and even crimes. Yet his character, on the whole, exhibits a rare magnanimity, as shown in his sparing Saul, his bitterest enemy, when that king was completely in his power. (See 1 Sam xxiv.) It should be borne in mind that David was not subjected to the powerful restraints which public opinion exercises in some directions on modern European monarchs. His fear of God and his generous feelings were the only checks to

his mighty passions and that license which long-continued success and a power all but unlimited in his own dominions tended to foster. If we consider these things, we shall probably find few sovereigns, even in the most civilized times, possessing despotic power, whose characters will bear a favorable comparison with that of David. As a writer of religious poetry, and especially of that kind which comes home to the feelings of all sorely-tried hearts, David has no equal among the poets of the human race. He wrote 73 of the 150 lyrics which compose the book of Psalms. Of the many commentaries on the Psalter, some of the ablest and most important are those of Calvin (1578–1610), Hengstenberg (1849–52), Hupfeld (1855), Delitzsch (1860–67), and Perrowne (1864–68; 2d ed. 1870). Of recent English versions, the most noteworthy are those of Noyes (1831; 2d ed. 1846) and Conant (1871). (See Rev. Samuel Chandler's "Critical History of the Life of David," 2 vols. 8vo, 1766, reprinted in one volume in 1853.)

Revised by R. D. Hitchcock.

David I., king of Scotland, the sixth son of Malcolm III., was born about 1080. He married, in 1110, Maud, a great-niece of William the Conqueror. He succeeded his brother, Alexander I., in 1124, and swore to maintain the right of his niece Matilda to the throne of England in case her father, Henry I., left no male issue. Henry died in 1135, and David afterwards waged war against Stephen, who disputed her claim to the throne. David invaded England, and was defeated at Northallerton in 1138. He promoted manufactures, education, and civilization. He died in 1153, and left the throne to his grandson, Malcolm IV.

David II., or **David Bruce,** king of Scotland, born in 1323, was a son of Robert Bruce, whom he succeeded in 1329. His kingdom was invaded in 1332 by Edward Baliol, who defeated the army of David. The latter was expelled, and retired to France, but his subjects continued to fight for him, and he recovered the throne in 1342. Having invaded England in 1346, he was defeated, captured, and detained until 1357. He died in 1370.

David (Félicien-César), a French musician and composer, born at Cadenet (Vaucluse) Mar. 8, 1810. He became about 1832 a disciple of Saint-Simon, and visited the Levant with eleven fellow-disciples, from which he returned to Paris in 1835; published "Oriental Melodies" (1835) for the piano, which were not successful. In 1844 he produced "The Desert," an *ode-symphonie*, which had a great success. Among his other works are "Christophe Colombo," an *ode-symphonie* (1847), "La Perle du Brésil," an opera (1851), and "Herculaneum" (1859). D. Aug. 2, 1876.

David (Jacques Louis), a celebrated French historical painter, founder of the French classical school of painting, was born in Paris Aug. 31, 1748. He was a pupil of Vien, with whom he visited Rome in 1775. Having passed several years in Rome and painted the "Triumph of Paulus Æmilius" and other works, he returned to Paris in 1780. He was admitted into the Royal Academy in 1783, revisited Rome in 1784, and painted a picture of the "Horatii," which was greatly admired. He produced the "Death of Socrates" in 1787, and "Brutus Condemning his Sons" in 1789. In the Revolution he was a violent Jacobin. Having been elected to the Convention in 1792, he voted for the death of the king, and was an accomplice or partisan of Robespierre. He was the manager of the national festivals and spectacles during the republic. He painted at this time several pictures relating to the events of the Terror—"The Death of Marat," "The Murder of Pelletier," "The Jeu des Paumes." He was appointed first painter to Napoleon about 1804, and was banished as a regicide in 1815. He afterwards resided at Brussels, where he died Dec. 29, 1825. His body was refused burial in France. "The Rape of the Sabines" is regarded as his masterpiece. (See Miel, "Notice sur J. L. David," 1834; Delécluze, "David et son École," 1855.) Revised by Clarence Cook.

David (Jérôme Frédéric Paul), Baron, a French politician, born in 1823, a grandson of Jacques Louis David, has since 1859 been a member of the Corps Législatif and a leader of the ultra-Bonapartist party; in 1867, and again in 1869, vice-president of the Corps Législatif. After the resignation of the Ollivier ministry (Aug., 1870), he was minister of public works in the short-lived cabinet of Count Palikao. He wrote "Réflexions et discours sur la propriété chez les Arabs" (1862).

David (Pierre Jean), a French sculptor known as **David d'Angers,** born at Angers Mar. 12, 1789. He gained at Paris the first prize (with a pension) in 1811, and then went to Rome to pursue his studies. He formed a friendship with Canova, returned to France in 1816, and produced a statue of the great prince of Condé, by which he acquired a high reputation. In 1826 he became a member of the Institute. Soon after the revolution of 1830 he was employed by the government to adorn the Pantheon with sculptures. Among his works are busts of Washington, La Fayette, Arago, Goethe, and Lamartine, and statues of Cuvier, Racine, and Jefferson. He was a republican member of the National Assembly in 1848. Died Jan. 5, 1856. Revised by Clarence Cook.

Da'vidists, Da'vid-Geor'gians, or **Jo'rists,** a sect founded by David George or Joris, otherwise called John of Bruges, an Anabaptist leader, who was born at Delft in Holland in 1501 or 1502, and died at Bâle in 1556. He pretended to be the Messiah, denied the resurrection, and held various heretical opinions. The sect existed in Holland nearly a century after his death.

Davids Island [named from a former owner], an island of 100 acres in Long Island Sound, within the township limits of New Rochelle, Westchester co., N. Y. It was purchased in 1867 by the U. S. government for $38,500, to be used for military purposes.

Da'vidson, a county in the S. E. of Dakota Territory. Area, 432 square miles. It is traversed by the Dakota River or Rivière-au-Jacques. This county has been formed since the census of 1870. There are fine intervale or bottom lands along the streams.

Da'vidson, a county in W. Central North Carolina. Area, 620 square miles. It is bounded on the W. by the Yadkin River. The surface is hilly; the soil is mostly fertile. Cattle, grain, tobacco, wool, and hay are raised. It is traversed by the North Carolina R. R. Gold, iron, copper, silver, and lead have been found here. Capital, Lexington. Pop. 17,414.

Davidson, a county of Middle Tennessee. Area, 500 square miles. It is intersected by the Cumberland River, navigable for steamboats. The surface is undulating; the soil is fertile. Grain, tobacco, cotton, wool, hay, etc. are produced, and the manufactures are varied, and embrace machinery, carriages, saddlery, harnesses, metallic wares, etc. Good limestone is abundant here. The Nashville and Chattanooga R. R. connects in this county with the Louisville and Nashville and other railroads. Capital, Nashville. Pop. 62,897.

Davidson, a post-township of Sullivan co., Pa. P. 634.

Davidson (James Wood) was born in 1829 in Newberry district, S. C., and graduated with honors at the South Carolina College in 1852; was professor of Greek in Mount Zion College, Winnsboro', S. C., 1854–59, and has since been an instructor, except while serving in Virginia as an officer of Lee's army. He has published a "School History of South Carolina" and "The Living Writers of the South," besides other valuable works.

Davidson (Lucretia Maria), an American poetess, born at Plattsburg, N. Y., Sept. 27, 1808. She wrote verses in early childhood, and is said to have composed 278 poems. Died Aug. 27, 1825. A collection of her poems was published, with a memoir, by S. F. B. Morse in 1829.

Davidson (Margaret Miller), a poetess, a sister of the preceding, was born Mar. 26, 1823. She was distinguished for her precocity and sensibility. Died Nov. 25, 1838. Her poems were praised by Washington Irving, who wrote a memoir of her life.

Davidson (Robert), D. D., was born at Carlisle, Pa., in 1808. His father was president of Dickinson College. The younger Davidson studied theology at Princeton, became president of Transylvania University, and was for some time superintendent of public instruction in Kentucky. Among his numerous writings are "History of the Presbyterian Church in Kentucky," "The Christ of God," and "Elijah, a Sacred Drama."

Davidson (Thomas), F. R. S., F. G. S., an English palæontologist, born May 17, 1817, at Edinburgh. He has written "British Fossil Brachiopoda" and "Illustrations and History of Silurian Life."

Davidson (Gen. William) was born in Lancaster co., Pa., in 1746. The family was of Irish extraction. In 1750 they removed to Rowan co., N. C. William, the youngest son, was educated at Queen's Museum, afterwards styled Liberty Hall, in Charlotte, the county-seat of Mecklenburg, adjoining Rowan. Old Mecklenburg had blazed out in the sacred cause of freedom long before the sparks were discerned in some other parts of the land. Even her patriotic women formed a solemn league against laggards, the universal sentiment being, "None but the brave deserve the fair." He married a daughter of Mr. John Brevard of Centre, who had seven sons in the American army. Among these was Ephraim Brevard, the distinguished author of the Mecklenburg Declaration of Independence. Our young hero was made major in one of the first regiments organized in North Carolina. He fought at Monmouth, Brandywine, and Germantown, and is said to have

commended himself to the approval of the great and good commander-in-chief himself. For his efficiency and fidelity he was promoted to be lieutenant-colonel, with the command of a regiment. With three years of such campaigning he brought back with him to his loved Carolina much military prestige. In a skirmish at Calson's Mill a ball passed through his body. Upon his recovery he was made brigadier-general. His energy and popularity were made available in his rallying and organizing the militia throughout this region. Days of darkness were now upon us. Lord Cornwallis had broken up camp at Winnsboro', and had resolved to crush Morgan and Greene in succession. He had put himself upon the war-path. The haughty and bloodthirsty Tarleton was detached, and sent forward to take Morgan. He found him at Cowpens, and was signally defeated. Tarleton returned to his master a sadder and a wiser man. There was now an interesting trial of speed for the Catawba. Morgan had a little the start, but his 500 British prisoners were a great clog to him. The Americans' rear crossed at Sherrill's Ford only two hours before the British van came in sight. Morgan's main body moved on towards Salisbury. The prisoners were forwarded to Virginia. It was now sunset, and Cornwallis rested his jaded army that night on the W. bank. He slept secure of his victim, but Providence smiled on the patriot army. That night it rained heavily, and the next day and the next the river was booming. Cornwallis followed the stream in quest of a better crossing. Greene, full of good cheer and of mischief-making, had taken two or three trusty troopers and dashed across the country to Beattie's Ford. There Morgan, Davidson, and Col. Washington met him by previous concert. Going out of camp a little distance, the four held a brief conference, and then each betook himself to his own post. Gen. Davidson, with 250 militia and Capt. Graham's cavalry, was soon *en route* for Cowan's Ford, 4 miles below. This young cavalier was afterwards Gen. Graham, worthy father of a worthy son, ex-Gov. William A. Graham. As they rode along together, Gen. Davidson remarked to Graham that though Greene saw the Catawba for the first time that day, he seemed to be more familiar with it than those who had been reared on its banks. The little band reached their destination about dusk. They could scarcely be expected to do more than mask the retreat of our little army, or at best hold Cornwallis in temporary check. It was of course uncertain where his lordship would choose to cross. He made a feint of so doing at Beattie's Ford, whilst the main body of his army had, after midnight, been marched down to Cowan's. This being a more private and dangerous crossing, he had hoped it might escape the attention of his adversary. The camp-fires on shore convinced him of his miscalculation. Though the swollen waters had only partially subsided, his destiny seemed to urge him onward. In the bold Britons plunged, and on they pressed. Owing to the dense fog which hung over the river, Lieut. Thomas Davidson's picket stationed at the "wagon ford" did not discover them at once, but soon opened fire on them. The cavalry came to their aid. The general had encamped opposite the island, a quarter of a mile below, where the "horse ford" comes out. This ford begins where the other does, but then takes down stream and across the island, very much as at present. The wagon ford is very jagged and rough, bearing obliquely up. It is said that the reason they did not take the horse ford was that their guide abandoned them in mid-stream, and that they, not knowing the ford, bore right across. By the time the general reached the spot with the main force and took position, some of the British sections had gained the shore and commenced firing. It is not surprising that a few well-directed volleys from the British made his lordship master of the situation. The casualties on their side were thirty-one killed, among whom was a brave officer of the Guards, Col. Hall, and thirty-five wounded. We lost four killed, all privates, except the gallant Gen. Davidson, who, pierced through the breast with a rifle-ball, fell from his horse and expired without a struggle. He thus sealed with his life-blood his devotion to the cause so dear to his heart. By referring to the date, Feb. 1, 1781, we see that he was taken away in the full flush of manhood and of his usefulness. He sleeps in the quiet cemetery of Hopewell church. His sword hangs in Chambers Hall at Davidson College. This flourishing institution received from him its name, and we fondly trust it will help to perpetuate his memory as effectually as the sculptured marble voted, but never erected over him, by a not the less grateful and appreciative Congress. W. G. Richardson.

Davidson College, Mecklenburg co., N. C., was founded in 1837. The name was given in honor of Gen. William Davidson, a Revolutionary officer who fell at Cowan's Ford on the Catawba River, not far from where the college is situated. It had its origin in an hereditary thirst for sound learning and pure religion which characterized the people of Western North Carolina from a very early period. As early as 1770 they obtained a charter from the colonial legislature to incorporate "Queen's Museum" at Charlotte in Mecklenburg county, which was the first college ever attempted in the State. This charter was repealed by royal proclamation, but the institution was not abandoned. In 1777 it was rechartered, as "Liberty Hall," and continued its operations until 1780, when it was closed by the progress of the Revolution. Again, in 1820, earnest efforts were made in Western North Carolina to establish an institution of high grade, to be called "Western College." This also failed. The next movement began in 1835 in Concord Presbytery. This led to the establishment of Davidson College in 1837, for which a charter was obtained in 1838. Thus it appears that Queen's Museum, Liberty Hall, Western College, and finally Davidson College, have been so many successive efforts to embody in a practical, working form the intellectual and religious life of Western North Carolina. In all these efforts the Scotch-Irish Presbyterian element was predominant; and Davidson College, while its charter distinctly announces that its object is "to educate youth of all classes, without any regard to the distinction of religious denominations," is under the government and control of Presbyterians exclusively. All the presbyteries of North Carolina and Bethel Presbytery in South Carolina are now represented in its board of trustees.

The institution at the beginning received a valuable landed estate from William Lee Davidson, Esq., the son of Gen. Davidson. Upon this land the college buildings were erected. A small endowment was obtained by contributions from friends and patrons and by the sale of scholarships, but the college did not attain to its present efficient equipment until after the munificent bequest of $258,000 by Mr. Maxwell Chambers of Salisbury, N. C. It lost much of its endowment by the late war; but its buildings, libraries, cabinets, apparatus, etc. are ample. It has seven professors and two organized courses of instruction —the one literary, and the other scientific. It has graduated 352 students, and of those who have gone out from its halls, about 100 have entered the gospel ministry.

The Rev. R. H. Morrison, D. D., to whose enlightened Christian zeal and well-directed energy Davidson College owes its existence and much of its prosperity, was its first president. He was succeeded by the Rev. Samuel Williamson, D. D., in 1841; the Rev. Drury Lacy, D. D., became president in 1854, the Rev. J. L. Kirkpatrick, D. D., in 1860, and the Rev. G. Wilson McPhail, D. D., LL.D., in 1866. In 1871, when the presidency again became vacant by the death of Dr. McPhail, the trustees determined to substitute the office of chairman for the presidency of the college, and Prof. J. R. Blake was elected to the new office.

J. R. Blake.

Davidson's, a township of Iredell co., N. C. Pop. 1540.

Da'vie, a county in W. Central North Carolina. Area, 300 square miles. It is bounded on the E. by the Yadkin River. The surface is uneven. Tobacco, grain, and wool are staple products. Iron ores and limestone are found. Capital, Mocksville. Pop. 9620.

Da'vie (William Richardson), General, was born in England June 20, 1756, and emigrated to America in early youth. He graduated at Princeton in 1776, served as colonel in the Revolutionary war, and was a delegate from North Carolina to the convention which formed the Federal Constitution in 1787. In 1799 he was chosen governor of North Carolina. Died Nov. 8, 1820.

Da'vies (Charles), LL.D., an American officer and mathematician, born Jan. 22, 1798, in Washington, Conn., graduated at West Point in 1815. After a year in garrison at New England posts, he resigned Dec. 1, 1816, and was attached to the Military Academy as assistant professor till May 1, 1823, when he was appointed professor of mathematics, holding this position till May 31, 1837, when he again resigned for a like position in Trinity College, Hartford, Conn. He was appointed paymaster U. S. A. Nov. 17, 1841, holding office till Sept. 30, 1845, and was subsequently professor of mathematics and philosophy in the University of New York 1848–49, and of higher mathematics in Columbia College, New York City, 1857–65. After leaving West Point in 1837 he devoted most of his time and talents to the preparation of a complete series of mathematical text-books, adopted largely in public schools. He is a member of several scientific and educational associations. George W. Cullum, *U. S. Army.*

Davies (Henry E., Jr.), an American lawyer and general, born in New York July 2, 1836, educated at Harvard, Williams, and Columbia Colleges, studied law, and was admitted to the bar in 1857. In April, 1861, he en-

tered the army as captain Fifth New York Volunteers—was transferred July, 1861, as major to the Second New York Cavalry, of which regiment he subsequently became colonel, remaining in command till Sept., 1863, when he was commissioned a brigadier-general of volunteers, and assigned to a command in the cavalry corps of the Army of the Potomac, serving with distinction till the close of the war (brevet major-general of volunteers Oct., 1864). In June, 1865, he was made a major-general, and assigned to the command of the middle district of Alabama, which he held till Jan. 1, 1866, when he resigned. He was public administrator of the city of New York from Jan., 1866, to Jan., 1869, and assistant district attorney of the southern district of New York from July 20, 1870, to Dec. 31, 1872. G. C. Simmons, *Clerk Board of Eng'rs.*

Davies (Sir John), an English poet and judge, born in Wiltshire in 1570, was educated at Oxford. He was appointed solicitor-general of Ireland in 1603, and published in 1612 an able work on the political state of Ireland. In 1620 he was elected a member of the English Parliament. His chief poem is entitled "Nosce Teipsum" (1599). He became lord chief-justice in 1626, and died Dec. 7, in the same year.

Davies (Samuel), D. D., a Presbyterian divine and eminent pulpit-orator of Welsh descent, was born near Summit Ridge, Newcastle co., Del., Nov. 3, 1723. He spent some years as a sort of missionary in Hanover co., Va. He was one of the founders of the College of New Jersey, and succeeded Jonathan Edwards as president of it in 1759, and died Feb. 4, 1761. A collection of his sermons was published in London soon after his death. The last American edition, in three volumes (1849), which claims to be complete, contains an essay on the life and times of the author by Rev. Albert Barnes. President Davies takes rank among the greatest of pulpit orators.

Davies (Thomas), famous as the author of the "Life of David Garrick" (1780), was born probably in 1712, studied at Edinburgh, and became an unsuccessful actor in London, where he was also a bookseller and publisher. He was a friend of Dr. Samuel Johnson, who was warmly attached to him. Attacked by Churchill in the "Rosciad," he was compelled by ridicule to leave the stage. Besides the work above mentioned, which brought him fame and profit, he published several other works, chiefly biographical. Died in 1785. (See Boswell's "Life of Johnson.")

Davies (Thomas A.), an American officer and merchant, born in 1809 in St. Lawrence co., N. Y., graduated at West Point in 1829. He served as lieutenant of infantry on garrison duty till he resigned Oct. 31, 1831; civil engineer on the Croton Aqueduct, New York, 1831–33 and 1840–41; and merchant in New York City 1833–39 and 1841–61. At the beginning of the civil war he resumed the military profession as colonel of Sixteenth New York volunteers, was appointed brigadier-general U. S. volunteers May 7, 1862, and served in Manassas campaign 1861, engaged at Bull Run; in Mississippi campaign 1862, engaged in the siege of Corinth; in Northern Mississippi 1862, engaged in the battle of Corinth, and command of various districts 1862–65. Brevet major-general U. S. volunteers July 11, 1865, for gallant and meritorious services, and mustered out of service Aug. 24, 1865.

George W. Cullum, *U. S. Army.*

Da'viess, a county in the S. W. of Indiana. Area, 423 square miles. It is bounded on the S. and W. by the East Fork and West Fork of White River, which unite at the south-western extremity of the county. The soil is mostly fertile. Coal is found. Cattle, grain, tobacco, wool, and lumber are produced; carriages, wagons, etc. are manufactured. It is intersected by the Ohio and Mississippi R. R. Capital, Washington. Pop. 16,747.

Daviess, a county in the N. W. of Kentucky. Area, 550 square miles. It is bounded on the N. by the Ohio River, and on the S. and W. by Green River. The surface is nearly level; the soil is fertile. Coal is found here. Tobacco, cattle, grain, and lumber are produced. It is intersected by the Owensboro' and Russellville R. R. Capital, Owensboro'. Pop. 20,714.

Daviess, a county in the N. W. of Missouri. Area, 576 square miles. It is intersected by Grand River. The surface is undulating; the soil is fertile. Cattle, grain, tobacco, and wool are staple products. It is traversed by a branch of the St. Louis Kansas City and Northern R. R., and by the South-western branch of the Chicago Rock Island and Pacific R. R. Capital, Gallatin. Pop. 14,410.

Daviess (Joseph H.), an American lawyer and patriot, born in Bedford co., Va., Mar. 4, 1774, studied law and attained a high position in his profession, was U. S. attorney for the district of Kentucky, and vigorously opposed Aaron Burr in 1806. He was mortally wounded at the battle of Tippecanoe Nov. 7, and died Nov. 8, 1811. Several counties in the U. S. were named in his honor.

Da'vila (Enrico Caterina), an Italian historian, born at Sacco, near Padua, Oct. 30, 1576. He was educated at Paris, and entered the service of Henry IV. of France, and about 1606 the service of the Venetian republic, and commanded with success in several actions. He published in 1630 a "History of the Civil Wars of France from 1559 to 1598" ("Historia della Guerre Civili," etc.). Died in July, 1631.

Da'vis, a county in the S. S. E. of Iowa. Area, 480 square miles. It is intersected by Fox River. The surface is undulating; the soil is fertile and well watered. Cattle, grain, wool, hay, butter, and timber are staple products. It is traversed by a branch of the St. Louis Kansas City and Northern, by the Burlington and South-western, and by the South-western branch of the Chicago Rock Island and Pacific R. Rs. Capital, Bloomfield. Pop. 15,565.

Davis, a county in N. E. Central Kansas. Area, 386 square miles. It is intersected by the Kansas River, and also drained by the Republican River. The surface is undulating; the soil is fertile. Grain, hay, butter, etc. are staple products. It is traversed by the Kansas Pacific and the Missouri Kansas and Texas R. Rs. The greater part of the county is prairie. Capital, Junction City. P. 5226.

Davis, a county in the N. E. of Texas. Area, 927 square miles. It is bounded on the N. by Sulphur Fork of Red River. The soil is fertile, and heavily timbered. Cotton, wool, corn, rice, and fruit are raised. Iron ore abounds. Lumber, flour, pig iron, and copperas are manufactured. Capital, Linden. Pop. 8875. This county was originally called Cass, but it was changed to Davis, and is so called in the U. S. census of 1870. In 1871 the name was again changed to Cass.

Davis, a county in the N. of Utah, is bounded on the W. by the Great Salt Lake. It is intersected by the Utah Central R. R. Grain and wool are raised. Capital, Farmington. Pop. 4459.

Davis, a township of Grant co., Ark. Pop. 578.

Davis, a township of Van Buren co., Ark. Pop. 488.

Davis, or **Davisville,** a post-village of Yolo co., Cal., at the junction of the Marysville branch with the Central Pacific R. R., 13 miles W. by S. of Sacramento.

Davis, a post-village of Rock Run township, Stephenson co., Ill., on the Western Union R. R., 13 miles N. W. of Freeport. It has one weekly newspaper.

Davis, a township of Fountain co., Ind. Pop. 663.

Davis, a township and village of Starke co., Ind. P. 244.

Davis, a township of Davis co., Kan. Pop. 2748.

Davis, a township of Caldwell co., Mo. Pop. 573.

Davis, a township of Lafayette co., Mo. Pop. 1723.

Davis, a township of Shenandoah co., Va. Pop. 2293.

Davis (Andrew Jackson), a clairvoyant and prominent Spiritualist, was born Aug. 11, 1826, at Blooming Grove, Orange co., N. Y. His first work, "The Principles of Nature, her Divine Revelations," etc. (1845), professes to have been dictated by him under spiritual influence, at a time when he had received almost no education. He has since published a number of other works, of which the principal is "The Great Harmonia" (5 vols., 1850–59). (See "The Magic Staff, an Autobiography of A. J. Davis," 1857.)

Davis (Benjamin F.), an American officer, born in Alabama in 1832, graduated at West Point in 1854, and served with distinction in the infantry and dragoons in New Mexico. In 1862 he became colonel of the Eighth New York Cavalry, and while leading a brigade to the charge was instantly killed, June 9, 1863, at the combat of Beverly Ford, Va.

Davis (Charles A.), an able Methodist Episcopal preacher, born Oct. 7, 1802, was admitted to preach in the Baltimore Conference in 1824. He occupied several of the most important pulpits of his denomination. After the division of his Church into two bodies he joined the Methodist Episcopal Church South. Becoming a post-chaplain of the U. S. navy, he advocated the national cause during the civil war, and united again with the Methodist Episcopal Church. He died at the Naval Hospital, Norfolk, Va., Feb. 20, 1867.

Davis (Charles Henry), LL.D., U. S. N., born Jan. 16, 1807, in Boston, Mass., entered the navy as midshipman Aug. 12, 1823, became passed midshipman in 1829, lieutenant in 1834, commander in 1854, captain in 1861, commodore in 1862, and rear-admiral in 1863. In 1859, Davis was appointed superintendent of the American "Nautical

Almanac." In 1861 we find him a member of a board of officers assembled at Washington to inquire into and report upon the condition of the Southern coast, its harbors and inlets, with a view to offensive operations on the part of the government. This led to the organization of the expedition against Port Royal, in which Davis bore a conspicuous part as chief of staff. His services prior to and at the capture of Port Royal may be best gathered from Flag-Officer Dupont's official report of Nov. 11, 1861, in which, referring to Charles H. Davis, he says: "I have yet to speak of the chief of my staff and fleet-captain, Commander Davis. In the organization of our large fleet before sailing, and in the preparation and systematic arrangement of the details of our contemplated work—in short, in all the duties pertaining to the flag-officer—I received his most valuable assistance. He possesses the rare quality of being a man of science and a practical officer, keeping the love of science subordinate to the regular duties of his profession. During the action he watched over the movements of the fleet, kept the official minutes, and evinced that calmness in danger which, to my knowledge for thirty years, has been a conspicuous trait in his character." On the 9th of May, 1862, Davis relieved Flag-Officer Foote of the command of the Western flotilla off Fort Pillow, and on the following day beat off a squadron of eight iron-clads, which had steamed up the Mississippi and attacked him. The vessels with Davis at the time were seven in number. The action was a spirited one, and lasted nearly an hour; three of the hostile gunboats were disabled, but, taking refuge under the guns of Fort Pillow, could not be captured. On the 5th of June Fort Pillow was abandoned by the Confederates, and on the 8th Davis fell in with their iron-clads and rams opposite the city of Memphis. A running fight ensued, resulting in the capture of all the Confederate vessels but one, and the surrender of Memphis. For his services during the civil war Davis received the thanks of Congress and was made a rear-admiral. On his return from the Mississippi he was appointed chief of the bureau of navigation, and in 1865 superintendent of the Naval Observatory, in which capacity he served for two years, when he was detailed as commander-in-chief of our squadron on the coast of Brazil, where he remained until 1869. On his return to the U. S. he was ordered to Washington on special duty, and in 1870 was appointed to the command of the U. S. navy-yard at Norfolk, Va.

FOXHALL A. PARKER, U. S. N.

Davis (DANIEL), an American lawyer, the father of Admiral C. H. Davis, was born at Barnstable, Mass., May 8, 1762, settled at Portland, Me. (then called Falmouth), in 1782, and held many prominent offices in Massachusetts, of which Maine was then a part. In 1804 he removed to Boston, and in 1832 to Cambridge, Mass., where he died Oct. 27, 1835. He was the author of several legal works.

Davis (DAVID), LL.D., an American jurist, born in Cecil co., Md., Mar. 9, 1815, educated at Kenyon College, O., studied law with Judge Bishop in Lenox, Mass., and in the Law School at New Haven, Conn. In 1836 he settled in Bloomington, Ill., where he continues to reside; he was elected to the lower house of the Illinois legislature 1844–45, to the constitutional convention which framed a new constitution for the State 1847; elected judge of the eighth judicial circuit of Illinois in 1848, re-elected in 1855, and again in 1861. While serving this last term he was appointed by President Lincoln an associate justice of the Supreme Court of the U. S. Oct., 1862, which position he still holds. He was nominated by the Labor Reform party in 1872 as a candidate for the presidency.

Davis (EDWIN HAMILTON), M. D., an American archæologist, born in Ross co., O., Jan. 22, 1811, graduated at Kenyon College in 1833. He became professor of materia medica and therapeutics in the New York Medical College in 1850. He wrote "Monuments of the Mississippi Valley" (in vol. i. of the "Smithsonian Contributions") and other works.

Davis (EMERSON), D. D., a Congregational divine and author, born at Ware, Mass., July 15, 1798, and graduated at Williams College in 1821, was for some time tutor in that college and preceptor in the academy at Westfield, Mass. He became in 1836 pastor of the First Congregational church in the latter town, where he remained for life, greatly honored and beloved, and exerting a wide and very useful influence, especially in educational affairs. In 1847 he received the degree of D. D. from Harvard College. He was vice-president of Williams College from 1861 to 1868. He published "The Teacher Taught" (1839), "History of Westfield" (1826), "The Half Century" (1852), and various minor essays, sermons, etc., besides five manuscript volumes of biographical writings, as yet unpublished. Died at Westfield, Mass., June 8, 1866.

Davis (GARRET), born in Mount Sterling, Ky., Sept. 10, 1801, was admitted to the bar in 1823, became a Whig member of Congress (1839–47), and a Democratic U. S. Senator from Kentucky (1861–72). He was very active in preventing the secession of his native State in 1861. Died in Sept., 1872.

Davis (GEORGE LEONARD), U. S. N., born Aug. 10, 1833, in Massachusetts, entered the navy as a paymaster April 16, 1861, and commanded the powder division of the steam-sloop Pensacola at the passage of Forts St. Philip and Jackson and capture of New Orleans in 1862. His services on that occasion are thus honorably mentioned in the official report of the executive officer of the Pensacola to Capt. Henry W. Morris of April 30, 1862: "The powder division was *perfectly* served under the command of Paymaster George L. Davis. Its good order and efficiency are worthy of special notice." FOXHALL A. PARKER, U. S. N.

Davis (GEORGE T.), U. S. N., born May 20, 1844, in Massachusetts, graduated at the Naval Academy as ensign in 1863, became a master in 1866, a lieutenant in 1867, and a lieutenant-commander in 1868. He was attached to the iron-clad steamer New Ironsides in 1863–64, during her various engagements with the forts and batteries in Charleston harbor, and was in both attacks on Fort Fisher in 1865.

FOXHALL A. PARKER, U. S. N.

Davis (GEORGE T.) was born in Sandwich, Mass., Jan. 12, 1810, graduated at Harvard College in 1829, was admitted to the bar in 1832, was a State senator in Massachusetts several terms, and a representative in Congress (1851–53).

Davis (HENRY), D. D., an American Presbyterian divine, was born at East Hampton, N. Y., Sept. 15, 1771, and graduated at Yale in 1796. He was for seven years a tutor in Williams and Yale Colleges; professor of Greek at Union College, Schenectady, N. Y., 1806–09; president of Middlebury College, Vt., 1809–17; president of Hamilton College, Clinton, N. Y., 1817–33. He was a preacher of very eminent ability, one of the founders of Auburn Theological Seminary, and an active friend of foreign missions. Died at Clinton, N. Y., Mar. 8, 1852.

Davis (HENRY WINTER), LL.D., an American statesman, born at Annapolis, Md., Aug. 16, 1817. He was elected a member of Congress by the voters of Baltimore in 1854 and 1856. He was an eloquent speaker, and acted with the "American" party. In 1858 he was re-elected. Soon after the civil war began he became a radical Republican. He was chairman of the committee of foreign affairs in the Thirty-eighth Congress (1863–65). Died Dec. 30, 1865.

Davis (ISAAC), LL.D., born in Northboro', Worcester co., Mass., June 2, 1799, and graduated at Brown University (of which he is now one of the fellows) in 1822. He had an extensive and lucrative legal practice in Worcester, Mass., where he still resides. He was president of the Massachusetts Baptist State Convention 1833–40, president of board of trustees of Worcester Academy 1833–73, Democratic candidate for governor of Massachusetts in 1845, 1846, and 1861, mayor of Worcester in 1856, 1858, 1861, member of the State senate in 1843–54, member of governor's council 1851, member of the house of representatives (State) and chairman of committee on judiciary in 1852, member of the Massachusetts constitutional convention in 1853, and member of the Massachusetts board of education in 1852–60. Mr. Davis has been a liberal and judicious patron of education, and is one of the most respected and influential citizens of Massachusetts. His "Addresses, Speeches, and Historical Discourses" have been published.

Davis (Rev. JAMES), an English dissenter, born in Kent June 1, 1812, graduated at Cheshunt College, became a preacher of London, and has been for many years secretary of the British branch of the Evangelical Alliance. He was a delegate of the Alliance at its meeting in New York in 1873.

Davis (JEFFERSON), LL.D., an officer and statesman, born June 3, 1808, in Christian co., Ky., graduated at West Point 1828, served as lieutenant of infantry at Western posts 1828–33, of First Dragoons as adjutant 1833–34, and on frontier service 1834. After resigning June 30, 1835, he became a cotton planter in Warren co., Miss., 1835–46, presidential elector from Mississippi 1844, member U. S. House of Representatives 1845–46, colonel First Mississippi Rifle Volunteers in the war with Mexico 1846–47, engaged at Monterey and Buena Vista (severely wounded), member of the U. S. Senate 1847–51, and chairman of the committee on military affairs 1849–51, secretary of war in President Pierce's cabinet 1853–57, member of the U. S. Senate and chairman committee on military affairs 1857–61, President of the Southern Confederacy Feb. 4, till captured May 10, 1865, at Irwinville, Ga., prisoner of war 1865–67 at Fort

Monroe, Va., and now president of Carolina Life Insurance Company. GEORGE W. CULLUM, *U. S. Army.*

Davis (JEFFERSON C.), an American general, born in Clarke co., Ind., Mar. 2, 1828. He was one of the garrison of Fort Sumter when it was bombarded by the insurgents in April, 1861. He commanded a division at the battle of Stone River, which ended Jan. 2, 1863, and a corps of the army of Gen. Sherman in the march from Atlanta to the sea, in Nov. and Dec., 1864.

Davis (JOHN), a prominent minister of the Methodist Episcopal Church, was born in Northumberland co., Va., Oct. 30, 1787, and became an itinerant preacher in 1810. For over forty years he was one of the leaders of his Church, an admirable presiding elder, and a very powerful and influential preacher. He died in Hillsborough, Va., Aug. 13, 1853.

Davis (JOHN), LL.D., born in Plymouth, Mass., Jan. 25, 1761, graduated at Harvard in 1781, became a lawyer of Plymouth in 1786. After holding other important offices, he became in 1795 comptroller of the U. S. treasury, in 1796 Massachusetts district attorney, and in 1801 U. S. district judge for Massachusetts. He was an eminent antiquary and a learned scientist. Died at Boston, Mass., Jan. 14, 1847. He was a prominent member of many learned societies, and published several addresses and papers, chiefly upon scientific and historical subjects.

Davis (JOHN), LL.D., an American Senator, was born in Northborough, Mass., Jan. 13, 1787, and graduated at Yale in 1812. He was elected a member of Congress in 1824, and governor of Massachusetts 1833–35 and 1840–41. In 1835 he was chosen a Senator of the U. S. for six years by the Whigs, and again elected in 1845. He advocated a protective tariff. He was often called "Honest John Davis." Died April 19, 1854.

Davis (JOHN A. G.), an able jurist of Albemarle co., Va., was born in 1801 in Middlesex co., Va., and graduated at William and Mary College, where he was a law professor 1830–40; he was also a practising lawyer, and for some time a journalist at Charlottesville. He wrote a number of valuable legal works. Died Nov. 14, 1840, from the effects of a shot fired at him by a student.

Davis (JOHN CHANDLER BANCROFT), an American lawyer, born at Worcester, Mass., Dec. 29, 1822, educated at Harvard College, studied law and followed the practice of his profession. In 1849 he was appointed secretary of legation at London, but returned to the U. S. in 1852, and resumed his profession. He was assistant secretary of state 1869–71, agent of the U. S. at Geneva during the meeting of the tribunal of arbitration for the settlement of all points of difference between the U. S. and Great Britain 1871–72; assistant secretary of state 1873–75; and U. S. minister at Berlin since 1875.

Davis (Sir JOHN FRANCIS), BART., K. C. B., an English officer and Orientalist, was born in London in 1795. He first went to China in 1816. He was chief superintendent at Canton, and in 1841–48 governor of Hong Kong. Among his works is "The Chinese, a General Description of China and its Inhabitants" (2 vols., 1836), which is highly esteemed. He has written several works upon Chinese literature, with which his acquaintance is remarkable.

Davis (JOHN LEE), U. S. N., born Sept. 3, 1825, at Carlisle, Sullivan co., Ind., entered the navy as a midshipman Jan. 9, 1841, became a passed midshipman in 1847, a lieutenant in 1855, a lieutenant-commander in 1862, a commander in 1866, and a captain in 1873. In Nov., 1849, Davis, with one of the boats of the Preble, carrying two officers and twelve men, boarded and captured a piratical Chinese junk off Macao, killing three of her crew and taking the rest prisoners. He was the executive officer of the Waterwitch in her engagement (Oct. 12, 1861) with the Confederate ram Manassas, and afterwards with a squadron off Pilot Town, at the mouth of the Mississippi. He commanded the gun-boat Wissahickon in the fights with Fort McAllister of Nov. 19, 1862, and of Jan. 27, Feb. 1, and Feb. 28, 1863. On Mar. 9, 1863, off Charleston he sunk the blockade-runner Georgiana, and on June 5, 1863, chased the Isaac Smith ashore off Fort Moultrie, where she was destroyed. In command of the iron-clad Montauk he participated in all the battles of the summer and fall of 1863 in Charleston harbor with Forts Sumter, Gregg, Moultrie, and Wagner and Batteries Bee and Cumming's Point. In command of the Sassacus he took part in the Fort Fisher fights, and was recommended for promotion by Admiral Porter. Since the war he has been constantly employed, either afloat or ashore, and was one of the members of the board of 1866–67 appointed to examine volunteer officers for admission into the navy.

FOXHALL A. PARKER, U. S. N.

Davis (JOHN W.), M. D., a politician, was born in 1799 in Lancaster, Pa., completed his medical studies at Baltimore, and in 1823 became a resident of Indiana, where he was soon chosen to fill responsible public offices. He was elected a surrogate, was twice Speaker of the Indiana house of representatives, a commissioner to treat with the Indians, was a Democratic member of Congress, elected in 1835, in 1839, and in 1843, when he was chosen Speaker of the House of Representatives at Washington. In 1848 he became U. S. commissioner to China, was governor of Oregon Territory (1853–54), and in 1852 was president of the convention at Baltimore which nominated Franklin Pierce for President. Died at Carlisle, Ind., Aug. 22, 1859.

Davis (MATTHEW L.), an American writer, born in New York in 1766, was an intimate friend of Aaron Burr. His chief work is "Memoirs of the Life of Aaron Burr" (2 vols., 1836–37). Died June 21, 1850.

Davis (NATHAN SMITH), M. D., was born at Greene, Chenango co., N. Y., Jan. 9, 1817, and received his medical education at Geneva, N. Y. He was in 1848 editor of the "Annalist" in New York City. Since 1849 he has been a resident of Chicago. He was editor of the "Chicago Medical Journal" (1849–59), and in 1860 became editor of the "Chicago Medical Examiner." He has published a volume on "Agriculture," a "History of Medical Education," "Clinical Lectures" (1873), and other works. He is professor of the principles and practice of medicine in Chicago Medical College.

Davis (NATHANIEL), of Limestone, Ala., served in the house and senate of that State from 1840 to 1852. He was uneducated, but not without considerable natural gifts. He died in 1853.

Davis (NICHOLAS), a Virginian who settled in Limestone, Ala., was a representative in the first legislature held in Alabama, and served subsequently in the senate from 1820 to 1828.

Davis (NOAH), a Baptist divine, born near Salisbury, Mass., July 28, 1802, entered the ministry in Norfolk, Va. He was one of the founders of the Baptist General Tract Society (established in 1824, afterwards the American Baptist Publication Society), of which he became the manager. He removed to Philadelphia, where he fulfilled his duties in the Tract Society with great energy and success. Died July 30, 1830.

Davis (NOAH), an American jurist, born at Haverhill, N. H., Sept. 10, 1818, attended the district school at Albion, N. Y., whither his parents had removed in 1825, then the seminary at Lima, and was admitted to the bar in 1841. In 1844 he entered into partnership with Sanford E. Church, afterwards judge of the court of appeals, with whom he practised law in Albion for about fourteen years. He was appointed a justice of the supreme court of New York upon the resignation of Hon. James Mullet, in which dignity he continued through the two terms succeeding, until in 1864 he resigned in order to take a seat in Congress. He commenced the practice of law in New York City in 1869, and the same year again took a seat in Congress, resigning in 1870 in order to assume the duties of U. S. attorney for the southern district of New York, and was elected judge of the supreme court of the same district in 1873. Soon after taking his seat on the bench there devolved upon him the conduct of the important trials of Edward Stokes for the murder of Fisk and of William M. Tweed for malfeasance in office.

Davis (REUBEN), a native of Tennessee, was born Jan. 18, 1813. He was a physician, and afterwards a lawyer and judge in Mississippi, serving on the bench of the high court of errors and appeals, was for a time colonel of Mississippi Rifles in the Mexican war, and was twice elected to Congress from Mississippi before the late civil war, during which he favored the Confederate cause.

Davis (THOMAS T.) was born at Middlebury, Vt., Aug. 22, 1810, graduated at Hamilton College, Clinton, N. Y., in 1831, and was admitted to the bar in 1833. In 1862 and 1864 he was elected a representative to Congress from New York. He is well known as a manufacturer, and is connected with coal-mining and railroad interests.

Davis (TIMOTHY) was born in Gloucester, Mass., April 12, 1821, learned the printer's trade, and was afterwards a merchant of Boston, Mass. He was elected in 1854 and 1856 to Congress from the Gloucester district of Massachusetts, and in 1861 was appointed to a position in the Boston custom-house by President Lincoln.

Davis's Strait [named in honor of Capt. John Davis, noticed above] connects Baffin's Bay with the Atlantic Ocean, and lies between Greenland and British North America. It is about 160 miles wide at the narrowest part. A constant current runs southward through this strait from the circumpolar regions. Davis's Strait is frequented by many whaling ships.

Da'vison, a township of Genesee co., Mich. Pop. 1124.

Da'viston, a township of Tallapoosa co., Ala. P. 1578.

Da'vits (plu.), [etymology uncertain], the wooden or iron frame used for hoisting and lowering boats on shipboard. The "fish-davit" is a gaff used in fishing the anchor. Boat-davits have been to some extent superseded by ingenious BOAT-LOWERING APPARATUS (which see).

Da'vors (Jo.), author of a work, now rare and valuable, called "The Secrets of Angling" (London, 1613). This work is quoted by Walton, and the writer's name is doubtless a fictitious one. The authorship has been ascribed to John Donne, John Davisson, John Davies, and other writers of that day.

Davoud Pasha, a Turkish minister, born in Mar., 1816, is a Catholic Armenian. He studied at Berlin, and became professor at the military college at Constantinople. He afterwards was secretary of the embassy at Berlin, became director of the construction of telegraphs, and in 1861 was appointed governor of Lebanon during the strife between the Druses and the Maronites, which post he resigned in 1868, becoming minister of public works.

Davout, or **Davoust** (LOUIS NICOLAS), duke of Auerstadt and prince of Eckmühl, an able French marshal, born near Noyers (Yonne) May 10, 1770. He was a fellow-student of Bonaparte at Brienne, and entered the army in early youth. In 1793 he gained the rank of general of brigade, and in 1798 went with Bonaparte to Egypt. He became a general of division in 1800, and commanded the cavalry of the army of Italy in that year. Having received a marshal's baton in 1804, he led the right wing at Austerlitz in Dec., 1805, and defeated the Prussians at the battle of Auerstadt, Oct. 14, 1806. For his services at Eckmühl he was created prince of Eckmühl in 1809. He took part in the Russian campaign of 1812, and was wounded at Borodino. He was afterwards governor of the Hanse Towns, and defended Hamburg for several months against the allies. During the Hundred Days (1815) he was Napoleon's minister of war. He was commander-in-chief of the French armies in 1815, after the battle of Waterloo. Died June 4, 1823. (See CHÉNIER, "Vie du Maréchal Davout," 1866.)

Da'vy (Sir HUMPHRY), BART., F. R. S., a celebrated English chemist, was born Dec. 17, 1778, at Penzance, Cornwall. At an early age he displayed a taste for fiction and poetry, and when eleven years old is said to have composed part of an epic of which the hero was Diomede, son of Tydeus. Even in this work he manifested great powers of imagination and invention. He has left some respectable fugitive poems of a later date. His father died when he was sixteen, and shortly after this event Gregory Watt, son of the inventor James Watt, took lodgings at his mother's house. The young men were congenial in tastes, and a warm intimacy grew up between them, which seems to have played an important part in determining the studies and directing the genius of young Davy. But to Mr. Davies Gilbert the cause of science is still more indebted for the encouragement which he early gave to Davy, and finally for presenting him to the notice of the Royal Institution in London. He was associated in 1798 with Doctor Beddoes at Bristol in the Pneumatic Institution founded by that gentleman. The next year appeared his first contribution to science, under the name of "Essays on Heat and Light, with a New Theory of Respiration," which formed part of a volume published by Doctor Beddoes. In 1800 his "Researches, Chemical and Philosophical, chiefly concerning Nitrous Oxide and its Respiration," attracted much attention among scientists. These "Researches" made known his discovery of the peculiar intoxicating or exhilarating properties of nitrous oxide gas, and contain, besides, the results of interesting and dangerous experiments on the respiration of nitrogen, hydrogen, carburetted hydrogen, carbonic acid, and nitrous gases. In 1801 he lectured for the first time before the Royal Institution, in which he was made a professor in 1802. He was pre-eminently successful as a lecturer. In 1807 he delivered before the Royal Society his second Bakerian lecture, in which he gave an account of the decomposition by galvanism of the fixed alkalies, his great achievement, by which he proved that these alkalies are merely metallic oxides. It has been justly said that since the time of Sir Isaac Newton no contribution has been made to the "Philosophical Transactions" equal in importance to Davy's account of this great discovery. It is lamentable that one whose intellectual gifts were of so high an order should not have been above the intoxication of fame. Yet it is true that after Davy's rapid rise to fame he was sometimes guilty of an overbearing spirit, especially in his relation to younger seekers for distinction, a circumstance the less justifiable when we consider how much he himself owed to the kindness and generosity of scientific men. He was knighted in 1812, and not long afterwards he married a widow (Mrs. Apreece) of accomplishments and fortune. He was made a baronet in 1818. One of the most important of his inventions is the safety-lamp (1815–17). He became president of the Royal Society in 1820, and was elected to that office for seven succeeding years. In 1827 his failing health compelled him to resign. He died May 28, 1829, at Geneva.

The following are a few of his many important works: "Elements of Chemical Philosophy" (1812); "Elements of Agricultural Chemistry" (1813); papers concerning "Fire-Damp," etc. and accounts of his researches relating to "Oxymuriatic Acid" and "Fluoric Compounds." After his death were published his "Consolations in Travel," consisting principally of reflections and speculations of a religious nature. Davy appears to have been endowed to the fullest extent with all those gifts necessary to a profound student of the laws of nature. His intellect was at once comprehensive and penetrating, and he possessed, in addition, an inexhaustible invention and fertility in resources, joined to an enthusiasm which no difficulties could discourage. (See "Life of Sir Humphry Davy," by DR. J. A. PARIS, 1831; "Memoirs of the Life of Sir Humphry Davy," by his brother, DR. JOHN DAVY, 1836.)

REVISED BY J. THOMAS.

Davy (JOHN), M. D., a brother of Sir Humphry Davy, was born at Penzance, Cornwall, May 24, 1791, received his medical education at Edinburgh, graduating in 1814; entered the British army service, and was on duty chiefly in foreign parts. He published various professional and other works, of which the best known is a "Life" of his illustrious brother. He was himself an able scientific observer. Died April 24, 1868.

Davy's Safety-Lamp, invented by Sir Humphry Davy (1815–17), consists of a common oil lamp surrounded by wire gauze of 400 meshes to the square inch. It is used in coal-mines where fire-damp abounds. The explosion of fire-damp was formerly a very frequent cause of the destruction of life and property. This loss has been materially diminished by the safety-lamp. The principle is as follows: When fire-damp (light carburetted hydrogen gas mixed with air) is touched by a flame it explodes with great violence, but its flame cannot pass through fine wire netting, because the wire conducts away the heat, leaving the gas on the outside too cold to take fire, for it happily requires an intense heat to inflame the fire-damp. The space within the wire netting sometimes becomes filled with the flame. It is customary in well-regulated mines for the workmen to withdraw at such times until after good ventilation has been restored. The safety-lamp is unfortunately no protection against the very explosive "white-damp," which is charged with sulphuretted hydrogen. This gas is readily detected by its smell, which resembles that of rotten eggs. It is fatally poisonous to miners even when much diluted with air. Latterly, various other safety-lamps have been invented, but thus far there is no absolute protection against the explosion of gases in coal-mines. Vigilance in observing the signs of the presence of dangerous gases, and in securing good ventilation, is indispensable to safety. Recent observations appear to show that terrestrial magnetism has a certain influence, as yet unexplained, upon the generation of these gases.

Daw, or **Jackdaw,** the *Corvus monedula*, a bird of the crow family, found in Europe, Asia, and Africa, fourteen inches long, black, with a smoky-gray neck. Daws

Daw, or Jackdaw.

are very cunning, social, and active birds, often nesting in church-towers and old castles. They build a nest of sticks, of which they sometimes collect a large quantity. They frequent large towns.

Dawes (HENRY LAURENS), an American lawyer and statesman, born at Cummington, Mass., Oct. 30, 1816, graduated at Yale in 1839, was newspaper editor, and studied and practised law. He was a member of both

houses of the legislature of Massachusetts, district attorney, and has been a member of Congress since 1857, and occupied a prominent position as chairman of the committee on appropriations and that of ways and means.

Dawison (Bogumil), a German actor, born at Warsaw May 18, 1818, of Jewish stock. From 1852 to 1866 he was engaged at the royal theatre in Dresden, where his renderings of Shakspeare's, Goethe's, and Schiller's characters were much admired. From 1866 to 1868 he was in America. Died Feb. 2, 1872.

Daw'son, a county in the N. of Georgia. Area, 200 square miles. It is drained by the Etowah River. The surface is hilly; the soil is partly fertile. Corn, cotton, wool, and tobacco are raised. Capital, Dawsonville. Pop. 4369.

Dawson, a county in the N. E. of Montana Territory. Area, 30,390 square miles. It is drained by the Missouri and Milk Rivers. Pop. 177.

Dawson, a county in Central Nebraska. Area, 1008 square miles. It is intersected by the Union Pacific R. R. and the Platte River. The surface is nearly level. Capital, Plum Creek. Pop. 103.

Dawson, a post-village, capital of Terrell co., Ga., on the South-western R. R., 98 miles S. S. W. of Macon. It has one weekly newspaper and a car-factory. It contains the South Georgia Male Institute. Pop. 1099.

Weston & Combs, Props. "Journal."

Dawson (Henry Barton), an historian, was born at Gosberton, Lincolnshire, England, June 8, 1821, and with his parents came to the U. S. in 1834. In 1845 he became a temperance journalist in New York. He has published several historical and antiquarian works, chiefly relating to the Revolutionary period in the U. S. He has been a Democratic editor in Yonkers, N. Y. (1855–66), and in the latter year became editor of the "Historical Magazine."

Dawson (John William), LL.D., F. R. S., an eminent geologist, born at Pictou, Nova Scotia, Oct., 1820. He was educated at the University of Edinburgh. Under the direction of Sir Charles Lyell he made explorations in the province of Nova Scotia in 1841, and gave an account of its geology in the "Proceedings of the Geological Society of London." He was appointed superintendent of education in Nova Scotia in 1850, and principal of McGill College at Montreal 1855, which position he still holds (1873). In 1848 he published a "Handbook of the Geography and Natural History of Nova Scotia," "Hints to the Farmers of Nova Scotia" (1853), "Acadian Geology" (1855; enlarged ed. 1868), "Archaia, or Studies of the Cosmogony and Natural History of the Hebrew Scriptures" (1859); also an excellent popular treatise on geology, published serially in the "Leisure Hour" (1871–72), republished (1873) under the title "The Story of the Earth and Man." He has contributed numerous geological memoirs and articles to the "Proceedings of the Geological Society of London," "The Canadian Naturalist," "Silliman's Journal," and other periodicals. He is author of the admirable article on Geology published in this work.

Dawson (Lucien L.), U. S. M. C., born Feb. 5, 1837, in Kentucky, entered the marine corps as second lieutenant Jan. 13, 1859, became a first lieutenant early in 1861, and a captain Nov. 23 of the same year. He was brevetted major for gallant and meritorious services at the assault on Fort Fisher on Jan. 15, 1865, where he led the marines of the fleet.

Foxhall A. Parker, U. S. N.

Dawson (William C.), a distinguished lawyer, jurist, and statesman of Georgia, born Jan. 4, 1798, was educated at the university of the State, graduated in 1816, studied law at Litchfield, Conn., and settled at Greensboro', Ga., in his native county. For twelve years he was clerk of the house of representatives of the general assembly of the State. He was several times a member of the house and senate of the State legislature. He was a member of the House in the Federal Congress from 1837 to 1842; afterwards he was judge of the superior courts in his State, and from 1849 to 1855 he was a Senator in Congress. He died May 5, 1856.

Daw'sonville, a post-village, capital of Dawson co., Ga., about 50 miles N. N. E. of Atlanta.

Dax (anc. *Aquæ Augustæ*), a town of France, department of Landes, is pleasantly situated on the Adour, 25 miles N. E. of Bayonne. It has a cathedral, a bishop's palace, and some manufactures of earthenware, brandy, leather, etc. Here are hot saline springs, which were used for bathing by the ancient Romans, and are still frequented by invalids. Pop. 9469.

Day [Lat. *dies*; Fr. *jour*; Ger. *Tag*], a word signifying either the interval of time during which the sun is above the horizon, or the time occupied by a complete revolution of the earth with reference to other celestial bodies. In the latter sense it denotes intervals of different duration, according as the body with which the revolution is compared is fixed or movable.

The astronomical or solar day, also designated the apparent day, is the time which elapses between two consecutive returns of the same terrestrial meridian to the centre of the sun. Astronomical days are of unequal length, for two reasons: 1, the unequal velocity of the earth in its orbit, which results in a greater apparent daily motion of the sun in winter than in summer; 2, the obliquity of the ecliptic, which causes the sun's apparent daily motion in right ascension (or in the plane of the earth's equator) to be less at the equinoxes than at the solstices. The astronomical day is computed from noon to noon.

The civil day, or mean solar day, is the time occupied by the earth in one revolution on its axis as compared with the sun. It is supposed to move at a *mean* rate in its orbit, and to make 365.2425 revolutions in a mean Gregorian year. This mode of measuring time makes the days all of equal length, and any special hour of the civil day sometimes precedes, and sometimes succeeds, the corresponding hour of the astronomical day. Most nations agree in fixing the beginning and end of the civil day at midnight.

The sidereal day is that portion of time which elapses between two successive culminations of the same star. Owing to the great distance of the stars, and their apparent fixedness in space, it is not perceptibly affected by the earth's orbital revolution, as is proved by all known astronomical observations. A sidereal day contains twenty-four hours fifty-six minutes four seconds of mean solar time. It is divided into twenty-four sidereal hours, which are subdivided into sidereal minutes and seconds. This is the universal mode of computing time among astronomers.

In most languages the word equivalent to our "day" is also used in a much more extended sense to denote an indefinite period of time. We speak of events which have transpired "in our own day." This figure of speech is especially common in Oriental languages, and is frequently found in the Bible.

Day, a township of Montcalm co., Mich. Pop. 510.

Day, a post-township of Saratoga co., N. Y. Pop. 1127.

Day (Benjamin F.), U. S. N., born Jan. 16, 1841, in Ohio, graduated at the Naval Academy as ensign in 1861, became a lieutenant in 1862, and a lieutenant-commander in 1866. He was attached to the steamer New London, West Gulf blockading squadron, in 1862–63, and was wounded in a night engagement on the Mississippi July 9, 1863. His services on this occasion are thus highly spoken of by his commanding officer, Lieut.-Com. George H. Perkins, in his report to Rear-Admiral Farragut of July 13, 1863: "The conduct of Lieutenant Day, my executive officer, deserves particular attention, who, after being wounded in the head, remained at his post and rendered valuable service, encouraging the men by his bravery and coolness." He was in the engagement with Howlett House batteries on James River in 1864, and in both attacks on Fort Fisher in 1865.

Foxhall A. Parker, U. S. N.

Day (George Edward), D. D., was born at Pittsfield, Mass., Mar. 19, 1815, graduated at Yale (1833) and at the Yale Theological Seminary (1838), was assistant instructor in sacred literature there from 1838 to 1840, was twice settled in the ministry, from 1840–47 in Marlboro', Mass., and from 1848 to 1851 in Northampton, Mass., from 1851 to 1866 was professor of biblical literature in Lane Theological Seminary, and since 1866 has been professor of the Hebrew language and literature and biblical theology in the theological department of Yale College. He has taken great interest in the instruction of the deaf and dumb, and has published (1845–61) two reports on the subject. From 1863 he edited the "Theological Eclectic" till 1871, when it was united with the "Bibliotheca Sacra." He translated and edited Van Oostersee's "Titus" in Lange's "Commentary," and has also translated (1871) Van Oostersee's "Biblical Theology of the New Testament." He was one of the contributors to Smith's "Bible Dictionary," and has published numerous articles in several leading reviews.

Day (Rev. Henry Noble), an author and educator, was born at New Preston, Conn., Aug. 4, 1808, graduated at Yale in 1828, was ordained to the Congregational ministry at Waterbury, Conn., in 1836, became professor of sacred rhetoric at the Western Reserve College, O., in 1840. He was a railroad president for many years, and president of the Ohio Female College (1858–64). Among his numerous educational works are "The Art of Elocution," "Elements of Logic," and "The Science of Æsthetics." He is now a resident of New Haven, Conn.

Day (Jeremiah), D. D., LL.D., an American mathematician, born in New Preston, Conn., Aug. 3, 1773, graduated at Yale College in 1795, became in 1801 professor of mathematics and natural philosophy in that college, and was president of the same (1822–1846). Among his works are an "Introduction to Algebra" (1814) and "Navigation and Surveying" (1817). Died Aug. 22, 1867.

Day (Thomas), an English author, born in London June 22, 1748, became heir to an ample fortune. He sympathized with the American patriots, and wrote two poems, entitled "The Devoted Legions" (1776) and "The Desolation of America" (1777). He selected from a foundling hospital two girls, whom he educated according to the system of Rousseau, with an intention to marry one of them, but he was disappointed by the ill-success of his experiment, and married Esther Milnes in 1778. His chief work is "Sandford and Merton" (1783–89), a popular juvenile tale of great merit. He was killed by the kick of a horse Sept. 28, 1789.

Day'ansville, a manufacturing village of New Bremen township, Lewis co., N. Y.

Day-Lil'y (*Hemerocallis*), a genus of liliaceous plants having a perianth with bell-shaped limb and sub-cylindrical tube, and globose seeds. Several varieties are cultivated in gardens; among these is the fragrant yellow day-lily (*Hemerocallis flava*). It is a native of Northern China, Siberia, and Hungary; it has been accounted good food for cattle, but another species, the *Hemerocallis fulva*, has more profuse foliage and is equally acceptable to cattle.

Days'man, a name used in England in former times, and sometimes now used in the northern counties, to signify an umpire or elected judge. Its use dates from the Middle Ages, when the word "day" was specially employed in judicial proceedings to denote the day assigned for the hearing of a cause. This word is also used in Scripture: "Neither is there any *daysman* betwixt us, that might lay his hand upon us both." (Job ix. 33.)

Day'ton, a township and post-village of Marengo co., Ala. The village is 38 miles W. of Selma. Total pop. 6731.

Dayton, a post-township of La Salle co., Ill. Pop. 653.

Dayton, a post-village of Sheffield township, Tippecanoe co., Ind. Pop. 385.

Dayton, a township of Adair co., Ia. Pop. 139.

Dayton, a township of Bremer co., Ia. Pop. 419.

Dayton, a township of Butler co., Ia. Pop. 383.

Dayton, a township of Cedar co., Ia. Pop. 1546.

Dayton, a township of Chickasaw co., Ia. Pop. 543.

Dayton, a township of Iowa co., Ia. Pop. 939.

Dayton, a township of Webster co., Ia. Pop. 975.

Dayton, a post-township of York co., Me. Pop. 611.

Dayton, a township of Newaygo co., Mich. Pop. 771.

Dayton, a township of Tuscola co., Mich. Pop. 660.

Dayton, a post-township of Hennepin co., Minn. Pop. 951.

Dayton, a post-village, capital of Lyon co., Nev., is on Carson River, 12 miles E. S. E. of Virginia City. Silver-mines have been opened in the vicinity. Here are several quartz-mills. Pop. of township, 918.

Dayton, a township and post-village of Cattaraugus co., N. Y., on the Erie R. R., 22 miles E. S. E. of Dunkirk. It has three cheese-factories and several lumber-mills. Total pop. 1267.

Dayton, a handsome city, capital of Montgomery co., O., on the left (E.) bank of the Great Miami, at the mouth of the Mad River, 60 miles N. N. E. of Cincinnati, and 67 miles W. by S. of Columbus; lat. 39° 44′ N., lon. 84° 11′ W. It is the terminus of the Atlantic and Great Western, the Cincinnati Hamilton and Dayton, the Dayton and Michigan, and the Dayton and Union R. Rs., all connecting. The Pittsburg St. Louis and Cincinnati and the Short Line from Cincinnati pass through it, and also the Miami Canal, connecting the Ohio with Lake Erie. The granite court-house, designed after the Parthenon, is 167 feet long and 62 wide. There are forty-five churches, among which the First Presbyterian and Grace (M. E.), built of Dayton granite, are fine specimens of architecture. The city has eight public schools, a high school, the Cooper Seminary for girls, and St. Mary's (Catholic) Institute for boys. It has a public library of 3500 volumes, 3 national and 4 private banks, 8 local insurance companies, 2 daily, 2 weekly, 1 tri-weekly and 2 weekly (German), and 2 weekly religious papers; also 3 semi-monthly and 5 monthly publications. There is a large water-power. A very extensive manufactory of railroad cars, a number of large agricultural implement works, employing as many as 5000 hands, six large breweries, two distilleries, factories of stoves, paper, cotton, and woollens, and extensive limestone quarries, which have furnished the materials for many buildings in Cincinnati, are among the industries of Dayton. Here is the National Soldiers' Home for disabled soldiers and sailors, on whose roll are the names of 2000 veterans. It has an admirable hospital, a library of 4000 volumes, and extensive grounds—600 acres. The resident manager is Hon. Lewis B. Gunckel, M. C. for the Dayton district. The tax-duplicate of Dayton is $25,000,000. The streets of Dayton, some of them 133 feet wide, cross each other at right angles, and twenty-six macadamized pikes radiate from the city. It is the heart of the Miami Valley, a beautiful and productive region. Pop. in 1860, 20,081; in 1870, 30,473.

W. D. Bickham, Ed. Dayton "Journal."

Dayton, a township of Richland co., Wis. Pop. 968.

Dayton, a township of Waupaca co., Wis. Pop. 871.

Dayton (Elias), an American general, born in New Jersey in 1735. He became a colonel about 1777, and served at the battles of Brandywine, Germantown, and Monmouth. He was a member of Congress (1787–88) Died July, 1807.

Dayton (Jonathan), LL.D., an American statesman, son of the preceding, born at Elizabethtown, N. J., Oct. 16, 1760. He served with distinction in the Revolutionary war, and was a delegate from New Jersey to the convention which framed the Federal Constitution in 1787. In 1791 he was elected a member of Congress, in which he acted with the Federal party. He was Speaker of the House of Representatives for two terms (1793–97), and was chosen a Senator of the U. S. in 1799. Died Oct. 9, 1824.

Dayton (William Lewis), LL.D., an American statesman, nephew of the preceding, born in Somerset co., N. J., Feb. 17, 1807. He studied law, was admitted to the bar in 1830, and practised at Trenton. In 1842 he was appointed a Senator of the U. S. to fill a vacancy, and in 1845 he was elected to the national Senate by the legislature of New Jersey for a term of six years. He voted with the Whigs, and opposed the extension of slavery. In 1856 he was nominated as the Republican candidate for Vice-President. Fremont and Dayton received 114 electoral votes, but they were not elected. Mr. Dayton was appointed minister to France early in 1861. Died in Paris Dec. 1, 1864.

De, a Latin particle, commonly signifying "down" or "from;" it is often *intensive*, and sometimes *privative* or *negative*, having occasionally nearly the force of the English particle *un*; *e. g. descendo* (from *de*, and *scando*, to "climb"), literally, to "climb down;" *decoquo*, to "boil down," to "boil thoroughly;" *deform* (from *forma*, "form," "beauty," "grace"), to "deprive of grace or beauty;" *decompose*, to "*un*-compound." *De* is also a preposition, signifying "concerning," also "from" or "down from."

Dea'con [from the Gr. διάκονος, a "servant;" Ger. and Lat. *diaconus*], in early times an officer of a church, whose duty it was to collect and dispense alms. According to an opinion generally prevailing among Protestants, the office was at first secular, although it is evident that deacons frequently exercised spiritual functions. The church at Jerusalem first chose seven deacons, who taught and baptized, as is shown by the example of Philip the deacon. In the second and third centuries the duties of deacons were increased, and it subsequently became expedient to divide their functions among the archdeacons, deacons, and sub-deacons. The offices of archdeacon and deacon were counted among the higher clerical orders (*ordines majores*); and after the twelfth century that of sub-deacon was so reckoned. In the Greek, Roman Catholic, Anglican, and Methodist Episcopal churches deacons are clergymen inferior in rank to ministers or priests, and are usually probationers for the latter office. In the Roman Catholic Church the peculiar robes of a deacon are the dalmatica and the stole. At Rome there are eighteen cardinal deacons, of whom the celebrated Antonelli is one. In Protestant churches the position of deacons is various. The Baptists and Congregationalists have deacons as superintendents of the temporal affairs of the church, and also as assistants in the administration of the sacraments. Among Presbyterians their place is often supplied by the ruling elders, but in the Free Church of Scotland and in some other Presbyterian bodies there are regularly ordained deacons.

Dea'coness [Gr. ἡ διάκονος; Lat. *ancilla*, *ministra*, *diaconissa*], the title of a rank of female officers in the apostolic and early Christian Church. They assisted in the care of the poor, especially of their own sex, gave instruction to the younger catechumens, arranged the agapæ or love-feasts, and took care of the sick. Until the fourth century, the deaconess was required to be a maiden, or

widow but once married, and sixty years of age, but the age was fixed at forty by the Council of Chalcedon (451 A. D.). She was assisted by the sub-deaconess. The office gradually died out, but sooner in the Latin than in the Greek Church. Several Western councils in the fifth and sixth centuries forbade the consecration of deaconesses, although the office appears not to have been wholly extinct till the tenth or eleventh century. At Constantinople there were deaconesses as late as the beginning of the thirteenth century, with no trace of them anywhere else in the East. In monasteries, nuns who take charge of the altar are called deaconesses. The Sisters of Charity and other like organizations perform a work analogous to that of ancient deaconesses. There is a movement for the resumption of the office in the Anglican and some other Protestant churches. Among the German Protestants the experiment has been successfully tried. A large and excellent Protestant school for deaconesses was established in 1835 at Kaiserswerth, Prussia, and many similar institutions have since sprung up in Europe.

Dead Color. In painting, a color is said to be dead when it has no gloss upon it. This is effected by the use of less oil and more turpentine than in ordinary paints.

Deaderick (William H.), M. D. See Appendix.

Dead'head, the extra length of metal given to a cast gun. It serves to receive the dross (Lat. *caput mortuum*, literally, "dead-head") which rises to the top of the liquefied metal, and which, were it not for the deadhead, would form the muzzle of the gun. When cooled and solid the deadhead is cut off. In popular language "dead-head" is used to denote a person who travels on a railroad or enters a place of amusement, etc. without paying.

Dead-Letter Office, in the U. S. postal department, is the place where unclaimed letters are sent. After remaining one month at the post-office to which they are directed, "dead" or unclaimed letters are sent to Washington, and are opened in the dead-letter office. When the writer's name and address can be ascertained the letter is returned to him; otherwise the letter is destroyed. In 1872 nearly 3,000,000 letters went to the dead-letter office. They are partly classified as follows: 58,000 letters had no county or State direction; more than 400,000 lacked stamps, and 3000 were posted without any address at all. The sum of $92,000 in cash, and more than $3,000,000 in drafts, checks, etc., were found in these letters. It appears that on an average every letter that is misdirected, or that goes to the dead-letter office from any cause, contains one dollar.

Deadly Nightshade. See Belladonna.

Dead Net'tle (*Lamium*), a genus of plants of the order Labiatæ, with a 5-toothed calyx and 2-lipped corolla, the upper lip arched, the lower trifid. The genera *Galeopsis* and *Galeobdolon*, resembling the *Lamium*, are often called by this name. *Lamium purpureum* and other species are common weeds in Great Britain, and are naturalized in the U. S. There is an old belief that the touch of the dead nettle causes an irritation which may end in death; hence the name. It appears, however, to be quite harmless.

Dead Reck'oning, a term used in navigation, signifies the calculation of a ship's place at sea without taking observation of the heavenly bodies. The chief elements from which the reckoning is made are the point of departure (*i. e.* the latitude and longitude of the place from which she sailed), the course or direction of her movement (ascertained by the compass), the rate of sailing, measured from time to time by the log, and the time that has elapsed. The data are liable to errors and uncertainties, in consequence of currents, changes of the wind, etc. (See Navigation, by Lieut.-Commander Alex. H. McCormick, U. S. N.)

Dead River Plan'tation, a township of Somerset co., Me. Pop. 100.

Dead Sea, or **Sea of Sodom** [Arab. *Bahr Loot*, "Sea of Lot:" anc. *Lacus Asphaltites*], called in Scripture the **Salt Sea,** a celebrated lake in the southern part of Palestine. Its northern end is about 20 miles E. of Jerusalem. Its length, as determined by Lieut. Lynch in 1848, is 40 geographical miles, and its breadth from 9 to 9½ geographical miles. The greatest depth, according to Lieut. Dale (1848), is 1308 feet; according to Lieut. Symonds (1841), 1350 feet. Its depression below the Mediterranean, as measured by Lieut. Dale, is 1316.7 feet, and its bed is accordingly by far the deepest known fissure on the surface of the earth. The Dead Sea is fed by the Jordan and other streams, but has no apparent outlet, and the surplus water is carried off by evaporation. It is enclosed between naked cliffs of limestone, which on the eastern side rise 2000 feet or more above the water. The shores present a scene of desolation and solitude encompassed with deserts and dreary salt-hills. On the southern shore is a remarkable mass of rock-salt called *Usdum* (Sodom), which is supposed to indicate the site of the ancient city of Sodom. Large quantities of asphaltum were thrown up to the surface of the lake by the earthquakes of 1834 and 1837. The water of this lake is remarkable for its great specific gravity (which is 1.25, or one-fourth greater than pure water) and its intense saltness, nearly seven times that of the sea, but varying considerably at different seasons. About 25 per cent. is the average proportion of saline matter by weight. The chlorides of sodium, magnesium, and calcium are the most abundant salts dissolved in it. Ducks have been seen swimming on its surface. The bed occupied by this lake is part of a long and narrow depression or fissure which extends from the Lake of Galilee southward, and is nearly 200 miles in length. The adjacent table-land is more than 3000 feet above the Mediterranean, so that the fissure is nearly 6000 feet deep. It is supposed that all of this depression was formerly covered with sea-water. (See Lieutenant Lynch, "Narrative of the U. S. Expedition to the River Jordan and the Dead Sea," 1849.)

Revised by R. D. Hitchcock.

Deaf and Dumb, or **Deaf-Mutes** [Fr. *sourds-muets*]. Those born deaf are dumb, because they cannot learn to speak without the guidance of the sense of hearing, which enables them to imitate sounds. The same is true of those made deaf by disease or accident in early infancy. After learning to speak, the occurrence of deafness does not greatly impair the speech, although persons becoming deaf during childhood sometimes retain throughout life the childish tone which they have learned. The average number of deaf-mutes in Europe in 1830 was about 1 in 1500 of the total population; in 1850, according to the investigations of Dr. Peet, 1 in 1360. In the U. S. the census of 1870 gives the whole number of deaf-mutes as 16,205, or over 1 to every 2379 inhabitants. Very possibly these returns are only approximative, parents being often reluctant to acknowledge this defect in their children, and census marshals negligent.

Congenital deafness is reasonably believed to be caused by imperfection of development under influences which lower the grade of nutrition in the embryo during gestation, or which affect, through the constitution of one or both of the parents, the immediate result of conception. Among these influences the most marked appear to be intemperance, marriages between those nearly related, syphilis, and scrofula. Boudin asserts that in France nearly 25 per cent. of deaf-mutes are the offspring of marriages of consanguinity; and somewhat similar estimates have been obtained by Drs. Howe and Bemiss in their statistical inquiries upon the effects of such marriages in the U. S.

On account of the comparative helplessness of deaf-mutes they were placed, in the code of Justinian, among persons incapable of the legal management of their affairs. During the Middle Ages they were deprived of the right of feudal succession. Yet in all times they have occasionally shown considerable capacity for culture. Pliny mentions Quintus Pedius, a deaf-mute, related to the emperor Augustus, as a successful painter at Rome; and in later times the uncle of one of the kings of Sardinia, notwithstanding the same defect, acquired a good education. The earliest account of a deaf-mute being taught to speak is ascribed to Bede, about 700 A. D. Rodolph Agricola of Groningen, who died in 1485, first mentioned an instructed deaf-mute. Jerome Cardan, half a century later, wrote philosophically on the principles involved in such instruction. Ponce de Leon, a Spanish monk, who died in 1584, and Pasch, a clergyman of Brandenburg, were the first teachers of whom we have any account. Juan Pablo Bonet published, at Madrid, the earliest known treatise on deaf-mute instruction. He gave a manual alphabet quite different from those which Bede has preserved as used by the ancients. About 1660 to 1700 Dr. John Wallis of Oxford and John Conrad Amman of Holland published remarkable treatises on this art.

In England the first manual alphabet was published by George Dalgarno, by birth a Scotchman, but residing for a long time at Oxford. He died in 1687. The first school for deaf-mutes in Great Britain was established in Edinburgh in 1760 by Thomas Braidwood. Some years afterwards it was removed to the neighborhood of London, and thus no doubt suggested the origination of an asylum in London in 1792, of which Dr. Joseph Watson was the first principal. The first public establishment in the world for the instruction of deaf-mutes was founded at Leipsic in 1778 by the elector of Saxony, under the directorship of Samuel Heinecke.

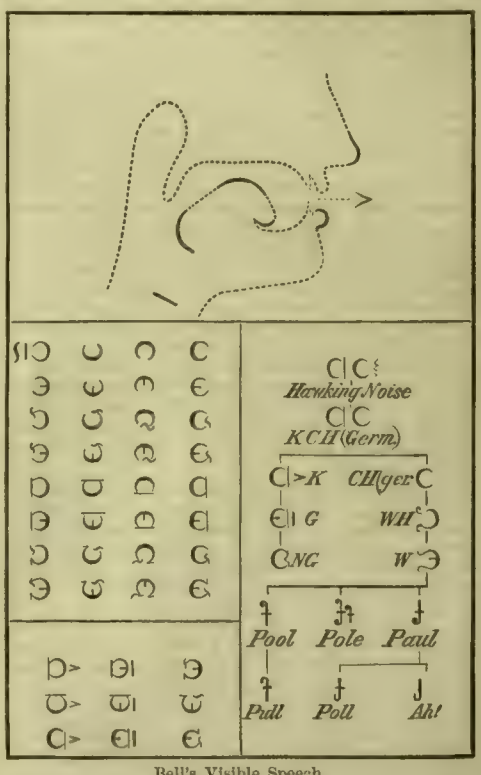
The credit of systematizing the instruction of the deaf and dumb in France is ascribed "to the abbé Charles Michel de l'Épée of Paris," but greater success was in some individual cases attained by a Spaniard, Jacob Rodrigues Pereira, whose school was conducted at Bordeaux. These men undoubtedly both contributed to the work; as did also Sicard, the successor of the abbé de l'Épée, and Itard. In the U. S. the system matured by the experience of

the French was brought over in 1816 by the late Doctor Thomas H. Gallaudet, with the personal aid of Laurent

One-handed Alphabet.

Clerc, an educated deaf-mute. Other names especially associated with useful labors on behalf of the same class are those of Dr. F. A. P. Barnard, Lewis Weld, and William W. Turner, of the Hartford Institution; H. P. Peet, LL.D.,

Two-handed Alphabet.



of New York; Abraham B. Walton of Philadelphia, J. A. Jacobs of Kentucky, and the two sons of Thomas H. Gallaudet (Thomas and E. M.), and Doctor S. G. Howe of Boston.

The most remarkable instance on record, perhaps, is that of the instruction, under the care of Doctor Howe, of Laura Bridgman, who was born blind as well as deaf-mute. By attracting her attention through the sense of touch, it was found possible to develop to a considerable degree her intelligence and capacity for communication with others. A similar example occurred earlier in Julia Brace in the Hartford Asylum, while under the charge of the Rev. Thomas H. Gallaudet.

The two principal modes of conveying instruction to the deaf and dumb are by the manual *sign-language*, and by the pupils watching the lips of the teacher during articulation. Real objects and models, pictures, etc. can of course also be used. The sign-language is much the most easily and rapidly acquired, and is more generally employed in Europe, as well as in this country. It is largely in use among the American Indians, and by means of it natives of the most distant portions of the continent can understand each other. It is said that a party of Indians present in London at an exhibition of performances by deaf-mutes were delighted to find themselves able to converse with the latter by signs.

The method of teaching by *articulation*, the pupil learning to recognize words (and, in time, to utter them) by closely watching the motions of the lips and tongue in speech, is not favored by all experienced instructors. Except in very few cases it has not been adopted in the Hartford Asylum. The argument urged against it is, that the great length of time required for its acquisition can be better employed in obtaining knowledge according to the sign-method. Yet it has sometimes proved very successful, as in the private school of Miss Rogers at Chelmsford, Massachusetts. In Christiania, Norway, in 1872, a deaf-mute was, by instruction in this way, prepared creditably to enter the university as a student. Some have supposed that by means of lip-teaching intelligent deaf-mutes might become pupils in the common schools. Itard, and his successor Blanchet, in France, and the Abbé Carton, founder of an institution for the deaf and dumb in Bruges, Belgium, are amongst those who have especially labored on behalf of the method of teaching by articulation. This method was at first employed at the Clarke Institution at Northampton, Massachusetts, but has now given place to the Bell system.

A new method of teaching articulation has recently been brought into notice in this country. It is called *visible*

Bell's Visible Speech.

speech, and was invented by A. Melville Bell, a professor of vocal physiology in England, about 1848. It consists of a species of phonetic writing, based not upon sounds, but on the action of the vocal organs in producing them.

The characters of this universal alphabet, as matured in 1864, reveal to the eye the position of those organs in the formation of any sound which the human mouth can utter. In 1869 the first attempt was made in England to apply this alphabet in the instruction of deaf mutes; and in 1872 it was introduced by Mr. A. Graham Bell, the son of the inventor, into the Clarke Institution at Northampton, where it has superseded the old method of imitation, and is the only method of teaching articulation used. It is now (1873) used in the American asylum, with a limited number of both congenital and semi-mute pupils, with success. Its practical value as a means of instruction with all classes of deaf-mutes has not been as yet sufficiently tested. Mr. Abraham Bell has opened a school for instructing teachers in this system in Boston.

Of institutions for the education of deaf-mutes there were in 1870 about 80 in Germany, 45 in France, 22 in Great Britain, and 36 in the United States. The largest in Europe is that in London, with 300 pupils. The largest in America, and probably in the world, is in New York—588 pupils. This was founded in 1818, that at Hartford in 1817, and the asylum in Philadelphia in 1820.

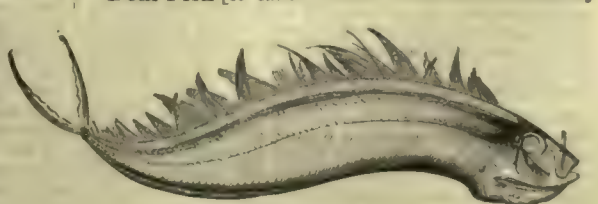
Revised by Henry Barnard.

Deaf'ness [Lat. *surditas;* Fr. *surdité;* Ger. *Taubheit*], loss or imperfection of hearing, may be congenital or acquired, permanent or temporary, complete or incomplete. It may be (1), "nervous"—that is, caused by organic or functional disease of the auditory nerve or of the brain itself. Deafness of this kind is sometimes curable, but frequently it is permanent. It may be (2), the result of local disease or accident. Disease of the structures of the ear frequently follows scarlet fever, and is often of a scrofulous character. When such disease leads to organic changes, even if they be slight, permanent and perhaps complete deafness may result. (3), Cerumen (ear-wax) frequently fills the passage of the ear. In such cases oil should be dropped into the ear, and a gentle flow of warm water from a syringe will generally remove the obstruction. (4), When the *membrana tympani* (ear-drum) is accidentally perforated, much good is often done by the use of Toynbee's artificial ear-drum. (5), The Eustachian tube may be the seat of mucous inflammation, and may require surgical treatment. Counter-irritation behind the ears, the use of general tonics, etc. may be beneficial; and this is more especially true of the deafness of aged people. (See Toynbee on "Diseases of the Ear," 1860; Roosa, "On Diseases of the Ear," new ed. 1871.)

Since the year 1844, when the attention of physicians was first called to the subject, the growth of minute fungi (*Aspergillus*, etc.) in the ear has been reported to be a common cause of disease of that part. The meatus and tympanum are sometimes covered with the growth, in the form of white or yellow mould on their surfaces. Tinnitus, inflammation, and the accumulation of wax are attendant symptoms, and the treatment consists in the application of a solution of carbolic acid, five grains to the ounce of water. The fungi are perhaps the effects of disease rather than the cause. Revised by Willard Parker.



Deák (Francis), an eminent Hungarian statesman and orator, born at Kehida in the county of Zala (Szalad) Oct. 17, 1803. He studied law, which he practised in his youth, was elected to the National Diet in 1832, and became the leader of the liberal party. Soon after the revolution of Mar., 1848, he became minister of justice, and projected important reforms in that department. He resigned office when Kossuth obtained power in Sept., 1848. On the defeat of the Hungarian patriots in battle in 1849, he quitted public life and retired to his estate. Having been elected to the Diet in 1861, he became the leader of the moderate party and the most popular man in Hungary. He was the author of the address sent by the Diet to the emperor, and of the protest against the imperial rescript in 1861. Deák is regarded as the master-spirit of the movement by which the constitutional autonomy of Hungary was restored in 1867, and large concessions to civil and religious liberty were extorted from the emperor. From that time he remained the recognized leader of the liberal party, commonly called, after him, the "Deákist," and which had without interruption a majority of the Hungarian Diet. He refused all offers of a place in the ministry, but no change in the ministry was made without his consent. Died Jan. 28, 1876.

Deal [from the Ang.-Sax. *dael*, a "portion," akin to the Ger. *Theil*, "part" or "piece," originally a piece of any kind of timber, afterwards applied particularly to fir or pine], the commercial name used especially in Great Britain for boards exceeding six feet in length and seven inches wide. Smaller boards are called battens. Deals are generally three inches in thickness; when thinner, they are usually called planks, but thin boards are often called deals. They are imported into Great Britain chiefly from Sweden, Norway, and British America, and are sawed into thinner pieces for use.

Deal, a maritime town and bathing-place of England, in Kent, is on an open beach of the North Sea, near the S. extremity of the Downs, 8 miles N. N. E. of Dover. It has been one of the Cinque Ports since the early part of the thirteenth century. A good anchorage extends between Deal and Goodwin Sands, 8 miles distant. The place is defended by Deal Castle, Sandown Castle, and Walmar Castle, in the last of which the duke of Wellington died in 1852. Cæsar landed near Deal in 55 B. C. The castle was built by Henry VIII. in 1539. Its roadstead is famous as a resort for shipping. Here passengers and mails are landed, though less frequently than in former years. Its trade is small, and its manufactures are not important. Pop. in 1871, 8004.

Deal, a post-village of Ocean township, Monmouth co., N. J., 5 miles S. of Long Branch. It is a place of summer resort, being more retired and quiet than Long Branch.

Deal Fish [so called because its thin and wide body

The Deal Fish.

somewhat resembles a *deal* or plank], the *Gynetrus arcticus*, a fish of the family Cepolidæ, is from four to six feet long, eight inches broad, and one inch thick, and is found in high northern latitudes.

Dean [Lat. *decanus*, from *decem*, "ten," because the dean anciently presided over ten canons], an ecclesiastical title applied to officers of several different kinds. In some of the Anglican churches deans are dignitaries next in rank to the bishops. They preside over the chapters of canons and prebendaries, and in the old dioceses nominally elect the bishops. In England they are attached to each diocese. Rural deans are inspectors of parishes, who make report of their visitations to the bishop. Deans of college faculties are the presiding or executive officers. Various chapels in England and the chapel-royal of Scotland have deans attached to them. The three Scottish deans are Presbyterians of the national Church.

Dean (Amos), LL.D., was born at Barnard, Vt., Jan. 16, 1803, graduated at Union College in 1822, became an eminent lawyer, and was a professor of medical jurisprudence in the medical school and of law in the law school at Albany, N. Y. Died Jan. 26, 1868. He was the author of many valuable law treatises, and also published "Philosophy of Human Life" (1839), "Medical Jurisprudence" (1854), and other works. Since his death his "History of Civilization" (7 vols. 8vo) has been published (1868–69).

Dean (James), LL.D., was born at Windsor, Vt., Nov. 26, 1776, graduated at Dartmouth in 1800, was tutor in the University of Vermont (1807–09), and professor of mathematics there (1809–14, 1821–24). He published a "Gazetteer of Vermont" (1808). Died Jan. 20, 1849.

Dean (John Ward), an antiquary, was born at Wiscasset, Me., Mar. 13, 1815. He published a "Memoir of Rev. Nathaniel Ward" (1868), "Memoir of Rev. Michael Wigglesworth" (1871), and a great number of accurate and valuable papers upon history, biography, and genealogy.

Dean (Julia), a beautiful and talented actress, was born at Pleasant Valley, N. Y., July 22, 1830. Her grandfather and father (Samuel and Edwin Dean) were actors of repute. Her mother was the actress Julia Drake. She married a Mr. Hayne in 1855, was divorced in 1866, and married a Mr. Cooper soon after. She had great popularity in the West and South. Died Mar. 6, 1868.

Dean (Rev. Paul), a distinguished minister of the Universalist and Unitarian denominations, was born in Barnard, Vt., in 1789. He held the doctrine of the so-called Restorationists, and was pastor of churches in Boston and in Easton, Mass. He published numerous sermons, etc. Died at Framingham, Mass., Oct. 1, 1860.

Dean (William), D. D., a Baptist missionary, born at Morrisville, N. Y., June 21, 1807, and in 1834 became a missionary of the society now known as the American Baptist Missionary Union. His labors have been devoted to the Chinese in their native country, and also in Siam, where they are very numerous. He is the author of several religious works in the Chinese language, into which he has translated parts of the Bible.—Mrs. Theodosia A. B. Dean, his second wife, died in 1843. A memoir of her life has been published.

Deane (Charles), LL.D., was born at Biddeford, Me., Nov. 10, 1813, and became a merchant in Boston. He is the author of numerous historical papers of value, among which are "Notices of Samuel Gorton" (1850), "Memoir of George Livermore" (1869), and "The Forms of Issuing Letters-Patent by the Crown of England" (1870).

Deane (James), a judge and missionary to the Indians of New York State, was born at Groton, Conn., Aug. 20, 1748, and graduated at Dartmouth College in 1773. At the age of twelve he became associated with the Rev. Mr. Mosely, a missionary to the Six Nations. After graduating from college he went as missionary to the Canadian Indians, and was employed by Congress to pacificate the northern Indians. He was commissioned as a major, and served in the Revolutionary war as an interpreter at Fort Stanwix. He was taken prisoner by the savages, but his life was saved by the efforts of some of their women. He was afterwards, for a long time, a judge in Oneida co., N. Y., and held other offices of trust. From him the village of Deanesville was named. He wrote upon Indian mythology a paper which is believed to be lost. Died at Westmoreland, Oneida co., N. Y., Sept. 10, 1823.

Deane (James), M. D., a geologist, born at Coleraine, Mass., Feb. 24, 1801, studied first law, and then medicine, of which he commenced the practice in 1831. He was an excellent operative surgeon. In 1835 he made known his discovery of remarkable fossil footprints in the new red sandstone near Greenfield. After his death his work upon these footprints was published by the Smithsonian Institution. He was the author of a valuable report "On the Hygienic Condition of the Survivors of Ovariotomy," and other papers. Died June 8, 1858.

Deane (John), an English seaman, born about 1679, who while in command of the Nottingham galley was wrecked in 1710 on Boon Island, off the coast of Maine. Here the crew remained twenty-one days, and having eaten the body of one of their number who had died, they were finally rescued. Deane published an account of this affair (Boston, 1711; 5th ed. 1762), appended to a sermon on the event by Cotton Mather, but his mate and others of the crew published a different statement (London, 1711). Deane was (1714–20) a naval officer under Peter the Great, but was banished to Kasan. He was afterwards a long time British consul at Ostend. His name is appended to a "Letter" (1699) from Moscow to the marquis of Caermarthen regarding the state of the Russian navy. Died at Wilford, Notts, Aug. 19, 1761.

Deane (Samuel), D. D., a poet, born at Dedham, Mass., July 30, 1733, graduated at Harvard College in 1760, and was librarian and tutor there for several years. He was pastor of the Congregational church at Falmouth, afterwards called Portland, Me. (1764–1814), author of "Pitchwood Hill" and other poems, a "Georgical Dictionary" (1790), and other works. Died Nov. 12, 1814.

Deane (Samuel), a divine, poet, and historian, was born Mar. 30, 1784, at Mansfield, Mass., and graduated at Brown University, Providence, R. I., in 1805. In 1810 he became pastor of the Second Congregational church in Scituate, Mass., where he remained for life. He published an excellent history of that town in 1831, besides several poems, sermons, etc. Died Aug. 9, 1834.

Deane (Silas), an American diplomatist, born at Groton, Conn., Dec. 24, 1737. He graduated at Yale College in 1758. He was a member of the Continental Congress in 1774, and was sent to France in 1776 as a political and financial agent. He was recalled in 1777, charged with having deviated from his instructions by making extravagant contracts, and by profuse promises to many French officers whom he persuaded to enter the service of the U. S. There is, however, very little doubt that Deane was a thoroughly able and honest man, as well as a zealous patriot. He was the victim of the unhappy jealousy of unworthy men, who wrought his social and financial ruin. Died in England Aug. 23, 1789. In 1842 too tardy justice was done his memory by Congress, which after careful examination of his accounts found that a large sum was due to his heirs, which sum was paid fifty-three years after his death as a poor man in a land of strangers and enemies.

Deane (William Reed), a genealogist, was born at Mansfield, Mass., Aug. 21, 1809. He was a nephew of Samuel Deane, the historian of Scituate. He was a large and able contributor to periodical literature, writing chiefly upon antiquarian subjects, genealogy, and the early New England history. Died June 16, 1871.

Dean, Forest of, in Gloucestershire, England, is a picturesque hilly tract, having an area of 22,000 acres, between the Severn and the Wye. It is mostly the property of the Crown, and nearly half of it is enclosed for the growth of timber for the navy. Here are forests of oak, beech, and other trees, coal and iron mines, and stone-quarries. This forest was formerly notorious for the debased moral and social condition of its inhabitants, who have been largely reclaimed by the influence of religious instruction.

Dean's, a township of Edgefield co., S. C. Pop. 1320.

Deans'ville, a post-village of Marshall and Kirkland townships, Oneida co., N. Y., on the Utica division of the New York and Oswego Midland R. R., 4 miles S. W. by S. of Clinton. It has an academy and two churches. P. 195.

Dear'born, a county in the S. E. of Indiana, bordering on the Ohio River. Area, 291 square miles. It is drained by the Whitewater River. The surface is partly hilly; the soil is fertile, and is based on limestone. Dairy products, grain, wool, and hay are the staples. It is intersected by the Ohio and Mississippi R. R. and the Indianapolis and Cincinnati R. R. Capital, Lawrenceburg. Pop. 24,116.

Dearborn, a township and village of Wayne co., Mich., on the Michigan Central R. R., 10 miles W. of Detroit. It has a U. S. arsenal. Pop. of village, 530; of township, 2302.

Dearborn (Henry), an American general, born in Hampton, N. H., Feb. 23, 1751. He served as captain at the battle of Bunker Hill, 1775, and as major in the campaign against Burgoyne in 1777. In 1778 he fought with distinction at Monmouth. He was a member of Congress from Massachusetts (1793–97), and secretary of war under Jefferson (1801–09). Having obtained the rank of

major-general, he captured York (now Toronto) in Canada April 27, 1813. He was U. S. minister to Portugal (1822–24). Died June 6, 1829.

Dearborn (Henry Alexander Scammell), a son of the preceding, was born at Exeter, N. H., Mar. 3, 1783, graduated at William and Mary College in 1803, became a lawyer in Massachusetts, was a brigadier-general of militia for the defence of Boston in 1812, was a member of Congress (1831–33), and as adjutant-general of Massachusetts loaned arms to Rhode Island during "Dorr's rebellion" (1843), for which act he was removed. He was the author of several biographical and commercial treatises. Died July 29, 1851.

Deas (Charles), an American painter, born in Philadelphia, Pa., in 1818. He was a grandson of Ralph Izard, the patriot of South Carolina, and was a pupil of John Sanderson. The best known of his pictures were Indian and prairie scenes from the far West. He became insane and died in ——.

Deasy (Rickard), LL.D., an Irish Roman Catholic statesman and jurist, born in 1812 and educated at the University of Dublin (Trinity College), was called to the bar in 1835, became queen's counsel in 1849, a serjeant-at-law in 1858, solicitor-general for Ireland in 1859, attorney-general in 1860, and a baron of the Irish exchequer in 1861. From 1855 to 1861 he was in Parliament, belonging to the "moderate Catholic" party, and representing the county of Cork.

Death [Gr. *θάνατος*; Lat. *mors, mortis*; Fr. *mort*; Ger. *Tod*], the cessation of vital functions in animals and plants. The active phenomena observed after death, such as material decay and loss of heat, are merely continuations of processes which have been going on through life. The corresponding operations of repair having ceased, the destructive processes become manifest. In a short time, however, in ordinary conditions, new and much more rapid destructive changes are induced. (See Decay.)

Local or partial death of an animal is called mortification, gangrene, or sphacelus; if in a bone, it is necrosis. Molecular death of animal tissue is called ulceration, except in bony tissues, when it has the name of caries. Systemic death is said by Bichat to be either—1, by "syncope," or fainting, when the heart's action fails from lack of its usual stimulus; 2, by "asphyxia,"* when suffocation occurs or the lungs cease to act; or, 3, by "coma," when death begins at the brain. Other authorities add to these forms death by (4) "anæmia," or deficiency of the blood, by (5) "asthenia," or weakness, and (6) by starvation; but these may be regarded as varieties of the first form, or syncope. Still others reckon as distinct forms of death (7) that by paralysis—which is indeed one of the causes of the second form—that produced by asphyxia, or apnœa. An eighth form, "necræmia," or death by the blood, when the latter element is poisoned or changed in character by disease, is mentioned by writers. It would be difficult to assign some instances (such as instantaneous death from an injury) to any one of these categories. It is asserted by many careful observers that death is usually painless, and that the apparent agony or struggle so often observed is automatic. Cases are on record of burial after apparent death. Such terrible mistakes may be prevented by observing the rule of preserving bodies until unequivocal signs of decay are observed.

Revised by Willard Parker.

Death Adder. See Acanthophis.

Death, Brothers of, a name sometimes given to the monks of the order of St. Paul the Hermit, which was suppressed by Pope Urban VIII. about 1630. They always carried with them a death's head to remind them continually of death.

Death, Punishment of. See Capital Punishment, by Rev. Abel Stevens, A. M., LL.D.

Death-Watch, the name of certain small beetles inhabiting human dwellings, and producing a sound like the ticking of a watch. This sound being more readily heard in the stillness attending sickness, it has given rise to the superstitious belief that it prognosticates death; hence the name, "death-watch." The noise is produced by the insect beating its head against the wood in which it is concealed. It is supposed to be the call of the male to its mate. The common death-watch (*Anobium*) is a species of borer. It is about a quarter of an inch in length, and of a dusky-brown color. A number of species are found both in Europe and the U. S. The *Atropos pulsatorius*, a very different insect, is called in England by the same popular name, and for the same reason.

Death-Watch.

De Augmentis, or, more fully, **De Augmentis Scientiarum** (*i. e.* "On the Advancement of the Sciences," or, as Bacon himself renders it, ["On] the Advancement of Learning," employing this word in a somewhat wider signification than is usual at the present time), a celebrated treatise written by Lord Bacon, and forming the opening chapter of his great work, the "Instauratio Magna." It is next to the "Novum Organum" Bacon's most important philosophical treatise.

Débâcle, a French word signifying "the breaking up of ice" in a river or harbor. The term is used by geologists to denote a sudden rush or flood of water, which breaks down all opposing barriers, and leaves its path covered with scattered fragments of rock and other *débris*. The term is used also to designate any political, moral, or financial crash.

De Bas'trop, a township of Ashley co., Ark. P. 1386.

Deba'table Land, a tract of country on the western border of Scotland and England, lying between the Esk and Sark. It was for a long time a cause of contention between the two countries, and even after its division by royal commissioners in 1542, continued to be a refuge for outlaws. It was divided by a line drawn from E. to W. between the rivers, the eastern part being adjudged to England, and the western half to Scotland.

Deben'ture [from the Lat. *debentur*, "they (*i. e.* debts) are owing" (from *debeo*, to "owe")], a term applied to different documents or writings acknowledging a debt, as the acknowledgments given by railroad companies for special loans; also an instrument or writing by which government is charged to pay to a creditor or his assigns sums found due. The term is particularly applied to custom-house certificates, entitling the exporter to a drawback or bounty.

De'bir (*i. e.* a "sanctuary"), a city of the tribe of Judah several times mentioned in the Bible, was situated W. of Hebron in the hill-country, and in a dry and arid place. It was captured by Joshua, or rather by Othniel, was inhabited by the Anakim, and had a Canaanitish king. It was afterwards given to the priests of the Hebrews. It was also called Kirjath-sepher and Kirjath-sannah. Its site is not at present accurately known. There was also a place of this name near Jericho, and probably another belonging to the tribe of Gad, E. of the river Jordan.

Déblai [supposed to be derived from the Low Latin *deblado*, to "take away grain," or perhaps anything of a granular or crumbling nature], in fortification, is any hollow place or excavation in the ground made during the construction of a parapet or siege-work. The earth taken from the cavity is the remblai.

De Blaquiere, Barons, a noble family of Ireland, received the baronetcy in 1784 and entered the baronage in 1800.—Sir William Bernard de Blaquiere, fifth Lord de Blaquiere, was born in 1814, and succeeded his brother in 1871. He is an officer of the royal navy, though now on the retired list.

Deblois, a post-township of Washington co., Me. P. 139.

Deb'orah, a Hebrew prophetess and judge, the wife of Lapidoth, gained celebrity by her successful efforts to liberate the Israelites from Jabin, king of Canaan. (See Judges iv.) She is supposed to have composed the spirited and beautiful lyric which forms the fifth chapter of Judges.

Débouch [from the Fr. *déboucher*, to "pass out," to "empty itself," as a river], a military term, signifying to march out from a wood, defile, or other confined place into open ground; also an outlet or available issue by which an army can march out.

De Bow (James Dunwoody Brownson), an American writer on commerce and statistics, was born at Charleston, S. C., July 10, 1820. He studied law, and was admitted to the bar in 1844. In 1845 he removed to New Orleans and founded "De Bow's Commercial Review," which he edited for many years. He became in 1847 professor of political economy in the University of Louisiana. Died at Elizabeth, N. J., Feb. 27, 1867.

Debrec'zin, a royal free town of Hungary, capital of the county of Bihar, is on an extensive sandy plain 116 miles E. of Pesth. The houses are mostly but one story

*This use of the word "asphyxia" (which literally means "lack of pulse") is most unfortunate, though sanctioned by usage. A better word is "apnœa"—*i. e.* "failure of breath."

high; the streets are unpaved and dirty. It contains a handsome town-hall, several hospitals, and a Calvinistic college with twenty-four professors and a library of 20,000 volumes. It has manufactures of earthenware, combs, soap, and tobacco-pipes. Here are extensive markets for cattle and swine. A large majority of the inhabitants are Protestants and Magyars. It is connected with Pesth by a railway. Pop. in 1869, 46,111.

Debt, in law, means a sum of money due which is certain in amount or capable of being reduced to certainty. Such an indebtedness may arise either as the result of a judgment of a court of justice, or on a sealed instrument (specialty), or on an unsealed instrument, or on a mere oral contract. Debts are thus distinguished into such as are of record, or of special contract or simple contract. They may arise either on an express or implied promise. Debts may be collected by an action of debt, or in some instances by an action of covenant. The last action is resorted to when the duty to pay is derived from a contract under seal. The form of action called *indebitatus assumpsit* ("being indebted, he promised") may also be used where the indebtedness is incurred by reason of a simple contract. A debt may be discharged in various ways, as by ACCORD AND SATISFACTION, RELEASE, PAYMENT, NOVATION, etc. The statute of limitations will be a bar to an action. The time within which the action must be brought under such a statute varies in the different States. (See LIMITATIONS, STATUTE OF, by PROF. T. W. DWIGHT, LL.D.)

ACTION OF DEBT is a common-law action brought to collect a debt. It is also used to collect a penalty given by statute. When an action of debt is brought on a written instrument, the defendant may deny its existence. If he asserts that there is no such record as the plaintiff alleges, his plea is called *nul tiel record;* if he claims that a sealed instrument which is set up as the foundation of an indebtedness was never executed, his plea is *non est factum.* These pleas merely deny the *existence* of the judgment or specialty. If he has any other defence, he should disclose it by specially setting it forth. So he may deny the existence of a simple contract debt, or may set up in his pleadings any special facts which, while they admit the existence of the debt, show that the plaintiff has no right to recover. A judgment in the action for the recovery of a debt itself constitutes a new debt, on which another action may be brought, and so on, unless there be some statutory restriction of the right to bring an action upon a judgment, as there is in some of the American States. Under the codes of procedure of some of the States the technical action of debt no longer exists, as there is but one civil action. The same remedy may be had in substance under a complaint setting forth the facts constituting the cause of action.

T. W. DWIGHT.

Debt, National, of the U. S. The national debt of the U. S., as it existed at the commencement of the year 1873, consisted almost entirely of obligations incurred or accruing since the beginning of 1861, and, as usually stated in official reports, it was, on Jan. 1, 1873, $2,162,252,338. But this sum embraces all known liabilities of the government, including the entire amount of currency outstanding issued by the treasury directly, with various items of old debts long unclaimed, and probably obsolete, though still necessarily carried on the books of the treasury. The following is the official summary statement for Jan. 1, 1873:

Debt bearing interest in coin:			
Bonds at 6 per cent.	$1,342,084,150		
Bonds at 5 per cent.	414,567,300		
	$1,756,651,450	Interest,	$40,040,292
Debt bearing interest in lawful money:			
Certificates of indebtedness at 4 per cent.	678,000		
Certificates at 3 per cent.	2,780,000		
Navy pension fund, at 3 per cent.	14,000,000		
	$17,458,000	Interest,	264,273
Debt on which interest has ceased since maturity.	4,084,220	Interest,	345,991
Debt bearing no interest:			
Legal-tender notes.	357,500,000		
Old demand notes.	1,142,294		
Fractional currency.	45,722,062		
Certificates of deposit.	25,370,000		
Coin certificates.	23,263,000		
	$452,997,356		
Unclaimed interest.			16,605
	$2,231,191,026		$40,667,161
Total debt.			$2,271,858,187
Cash in treasury, coin.	$74,359,276		
" " currency.	9,876,574		
Deposit held to redeem certificates.	25,370,000		109,605,849
Total debt, less cash in the treasury.			$2,162,252,338
Bonds issued to Pacific Railway companies.			$64,623,512

This repetition of the official statement is required to show that the debt proper is substantially little more than the first two items, of five and six per cent. gold-bearing bonds named above; the remaining items being nominal or contingent, at least as regards demands for interest or for repayment. The certificates of indebtedness are all to be retired; and the navy pension fund is a sum nominally reserved, by act of July 1, 1864, to secure the annual interest of $420,000 required to pay pensions in the navy. The certificates of deposit and coin certificates represent or are exchangeable for cash in the treasury; and the currency, amounting to $403,232,062—exclusive of demand notes probably in greater part lost—is not likely to be retired or put in interest-bearing bonds.

The six per cent. bonds, which constitute the bulk of the debt, are in rapid progress of cancellation by purchase in extinguishment of the debt, and also by substitution of new bonds at 5 per cent. interest. The total amount of such bonds purchased and cancelled from May, 1869, to Jan. 1, 1873, is $299,901,100; and the amount exchanged for 5 per cent. bonds under authority of the act of July 11, 1870, is $200,000,000. The act of Jan. 20, 1871, authorizes a further issue of $300,000,000 of such 5 per cent. bonds, to be applied exclusively to the cancellation of other bonds bearing 6 per cent. interest; and a contract for the exchange of this entire sum has been completed, $100,000,000 of the 6 per cents. being already notified as called in for redemption, and subscriptions having been received for a like sum of 5 per cent. bonds to replace them. On the completion of these exchanges the debt bearing 5 per cent. interest will be about $715,000,000, and that at 6 per cent. $1,042,000,000, should no other reductions take place. The reduction of the debt began in April, 1869; in the last nine months of that year it was reduced $71,903,524; in 1870 it was reduced $119,251,240; in 1871, $88,229,382; and in 1872, $82,075,152. By various acts in 1870–72 large reductions were made in the leading sources of revenue, the customs and internal revenue, and it is probable that the monthly reductions will be less in 1873 than in either of the three previous years, and possibly not more than is required by the sinking fund act, or about $32,000,000.

Of the entire outstanding obligations of the U. S. government there are the following items long remaining unpaid, and of which most of the vouchers are probably lost; but some portion may possibly be claimed:

Old debt, prior to 1800, with items of 1812, and others to 1837	$37,665
Treasury notes, 1837–46, balance outstanding	82,575
Treasury notes of 1846	6,000
Mexican indemnity stock	1,105
Treasury notes of 1847	950
Loan of 1847	1,650
Bounty land-scrip, Feb. 11, 1847	3,900
Loan of Mar. 31, 1848	5,500
Texas indemnity stock, Sept. 19, 1850	174,000
Treasury notes of 1857	2,000
	$335,345

On the bonded items of this debt there is also an account of $75,596 accrued interest, constituting a nominal rather than a real charge, but entering into the aggregate of debt, as before stated. Of all the large creations of debt at the formation of the government, and again in 1813–15, 1837–45, and 1846–50, the small items above named alone remain. In 1858 a loan of $20,000,000 at 5 per cent. was issued, which is part of the existing debt, but the loan of $21,000,000 in 1860 is practically extinguished. With 1861 the issue of the great existing loans began, and the following is a condensed account of the acts of authority, the issues, and the outstanding amounts of all the present debt.

By the act of June 14, 1858, a loan of $20,000,000 at 5 per cent. was authorized, to run fifteen years, all of which was issued, and is still outstanding, redeemable after Jan. 1, 1874. By act of June 22, 1860, a loan of $21,000,000 at 6 per cent., for twenty years, was authorized, $7,022,000 only being issued, of which $10,000 only is outstanding. The series of loans called for by the war began with that authorized by the act of Feb. 8, 1861, of $25,000,000 at 6 per cent. for twenty years, of which $18,415,000 were issued, nominally at par, but really costing about 1¼ per cent. in negotiation. All this loan is outstanding, and is known as part of the 6 per cents. of 1881. Next, on Mar. 2, 1861, treasury notes bearing 6 per cent. interest were authorized, of which $35,364,450 were issued; all being now redeemed but $3150. This was a most important act for the relief of the government, the notes being received for customs, and being redeemable within two years. Also on Mar. 2, 1861, bonds at 6 per cent., running twenty years, were authorized for the Oregon war debt; $1,095,850 being issued, of which $945,000 remain out, falling due in 1881. On July 17, 1861, $250,000,000 of 7 per cent. bonds, to run twenty years, were authorized, with authority to issue any part of this amount

in the form of treasury notes, running three years, at 7 3/10 per cent. interest, or notes not bearing interest payable on demand, or treasury notes for one year at 3 65/100 per cent. interest, exchangeable for 7.30 notes; but the whole amount of demand notes not at interest shall not exceed $50,000,000. An act of Aug. 5, 1861, authorized the issue of bonds at 6 per cent. interest, running twenty years, to exchange for the one-year and three-year notes before authorized, with accumulated interest, at any time before or at their maturity; and the demand notes were declared receivable for all public dues. These acts were most wisely designed and signally successful: the demand notes, though at first rejected by the banks, before the close of the year were at a premium; and the interest-bearing notes became very acceptable, and were readily converted, with their accumulated interest, into the permanent 6 per cent. bonds. The current of public preference was then changed in favor of the government issues, which at first were received with aversion, particularly by the banks. A very large issue of these notes took place, the 7.30 notes reaching $140,094,750, and the 3.65 one-year notes a large sum, with the full $50,000,000 of demand notes. Of the 6 per cent. twenty-year bonds issued in redemption of the one- and three-year notes, there were $189,321,200, all being now outstanding, and due in 1881. On Feb. 12, 1862, $10,000,000 more of demand notes were issued, of which $88,296 remain outstanding; also $20,000 of the 7.30 notes are still out, both being probably lost.

The preceding very successful issues laid the basis for the first great popular loan, authorized Feb. 25, 1862, of $500,000,000 of 6 per cent. bonds, redeemable after five and payable after twenty years—the standard 5.20s of the stock list. A large subscription was at once made, and the full $500,000,000 were issued. The acts of Mar. 3, 1864, and Jan. 28, 1865, added $15,000,000 more to the authorization. Being redeemable after five years, a large amount of these have been called in, only $267,289,100 remaining out Jan. 1, 1873. By this act of Feb. 25, 1862, $150,000,000 of circulating notes were authorized and made a legal tender; $50,000,000 to be in place of the demand notes of July 17, 1861. On July 11, 1862, $150,000,000 more were authorized, and on Mar. 3, 1863, $150,000,000 more—$450,000,000 in all. The whole amount was issued, and formed the great volume of currency known as *greenbacks*. Of this issue $400,000,000 was made permanent, but contractions in 1868 and 1869 reduced the amount, and $358,557,907 only remained out Jan. 1, 1873. The act of Feb. 25, 1862, also authorized the acceptance of $25,000,000 of deposits at 5 per cent. interest; this authorization was increased to $50,000,000 Mar. 17, 1862, and to $100,000,000 July 11, 1862. On June 30, 1864, a further sum of $50,000,000 was added, this to pay 6 per cent. interest; all this, described as temporary loan, was to be repaid on ten days' notice, and was so repaid in 1865 and 1866, except $78,560 unclaimed. This temporary loan was very advantageous to both citizens and the government; the full amount authorized in each case was promptly offered, and the repayment reluctantly accepted when the necessities of the government no longer required the money.

The act of Mar. 1, 1862, authorized the issue of certificates of indebtedness to public creditors in adjustment of any claims, such certificates to bear 6 per cent. interest, and to run one year. The sum of $561,753,241 of such certificates was issued, all of which were redeemed in 1863, 1864, and 1865, except $5000. A most important service was rendered by these certificates, particularly in obtaining war-supplies. They were readily taken, and facilitated the funding of general indebtedness as they matured. The act of July 17, 1862, authorized the issue of postage stamps as currency, and made them receivable in payments to the U. S. in sums less than five dollars. An act of Mar. 3, 1863, authorized the use of fractional notes (parts of a dollar) in place of postal currency, limiting the amount to $50,000,000; which authorization was confirmed by the act of June 30, 1864. This issue was promptly called for to the extent of $30,000,000, and it has varied from that sum to the present amount of $45,722,061, outstanding Jan. 1, 1873. So much time has elapsed since the issue of the legal-tender notes and the smaller notes here described that it is safe to assume that without important changes in the general financial policy they are likely to remain as they are—nominal rather than real debt. No substitute for either can at present be found or appears to be desired.

By act of Mar. 3, 1863, a loan of $900,000,000 was authorized at 6 per cent. for ten or forty years, principal and interest payable in coin; of which $75,000,000 only was issued, and taken at a premium of 3½ to 4 per cent.; preference being given because of a possible distinction existing adverse to the payment of the principal of the 5.20s in coin. This act was repealed June 30, 1864, but the $75,000,000 remain outstanding. The same act, Mar. 3, 1863, also authorized $400,000,000 of one-, two-, and three-year treasury notes, at not over 6 per cent. interest, to be a legal tender for their face-value, principal and interest payable in lawful money. Of these there were—

One-year notes, issued.....	$44,520,000, at 5 per cent.	$93,795	out.
Two-year notes, "	166,180,000, at 5 "	62,350	"
Three-year notes (comp'd)...	266,595,440, at 6 "	532,920	"

This act authorized the exchange of new treasury notes for any of these issues outstanding at any time; and provided for $150,000,000 more of currency, not at interest, to facilitate such exchange. In all, $477,595,440 of these treasury notes of 1863 were issued; all of which, with the exception above stated, were cancelled or exchanged before May 15, 1868. It will be seen that but a small amount of permanent loan was created in 1863, treasury notes being largely used. The loans of 1864 began with an issue of $200,000,000, authorized Mar. 2, 1864, at 5 or 6 per cent., principal and interest payable in coin; $196,117,300 was issued at 5 per cent., to run forty years—10.40s of 1864—and $3,882,500 at 6 per cent. Most of the 5 per cents. brought a premium of from 1 to 7 per cent., and $194,567,300 remain out, with $2,298,000 of the 6 per cents. On June 30, 1864, another loan of $400,000,000 was authorized, at 6 per cent—5.20s of 1864—$125,561,300 being issued, and $68,974,680 remaining out Jan. 1, 1873. But the demand was enormous at this time; and the loans not being fully taken, the act of June 30, 1864, authorized the issue of $200,000,000 of 7.30 treasury notes, to run three years; which authority was extended by act of Mar. 3, 1865, to embrace $600,000,000 more. Under this authority $829,992,500 of 7.30 interest-bearing notes were issued, all of which were duly redeemed or exchanged before the 15th of July, 1868, except the sum of $303,900, not presented, and in part probably lost. On July 1, 1864, the secretary of the treasury was directed to invest a part of the sum accruing from naval captures as a navy pension fund, in registered securities bearing 3 per cent. interest in currency; which was done to the extent of $14,000,000; but this is a nominal or contingent liability only, so far as the capital is concerned.

The loans of 1865 began with the authorization of $600,000,000 of 6 per cent. 5.20 bonds by act of Mar. 3, to be applied only to the reimbursement of treasury notes or other outstanding obligations of the government. Two issues were made—on July 1, 1865, $322,998,950, and on Nov. 1, 1865, $203,327,250; of which issues $365,328,350 were out on Jan. 1, 1873. By authority of the same act, as construed by act of April 12, 1866, a further issue was made in July, 1867, of $379,616,050, and of $42,539,350 on July 1, 1868; these sums being employed to retire treasury notes and other obligations, but not to increase the public debt. Most of these last issues remain out—viz. $315,874,000 of 1867, and $38,638,400 of 1868. They are described as consols of 1865, 1867, and 1868. By act of Mar. 3, 1867, $50,000,000 of temporary loan certificates of deposit were authorized, bearing 3 per cent. interest, to be used to redeem compound-interest notes; and the act of July 25, 1868, authorized $25,000,000 more. Under both acts $85,150,000 of such certificates were issued, of which $2,780,000 were outstanding Jan. 1, 1873.

On July 8, 1870, certain war-claims of Maine and Massachusetts were adjusted by the issue of $678,362 of certificates bearing 4 per cent. interest in currency; $678,000 of which yet remain out. By act of July 14, 1870, $200,000,000 at 5 per cent., $300,000,000 at 4½ per cent., and $1,000,000,000 at 4 per cent. of new thirty-year bonds, principal and interest payable in coin, were authorized, to be used solely to retire 6 per cent. or other bonds of earlier issues. No action was taken until after the act of Jan. 20, 1871, which increased the 5 per cents. to $500,000,000, with interest payable quarterly. On May 1, 1871, $200,000,000 were issued, and exchanged for 6 per cents. at par; and on Feb. 1, 1873, $300,000,000 more were contracted to be so exchanged, on the same terms as in 1871. No increase of the debt was authorized, but a sum of advance interest was granted on the new issues for three months, to cover all the costs of negotiation and exchange. The full sum of $100,000,000 first offered to subscribers under the last negotiation was taken promptly, on being offered, before Feb. 20, 1873.

By acts of July 1, 1862, and July 2, 1864, bonds guaranteed by the U. S., and bearing 6 per cent. interest, to run thirty years, were authorized to be issued to the several Pacific Railway companies, on the completion and acceptance of finished portions of the several roads. During 1868 and 1869, chiefly, sums of $25,885,120 to the Central Pacific, of $27,236,512 to the Union Pacific, of $6,303,000 to the Kansas Pacific, with $5,198,880 to certain branch roads, were duly issued. For the present the interest on these bonds has been paid by the U. S., but they are secured by mortgage on the entire lines of the roads, of which they represent but one-half the capital stock.

The mere numerical statement of the vast transactions

through which the present debt was created almost precludes explanation of the not less remarkable circumstances transpiring in connection with these movements. The magnitude of these transactions is without a parallel in history, and the wholly unexpected power developed in 1862 to conclude great loans without resort to European markets produced a profound effect on both the government and the people. The popular loan of $515,000,000 in 1862 was the most remarkable of these events in its magnitude and its entire success; but subsequently a long period elapsed in 1863 and 1864 during which a permanent funded loan could with difficulty be placed. Very heavy issues of treasury notes and currency became necessary, with all the aid derivable from temporary loans, certificates of indebtedness, and compound-interest notes. At this time the severest trial of the credit and resources of the government took place. Gold rose in Sept., 1864, to 250 or more, and although many favorable results in practical business ensued from this high price of gold, investors in permanent securities were alarmed, and many looked forward to a necessity that might compel the scaling of the existing debt and a funding at gold values, for the purpose of creating a stock certain to be reimbursed, principal and interest, in gold. Heavy holders relieved themselves as far as practicable, and no opening appeared to place new loans advantageously. But at the close of 1864 a favorable reaction took place: great profits had been realized on produce-shipments outward during the year; gold declined rapidly, and the basis of its highest advance was shown to have been in part fraudulent as well as simply speculative; confidence was restored, and the coming close of the war reassured the country as to future increase of the debt. So large a share of treasury notes and certificates bore interest as also to render claimants and holders easy until a proper opportunity should be afforded to consolidate this floating debt, and the apprehended decline of securities was, for these reasons, almost wholly averted.

At this time the first material attempts at placing securities abroad began, the German market being first opened, though leading bankers still refused to quote them at all.* In England an attempt to place the small sum of $10,000,000 in Mar., 1863, on government account, wholly failed, and the bonds, which were 5.20s of 1862, were returned to the treasury. Great as was the profit of purchasing 6 per cent. gold-bearing securities at the low price they bore in gold in London, there was absolutely no investment in them, and only long afterward were any considerable numbers taken.

This adverse opinion in Europe was not, on the whole, unfavorable to American interests, since the appreciation of values occurring at and after the close of the war was felt almost wholly by our own people. So strong had the people become through the self-reliance imposed by these trials that the productive force of the country was at its highest point, and profits were realized so largely as to render all alike indifferent to the standing our credit might have in any foreign market. Subsequent to the close of the war the securities of undoubted position as regards payment of the principal in gold began to go abroad quite as freely as the public interests demanded. While discussions were pending in 1868 and 1869 as to the legal position of the principal of the 5.20s of 1862 and other like issues, the market for these continued to be confined to the U. S., but no necessity at any time existed for enlarging it, and no public interest has been prejudiced by the general restriction of sales abroad. Active as the discussion was in 1868 and 1869 as to the ultimate redemption of the issues referred to, it had immediate good effects in favoring the acceptance of the consols of 1867 and 1868, which were specifically pledged to be reimbursed in coin; and it ended in a general acquiescence in the view that sound policy required that no distinction should be recognized in the basis of these great loans, and that they all could be and would be reimbursed in coin. The practical point was fully turned by the Funding act of July, 1870, under which $500,000,000 of stocks fully pledged as payable in coin are taking the place of a like capital sum of 6 per cents. of the earlier issues, covering nearly all upon which doubt was at any time raised.

The conspicuous measures of wise legislation through which such vast sums have been raised and expended within the brief period of ten or twelve years have in part been indicated in the course of the above citation of events. They were, briefly, the demand and interest-bearing notes of July, 1861, the popular loan of May, 1862, and the legal-tender issues of Feb. and July, 1862, and Mar., 1863. The National bank system was also important, together with the large issues of treasury notes, temporary loans, etc. in 1864. After the close of the war it became easy to fund all these temporary securities without loss to the government or its creditors. The full effect of these beneficial measures was seen in the unexampled prosperity of the country, not only while the debt was accumulating and prices were high—even inordinately so—but also through the entire period of gradual return to normal prices in 1869. At this time a great and steady reduction of the debt began, sustained by full or increasing revenues and reduced expenditures, for nearly four years to the close of 1872; the total cancellation of 6 per cent. bonds being $299,891,100, and the total reduction of debt $363,697,000. The monthly interest charge is reduced one-fifth, being $8,516,808, as compared with $10,532,462 on Mar. 1, 1869. With the retirement of $300,000,000 of 6 per cents., and the substitution of a like sum of 5 per cents., as now provided, a further reduction of $250,000 will take place in the monthly interest charge, or over $3,000,000 yearly.

The several issues of bonds constituting the body of the funded debt have always borne a premium in lawful money, and have steadily appreciated in value as measured in gold. At the time of the first purchases in extinguishment of the principal, in May, 1869, the net cost of the bonds in gold was 83 per cent. of the par value; rising to 93.5 per cent. Jan. 5, 1870; to 97 per cent. Jan. 4, 1871, and to 99.99 per cent., or par, Jan. 4, 1872, and so remaining. The value of these securities is thus at par in gold for those liable to recall and cancellation, while all not so liable have always borne a large premium in currency, and usually a small premium in gold, being quoted in currency at 16 to 18 and sometimes 20 per cent. premium when gold was 12 to 14 per cent., or 2 to 5 per cent. above par. The steady maintenance, for the entire period since their issue, of a premium on all the permanent securities constituting the debt, is a remarkable proof of the stability of the public credit.

By act of Feb. 25, 1862, an amount of the gold receipts from customs sufficient to pay, in each fiscal year, 1 per cent. of the entire debt of the U. S. was set apart as a sinking fund for its redemption; but the pressure of current demands on the treasury prevented any action under this law until May, 1869; since which date, up to June 30, 1872, there have been purchased $99,397,600 of bonds of the various issues known as 5.20s, at a net cost in currency of $110,997,186. The interest of the bonds or debt so purchased being also set apart for the same purpose, the sinking fund became, by act of July 14, 1870, a cumulative appropriation in extinguishment of the debt, though not distinguished in operation from the regular mode of monthly purchase then begun with surplus funds of the treasury. Thus, though the general debt was less in 1872 than in 1870, the 1 per cent of the sinking fund, with its accumulated interest, gave the sum of $32,679,553 to be applied to such purpose in the latter year, as compared with $27,660,879 in 1870. The maintenance of the sinking fund as a practical agency for paying the debt of course depends on the continuance of surplus revenues. If so continued, the debt will be rapidly paid; but the reduction of leading items of customs and internal revenue charges made in 1870 and 1872 renders it doubtful whether more than the stipulated sums of the sinking fund will, at least for 1873, be available for the purpose. By direction of the act of July 14, 1870, the bonds purchased for the sinking fund, with all others purchased in extinguishment of the debt, were cancelled and destroyed, and the sinking fund was made a permanent annual appropriation from the customs revenues.

The history of former loans of the U. S. government, as well as those of the last decade, shows that only small reductions of their nominal or face-value have been suffered in negotiation, and that all obligations have been paid in full. By various small loans and issues of treasury notes $21,820,000 was borrowed from 1791 to 1800; the principal of debt remaining under the consolidation in 1791 being $75,463,476. Before the year 1810 this was reduced to $45,209,737, nothing having been borrowed from 1800 to 1810. In 1810, $2,750,000 was borrowed; and in 1812–17, $107,511,234 was realized from various loans, an aggregate discount of $6,169,681 being submitted to in their negotiation—nearly 6 per cent. In 1820 and 1821 the sum of $8,000,000 more was borrowed, without discount; and in 1824 and 1825, $10,000,000 more, also at par. But the debt was rapidly reduced, and wholly paid before the end of the year 1835; a large surplus revenue accumulating in 1836, which was distributed to the several States in 1837. In the same year loans again began, and the sum of $67,981,573 was realized from such loans from 1837 to 1844, much loss being incurred. The debt was reduced in the two following years, standing at $15,550,000 in 1846; in 1847, 1848, and 1849 large loans were made, realizing $82,967,200. Large

* Among the efforts made to avert the danger and discouragements that appeared imminent in the latter part of 1864 was the preparation and publication of a statement of the national resources, issued under the auspices of the treasury department, and very largely distributed by that department, by the secretary of state to representatives of the government abroad, and by loyal associations in various States.

receipts of revenue served to reduce this debt to less than $30,000,000 in 1857, to which $20,000,000 of bonds was added in 1858, with some treasury notes, giving $60,000,000 of debt at the commencement of the late war. At one period only (in 1835) was the debt wholly paid off.

Comparatively little has been written in permanent form on the subject of the national debt of the United States, other than the official reports of the secretaries of the treasury, entitled the "Finance Reports," 1861 to 1872. In these the principles and policy of the government are clearly elucidated, and the history of the several issues, withdrawals, and cancellations is fully given. The principal publications referring to the subject are J. G. Gibbons, "On the Public Debt of the United States" (1867); "How the National Debt can be Paid," by William Elder (1867); "Is our Prosperity a Delusion?" (1868); "The Science of Wealth," by Amasa Walker (1867–72); Baxter, "On the National Debt of England and the United States" (1872), with various pamphlets, speeches, reports, etc. by other authors. During the war many pamphlets were published by individuals, proposing plans for the liquidation or extinguishment of the public debt, or in opposition to specified measures of the government, but few were of great importance or of permanent value. The measures actually adopted were, on the whole, wisely framed and singularly successful in their operation. The difficulties temporarily existing, or feared by some, disappeared with the lapse of time, and the public acquiescence became universal. It is not easy now to see what one of the great measures actually inaugurated could have been spared from the list of enactments necessary to sustain the country in the peculiar exigencies arising during the last twelve years.

Lorin Blodget.

Dec'agon [from the Gr. *δέκα*, "ten," and *γωνία*, an "angle"], a plane geometrical figure having ten sides and ten angles. If the sides and angles are all equal, the figure is a regular decagon, and inscribable in a circle. A regular decagon may be formed from a regular pentagon by describing a circle round the latter, bisecting the arcs between its angular points, and drawing lines joining the angular points to the points of the intermediate section.

Decalitre [Fr.], a measure equivalent to ten litres. (See Litre.)

Dec'alogue [Heb. עשרת הדברים; Gr. *δεκάλογος*, or *οἱ δέκα λόγοι*, "the ten words"], called also the **Ten Commandments,** and often spoken of as the "moral law," in distinction from the ceremonial law of the Jews, is that part of the law of Moses contained in Exodus xx. 3–17 and repeated in a hortatory form in Deuteronomy v. 7–21. It was originally written upon two tablets of stone (Ex. xxx., etc.), which were placed within the ark of the covenant. The text of Scripture (Ex. xxxiv. 28) appears to fix the number of these commandments at ten, but various opinions exist as to the manner of dividing them. The arrangement recognized by the Greek Church and most Protestants, called the Origenian division, is that which was approved, though not originated, by Origen. It had been approved by Philo and Josephus, and was generally adopted by the Christian Church. But in the West it faded out, and was revived by Leo Judæ (1482–1542) in his catechism, 1534, and by Calvin, 1536. The Roman Catholics, at least in their catechisms, unite into one what most Protestants consider the first and second commandments, and divide the tenth Origenian commandment into two. This was Luther's arrangement, and is generally, though not universally, followed by the Lutheran Church. It is called the first Masoretic arrangement. The modern Jews adopt what is called the Talmudical arrangement, which gives as the first commandment the words contained in Ex. xx. 2, and has for its second commandment the first and second of the Origenian arrangement. The second Masoretic, adopted by English Roman Catholics, differs from the first Masoretic only in inverting the order of the ninth and tenth commandments. The ten commandments, with the exception of the two regarding the Sabbath and reverence to parents, are negative ones, forbidding certain actions, and leaving positive precepts to other laws or to the individual conscience. The Decalogue is generally regarded as a moral code, binding from its own nature. It is, however, admitted that the fourth (or Sabbath) commandment has a positive as well as a moral element in it. Christ reduced the ten commandments to two.

Revised by R. D. Hitchcock.

Decam'eron [It. *Decamerone*, from the Gr. *δέκα*, "ten," and *ἡμέρα*, a "day"], the name given by Boccaccio to his celebrated collection of tales, which are supposed to be narrated in turn during ten days by a party of guests assembled at a villa to escape from the plague, which raged at Florence in 1348.

De Camp (John C.), U. S. N., born Oct. 5, 1812, in New Jersey, entered the navy as a midshipman Oct. 1, 1827, became a passed midshipman in 1833, a lieutenant in 1838, a commander in 1855, a captain in 1862, a commodore in 1866, and a rear-admiral (retired list) in 1870. He commanded the Iroquois at the passage of Forts St. Philip and Jackson and capture of New Orleans, and, in short, in every action on the Mississippi under Farragut, to and including Vicksburg, in all of which he was conspicuous for gallant bearing.

Foxhall A. Parker, U. S. N.

Decamps (Alexandre Gabriel), a celebrated French painter of history and landscapes, was born in Paris Mar. 3, 1803. He visited the Levant about 1827, and painted mostly Oriental scenes with striking light-effects. He painted history, landscapes, genre, and animals, all with success. Among his works are the "Defeat of the Cimbri" (1834), a "Souvenir of Turkey in Asia," and "Les Singes Experts." His historical works are commended for grandeur of conception and a bold and free style of treatment. At the Exposition of 1855 his pictures divided the public attention with those of Ingres, Delacroix, and Vernet. Died at Fontainebleau Aug. 22, 1860. (Théophile Silvestre, "Histoire des Artistes Vivants," Paris, 1856.)

De Candolle (Augustin Pyrame), M. D., an eminent botanist of French extraction, born at Geneva Feb. 4, 1778. He studied at Geneva, and in 1796 he removed to Paris, where he studied chemistry and medicine, and became a pupil of the botanist Desfontaines and enjoyed the friendship of Cuvier and Humboldt. He published a "History of Succulent Plants" (1799–1803). In 1804 he graduated with an "Essay on the Medicinal Properties of Plants." Lamarck's "Flora of France," the first volume of which appeared in 1804, was prepared by him. He became in 1808 professor of botany at Montpellier, and published in 1813 his "Elementary Theory of Botany," a profound work, in which he developed his new system of classification according to the natural method. In 1816 he removed to Geneva. He projected a great work which should give a description of all known plants, and published two volumes (1818–21), with the title "Regni Vegetabilis Systema Naturale." Perceiving that the life of one man was not adequate to complete the work on so vast a scale, he modified his plan, and undertook to present a methodical arrangement of all known plants by orders, genera, and species in his "Prodromus Systematis Naturalis Regni Vegetabilis" (10 vols., 1824–46), which he did not live to finish. This is a very important book of reference for working botanists. Among his other works is "Organographie Végétale" (1827). Died at Geneva Sept. 9, 1841.—His son, Alphonse Louis Pierre de Candolle, born Oct. 28, 1806, has written several botanical works, published his father's "Mémoires et Souvenirs" (1862), and continued the "Prodromus." (See Flourens, "Éloge historique de P. de Candolle," 1842; Delarive, "A. P. Decandolle, sa Vie et ses Travaux," 1851.)

Decanta'tion [from the Fr. *décanter* (It. *decantare*), to "pour"], the act of decanting; the pouring off a clear liquid from its sediment or subsidence. Chemists often resort to this process instead of filtration to separate the clear supernatant liquid from precipitates, and they sometimes perform the decantation by means of a siphon.

Decapita'tion [Late Latin *decapitatio*, from Lat. *de*, "from," "off," and *caput* (gen. *capitis*), a "head"], a form of Capital Punishment (which see) in which the head is severed from the body by an executioner. Under the English government hanging has taken the place of decapitation, the last instance of the latter having occurred in 1745. This mode of punishment is still used in some of the German states and in France. In France the Guillotine (which see) is still used. Decapitation is of very ancient origin. It is a frequent punishment among Oriental nations.

Dec'apod [from the Gr. *δέκα*, "ten," and *ποῦς* (gen. *ποδός*), a "foot"], a name applied by Cuvier to an order of crustaceans, comprehending those which have ten thoracic feet. The same name is also applied to a tribe of cephalopods, including those which have ten locomotive and prehensile appendages proceeding from the head, two of which are longer than the rest, and called tentacles. Decapod crustaceans are usually divided into three sub-orders—the long-tailed, the irregularly-tailed, and the short-tailed decapods. Shrimps, prawns, lobsters, and crawfish are examples of the first sub-order; the other two sub-orders contain the numerous species of crab.

Decap'olis [from the Gr. *δέκα*, "ten," and *πόλις*, a "city"], a district containing ten cities of Palestine and Syria, founded principally by veterans from the army of Alexander, but recolonized and endowed with special privileges after the Roman conquest of Syria (65 B. C.). Ancient writers are not agreed in regard to the names of these cities. According to Pliny, they were Damascus, Phila-

delphia, Raphana, Scythopolis, Canatha, Dion, Gadara, Gerasa, Pella, and Hippos. All, except Scythopolis, were on the E. side of the Jordan.

Deca'tur, a county which forms the S. W. extremity of Georgia. Area, 1062 square miles. It is bounded on the W. by the Chattahoochee, and intersected by the Flint River. The soil is generally fertile. Rice, maize, oats, tobacco, cotton, and wool are the chief products. It is partly traversed by the Atlantic and Gulf R. R. Capital, Bainbridge. Pop. 15,183.

Decatur, a county in the S. E. of Indiana. Area, 372 square miles. It is drained by Clifty and Sand creeks. The surface is undulating; the soil is based on limestone, and is fertile. Cattle, grain, wool, hay, and dairy products are raised. The most numerous manufactories are those of saddlery and harness. It is intersected by the Indianapolis and Cincinnati R. R. Capital, Greensburg. Pop. 19,053.

Decatur, a county in the S. of Iowa. Area, 528 square miles. It is intersected by the Crooked Fork of Grand River. The surface is mostly undulating prairie; the soil is fertile. Cattle, grain, wool, hay, butter, and lumber are produced. Capital, Leon. Pop. 12,018.

Decatur, a county in W. Central Tennessee. Area, 325 square miles. It is bounded on the E. by the Tennessee River. The soil is mostly fertile. Cattle, grain, tobacco, cotton, and wool are raised. Capital, Decaturville. Pop. 7772.

Decatur, a post-village of Morgan co., Ala., on the Tennessee River and the Memphis and Charleston R. R., which here connects with the Nashville and Decatur R. R., 122 miles S. of Nashville (Tenn.). It has two weekly newspapers. Pop. of Decatur township, 2821.

Decatur, the capital of De Kalb co., Ga., is finely situated on the Georgia R. R., 6 miles E. N. E. of Atlanta. Pop. 401.

Decatur, a city, capital of Macon co., Ill., is about 1 mile N. of the Sangamon River, and on the Central R. R. where it crosses the Toledo Wabash and Western R. R., 39 miles E. of Springfield, the terminus of the Paris and Decatur, Mattoon Sullivan and Decatur, Decatur and East St. Louis, Pekin Lincoln and Decatur, Decatur and State Line, Indiana and Illinois Central, running to Indianapolis, Champaign Monticello and Decatur, and Peoria Atlanta and Decatur R. Rs., making nine railroads centering at this point. It has about four miles of street railway. It has twelve churches, one national bank, one rolling-mill, and several factories. One daily and five weekly newspapers are issued here. Decatur has increased rapidly in the last decade. Pop. 7161; of township, 1337.
MILLER & ADDIS, PUBS. "MAGNET."

Decatur, a post-village, capital of Adams co., Ind., on the St. Mary's River and on the Cincinnati Richmond and Fort Wayne R. R., 21 miles S. S. E. of Fort Wayne. It manufactures wagon material and stoves. It has one weekly newspaper. Pop. 858. ED. "EAGLE."

Decatur, a township of Marion co., Ind. Pop. 1559.

Decatur, a post-township of Decatur co., Ia. P. 1046.

Decatur, a post-village of Van Buren co., Mich., on the Michigan Central R. R., 116 miles E. by N. of Chicago. It has a national bank and one weekly newspaper. Pop. 1420; of Decatur township, 2512.

Decatur, a post-township of Burt co., Neb. Pop. 614.

Decatur, a post-township of Otsego co., N. Y. P. 802.

Decatur, a post-village of Byrd township, Brown co., O. . Pop. 204.

Decatur, a township of Lawrence co., O. Pop. 1761.

Decatur, a township of Washington co., O. P. 1437.

Decatur, a township of Clearfield co., Pa. Pop. 1461.

Decatur, a post-township of Mifflin co., Pa. Pop. 1171.

Decatur, a post-village, capital of Meigs co., Tenn., on the Tennessee River, 140 miles E. S. E. of Nashville. P. 99.

Decatur, a post-village, capital of Wise co., Tex., is 200 miles N. of Austin City, on a beautiful eminence. It has one weekly newspaper.

Decatur, a township of Green co., Wis. Pop. 2459.

Decatur (STEPHEN), a famous American commodore, was born at Sinnepuxent, Md., Jan. 5, 1779, and entered the navy in 1798. In Feb., 1804, he led a small party which burned in the harbor of Tripoli the American frigate Philadelphia after she had been captured. For this gallant exploit he was raised to the rank of captain. Having taken command of the frigate United States, he captured the British frigate Macedonian Oct. 25, 1812. A gold medal was voted to him by Congress for this victory. He was blockaded by a superior force in the harbor of New London in 1813–14. In May, 1815, he was appointed commander of a squadron of three frigates and seven smaller vessels, which was sent to chastise the Algerines. He captured two Algerine vessels of war June 17 of that year, and compelled the dey of Algiers to sue for peace. He was killed in a duel by Commodore James Barron Mar. 22, 1820. He was noted for his resolute spirit and cool intrepidity. (See his life, in SPARKS's "Am. Biography.")

Deca'turville, a post-village, capital of Decatur co., Tenn., 6 miles from the W. bank of the Tennessee River, 100 miles W. S. W. of Nashville. Pop. 188.

Decay' [remotely from the Lat. *decado*, to "fall"] is the comparatively slow oxidation or burning which moist organic matter undergoes when exposed to air. It is not usually accompanied by perceptible increase of heat, unless putrefaction or fermentation is associated with it. Substances rich in nitrogen are especially liable to decay; consequently, most animal substances decay more rapidly than any vegetable matters except the softest and most nitrogenous. The decay of animal substances after death is, according to the observations of Duvernoy, probably but the continuation of the normal disassimilation which goes on throughout life; but as the corresponding processes of repair have ceased, the decay becomes apparent for the first time after death. The decay of nitrogenous matters in the proper circumstances is accompanied by certain processes known as putrefaction and fermentation—processes which are accompanied by the growth of fungi, often microscopical, and by complex chemical changes which materially hasten the process of destruction.

Decazes (ÉLIE), DUC, a French minister, born Sept. 28, 1780. He was appointed minister of police in place of Fouché by Louis XVIII. in 1815, then minister of the interior, and prime minister in 1819. He resigned in Feb., 1820, when accused of connivance with the assassination of the duke of Berry. Decazes still retained the favor of the king, who sent him ambassador to London, and gave him the title of duke. Died Oct. 25, 1860.

Decazeville, a town of France, department of Aveyron, about 20 miles N. E. of Villefranche. It has extensive blast-furnaces and iron-forges. Coal-mines are worked in the vicinity. Pop. 7106.

Dec'can [Sanscrit, *Dacshinq*, "the south"], a term formerly applied to the whole of Hindostan S. of the Nerbudda River or Vindhya Mountains, but now usually limited to the country between the Nerbudda and the Kistnah. It comprises Aurungâbâd, Beeder, Berar, Bejapoor, Candeish, Gundwana, Northern Circars, and Orissa.

Decem'ber [Fr. *Décembre*, from the Lat. *decem*, "ten"], the twelfth and last month of the year, is so called because in the ancient Roman calendar it was the tenth month of the year.

Decem'viri (sing. **Decemvir**), [Lat., from *decem*, "ten," and *vir* (plu. *viri*), a "man"], a name applicable to ten persons appointed for particular purposes, but more especially applied to the ten magistrates elected from the Roman patricians to draw up a code of laws founded on the more approved institutions of Greece; they were also invested with supreme authority to govern the state. The experiment proved entirely successful; their laws were approved by the senate and engraven on ten metal tablets; and their official duties were discharged with so much satisfaction that, at the expiration of their year of office, it was resolved, as their work was not completed, to continue the same form of government. A new commission, invested with the same power, was appointed for the next year, to which the plebeians were admitted, the result of which was two additional tablets, thus completing the famous Twelve Tables which in subsequent times became the foundation of all Roman law. The new decemviri, however, proceeded to the most violent acts of despotism, perpetrating various outrages on the persons and families of the plebeians, which so exasperated the people that an insurrection broke forth; the decemviri were driven from office, and the ordinary magistrates were re-established.

The *decemviri litibus judicandis* ("ten men for settling lawsuits") formed a kind of court for trying civil cases, and, later, for matters involving life and death. The *decemviri sacris faciundis* (the "ten men for performing sacred duties"), first instituted about 367 B. C., were five patricians and five plebeians who had charge of the Sibylline books until the time of Cicero, when they were made fifteen in number. They were considered sacred to Apollo. There were also decemviri for dividing the public lands.

Decen'nial [from the Lat. *decennium*, a "period of ten years" (from *decem*, "ten," and *annus*, a "year")], occurring every ten years. For example, the U. S. census is decennial. The decennial games (*decennia* or *decennalia*) among the later Romans were celebrated in consequence

of the fact that the emperor Augustus pretended to refuse the empire for life, choosing to be elected to it for a period of ten years, at the end of which time he accepted it for ten years more, and so on till the end of his life. The fiction was kept up till the last days of the empire by the observance of the decennial games.

Dechant (Rev. Jacob William) was born at Kreuznach, in the Palatinate, Feb. 18, 1784, and emigrated to America in 1805. He was ordained to the ministry of the German Reformed Church in 1808. He labored with success as a missionary among the Germans of Ohio and Pennsylvania, and instructed numbers of theological students. Died of cholera Oct. 5, 1832.

De Charms (Richard), an American Swedenborgian minister and writer, born in Philadelphia Oct. 17, 1796, graduated at Yale College in 1826. He published "The New Churchman Extra," and several volumes of sermons. Died Mar. 20, 1864.

Decherd', a post-village of Franklin co., Tenn., is the E. terminus of the Winchester and Alabama R. R., and is also a station of the Nashville and Chattanooga R. R., 82 miles from Nashville.

Decid'uous [Lat. *deciduus*, from *de*, "down," and *cado*, to "fall"] **Trees** are trees whose leaves fall off in autumn and are annually renewed in the spring. The greater part of the trees and shrubs of temperate climates are deciduous, but in tropical countries the forest trees maintain generally a perennial verdure, except where the diversities caused by the wet and dry seasons are extreme. Trees that are not deciduous are called evergreen.

Deciduous Teeth, called also, in mammals, temporary or milk teeth, are the teeth which appear in infancy, and which after a time fall out, and are succeeded by the permanent teeth. In children there are twenty such teeth, ten in each jaw—four molar, two canine, and four incisor teeth. In reptiles and fishes all teeth are deciduous, being continually cast out and renewed.

Dec'imal [from the Lat. *decimus*, "tenth" (from *decem*, "ten")], a number written in the scale of tens. The name is especially applied to a Decimal Fraction (which see).

Decimal Fraction is a fraction whose denominator is a decimal number or power of ten. Thus, $\frac{1234}{100}$ is a decimal fraction. It may be decomposed into the sum $\frac{1000}{100} + \frac{200}{100} + \frac{30}{100} + \frac{4}{100} = 10 + 2 + \frac{3}{10} + \frac{4}{100}$. By an obvious extension of the method of local values, where each digit has ten times the value of the like digit which immediately follows it, the above decimal fraction may be, and usually is, written thus: 12.34, where the decimal point after the 2 merely serves to indicate which digit represents *units*. In this form a decimal fraction is termed a *decimal*.

For the purpose of indicating the units' place the method of Sir Isaac Newton, of using a point placed for distinction near the top of the figures, is frequently used. The operations of addition, subtraction, multiplication, and division may be applied to decimals in exactly the same manner as to integers. The only additional rules in decimals refer to the position of the decimal point.

In their abbreviated form, decimal fractions are now extensively employed in arithmetical calculations. A subdivision of weights and measures on the principle of decimal division was introduced into France at the time of the Revolution, and has since been adopted by a large portion of the civilized world.

Decima'tion [Lat. *decimatio*, from *decem*, "ten"], in Roman history, the selection by lot of one man out of every ten, who was put to death in cases of mutiny or other grave offence committed by a body of troops. Decimation has seldom been practised in modern times. Blücher decimated a body of mutinous troops before the battle of Waterloo.

Decimi, dā'che-mee [from the Lat. *decimus*, "tenth"], an Italian term used in music, signifying an interval of ten diatonic degrees, as from C to E, or third above the octave, as which it is always treated in harmony. In double counterpoint, where a necessary difference has to be made, it is treated differently from the third, although the same harmonic rules obtain; also in thorough-bass, where the figure 9 rises a degree to 10, instead of falling a degree to 8.

De'cius (Caius Messius Quintus Trajanus), a Roman emperor, born in Pannonia about 200 A. D. He became a general in the service of the emperor Philip, and had command of an army which revolted against Philip and proclaimed Decius. In the battle that ensued Philip was defeated and killed in 249 A. D. A severe persecution of the Christians occurred in the reign of Decius, who was killed in battle by the Goths in Nov., 251 A. D.

Decius Mus (Publius), a Roman consul and patriot who obtained celebrity by devoting himself to the Dii Manes as a sacrifice. In a battle against the Latins (337 B. C.) he rushed into the midst of the enemy and was killed. His son, P. Decius Mus, imitated his example in 296 B. C., when he commanded against the Gauls.

Deck [from the Ang.-Sax. *decan*, to "cover," and allied to the Lat. *tectum*, a "covering" or "roof" (from *tego*, *tectum*, to "cover"); Fr. *pont* or *tillac*], a planked flooring, forming also a covering or division to a ship. In large vessels there are several decks, as the upper, main, lower, and orlop decks. Smaller ships have two whole and one half deck, and still smaller only one of each.

Deck'er, a township of Richland co., Ill. Pop. 971.

Decker, a township of Knox co., Ind. Pop. 837.

Decker (Thomas), an English dramatist, born before 1600. He wrote several plays in partnership with Ford and Rowley. His principal works are "Fortunatus, or the Wishing-Cap," "The Honest Whore," and the "Gull's Horn-Book." Died about 1638.

Deck'ertown, a post-village of Wantage township, Sussex co., N. J., on the New York and Oswego Midland R. R., 66 miles N. W. of Jersey City. It has one national bank and one weekly newspaper.

Declara'tion [Lat. *declaratio*, from *declaro*, to "make clear"], an affirmation; the act of declaring; a public announcement; a public expression of facts or opinions; a proclamation. Among the most memorable of all political documents is the American Declaration of Independence (which see). The first Colonial Congress passed an important "Declaration of Rights" at Philadelphia on the 14th of Oct., 1774. Though less famous than the Declaration of Independence, it is of scarcely less importance in the history of our country. (See Gillet's "Federal Government," 1871, pp. 17–27.) A "Declaration of the Rights of Man" was adopted by the National Assembly at Paris Aug. 18, 1789. The "Declaration of Thorn" (Lat. *declaratio Thorunensis*) was a confession of faith drawn up at Thorn, in Poland, in 1645, for the use of the Reformed churches, the design being to settle controverted points.

Declaration, in law, is a specification of a cause of action by a plaintiff against a defendant; the pleading in which a plaintiff sets forth his case against the defendant. It contains certain formal or substantial parts, such as the title, venue, the cause of action, and the conclusion. If the plaintiff fails to declare within a certain time, the defendant may obtain judgment of *non pros*. The term is used in other significations in other branches of the law—*e. g.* declaration of trust, declaration of uses, declaration in evidence, etc.

Declaration of War, the formal announcement by a government of its intention to wage war against another, is a proceeding which is observed among all civilized nations, though instances have frequently occurred where *de facto* wars have been carried on without such notification, as between the English and Spanish at sea at various times during the reigns of Elizabeth and James I. of England. Powerful nations have also sometimes, without any such declaration, attacked the weak, designing a breach of international law. In the U. S. the declaration of war is a power exercised by Congress alone. During the age of chivalry, a herald made declaration of war at the enemy's court, his tabard on his arm. No offence was taken at his defiance, which was frequently rewarded by gifts of money from the party defied. (See International Law No. II., by Pres. T. D. Woolsey, S. T. D., LL.D.

Declaration of Independence.* The first Congress of the thirteen British colonies, which led to their ultimate union in resistance to the British crown, and their jointly throwing off their allegiance to the same, as well as their ultimate union as the United States of America, met in Philadelphia on the 5th of Sept., 1774. The immediate cause of this assemblage was what was called "the Boston Port Bill;" that is, an act of Parliament by which the port of Boston was closed and the custom-house removed to Salem, because of the destruction of the tea at the former place. This was looked upon by the friends of constitutional liberty in all the colonies as a direct attack by usurpation upon the chartered rights of Massachusetts. If they should silently permit this gross outrage to be perpetrated upon a sister colony, they saw no security against similar outrages being perpetrated in turn upon their own chartered or constitutional rights. It was now that the cry of "The cause of Boston is the cause of us all" was raised in Virginia, and extended from the Penobscot to the Altamaha. The result was the call of a general Congress of all the colonies, to meet, by deputies, at the time and place stated, for joint consultation and joint action in maintenance of principles essential to the preservation of the rights and liberties of all. The idea of independence or

* By Hon. Alex. H. Stephens.

separation was at this time entertained by no one. Upon the assembling of this Congress, Peyton Randolph of Virginia was chosen the president of it, and Charles Thompson secretary. In all the deliberations of this body each colony stood upon an equal footing with the others, without regard to population, wealth, or the number of delegates sent. All questions were decided by the colonies present, each having one vote only. They urged several measures upon the consideration of their constituents as proper means for obtaining a general redress of grievances, and

Old Pennsylvania State-house, or "Independence Hall" (where the Declaration was signed), as it appeared in 1776.

also prepared and published a declaration of what they considered the indefeasible rights of all the colonies under the British constitution. They adjourned on the 26th of Oct., 1774, with a recommendation to the colonies to meet in Congress again, by deputies, on the 10th of May, 1775.

In speaking of the papers issued by this assemblage, Lord Chatham said in the British Parliament that, though he had studied and admired the free states of antiquity, the master-spirits of the world, yet for solidity of reasoning, force of sagacity, and wisdom of conclusion no body of men could stand in preference to this Congress. All this, however, incensed rather than appeased the ministry. On the 1st of April, 1775, they had 3000 troops in Boston for the purpose of enforcing their iniquitous measures at the point of the bayonet. Hostilities soon ensued. The battles of Concord and Lexington were fought. Engagements also took place at Ticonderoga, Crown Point, and Skenesborough in New York.

It was in this state of things that the second Congress of the colonies assembled at Philadelphia on the 10th of May, 1775, according to the recommendation of its predecessor. Peyton Randolph of Virginia was again chosen president, but soon being called home on urgent business, John Hancock of Massachusetts was, on the 24th of May, chosen president of the Congress in his stead. The crisis was now becoming not only serious, but alarming. The purpose of Great Britain to reduce the colonies to absolute subjection without any redress of grievances seemed to be evident. The Congress, with firmness and without hesitation, determined to resist force by force. Troops were raised for the purpose. In setting forth the reasons for their action in thus defending themselves and their constituents, they declared that they had "no wish to separate from the mother-country, but only to maintain their chartered rights." "In our native land," said they, "and in defence of the freedom which is our birthright, and which we have ever enjoyed till the late violation of it, for the protection of our property, acquired solely by the honest industry of our forefathers and ourselves, against violence actually offered, we have taken up arms. We shall lay them down when hostilities shall cease on the part of the aggressors, and all danger of their being renewed shall be removed, and not before."

On the 14th of June, 1775, at the instance of Massachusetts, George Washington, one of the delegates of Virginia, was unanimously appointed commander-in-chief of all the colonial forces. He was commissioned in the name of the united colonies, the name of each colony present by its deputies being set forth in the commission. This office he accepted on the condition that he should receive no salary except the payment of his actual expenses.

Three days afterwards the battle of Bunker Hill was fought. Washington did not reach the vicinity of Boston until the 12th of July, 1775, when he assumed the command of the colonial army assembled there. It was not until the early part of the year 1776 that the public mind throughout the colonies began generally and seriously to consider the question of independence, though a portion of the people of North Carolina had taken this view of the subject almost from the beginning of the recent troubles. As early as the 20th of May, 1775, their celebrated Mecklenburg convention assembled and announced their famous declaration, severing for ever themselves from all their allegiance to the crown of Great Britain.

In Jan., 1776, Massachusetts instructed her delegates in the Congress of the colonies at Philadelphia to vote for independence. South Carolina gave similar instructions to her delegates in March. Georgia and North Carolina did the same in April. In May, Gen. Washington wrote from the head of the army, then at New York, "A reconciliation with Great Britain is impossible. . . . When I took command of the army I abhorred the idea of independence; but I am now fully satisfied that nothing else will save us." In the same month Virginia instructed her delegates in Congress to vote for independence. New Hampshire, New Jersey, and Maryland followed in giving similar instructions to their delegates early in June. Pennsylvania and New York delayed action, still indulging hopes of an adjustment of the controversy. The general instructions of the colonies to their delegates were to renounce all allegiance to the British crown, and to form a confederation among themselves as independent States. On the 7th of June, Richard Henry Lee, a delegate from Virginia, moved a resolution in Congress that "these united colonies are, and of right ought to be, free and independent States, ... and that a plan of confederation be prepared and transmitted to the respective colonies for their consideration and approbation." This resolution was adopted on the 11th of June. Two committees were appointed under it—one to prepare a Declaration of Independence, and the other to prepare Articles of Union or Confederation. The committee to prepare the Declaration of Independence consisted of Thomas Jefferson of Virginia, John Adams of Massachusetts, Benjamin Franklin of Pennsylvania, Roger Sherman of Connecticut, and Robert R. Livingston of New York. They reported on the 28th of June, but action on the report was deferred for some days for the delegates from Pennsylvania and New York to receive their instructions

and powers to vote for the Declaration. This celebrated paper was drawn up by Mr. Jefferson, the chairman of the committee, being only slightly modified in some parts, as

The "Liberty Bell" was first imported from England in 1753. It was cracked at the first ringing after its arrival, and recast in Philadelphia in the same year. Upon the fillets around it were cast (twenty-three years before the Declaration of Independence) the prophetic words, "Proclaim liberty throughout all the land, unto all the inhabitants thereof." After the first reading of the Declaration it was rung for more than two hours, with the firing of cannon and the beating of drums. The bell has been broken for many years. It now stands in the hall of the old State-House, Philadelphia.

it now stands, at the suggestion of other members. It came up for final action on the 4th day of July, when it received the unanimous vote, not only of all the colonies, but of all their delegates in Congress. It was voted upon by colonies as separate and distinct political bodies, and as it stands on the journal is in these words:

IN CONGRESS, July 4, 1776.

THE UNANIMOUS DECLARATION OF THE THIRTEEN UNITED STATES OF AMERICA.

When, in the course of human events, it becomes necessary for one people to dissolve the political bands which have connected them with another, and to assume, among the powers of the earth, the separate and equal station to which the laws of nature and of nature's God entitle them, a decent respect to the opinions of mankind requires that they should declare the causes which impel them to the separation.

We hold these truths to be self-evident, that all men are created equal; that they are endowed by their Creator with certain unalienable rights; that among these are life, liberty, and the pursuit of happiness. That to secure these rights, governments are instituted among men, deriving their just powers from the consent of the governed; that whenever any form of government becomes destructive of these ends, it is the right of the people to alter or to abolish it, and to institute a new government, laying its foundation on such principles, and organizing its powers in such form, as to them shall seem most likely to effect their safety and happiness. Prudence, indeed, will dictate that governments long established, should not be changed for light and transient causes; and accordingly, all experience hath shown, that mankind are more disposed to suffer, while evils are sufferable, than to right themselves by abolishing the forms to which they are accustomed. But when a long train of abuses and usurpations, pursuing invariably the same object, evinces a design to reduce them under absolute despotism, it is their right, it is their duty, to throw off such government, and to provide new guards for their future security. Such has been the patient sufferance of these Colonies, and such is now the necessity which constrains them to alter their former systems of government. The history of the present king of Great Britain is a history of repeated injuries and usurpations, all having, in direct object, the establishment of an absolute tyranny over these States. To prove this, let facts be submitted to a candid world:

He has refused his assent to laws the most wholesome and necessary for the public good.

He has forbidden his Governors to pass laws of immediate and pressing importance, unless suspended in their operation till his assent should be obtained; and, when so suspended, he has utterly neglected to attend to them.

He has refused to pass other laws for the accommodation of large districts of people, unless those people would relinquish the right of representation in the Legislature; a right inestimable to them, and formidable to tyrants only.

He has called together legislative bodies at places unusual, uncomfortable, and distant from the depository of their public records, for the sole purpose of fatiguing them into compliance with his measures.

He has dissolved representative houses repeatedly, for opposing, with manly firmness, his invasions on the rights of the people.

He has refused, for a long time after such dissolutions, to cause others to be elected; whereby the legislative powers, incapable of annihilation, have returned to the people at large for their exercise; the State remaining, in the mean time, exposed to all the danger of invasion from without, and convulsions within.

He has endeavored to prevent the population of these States; for that purpose, obstructing the laws for the naturalization of foreigners; refusing to pass others to encourage their migration hither, and raising the conditions of new appropriations of lands.

He has obstructed the administration of justice, by refusing his assent to laws for establishing judiciary powers.

He has made judges dependent on his will alone, for the tenure of their offices, and the amount and payment of their salaries.

He has erected a multitude of new offices, and sent hither swarms of officers to harass our people and eat out their substance.

He has kept among us, in times of peace, standing armies, without the consent of our legislature.

He has affected to render the military independent of, and superior to, the civil power.

He has combined, with others, to subject us to a jurisdiction foreign to our constitution, and unacknowledged by our laws; giving his assent to their acts of pretended legislation.

For quartering large bodies of armed troops among us:

For protecting them, by a mock trial, from punishment, for any murders which they should commit on the inhabitants of these States:

For cutting off our trade with all parts of the world:

For imposing taxes on us without our consent:

For depriving us, in many cases, of the benefits of trial by jury:

For transporting us beyond seas to be tried for pretended offences:

For abolishing the free system of English laws, in a neighboring province, establishing therein an arbitrary government, and enlarging its boundaries, so as to render it at once an example and fit instrument for introducing the same absolute rule into these Colonies:

For taking away our charters, abolishing our most valuable laws, and altering, fundamentally, the powers of our governments:

For suspending our own legislatures, and declaring themselves invested with power to legislate for us in all cases whatsoever.

He has abdicated government here, by declaring us out of his protection, and waging war against us.

He has plundered our seas, ravaged our coasts, burnt our towns, and destroyed the lives of our people.

He is, at this time, transporting large armies of foreign mercenaries to complete the works of death, desolation, and tyranny, already begun, with circumstances of cruelty and perfidy scarcely paralleled in the most barbarous ages, and totally unworthy the head of a civilized nation.

He has constrained our fellow-citizens, taken captive on the high seas, to bear arms against their country, to become the executioners of their friends and brethren, or to fall themselves by their hands.

He has excited domestic insurrections among us, and has endeavored to bring on the inhabitants of our frontiers, the merciless Indian savages, whose known rule of warfare is an undistinguished destruction of all ages, sexes, and conditions.

In every stage of these oppressions, we have petitioned for redress in the most humble terms; our repeated petitions have been answered only by repeated injury. A prince, whose character is thus marked by every act which may define a tyrant, is unfit to be the ruler of a free people.

Nor have we been wanting in attention to our British brethren. We have warned them, from time to time, of attempts made by their legislature to extend an unwarrantable jurisdiction over us. We have reminded them of the circumstances of our emigration and settlement here. We have appealed to their native justice and magnanimity, and we have conjured them, by the ties of our common kindred, to disavow these usurpations, which would inevitably interrupt our connections and correspondence. They, too, have been deaf to the voice of justice and consan-

guinity. We must, therefore, acquiesce in the necessity which denounces our separation, and hold them, as we hold the rest of mankind, enemies in war, in peace friends.

We, therefore, the Representatives of the United States of America, in General Congress assembled, appealing to the Supreme Judge of the world for the rectitude of our intentions, do, in the name and by the authority of the good people of these Colonies, solemnly publish and declare, That these United Colonies are, and, of right, ought to be, *free and independent States;* that they are absolved from all allegiance to the British crown, and that all political connection between them and the State of Great Britain is, and ought to be, totally dissolved; and that, as *free and independent States*, they have full power to levy war, conclude peace, contract alliances, establish commerce, and to do all other acts and things which *independent States* may of right do. And, for the support of this Declaration, with a firm reliance on the protection of Divine Providence, we mutually pledge to each other, our lives, our fortunes, and our sacred honor.

Declaration of Independence, The Mecklenburg. More than thirteen months before the adoption of the Declaration, above given, by the Continental Congress, a series of resolutions embodying a similar declaration had been adopted by the citizens of Mecklenburg co., N. C., at a public meeting holden at Charlotte, the seat of justice of the county. Of this important historical incident different accounts are given. According to the statement generally received in North Carolina, the meeting above referred to was held on the 20th day of May, 1775, and the document itself was in the words following:

"*Resolved*, 1. That whoever directly or indirectly abetted, or in any way, form, or manner, countenanced the unchartered and dangerous invasion of our rights, as claimed by Great Britain, is an enemy to this country—to America—and to the inherent and inalienable rights of man.

"*Resolved*, 2. That we, the citizens of Mecklenburg county, do hereby dissolve the political bands which have connected us to the mother-country, and hereby absolve ourselves from all allegiance to the British crown, and abjure all political connection, contract, or association with that nation, who have wantonly trampled on our rights and liberties, and inhumanly shed the blood of American patriots at Lexington.

"*Resolved*, 3. That we do hereby declare ourselves a free and independent people; are, and of right ought to be, a sovereign and self-governing association, under the control of no power other than that of our God and the general government of the Congress; to the maintenance of which independence we solemnly pledge to each other our mutual co-operation, our lives, our fortunes, and our most sacred honor.

"*Resolved*, 4. That as we acknowledge the existence and control of no law or legal officer, civil or military, within this county, we do hereby ordain and adopt as a rule of life, all, each, and every of our former laws; wherein, nevertheless, the crown of Great Britain can never be considered as holding rights, privileges, immunities, or authority therein.

"*Resolved*, 5. That it is also further decreed that all, each, and every military officer in this county is hereby retained in his former command and authority, he acting conformably to these regulations. And that every member present of this delegation shall henceforth be a civil officer—viz. a justice of the peace in the character of a '*committee-man*,' to issue process, hear and determine all matters of controversy, according to said adopted laws, and to preserve peace and union and harmony in said county; and to use every exertion to spread the love of country and fire of freedom throughout America until a more general organized government be established in this province."

Other accounts give May 31, 1775, as the date of the meeting; and make the declaration to consist of a preamble and twenty resolutions, of which twelve (the fourth to the fifteenth inclusive) make provision for the military organization of the male population and for the administration of justice, and the rest, with the preamble, are as follows:

"*Whereas*, By an address presented to His Majesty by both houses of Parliament in February last, the American colonies are declared in a state of actual rebellion, we conceive that all laws and commissions confirmed or derived from the authority of the king and Parliament are annulled and vacated, and the former civil constitutions of these colonies for the present wholly suspended. To provide in

some degree for the exigencies of this county in the present alarming period, we deem it proper and necessary to pass the following resolves—viz.:

"I. That all commissions, civil and military, heretofore granted by the crown to be exercised in these colonies, are null and void, and the constitution of each particular colony wholly suspended.

"II. That the Provincial Congress of each province, under the direction of the great Continental Congress, is invested with all legislative and executive powers within their respective provinces, and that no other legislative or executive power does or can exist at this time in any of these colonies.

"III. As all former laws are now suspended in this province, and the Congress has not yet provided others, we judge it necessary, for the better preservation of good order, to form certain rules and regulations for the internal government of this county until laws shall be provided for us by the Congress. . . .

"XVI. *That whatever person shall hereafter receive a commission from the crown, or attempt to exercise any such commission heretofore received, shall be deemed an enemy to his country;* and upon confirmation being made to the captain of the company in which he resides, the said company shall cause him to be apprehended and conveyed before two selectmen, who, upon proof of the fact, shall commit said offender to safe custody until the next sitting of the committee, who shall deal with him as prudence may direct.

"XVII. That any person refusing to yield obedience to the above rules shall be considered equally criminal and liable to the same punishments as the offenders last mentioned.

"XVIII. That these resolves be in full force and virtue until instructions from the Provincial Congress regulating the jurisprudence of the province shall provide otherwise, or the legislative body of Great Britain resign its unjust and arbitrary pretensions with respect to America.

"XIX. That the eight militia companies of this county provide themselves with proper arms and accoutrements, and hold themselves in readiness to execute the commands and direction of the general Congress of the province and this committee.

"XX. That the committee appoint Col. Thomas Polk and Dr. Joseph Kennedy to purchase three hundred pounds of powder, six hundred pounds of lead, and one thousand flints for the use of the militia of this county, and deposit the same in such place as the committee may hereafter direct.

"Signed by order of the committee,

"JOSEPH BREVARD, *Clerk of the Committee.*"

There seems to be no difficulty in believing that both accounts are true, and both documents genuine. The action of the 20th of May must have necessitated some more full provision for the public safety and for securing the order of society than had been made at that time; and such a meeting as that of the 31st must doubtless have been held, whether the previously adopted declaration had then been reiterated or not. (The historical questions connected with this matter, will, however, be found fully discussed by the Hon. William A. Graham of North Carolina, under the title MECKLENBURG DECLARATION OF INDEPENDENCE, HISTORY OF.)

F. A. P. BARNARD.

Declaration of Rights, a state paper presented to the prince and princess of Orange (afterwards William III. and Mary II.) at the time the crown was tendered to them (Feb. 13, 1689). The declaration had been drawn up by the Convention-Parliament, and complained of the following grievances which England had endured during the reign of James II.: The exercise of the dispensing power, the establishment of illegal ecclesiastic tribunals, unlawful taxation, the unlawful maintenance of the army, interference with the courts and the elections, the levying of excessive bail, the infliction of barbarous punishments, and the refusal to hear petitions. The declaration then asserted the rights which had been thus violated, and claimed various privileges for the nation. The substance of this declaration became the "Bill of Rights," passed in the second session of the first Parliament under William and Mary.

Declen'sion [Fr. *déclinaison;* Lat. *declinatio,* from *declino, declinatum,* to "bend aside," to "inflect"], a term applied in grammar to the inflection of nouns, adjectives, and pronouns according to their different cases. Such inflections in English are limited to three cases—the nominative, the genitive or possessive, and the accusative or objective. Thus, the personal pronoun *he* is declined as follows: nom. *he,* gen. *his,* acc. *him,* etc. But this regular inflection is limited in our language to pronouns. Our substantives have ordinarily but one change of case inflection, which occurs in the genitive, and is formed by the addition of *s,* with an apostrophe, to the nominative. In Latin there are six cases, in Greek five, in German four, in Russian seven, in Sanscrit eight, and in some languages even more. Of the cases, the first is the nominative or name-case (from the Lat. *nomino, nominatum,* to "name," and more remotely from *nomen,* a "name"). It is that form which is usually found in a list of nouns or names, in which case the subject-noun is always found. The genitive case (Lat. *casus genitivus,* from *gigno, genitum,* to "beget," implying the origin or source), also called the possessive case, indicates either the source or the possessor. Thus, when we say the "sun's light," the sun is not the possessor of the light which it has emitted, but its source. In some cases the genitive implies a relation which is neither origin nor possession. Thus we speak of "Cæsar's enemies," in which case the possession is formal, and not logical. The dative case (Lat. *casus dativus,* from *do, datum,* to "give") frequently denotes attribution or giving. Thus, in Latin we say "*Dedit mihi librum,*" "He gave (to) *me* the book;" in which example the pronoun is dative. The dative, however, frequently does not imply any giving or attribution; as in the Lat. "*Diis invisus,*" "hateful to the gods," where a certain relationship is implied. The dative in Greek and Latin seldom signifies motion to any place. The accusative (from the Lat. *accuso, accusatum,* to "accuse"), called also the objective case, is frequently the object of an active verb or of a preposition, and in general is regarded as indicating the object towards which motion is directed or the place at which it ends. The vocative (from the Lat. *voco, vocatum,* to "call") is the form of a noun in which a person is addressed or apostrophized. In English this case is identical in form with the nominative. The ablative (from the Lat. *ab,* "away," and *fero, latum,* to "carry") is properly the case of a noun from which something is taken or carried away. The Latin ablative also represents the instrumental and locative cases. The instrumental case properly designates the means by which anything is done, and is found in the Sanscrit and Russian. In most languages some other case, or a preposition with its object, takes its place. The locative case (from the Lat. *loco, locatum,* to "place") is that form of a noun which indicates that it stands for the place where anything is, or is done. It is used in Sanscrit and Russian. In the latter language it is called *predlozhnii,* or "prepositional," because it is always accompanied by a preposition.

The Latin ablative includes, as we have seen, also the locative and the instrumental. In the Sanscrit, to which the Latin has a very near affinity, the instrumental, dative, and ablative plural are, in many words, almost identical with each other. For example, in the Sanscrit *bhūs* (signifying "the producer," hence the "earth," and also a "cow")—akin to the Lat. *bos*—has *bhūbhyās* in the dative and ablative plural, and *bhūbhīs* in the instrumental. The likeness between these forms and the Lat. *būbus* (dative and ablative of *bos*) is very remarkable, especially when we consider that *bos* in all its cases has a short penultima, except in the dative and ablative plural; while *bhūs* has also a short penultima except in the dative, locative, instrumental, and ablative plural cases, fully represented in Latin by the dative and ablative.

Certain particular methods of inflecting words are also called declensions. Thus, declinable words are in some languages classified in groups according to the various methods in which their cases are formed. These groups are called the "first declension," "second declension," etc.

J. THOMAS.

Decli'nation [Lat. *declinatio,* from *declino,* to "bend downward or deviate"], in astronomy, the angular distance of a celestial body from the celestial equator, measured along a great circle passing through the centre of the body and the poles of the heavens; or it may be defined to be the arc of a circle of declination passing through the place of the heavenly body, intercepted between that place and the celestial equator. The place of a star in the heavens is determined by means of its right ascension and declination, which correspond to longitude and latitude on the surface of the earth.

Declination of the Magnet'ic Nee'dle is the deviation of the axis of a magnetic needle (that is, the straight line which joins its poles) from the astronomical meridian. This declination is sometimes towards the W. and sometimes towards the E. From a table of observations made at Paris, it appears that since 1580 the declination has varied more than 31 degrees. In 1663 it vanished. From the date of the first observations till 1820 it advanced progressively westward, but since that time it has assumed a retrograde movement towards the E. The declination of the magnetic needle at London in 1865 was 20° 30′ At present it is scarcely perceptible at Cape Hatteras. To the W. of that point it is easterly, and to the E. the variation is westerly. (See MAGNETISM, by PROF. A. M. MAYER, PH. D.)

Declinom'eter [a word improperly formed from the Lat. *declinatio*, "declination," and the Gr. *μετρον*, a "measure"], an apparatus for measuring the declination of the magnetic needle, or the force of terrestrial magnetism in the plane of the horizon.

Decomposi'tion [from the Lat. *de*, "from," "un," and *compono, compositum*, to "put together"], a term used in chemistry to signify the separation of compound substances into their elementary parts. When compounds are resolved into their elements, or when the chemical constitution of substances is altered, they are said to be decomposed; and when in this operation new products are formed, such products are called the results of decomposition. Thus, ammonia is the result of the decomposition of certain animal substances; carburetted hydrogen gas is the result of the decomposition of pit-coal, etc. Chemists use the terms simple and compound, or single and double decomposition, to distinguish between the less and more complicated cases. When a compound of two substances is decomposed by the intervention of a third, which is itself simple or which acts as such, the case is one of simple decomposition; water, for instance, is a compound of oxygen and hydrogen. When the metal potassium, which is a simple body, is thrown into it, it is decomposed; the hydrogen is liberated in the form of gas, and the oxygen combines with the potassium to form potassa.

Deco'rah, a city of the second class, capital of Winneshiek co., Ia., situated on the Upper Iowa River, is the terminus of the Decorah branch of the Milwaukee and St. Paul R. R. It contains the Norwegian Lutheran College, an excellent graded public school, three banks, two weekly newspapers, two semi-monthlies (printed in Norwegian), two woollen-mills, one paper-mill, two foundries, four flour-mills, three wagon manufactories, and other industries. Pop. 2110; according to State census 1873, 2232; of township, 3723. A. K. Bailey & Bro., Eds. "Republican."

Dec'orate [from the Lat. *decoro, decoratum*, to "adorn"], to adorn, embellish; to cover with external ornaments. To decorate graves is to garnish them with flowers. The anniversary on which flowers are placed on soldiers' graves in the U. S. is called Decoration Day, and is observed on May 30th.

Deco'ria, a post-township of Blue Earth co., Minn. Pop. 262.

Decorated Style, in architecture, is also known as the "Middle Pointed" or pure Gothic style. It succeeded the First Pointed or Early English (1189–1272) by a transition so gradual that its origin in England is variously assigned to dates between 1272 and 1307, although in Germany and France it was considerably earlier. It finally passed by an equally gradual transition into the Perpendicular Gothic of the fifteenth century. The Decorated Style is regarded as the perfect flower of Gothic architecture. It is marked by geometrical window-tracery, richly ornamented doorways, delicate mouldings, and elaborately carved imitations of leaves, as of the vine and oak, often conventionalized, but not unfrequently copied from nature.

Decoy' [from *de*, "away," and the old English verb *coy*, to "entice"], to entice; to lead by artifice into a snare or into danger; to entrap by insidious means. As a substantive it signifies any object or thing by which persons or animals are enticed and lured into danger, etc.; a device by which aquatic birds, chiefly ducks, are enticed from a lake or river into a narrow winding canal or ditch, which, gradually becoming narrower, at last terminates under a cover of network several yards long. To draw the birds into this snare a tame duck called a decoy-duck is sometimes employed.

Decrescen'do, in music, is a gradual diminishing of sound, the reverse of Crescendo (which see). It is marked thus  .

Decre'tal [from the Lat. *decretum*, a "decree"], a decree of the pope, having the same authority in canon law as the decrees in civil. The body of the canon law consists—1st, of the *Decretalium*, a collection made by Gratian, a Benedictine monk, after 1150, and drawn from the opinions of the fathers, popes, and councils; 2d, of the *Decretalia*, collected by Pope Gregory IX. (1227–41) from the decretal rescripts or epistles of the popes. A *liber sextus* was added by Boniface VIII. (1294–1303), and other additions were made by succeeding popes.

Decretals, False, otherwise called the **Pseu'do-Isido'rian Can'ons,** the name of one of the most remarkable literary forgeries of which we have any record. It designates a collection of papal letters, canons, etc., partly genuine, but mostly spurious. The name of the author is unknown, but they are ascribed in the preface to one Isidorus Mercator (or, according to some MSS., Peccator), and hence they were long believed to be the work of St. Isidore of Seville. They date from the first half of the ninth century. Their spuriousness was first established by German Protestant critics in the sixteenth century, and is now admitted by all Roman Catholic writers. It appears to have been the object of the author of this great fraud to assist in freeing the Church from secular domination. It is maintained by some Protestant historians that the primacy of the popes is mainly based upon the false decretals; but while it cannot be denied that certain popes used them freely for their own advantage, there is no evidence of intentional fraud on the part of the popes, for the decretals were generally received as genuine; and it is maintained by Roman Catholic writers that the influence of the false decretals was small.

Decu'rion [Lat. *decurio*], the leader of a *decuria*, or body of ten men, in the Roman cavalry. Three *decuriæ* constituted a *turma*, or body of thirty men, and the name decurio was afterwards given to the commander of the larger body. In Roman law it was the name given to senators in the colonial governments.
